"But suppose the loss to be 4 inches on each stride, which it is much more likely to be, then it would amount to 36 yards 9 feet, or 13 lengths; which is fully enough to raise a cry of 'foul play,' the 'horse is amiss,' &c. Now, no jockey in the world, however frequently he may have ridden a horse, can so exactly measure his stride as to be enabled to detect a deficiency of one 72nd part of it, which 4 inches would be, much less could he detect the 288th part, which 1 inch would be: so that he never could make himself acquainted with the real cause of so signal and unexpected a defeat, and the whole matter would remain involved in mystery, casting suspicion and distrust on all around."—p. 35.

Unfortunately, the high-mettled racer, who wears the shoe and knows where it pinches has not the gift of speech like Dean Swift's Houynims. The horse has this deficiency in common with the baby, whence farriers find their cavalry quite as difficult to manage as physicians do their infantry, who cannot explain symptoms.

The falling off of speed which is often observed between a horse's "fast gallop" and the race, may be accounted for by his having taken his gallop in his *old* shoes, to which the feet were accustomed, while the race was run in *new* ones, firmly nailed on from head to heel, effectually "making him quite safe," by putting it out of the range of possibility that he should ever be enabled to "get into his best pace." Mr. Miles recommends three quarter plates, which should be fastened on by no more than six nails, and these placed only between the outer heel and the inner toe. This is well

worth Lord George Bentinck's consideration, whenever, his present race being over, the kind stars permit him to exchange the corrupt atmosphere, tricks, and politics of St. Stephen's for the fresh-aided downs of Newmarket, where, says Mr. Bracy Clarke, in his luminous *Podophora*, "wealth, learning often, and horses, do go hand-in-hand." Note also this wrinkle for fox-hunters:—never, when the season is over, let the horses' feet remain cramped up in short hunting-shoes, but relieve them by longer ones, just as the rider exchanges his top-boots for slippers: an easy shoe—blessings on the man who invented it—comforts a groggy, overhunted horse as much as it does a gouty, overhaunched mayor.

Mr. Miles, duly estimating the advantages of freedom of motion, had long converted his stable-stalls into boxes, from a dislike at seeing his hobby-horses treated worse than wild beasts, who at least are allowed to traverse their den. Loose boxes are too generally left untenanted because no horse happens to be an invalid; yet they are more useful to sound animals than even to sick ones, since prevention of disease is better than its cure. The poor beast, cribbed, cabined, and confined, chained to his rack, and tortured by being unable to change position, is put for hours to the stocks, and condemned to the hard labor of having nothing to do—which destroys dandies and bankrupt commissioners. The prisoner suffers more from long standing still than from any trotting on the hardest road—it is the rest, not the work, that kills; and still more, when the pavement of the stall is uphill, which, as his legs are of equal length, and not like a caméléopard's, is at once painful and injurious; he meets the difficulty by standing on his hind toes in order to equalize the weight, and thereby strains his tendons and gets "perched." The floor should be perfectly level and paved with granite slabs, which should drain themselves by having herring-bone gutters cut in them, as nothing is more fatal to the eyes of horses than the ammonia so usually generated under them. A box so arranged is not merely a luxury to a horse and mare, but as absolute a necessity as one at the Haymarket is to a lord and lady. Nature is ever our surest guide. The animal when grazing in a field never is quiet a second; frog and sole are always on the move, and therefore in good condition, because they regularly perform their functions; the cushion of the navicular is never there absorbed as it is in an idle stall. If the brains of learned men are liable to be dried up under similar circumstances of *otium cum pinguetudine*, the soles of irrational creatures necessarily must fare worse: turn the same animal into loose boxes, and the slightest tap on the corn-bin will occasion at least fifty wholesome expansions of every sensitive organ.

Mr. Miles gives working plans of the simple contrivance by which he converted a four-stalled stable into one of three boxes. This suppression of supernumerary stalls was effected by shifting the divisions. A tripartite arrangement is far preferable to solitary confinement, for horses are curious, social animals; they love their neighbors, and like to see what they are at, as much as county families do, whose pews adjoin in their parish church. The best partition is brick noggin, which should be cased with boarding, and surmounted with iron rails: the separation should be carried highest near the manger, in order to prevent the company from watching each other at meals—a thing which is not only unmannerly, but

injuriously to health. Each hopes to get some of his neighbor's prog, and is also afraid of his neighbor getting some of his; insomuch that the best bred horse, even when next to a pretty filly, invariably bolts his feed—just as a Yankee senator does at a boarding-house table d'hôte, although Fanny Butler sits at his side. Dyspepsia is the sure result of this imperfect mastication.

One word only on diet. The groom will persist in treating his horse like a Christian, which, in his theology consists in giving him as much too many feeds as he does to himself; but shoes are not more surely forged on anvils than diseases are in the stomach both of beasts and men who make themselves like them. Nature contrives to sustain health and vigor on a precarious, stinted supply, since it is not what is eaten but what is digested that nourishes. Her system should be imitated in quantity and quality; she regulates the former according to the length of the day and the amount of work required to be done, and bids the seasons, her hand-maids, vary the latter by a constant change in the bill of fare. Her primitive sauces are air and exercise, and her best condiment, however shocking to the nerves of Monsieur Ude, is mud: more pecks of real dirt are eaten by quadrupeds who graze in the fields, than are of moral dirt by your biped parasites who make love to my lord's eyebrow and soup-tureen. Provide, therefore, your nice nags with their cruet and salt-cellar, by placing in each manger a large lump of rock-salt and chalk, to which, when troubled with indigestion or acidity, they will as surely resort as the most practised London diners-out do to their glaubers and potash; nor will they often require any other physic. If a bucket of water be placed always in their reach, they will sip often, but never swill themselves out to distension, which they otherwise are "obligated to do" (like their valet) whenever liquor comes in their way, in order to lay in a stock like the camels, who reason on the uncertainty of another supply.

Boxes, however beneficial to horses, are unpopular with prejudiced grooms, who have an instinctive dread of improvements which do not originate with themselves; and although in truth few classes are more ignorant of the philosophy and ologies of the horse than stable folk, yet, in common with all who handle ribbons or horse-flesh, they have jockeyed themselves into the credit of being the knowing ones *par excellence*; accordingly such servants, especially if old ones and treasures, generally rule and teach their masters, for gentlemen pique themselves vastly on connoisseurship of pictures and horses, and are shy of asking questions which imply ignorance. The whole genus groom has an antipathy to any changes which give them more work; they particularly dislike, when they have "cleaned" their charges, to see them lie down, "untidy" and "dirty" themselves again; they sneer at what they call "finding mares nests;" and pretend that horses eat their beds, as the pious Æneas and his friends did their tables. But Mr. Miles has invented a remedial muzzle for these gross feeders, of which he gives us an engraving. Boxes again are ruinous to the veterinary surgeon, who fees grooms, since they do away with the great cause of profitable grogginess. These gentry are jealous of amateur farriery, and abhor any revelations to the uninitiated of family secrets in plain intelligible English. Mr. Miles cannot expect to be popular in the west, a latitude which imports rather than exports wise men; the horse-doctor shudders lest disease, death, and himself should be set aside, by every man—*Milite duce*

—becoming his own farrier. So thought the pupils of Abernethy, after his publication to the world of the panacea blue pill; "but take courage, gentlemen," said he, "not one of your patients will ever follow my advice." Mr. Miles, however, like the Oriental hakim, prefers exercise to mercurial treatment—"the best physician is a horse, the best apothecary an ass." Exercise, combined with cleanliness, is meat, drink, and physic for horse and groom; although the latter loves rather to lurk in the larder, and never carries his own Roman-cemented carcass—and thinks, reasoning from his own sensations, that no harm is done to a horse by not going out until his legs begin to swell. A regular daily walking-exercise of two hours is the smallest possible quantity to ensure health; while three or four are much better.

"When masters remember that the natural life of a horse is from thirty-five to forty years, and that three fourths of them die, or are destroyed, under twelve years' old—used up—with scarcely a foot to go upon; I take it," says Mr. Miles, "that they will be very apt to transfer their sympathies from the groom, and his trouble, to their own pockets and their horses' welfare."—p. 41.

Yet, were it not for the wise provision of nature which causes legs to swell after inaction, and the overlively exuberance of antics by which a fresh horse exhibits his schoolboy exultation of being let loose and getting out of the stable—probably even less than the present poor pittance of exercise would be given by idle grooms and timid masters.

The horny wall of the horse's foot is apt to get dry and brittle in a hot stable where temperature ought to range from 56° to 60°. Dry straw, coupled with excess of heat, produces cracks in the crust, the natural effects of overbaking; this is counteracted by grease and moisture, using the first first—which is an axiom—in order to prevent evaporation. Mr. Miles furnishes the receipt of an ointment which he has found to succeed admirably. In hot summer days the feet should be tied up in a cloth, and occasionally plunged into buckets of cool water; beware, however of washing the feet too soon after exercise, as it checks perspiration and induces fever; clean them when cool, and rub the hock and pasterns dry with the hand—the best of towels; a stopping also at night of fresh cow-dung keeps the frog moist and sweet.

LEGACY.—A bequest of goods and chattels by will. Some parents leave a good name as a legacy to their children; and some children, directly they get the good name, put it on the back of a bill as the best means of turning it into a profit. Many a good name has been eventually dishonored by this process. A legacy is either general or specific. The man who left behind him a receipt for a pill that was a specific for every disease, left undoubtedly a specific legacy. As it is just possible that a man may not have been taxed heavily enough in his lifetime, a tax is laid on his property at his death, called a legacy duty; so that the tax-gatherer may be said to pursue his victim even beyond the grave.—*Punch*.

THE WORSE FOR WEBSTER.—The accusations of fraud and speculation brought against the great American statesman, Mr. Webster, have turned out to be utterly groundless. We fear Mr. Webster will lose his popularity amongst his countrymen in Pennsylvania.—*Punch*.

BORNEO—JAPAN.

[Conclusion of an article in the Quarterly Review.]

A FAIRER field than Sarawak for the exertions of the Christian missionary scarcely presents itself in the uncivilized world. In that field we earnestly hope that the Church of England may be the first. The hill Dyaks in the province are estimated by Mr. Brooke at some 10,000 in number, and, as might be expected under such rule as he has established there, are fast increasing. The last accounts received speak of visits of chiefs to Mr. Brooke from a distance of two hundred miles in the interior :—

"These people," he states in one of his letters, "are mild, industrious, and so scrupulously honest, that a single case of theft has not come under my observation, even when surrounded by objects easily appropriated and tempting from their novelty. In their domestic lives they are amiable, and addicted to none of the vices of a wild state. They marry but one wife; and their women are always quoted among the Malays as remarkable for chastity. Their freedom from all prejudice and their present scanty knowledge of religion would render their conversion to Christianity an easy task, provided they are rescued from their present sufferings and degraded state; but until this be done it will be vain to preach a faith to them the first precepts of which are daily violated in their own persons."

Mr. Brooke says elsewhere, (vol. ii., p. 184,) "The Dyak is neither treacherous nor cunning, and so truthful that the word of one of them might safely be taken before the oath of half a dozen Borneans. In their dealings they are very straightforward and correct, and so trustworthy that they rarely attempt, even after a lapse of years, to evade payment of a just debt." Is not this a better raw material for Christian manufacture than the proud and warlike savage of New Zealand, or the Hindoo steeped in the prejudices of caste? Is such a field as this to be left to the Jesuit, or to the chances of Protestant sectarian zeal? We have some hope that these questions will be answered as they should be answered from rich and episcopal England; and that the great and wealthy of the land will come forward and tell our venerated primate—find us a man of piety, enterprising zeal, and judgment, and we will provide the means of establishing him in a land which, with God's blessing on his efforts, to use the words of one who knows it, he "will not wish to exchange for any sphere of action on this side heaven."*

The passages above quoted are well calculated to excite Christian sympathy on behalf of Mr. Brooke's special protégés, the aboriginal Dyaks; but it must not be supposed that he has no corner left in his heart for the Malay, who has been scarcely less maligned by common report, than the Helot race he oppresses. We cannot profess to know what notorious the term Malay conveys to our readers in general. With us it raises the vision

of a man of swarthy complexion, drugged with opium, running down a crowded street, pursued by the civil and military authorities, and stabbing right and left, at man, woman, and child, with a kris. This demoniac vision fades before Mr. Brooke's sketch from the living model :—

"Simple in their habits, they are neither treacherous nor blood-thirsty; cheerful, polite, hospitable, gentle in their manners, they live in communities with fewer crimes and fewer punishments than most other people of the globe. They are passionately fond of their children, and indulgent even to a fault. I have always found them good-tempered and obliging, wonderfully amenable to authority, and quite as sensible of benefits conferred, and as grateful as other people of more favored nations"—Vol. ii., p. 128.

Of course there is a reverse to this picture. Among their bad qualities Mr. Brooke enumerates deceit, a disposition to intrigue, superstition, and its attendant propensities to persecution and oppression. Add to these defects of the Asiatic character the outward circumstances of power in the hands of a corrupt aristocracy, all the vices without the advantages of a feudal system, and no wonder that occasional and scanty intercourse with ignorant, insolent, and unscrupulous European traders, should have led to acts of treachery and violence which have given the Malay a bad name—applied also, as the term is, to many races quite distinct from the real Malay, and from each other, in origin, habits, and language.

Mr. Brooke's time has been too much and too well employed to allow him to make many scientific additions to our knowledge of the natural history of Borneo. He has, however, not failed to collect some particulars of that race of quadrupeds for which the island has long been famous, and which, with one exception, is supposed to approach the nearest to man in anatomical structure and in its consequent habits and gestures. Nor has Mr. Brooke been idle as a collector. Five living specimens of the orang-outang were shipped by him in one vessel for England, but, we believe, died on the passage. His report on the animal, published in the "Transactions of the Zoological Society," is appended to Captain Keppel's first volume. The largest adult shot by Mr. Brooke was 4 feet 1 inch in height, but he obtained from the natives a dried hand which would indicate far greater dimensions, and we think there is ground to suppose that the stature which has been attributed to a Sumatran species, fully equalling or exceeding that of man, is attained by the same or a similar species in Borneo. Mr. Brooke's observations or inquiries do not tend to elevate the character of the Bornean animal in respect of its approximation to humanity, as compared with his West African competitor, the chimpanzee. The activity in his native woods, attributed to him by some writers, is denied by Mr. Brooke, who describes him as slow in his motions, even when escaping from man, and making no attempt at defence except at close quarters, when his teeth are formidable. He appears to be agile and dexterous in nothing but the formation of his nest, a mere sort of uncovered seat which he weaves of branches with much rapidity. Mr. Brooke's account of the nidification of the animal tallies exactly with that by Mr. Abel, the naturalist to the Chinese Embassy of Lord Amherst :—

"While in Java," says Mr. Abel, p. 325, "he lodged in a large tamarind tree near my dwelling; and

*The "Address" of the Rev. C. Brereton did not reach us until this article was completed. It gives an able précis of Mr. Brooke's labors, and concludes with an earnest appeal made to the English public, at his request, for assistance towards the establishment of a church, a mission house, and a school at Sarawak. Mr. Brooke is an attached member of the Church of England, and the Archbishop of Canterbury, and the Bishops of London, Norwich, Lichfield, Oxford, and Calcutta, have already given their sanction to the undertaking. May 26.

formed a bed by intertwining the small branches, and covering them with leaves."

"The rude hut," says Mr. Brooke, "which they are stated to build in the trees, would be more properly called a seat or nest, for it has no roof or cover of any sort. The facility with which they form this seat is curious; and I had an opportunity of seeing a wounded female weave the branches together and seat herself within a minute. She afterwards received our fire without moving, and expired in her lofty abode, whence it cost us much trouble to dislodge her."

Our accounts of the chimpanzee in its native state are perhaps little to be relied upon; but it is certain that in its gregarious and terrestrial habits it has a greater affinity to man than the solitary and arboreal orang-outang. The former is said to build a hut on the ground not much inferior to the dwelling of the negro—but, unlike him, to build it, not for his male self, but for his wife and family. He uses a club, possibly for support in locomotion, more certainly and with tremendous effect for assault and defence; and, if all tales be true, he buries his dead. In all these accomplishments the Bornean *homo sylvestris* is decidedly deficient. In youth both have been found gentle, playful, imitative of man, and capable of strong attachment. The chimpanzee some time since exhibited at Paris, who lived in the first circles of French society, was much visited by M. Thiers, and attended in his last illness by the court physicians, was most impatient of solitude. The maturer character of both species is probably much influenced by adventitious circumstances. The forests of Africa, swarming with huge reptiles and the larger carnivora, are a rougher school than those of Borneo, from which "*rabidæ tigres absunt et sæva leonum semina.*" A French navigator, Grandpré by name, tells us of a chimpanzee which became an able seaman on board a slaver, but was so ill used by the mate that he died of grief. Why does this give us a worse opinion of the mate, and a warmer feeling of indignation, than if the victim had been one of the human cargo? In their immunity from the fiercer beasts of prey the forests of Borneo have greatly the advantage not only over those Caffrarian wastes where the cowering missionary frequently reads prayers from his fortified wagon to a congregation of lions, but over the more civilized settlement of Singapore. Mr. Davidson's volume (p. 51) gives a frightful account of the degree to which the jungles of that island are infested by the tiger. Captain Wilkes, the very intelligent commander of the United States discovery expedition, who visited Singapore in 1842, affirms that before the settlement of the island tigers did not exist in it, but that they have since swum the straits, and have devoured no less than 200 human victims within a short distance of the town. It is no wonder that the botany of Singapore is, as Captain Wilkes states, imperfectly known. Its jungles come into respectful competition with the forests of Assam, from which, under Lord Auckland's government, five thousand tiger-skins were produced in one year to claim the government reward. The elephant is supposed to be extinct in Borneo, and we hear nothing of the camel, which Herrera mentions as abundant.

Having quoted Captain Wilkes, we may add that he bears the honorable and impartial testimony of an American gentleman and officer to the value of Mr. Brooke's exertions in Borneo, and that he appears to consider it impossible that they should

not be supported and carried out by the British government. Captain Wilkes did not touch at Borneo itself, but his account of the neighboring Sooloo Islands is the best and most detailed which has come under our notice.*

We have already referred to Mr. Davidson's volume. It is the work evidently of a man of very distinguished natural ability, and though proceeding from one whose life seems to have been devoted to mercantile industry and adventure, the style of its literary execution is such as most professed men of letters might well envy. He gives us a most agreeable *résumé* of observations collected in some forty passages across the ocean to India, the Indian Isles, China, and Australia. He defends the opium trade, insinuates a desire for the retention of Chusan, and advocates a compulsory opening of intercourse with Japan. Against this latter suggestion—with much respect for Mr. Davidson, and with grateful veneration for the memory of Sir S. Raffles, who did more than cast a longing eye on Japan—we enter our protest, on grounds which have been amply set forth in two former numbers of this Journal. We believe the Japanese to be a contented, prosperous, and, on the whole, well-governed people, ready to rip themselves up on the appearance of the British flag in their waters. If one empire of the world chooses to indulge a taste for seclusion, to eschew Manchester goods, and make its own hardware, we think it ought to be indulged. The risks of invasion would be serious to the invader, and success would be purchased at an expense of gunpowder and blood, which, though neither Quakers nor members of a peace society, we abhor to contemplate.

We are not, however, more than Mr. Davidson or Sir Stamford Raffles, indifferent to the advantages our commerce could derive from any relaxation, voluntary on the part of the Japanese, of their rigid system of non-intercourse; and we admit that there are circumstances of the present moment which may bring such a change of their policy within the verge of possibility. We have no doubt that long before this the reverberation of our guns on the banks of the Yellow River has been felt in the council chamber of the palace of Jeddo. It is not possible to pronounce what particular effect the sound may have produced on the Japanese mind. It is well known that the Japanese entertain a hereditary contempt and aversion for their near kinsmen of the celestial empire. In their commercial intercourse, the latter are subjected to restrictions as rigid, and conditions as humiliating, as those to which the Dutch have so long submitted. The original relationship of the two races was probably a near one, but a separation of ages has left the recollection of triumphant resistance to the Chinese invader unimpaired, and has produced striking differences between them, generally to the advantage of the Japanese. The habits of personal cleanliness which pervade all classes in Japan would alone constitute a strong distinction in their favor. We think it highly probable that the intelligence of the humiliation of the Chinese has been received in Japan with something of the satisfaction with which, as we remember to have heard, the Chinese wardens of the marches looked on at the discomfiture of the mountaineers of Nepal who gave so much trouble to our best troops and commanders. Their applications for assistance or refuge were met with insult and con-

* See "Narrative of the United States' Exploring Expedition." Philadelphia edition, vol. v., ch. ix.

tumuly, which broke out in such expressions as "Truly you are a great people! Who are you, that you should resist the English," &c. &c. We cannot, however, imagine that satisfaction of this description should be unmixed with apprehension at any prospect of a visit from the conquering nation whose exploits, seen either through Chinese or Dutch spectacles, might not assume a very prepossessing aspect, particularly when coupled with the last instance of the appearance of the English flag in the waters of Japan—that of the "Phaeton." We are nevertheless told that reports have reached Java that the Japanese government were in expectation of a visit from the English, and that the government at Jeddo would now receive an amicable commercial mission. If this be so, the experiment is worth trying; but if it be tried, we earnestly hope that it may be committed to some officer of approved discretion—some naval Pottinger—who will not stain our flag by any act of violence or illegal aggression, such as in the case of the "Phaeton" was to be palliated, but in our opinion hardly justified by the warlike relations which then existed between ourselves and the Dutch. We have no enemy now to run to earth in Japan, and if we cannot at once establish friendly relations with its inhabitants, and procure from the local authorities the usual hospitalities of a friendly port, pilotage, provisions, &c., without humiliating and inadmissible conditions, we know not by what law of nations we can insist on a reversal in our favor of the code of an empire which never itself has indulged in acts of aggression. We doubt, indeed, whether either menace or violence could lead to any result more satisfactory than they would deserve, and we believe that in such dangerous waters as those of Nagasaki, the safety not only of boats' crews, but even of a ship of war, might be compromised by rash contempt of Japanese militia, and equally by rash reliance on the weakness or the good-will of a people with whom self-sacrifice at the order of the sovereign is an inveterate custom.

As to any such specimen of bad faith as would be exhibited in our forcible retention of Chusan, we consider it beyond the sphere of serious argument or reprehension, and we do not imagine that there is much more chance of any diplomatic arrangement with the Chinese by which we could keep possession of it, than there is of Lord Aberdeen conveying the Channel Islands in a leasehold tenure to Louis Philippe, or of his obtaining from that sovereign a reëntry on our old possession of Calais.

We are, however, quite in accordance with Mr. Davidson when he advocates immediate measures for working the Borneo coal-field.

"All her majesty's steamers on the coast of China might be supplied," he says, "with fuel from the same quarter—particularly as several empty ships go to China every season in search of freights homeward, which would gladly call at Borneo en route and take in a cargo of coals to be delivered at Hong Kong at a moderate rate per ton. To establish this coal-trade on a permanent footing, a treaty would require to be entered into with the Sultan of Borneo. This, I have no hesitation in saying, might be effected, and the requisite arrangements made with the Borneo authorities by Mr. Brooke, whose influence in that quarter is deservedly all-powerful."—*Davidson*, p. 295.

Mr. Earl's volume, "Enterprise in Tropical Australia," is also a performance of sterling abil-

ity—and it is well calculated to make us anxious for the more expanded treatise on eastern commerce which he promises soon to publish. It has, and will probably still more, become the province of England to direct to Australia and other quarters the streams of population and labor which only require her hand to guide them from various over-peopled quarters of the east, to fertile but unpeopled wastes. At page 119 of Mr. Earl's volume will be found some valuable observations on this extensive and interesting subject. Many of the islands of the Indian seas adjacent to Australia, such as Kissi and Rotti, suffer periodically from famine—others are only relieved of their surplus population by the abominable expedient of the slave-trade. The Celebes, China, and Continental India, are all ready to irrigate the thirsty soil with streams of useful labor. Of these Mr. Earl considers the Malay the cheapest, from his habits and requirements as to dress the best customer for the British manufacturer, and the best adapted for clearing new lands. The Chinese are the best agriculturists, manufacturers, we believe we may add miners—India furnishes the best herdsmen. It has been found at Singapore that from these various sources the supply of labor has fully kept pace with a growing demand. Mr. Davidson says that the Chinese junks bring annually to this part of the world from six to eight thousand emigrants, who ultimately find employment either in the island, in the tin-mines of Borneo, or the Malayan peninsula. "*Spartam nactus es*"—if we can only contrive to turn to account the territory within our legitimate control, we shall rub on for some time to come without coercing Japan. The merchant and the emigrant to Australia will find much useful information in these two works of Messrs. Davidson and Earl; and with readers for amusement they cannot fail to be popular. We could fill pages with descriptions and anecdotes of the most lively interest which abound in both: Mr. Davidson's especially, exhibits a rare mastery in picturesque narration.

PUNCH'S POLITICAL DICTIONARY.

LODDS, HOUSE OF.—One of the constituent parts of the parliament of the United Kingdom, and comprising the body known as the peers; so that they who insist that our constitution is peerless, are guilty of a slight error. The lords are either spiritual, including the archbishops and bishops, or temporal, who may have been so called from their ancestors having first obtained their dignities by a readiness to temporize. The eldest son of a peer is a peer at his father's death—as if in the aristocracy of talent the eldest son of a poet should be born a poet. From the old proverb, one would imagine this was the rule of succession to the temple of the muses: but the words *poeta nascitur*, must be qualified by *non fit*, which may be translated, "Unless he is not fit for it." Peers are sometimes created from amongst lawyers and soldiers, when, to prevent the coronet being like a tin-kettle fastened on to the head, as in the celebrated dog case it was tied to the tail, it is usual to settle a pension in tail male, on the recipient of a peerage. The peers have been called the hereditary wisdom of the legislature; but as it is thought they can sometimes evince their wisdom better by holding their tongues, and keeping away from the house, their presence is not necessary to their votes, which may be given by proxy.

From the Spectator.

MR. TOWNSEND'S LIVES OF TWELVE EMINENT JUDGES.

SOME of these Lives originally appeared in the *Law Magazine*: they have been reprinted, partly in consequence of the praises bestowed upon two of them by the *Edinburgh* and *Quarterly Reviews*, partly in the opinion that a "collection of memoirs of eminent modern judges would not be unacceptable to the profession and the public generally;" an idea which induced the composition of the new Lives.

The Twelve Judges whom Mr. Townsend has selected as subjects for his pen may be described as belonging to the age of George the Third; for they were all appointed to the bench and left it during the reign of that monarch, with the three exceptions of Stowell, Eldon, and Tenterden. In selecting his subjects, Mr. Townsend seems to have been guided by his own test of eminence; for the characters and legal line of his heroes are varied enough. In common law, there are Buller, Kenyon, Gibbs, Ellenborough, and Tenterden; who, however they might differ in personal and professional nature, were all men of legal acquirements, who forced their way to wealth, celebrity, and station, by indefatigable labor and perseverance, and who may be taken, each in his line, as a fair specimen of the hard common lawyer, whom modern manner is gradually extinguishing, with his good as well as his evil. The two great equity lawyers are Eldon and Sir William Grant; the former eminent as a chancellor, but perhaps unrivalled for a knowledge of law and a power of hair-splitting; the latter with the highest repute as a complete and perfect judge of any man in modern or ancient times—though his reputation perhaps excels that portion of his works from which posterity must form its decision. Following these two eminent judges is Mitford, Lord Redesdale, chancellor of Ireland; a man who was rather an able practitioner and a respectable individual than of original and marked character either as a lawyer or a man. As a popular advocate, Erskine towers above all: as a judge, he can scarcely be called "eminent;" his post and the figure he made in it were entirely owing to his eminence at the bar. "The wary Wedderburn, who never went upon a forlorn hope nor ever threw away the scabbard," and who "had something about him which even treachery could not trust," is best known as an unscrupulous but clever political adventurer, whose memory is embalmed in history for his fierce though justifiable attack upon Franklin, his defence of Clive, and various intrigues with every party likely to serve his turn, till, finding the Foxite whigs hopeless and the Portland party not so pliant as he wished, he bargained with Pitt for the chancellorship. He had on his previous elevation to the common pleas been made Lord Loughborough; a name by which he is more familiarly known than by that of Earl of Rosslyn, which title he obtained when he was obliged to retire a few years afterwards. Pepper Arden, Lord Alvanley, though not so mere an adventurer as Loughborough, was active and celebrated as a politician rather than as a lawyer; though he creditably filled the posts of master of the rolls and chief justice of the common pleas. The remaining eminent judge was a civilian, and one of the most distinguished that ever lived. To profound learning and extensive acumen, William

Scott, Lord Stowell, added an amenity of disposition, an elegant literature, and graces of style which few lawyers of any age could equal; whilst his good taste never allowed his learning to encumber, or his literature to ornament his composition too much. He might be a shade over-exhaustive and over-argumentative; and perhaps he wanted the condensed gravity of judicial eloquence: but he gained in amenity what he lost in weight. These things, however, are rather of the nature of feature and complexion than constitutional qualities. Lord Stowell had the acumen which perceived distinctions, the comprehension which took in the entire range of the subject, the genius which detected the principle lurking in the instance; and he was thus often enabled to endow seemingly small cases with importance and dignity. In these larger qualities Stowell seems to us to have excelled all the rest of these eminent men; the best of whom were probably only "judges learned in the law," and whose learning eclipsed their philosophy.

Except in the case of Lord Eldon, where the materials were ready to Mr. Townsend's hand, the Lives in these volumes partake more of the article or memoir than of pure biography, whether we consider biography in the sense of a regular narrative of the incidents of a life and correspondence; or a masterly account of the career with a portrait of the character. For the former mode, space and materials were both perhaps wanting; to the latter Mr. Townsend is not exactly equal. He lacks the penetrative acumen, the strength of mind, and the freedom from prejudice, required in the more critical biographer. Indeed, he is a strong partisan in his views; which rather smack of the old tory lawyer, but without his insolence, virulence, and coarseness. These prejudices peep out in his estimate of persons: in which, however, Mr. Townsend is more successful than in his criticism; for some of his selected jokes are but indifferent, his specimens of eloquence or judgment do not always justify the praise they are put forward to support, and he has a remarkable knack of spoiling quotations. But the book is agreeable and interesting; partly from the character of Mr. Townsend's mind, which though not very keen or elevated, is exceedingly well adapted to the gossip of biography or of legal lore; partly from the nature of his subjects. A lawyer who rises to eminence has always some striking qualities: if not a profound juriconsult, or a keen and able pleader, he must have ready and flashy parts of some kind, sufficient to float him over the stormy competition of the bar, and make him "generally useful" in the senate. Eminence in art, science, and literature, is necessarily attained by solitary meditation and experiment; but a successful lawyer is generally throughout his entire career, and always in some part of it, brought into the actual business of life; and in times of movement, such as a majority of the judges in this volume lived in, connected with the struggles of factions as well as litigants, and engaged in forwarding or baffling the arts of unscrupulous power or of parties perhaps more unscrupulous. Then, the lawyer (we are speaking of the public pleader and the judge) is a man of this world. He lives almost in public—in the courts, in the houses of parliament, in circuit clubs, and at "common tables," where there is constantly going on a keen encounter of wits; and even if in private life he is an economic recluse like Kenyon or Eldon, his strength or eccentricity

of character supplies as many strong points as would be gained from the most liberal round of entertainments." In the majority of cases, the great lawyer is a man of struggles, not only with law but with fortune. There is no turning out a "heaven-born" lawyer either at equity or nisi prius. He gathers his knowledge by time and labor, and acquires by long practice that ready dexterity in its application which looks almost supernatural to the ignorant, as if he worked by witchcraft instead of wit. Many lawyers, too, have sprung from a mean origin and very narrow circumstances; so that their early career affords examples of the pursuit of distinction under difficulties: a circumstance that adds interest to their lives, though it may taint their character with coarseness, and induce something of unprincipled self-seeking. For the public biography of modern lawyers also there are ample materials, not merely in the professional but in the newspaper reports; a large amount of their good things and very often of their bad are familiar in the mouths of the profession, and there are always many people well acquainted with their personal characteristics and their bearing both in public and private life, should the writer himself not know them. With such excellent subjects, and ample materials to his hand, and with his professional *esprit de corps*, Mr. Townsend could scarcely fail in producing a pleasant and useful book for the world at large, and an interesting work for the lawyer or law student.

A point of interest connected with the book, though not necessarily with the subject of lawyers, are the events and manners over which the reader is carried. Dated from the early times of George the Third, the most striking events of that troubled reign are brought in review before us; whilst many of the anecdotes indicate the coarseness of manners and want of education not only found among the middle classes but even among the country gentlemen of the last century—the immediate successors to the Squire Westerns. Here is an instance from the life of Buller.

HIGH SHERIFFS, "SIXTY YEARS SINCE."

"There is a tradition on the Oxford Circuit, that he once met at the first assize town with a very unsophisticated sheriff, who bluntly demanded of his lordship, as he was stepping into his carriage, whether he was a *bonâ fide* judge, (the worthy functionary made but one syllable of *fide*), as they had been so often fobbed off with sergeants in those parts? When satisfied on this important particular, he took his seat aside of the judge. A grave severity on the countenance of Mr. Justice Buller occasioned some misgivings in the mind of the sheriff; who expressed his fear that he had unwittingly done something wrong. 'It is certainly,' said his lordship, with a smile, 'against etiquette on these occasions for the sheriff to take his seat fronting the horses, unless,'—he put his hand on the gentleman, who was starting up—'unless invited by the judge, as I now invite you.' Cradock tells a story of a learned predecessor's encounter with another sheriff, not unamusing. The world was then not so highly refined as at present. After the usual opening of common topics, such as the roads and the weather, the high sheriff began to feel himself a little more emboldened, and ventured to ask his lordship whether, at the last place, he had gone to see the elephant? The judge, with great good-humor, replied, 'Why

no, Mr. High Sheriff, I cannot say that I did; for a little difficulty occurred: we both came into town in form, with the trumpet sounding before us, and there was a point of ceremony to be settled, which should visit first.'"

THURLOW ON LOUGHBOROUGH.

"Lord Thurlow survived his lucky rival more than a twelvemonth; and on hearing of his death at Bath, said candidly, 'Well I hated the fellow, he could *parlez-vous* better than I could; but he was a gentleman!' His dislike afterwards vented itself in a bitter gibe. Being informed, we know not how truly, that George the Third, who had been laboring under mental hallucination, exclaimed, on Lord Rosslyn's death, 'I have lost then the greatest scoundrel in my dominions!' 'Said he so,' exclaimed Lord Thurlow, 'then by—he is sane!'"

GIBBS ON HIS EARLY CASES.

"He practised in the capacity of special pleader nearly ten years, organizing slowly, but surely, a large connection. 'When the attorneys have no one else to go to,' he remarked, with fretful naïveté, 'they come to me! Other pleaders have the luck of getting some easy cases. I never remember having had a single one. They were all difficult and complicated, and had nothing short about them but the fees.'"

PROFESSIONAL POPULARITY OF GIBBS.

"Unpopular in his own branch of the profession, the attorney-general could not boast of being a greater favorite with solicitors, especially the worse part of them. For though the temper of the man might be bad, and his manner hard, ungracious, and repulsive, his was not the abject spirit to truckle to those who had power in their hands, or to speak in honeyed speech to an efficient patron. If the action was founded in folly, in knavery, or in both, he never failed to acquaint its aiders and abettors with his opinion. His forensic bitterness always assumed its harshest tones when denouncing, as he termed them, the prowling jackals, the predatory pilot-fish, of the law. One of this class chanced to be standing near him as he was addressing the jury; when, suddenly turning round, he rivetted the attention of the whole court on his victim—'Does any of you want a dirty job to be done? There stands Mr. (naming the individual) ready and willing to do it.' The presiding judge interposed, but Sir Vicary persisted. 'I will not be silenced. The fellow deserves to be exposed, and I will expose him.' On another occasion, an attorney having brought a very thick brief to his lodgings in the assize town very late at night, was about to make his bow, when Sir Vicary Gibbs grasped the huge mass of paper, and inquired, 'Is all this evidence?' No, sir, replied the attorney; 'there are forty pages containing my observations.' 'Point them out.' He then tore these pages from the rest, thrust them into the fire, and concluded the interview with the sarcastic remark, 'There go your observations.'"

GARROW AND GIBBS.

"There were fierce struggles, we are told, between Gibbs and Garrow. He was often, indeed, in ordinary cases, an overmatch for Erskine himself; but Erskine could afford to sustain this defeat or this overreaching, and his temper was sweet as his nature was noble. Not such the temper of

Sir Vicary. When Garrow would run round him—get verdicts from him—beat down his damages by coarse clamor or hoarse laughing—even make points against him, or filch them, as he was wont to phrase it—the bystander saw such bitterness manifested in the defeated face, that he could not have wondered at seeing him cry for mere vexation.

JUDGES' PERQUISITES.

Lord Ellenborough died possessed of ample wealth, which has been computed to amount to 240,000*l.* So munificent a fortune may be easily accounted for. There were three offices of very considerable value at the disposal of the chief justice of the king's bench; those of the chief clerk, the *custos brevium*, and the clerk of the outlawries. The sale of these offices is now most fitly abolished, as inconsistent with the dignity and independence of the judicial station. Luckily for Lord Ellenborough, two of these places fell vacant shortly after his appointment. He refused 80,000*l.* which was offered for the disposal of the chief clerkship; and until his son was of age to receive it, added its amount, which was 7,000*l.* a year, to his own salary; realizing thus an income of 16,000*l.* a sum considerably larger than was enjoyed by those who immediately preceded and succeeded him. It equalled, nay, in some years exceeded, the income of the Lord Chancellor, and justified, even in a worldly sense, the sagacity of the learned lord's decision when in 1806 he refused the seals.

THE BRITISH MINISTERS.

Sir Robert Peel made his triumphal exit from office on Monday night, in a speech worthy of the occasion. Considered technically, as a matter of mere oratory, his speaking has often shown traces of more pains, of more artful structure, and more workmanlike elaboration; but such small points were beside the occasion. Many large questions of the past, solved and unsolved—of the future—crowded upon his utterance, and ill brooked the narrow limits prescribed by his discourse. And he evidently approached his task with small preparation of a special kind—with none, perhaps, but so much as was implied in the deeds of the past and in a determined purpose. His judgment was shown in the admirable temper which animated the whole, and in the manner in which he took up his ground for the future.

He does not go into opposition. So we understood him to imply four or five months ago, and his farewell speech confirms that impression. There has been a good deal of wrangling as to the interpretation to be put upon that portion of the speech which relates to affairs of party—some nicely balancing words, and insisting that they pledge the speaker to nothing; others insisting that they must be considered in reference to their general tenor. The latter is, no doubt, the just view. The speech was one of generalities, and not of specialities. And to expect that the exient minister would volunteer a schedule of particular details to which he should be pledged, (a supposition involved in the complaint that he does not stand pledged on particular points,) is puerile. His intent was as clear as possible. As we understand him, he is henceforward to consider questions that come before him in reference to their circumstances, their merits, and their practical

effects. It is to be observed that such a course would set aside the *details* of some past measures to which the late cabinet may have been committed; making him free to take them up *de novo* with the full lights of the time and on their own proper grounds. Resting upon what he said, we should not be surprised if Sir Robert Peel were even to abstain from crossing over to the opposition benches, and were to take his seat on the ministerial side as an independent supporter of the Queen's government. It must be allowed that such a departure from routine would be as startling as any of the more substantial innovations which he has made in the conduct of party; though it would quite accord with the spirit of his change from the service of party to that of his country.

One of the questions on which his probable course has given rise to great speculation is the sugar-duties. Sir Robert, presuming Lord John Russell to be the new minister, promises his support in carrying forward the same commercial principles as those which have recently guided the government: but in doing so, he makes reservations against the "derangement" of "great interests," with more of the same kind. The suspicious construe that reservation to mean, that Sir Robert Peel will abide by the differential sugar-duties on the anti-slavery pretext. We believe in no such interpretation. Sir Robert, no doubt, feels that there are moral considerations mixed up with the financial one of the sugar-duties; not only the black interests, which once monopolized the philanthropy of this country, but the colonial interests—the interests of that property which was so lavishly wasted by our wild legislation. His cabinet endeavored to satisfy justice, or rather to satisfy appearances, by adopting Captain Denman's new plan of African blockade, and by a hesitating sanction to cooly and negro immigration into the West Indies. The immigration is growing, in spite of official obstacles, kept up to the very latest date of Mr. Gladstone's incumbency of the colonial office—obstacles not, indeed, originating with him, but not swept away by him. Captain Denman's plan is under trial. The sugar-duties cannot be justly or ably handled apart from the whole West Indian question; but any minister who chose to deal with all, comprehensively, vigorously, and promptly, might give the British people cheap sugar and put the West Indies on the road to prosperity by the same act. We do not understand Sir Robert Peel's reservation to convey the shadow of a hint that he would refuse to consider, fairly, and without bias, any measure better than his own, or rather, than Mr. Gladstone's and Mr. Goulburn's, for settling the sugar-duties.

Ireland is another prominent point in the leave-taking speech, and one which has of course invited cavil. Sir Robert has broadly declared for perfect equality in the spirit of legislation between England and Ireland. This is hailed by some who look more to party than to national interests, as a new "inconsistency"—a virtual abnegation of the statesman's recent policy. It is quite the reverse; being a further carrying out of that policy which dictated the Maynooth grant, the recognition of Episcopal titles, and several other measures tending to equality. Formally, indeed, Sir Robert was defeated on a coercion bill: but it was the identical measure that the whigs in office had kept up for years; it was supported by the members of the last whig cabinet in the House of Lords; and by Lord John Russell himself and the whig com-

moners in the earlier stages—until, as Mr. Smith O'Brien informed his Irish audience at Conciliation Hall this week, it afforded opportunity for a vote to turn the ministry out. In fact, opinion on the subject of Ireland has matured with a suddenness unparalleled; but it was too late for Sir Robert Peel to throw away the bill which his own colleagues had introduced. It is negatived by the house: he now knows better what ground may be taken up in Irish pacification; and there is no "inconsistency" in his declaring a better ground than that of coercion.

But that which has perhaps caused the greatest shock to sensitive souls is Sir Robert's tribute to the great anti-corn-law agitator. The merit of repealing the corn-laws, he said, was due neither to himself nor to Lord John Russell, but solely to "Richard Cobden." Some people are puzzled as to the motive of the avowal, and of course are ready enough to find a bad one. The motive appears to us not recondite. Sir Robert Peel's strength, throughout his late career, to its triumphant close, has lain in his abiding by the plain truth; and his purpose was to give that plain truth a crowning avowal. There was, however, some little exaggeration of phrase; which Richard Cobden does not need. His merit lay in giving animation to an abstract question of right—in organizing a public opinion which had been created. But even that organized public opinion, lacking the elements of popular revolution, which it did, might have floundered on for years in ineffectual impotency had not Sir Robert Peel endowed it with the full power of the Executive. Richard Cobden would have carried the measure sooner or later: that it is carried in 1846 is due to Robert Peel. And in awarding the "*suum cuique*," there are others who ought not to be forgotten—Charles Villiers, whose motion was once a yearly scoff for short-sighted folks trusting in the majorities of the time being; Wolryche Whitmore, the predecessor of Charles Villiers in times of still remoter hope; and Colonel Thompson, who first popularized the science of the question, and supplied the instinctive common sense of the public with logical arguments and epigrammatic illustrations. The *corn-law catechism* was the ancestor of the Anti-Corn Law League. How necessary was the modern engine of agitation, is proved by the fact, that the author of the *catechism* is not in parliament to complete his work; so little of real "*public spirit*" is there in the constituencies!

Sir Robert Peel fitly closed his speech with a message of peace—the Oregon question is settled. "Lucky minister!" Ay, lucky are they who take pains to be so. In this instance the luck seems to have arisen from that judgment which shaped just such a measure as could be offered and adopted without derogation from the honor of either side.

Having laid down his power at the feet of the majority, Sir Robert Peel left the house, leaning on the arm of Sir George Clerk; and, having been recognized outside by a watching multitude—not a mob—he was escorted home to his private house in triumph. There was a contrast to the minister's triumphal return: his two antagonists—not the most illustrious but the most notorious—came away at the same time: their heads bent down, they seemed to shun recognition; and they were seen to pass away amid the scowls of those who did know them—lucky to escape in silence.

When all is done, you ask, what is the one

great cause for this general and intense apprehension of Sir Robert Peel's merits? It is not merely that he carried the two bills—other men share that honor. There seems to be even a paradoxical reference to past times when he abided by what were not merits. That is the key to the question: the singular merit of the statesman, in the popular eyes, is his unprecedented sacrifice to attain a good for his country: he sacrificed place, power, a show of that outward "consistency" which is prized so highly; he had the moral courage to brave all obloquy, and sacrifice to his new convictions a frank avowal of his own past errors in judgment: in a word, he sacrificed the individual to the nation. All is paid, with interest.

No incident illustrates more forcibly the magnitude of what Sir Robert Peel has done for the country, than the remarkable contrast between the last whig attempt to form a cabinet and the present completion of one. Then, all was embarrassment, difficulty, impossibility: now, all is smoothness and facility. Then, the cry was, what will Lord John Russell do to carry corn-law repeal? how can he muster a cabinet?—now, the corn-laws are out of the way, and the cabinet is formed. It was so much a matter of course that there was no anxiety about it—nothing beyond the commonest curiosity.

It was not expected that the Russell whig cabinet would be more than a revival of the Melbourne one; and so, in its elements, it proves to be. This is the list.

IN THE CABINET.

Lord Chancellor, Lord Cottenham.
President of the Council, Marquis of Lansdowne.
Lord Privy Seal, Earl of Minto.
Home Office, Sir George Grey.
Colonial Office, Earl Grey.
Foreign Office, Viscount Palmerston.
First Lord of the Treasury, Lord John Russell.
Chancellor of the Exchequer, Mr. Charles Wood.
Chancellor of the Duchy of Lancaster, Lord Campbell.
Paymaster General, Mr. Macaulay.
Woods and Forests, Viscount Morpeth.
Postmaster General, Marquis of Clanricarde.
Board of Trade, Earl of Clarendon.
Board of Control, Sir John Cam Hobhouse.
Chief Secretary for Ireland, Mr. Labouchere.
Admiralty, Earl of Auckland.

NOT IN THE CABINET.

Lord-Lieutenant of Ireland, Earl of Besborough.
Commander-in-chief, Duke of Wellington.
Master-General of Ordnance, Marquis of Anglesey.

Here we see the old familiar cards, only shifted. Still there is change both in the adaptation of men to particular offices and in the circumstances; and on the whole the change is for the better.

In glancing down the list, the eye is first stopped by the name of Sir George Grey as home secretary. Although not unknown for ability in official routine, and although Sir George made a marked improvement in his style of speaking, (relieving the fluent level with smart personalities,) he has yet to show what powers he has to undertake this very important office. Times are tranquil, but they may not always be so; and the home secretary cannot "exchange" at the prospect of danger, like a dandy officer. And even to support a comparison in mere administrative ability, the successor of Sir James Graham has no light task.

"Foreign office—Viscount Palmerston": well,

the fear of that sound has passed. The troublesome dangerous questions in America are settled—just in time. Lord Palmerston, with capital tact, improved the last opportunity to pay a propitiatory visit to Paris, and assuaged old rancors in that quarter. Moreover, the lesson which was received at Christmas, when the same appointment of foreign secretary destroyed a ministry in embryo, no doubt taught the whig leaders that Lord Palmerston's license must be settled beforehand; and it is to be presumed that a clear understanding has been come to on that head. The fact that Earl Grey, who protested before, has consented to sit in the cabinet now with the very clever Viscount, is some guarantee.

Of Lord Grey, in the colonial department, the very highest expectations are formed. Should he disappoint them, it will be a public misfortune; as the chances of party have put forward no second statesman to supply the place which he is expected to fill.

Mr. Charles Wood possesses aptitude for finance, knowledge, and general ability; and good is augured from his elevation to the Exchequer.

Lord Clarendon has earned a reputation in commercial diplomacy; he has also the reputation of earnestness and soundness in view; the way for a minister of commerce is now so well marked out that he can scarcely fail.

The reappointment of Sir John Hobhouse—lazy, negligent, and an abettor of the Afghan war—is unpopular with the Indian public at home, and will be so in India; it is too great a concession to individual "claims" upon party connections.

Lord Auckland also lost as well as won laurels in the East. Lord Ellenborough succeeded him in India as vice-king, and now he succeeds Lord Ellenborough at the Admiralty as first lord; so there is party compensation at least.

Lord Besborough, when Lord Duncannon, was well known to the public as a liberal but thorough-going whig; Irish affairs are well known to him; but it is not so well known whether he has the peculiar capacity for coping with the great "difficulty" of the day.

The Duke of Wellington opened his mouth on Monday, to do little more than utter a kind of general order announcing the retirement of the ministry. Afterwards, at a private interview with Lord John Russell, he is said to have declared that henceforth his mouth is to be closed on political subjects: he relapses into the mere military commander. So he says; but we look forward yet to some bits of his plain naïve good sense on suitable occasion.

Such is the cabinet: what is its premier? Recently we feared that he was the same punctilious cadet of "the house of Bedford" who would have headed a crusade to preach the particular doctrines of Lord John, but would not soil his glove in any other quarrel. Some rumors, however, indicate conversations on his part too. According to their showing, he has become alive to a true sense of the juncture, has looked a little beyond the whig circle, and actually has invited to join his ministry the most popular young members of the late government—even the three named by the *Spectator*, Lord Dalhousie, Lord Lincoln, and Mr. Sydney Herbert! The invitation failed of immediate effect; but the will may be taken for the deed. We begin to suspect that Lord John is a more promising student of living history than we gave

him credit for being; and we shall watch his new career with interest. He left office at a time of commercial difficulty and impending revolt; he returns to it in time of prosperity, profound tranquillity at home, and peace with all the world. His old difficulties have vanished: Ireland has grown to be one for the whigs as well as for their political rivals; but the great new difficulty is to keep pace with the immense progress achieved while he has been out of office. Surely, however, he may count on a fair trial in that arduous enterprise.

The Anti-Corn Law League is dissolved; its council "suspended," to be evoked at any attempt to revive the corn-laws. The league celebrates its own euthanasia with a golden chime, voting to its retiring chairman a cool ten thousand! There is nothing to complain of in that politic munificence. The league has earned its money: there is just the shadow of a chance that it may be wanted again, to stop attempts at reviving the corn-laws; and it is well to let it repose on its watch with the dormant vigor of an energetic life in it. The staff of servants who retire on their fees will have quick ears, should the suspended council need "flappers" to awaken it at the sound of danger.

Of course a ministerial crisis could not pass without a manifesto from Mr. O'Connell: and accordingly the member for Ireland has done his best to comply with the exigency. Nothing new was expected, and nothing new was produced; but, as usual, he issues a long schedule of grievances to be redressed, first in voluminous minuteness, then in brief. There is evidently a growing fear lest the accession of the whigs should be detrimental to the interests of the organized repeal agitation, by decoying away adherents: to counteract that dreaded influence, Mr. Smith O'Brien and others are industriously engaged in talking down the suspected tempters; whose support even of this last coercion bill is made a strong point against them. The repeal leaders, exhausted in shows of patriotism, beginning to quarrel among themselves at the instigation of self-love, know that they can no longer afford to tamper with avowed whig alliances. Ireland, we say, is likely to be *Lord John Russell's* "difficulty."

The Oregon question is settled. The American government have adopted, without altering a word, the final proposition made by this government. That proposition was based on the modified American offer, "the 49th parallel," said by intelligent people to be the last inch that the fierce democracy would yield. But the British government made two qualifying proposals, which did not interfere with the integrity of the American position: the 49th parallel was taken, not to the broad ocean, but to the salt waters only; the boundary to deflect southwards in the strait of San Juan de Fuca; thus leaving to England the whole of Vancouver's Island, with a command of the entrance to the strait. Moreover, England reserves a right of way up the Columbia river. Some doubt has been expressed as to the duration of this right—whether it is to be perpetual, or only during the currency of the charter to the Hudson's Bay Company. There is nothing to show for the limited interpretation. England will keep the right so long as she thinks it useful and the two countries are not at war; in the latter case, to lose it or to vindicate it *vi et armis*.—*Spectator*, 4th July.

THE OREGON TREATY.

THE great difficulty of fixing a frontier line between the territories of Great Britain and the United States in the north-west of America has at length been solved; and so rejoiced must every rational person in the two countries be at the mere fact of the solution, that few are inclined to criticise and carp upon the conditions. The difficulty was not so to fix the frontier line as would best reconcile, and least militate against, the real interests of both countries, but to satisfy public opinion as to the dignity of the nations being equally consulted.

Last year the pretensions of the two countries seemed quite irreconcilable. Successive English governments had peremptorily refused to entertain the idea, or even consider the preference, of any frontier north of the Columbia. The trade of the great fur company had for years floated down and up that river, on the bank of which were its main establishments, with ramifications and forts and stations extending north and south. On the other hand, the Americans, feeling themselves entitled to at least half the region, insisted that bounding them by the southern bank of the Columbia gave them not only less than half the territory and the coast, but of the coast or the harbor literally gave them nothing.

Mr. Polk and his public thought that the best means of forcing British opinion, and, consequently, the British ministry down to a more feasible and fair compromise was to bluster, to put forth extreme and extravagant pretensions, and plainly point to war as an alternative. We are sorry to say this has had the desired effect. Our tory chiefs put on a bold aspect, but took care at the same time to inquire, was the object in dispute worth fighting for? The Hudson's Bay Company had the monopoly of the disputed territory. It was asked, what was their tenure worth? The company replied, that in ten years they would have killed every head of game and skinned every beaver in the region, and that for other purposes they cared not for it. To go to war for land so estimated, and for a ten years' monopoly of some score of skins, seemed unwise, and the territory up to the 49th degree and the Straits of Fuca was offered to be given up. The only regret is, that this was not done long since, and that these concessions were not made to the pacific and courteous Mr. Webster, instead of to the blustering Mr. Polk.

Another difficult question was the free navigation of the river Columbia, which the American president declared could never be permanently yielded, and which the British government had always insisted on as due to the Hudson's Bay Company, as well as to the dignity of this country. This difficulty has been adroitly got rid of by stipulating the free navigation of the river for the Hudson's Bay Company, and those trading with it. Such stipulation will no doubt be of use as long as the company keep up their establishments at Fort Vancouver, and as long as they hunt the regions east and west of the upper part of that river. But all this tract they confess would of itself have been exhausted in ten years, and now, of course, will be abandoned sooner. As soon as the Hudson's Bay agents shall have ceased to collect furs and to distribute stores in those regions south of the 49th parallel, the navigation of the Columbia will no longer be either wanted or used by them. A glance at the map will in a moment show that from

Fort Langley, or the mouth of Fuca's river, it will be ten times as short and as facile to carry goods to any part or parts of the Columbia north of the 49th degree as to transport them from the mouth of the Columbia. The free navigation of the Columbia will thus become a dead letter in a very few years, even if there be no understanding as to its more formal abrogation.

In a military point of view, and looking to a secure and permanent colony, the possession of the whole of Vancouver's island answers every object of Great Britain in that part of the world. Notwithstanding the pertinacious struggle of the two countries for the mouth of the Columbia, it is more than probable that, now it has decidedly fallen to the United States, they will not be inclined to expend much labor on it, but that, on the contrary, the Admiralty Inlet and the southern shore of Fuca's Straits will attract them. In this case these straits will become the most active centre, and the presence of both nations in it will mutually aid each other's prosperity by the supply of mutual wants. It is remarkable that the Hudson's Bay Company has already preferred using Admiralty Inlet to the Columbia river, and that a portage of ninety miles had been established from the inlet to the Cowlisse river, so to avoid the difficulties of the bar at the mouth of the Columbia. In the division of the north-western region of America the British have preserved the same great advantages which they possess on the north-eastern coast, viz., the possession of the great coal-fields, so indispensable to their navigation. All know the unrivalled advantages of Nova Scotia, in this respect, to all the neighboring American states. And, according to Mr. Dunn's account, the vicinity of Fort M'Loughlin, within our Oregon limits, abounds in coal fields, which are not mere matter of speculation, but have been worked and tried by the agents of the Hudson's Bay Company.

It seems, that the final conclusion of the Oregon treaty will enable England to come forward as mediatrix between the United States and Mexico. Our accepting that treaty at such a moment proves how far England is from wishing to take advantage of a moment of embarrassment to hurt or press the United States. There will, therefore, be a strong party in Washington for accepting our mediation. Indeed, there is a good prospect of a far better understanding on all points between this country and the United States than has presented itself for many years.—*Examiner*, 4th July.

THE ANTI-CORN-LAW LEAGUE.

It is now nearly four years ago since we commented upon "the great fact" of our epoch. From that time up to the present, its development has been more than commensurate with our expectations. Its fruits have anticipated the period of our predictions. Its destiny is—to all visible and conjectural purposes—completed. And now, in the moment of triumph—at the *acme* of its power—the Anti-corn-law League subsides into a voluntary repose which, but for some sudden and unexpected strategy of its assailants, will merge into a voluntary extinction.

The history of this confederacy has been most curious. Of itself it is a political phenomenon, the full interest of which will be more fully realized by the historian or the philosopher of future days than in our own time. But it will be more inter-

esting in its consequences, even at a distant day, than in the immediate and fiscal objects on the attainment of which its energies were concentrated, and with the possession of which its ambition is satisfied. It would be unreasonable to suppose that an organization so perfect and so successful as this should not hereafter be followed by others inspired by the same hopes, resting on similar sympathies, and conducted by men of a like character. The prospect of such new creations—whether ordained for good or for evil—gives additional importance to that which has been the first of them in time, in fortune, and popularity.

The progress of the league is without its parallel in history. The summary of it—now familiar to the world—as sketched by its chairman at the recent meeting in Manchester, is this:—In the year 1838 a small body of gentlemen connected with manufactures and commerce met in Manchester.—Amongst them were a few members of Parliament friendly to free trade, but not persons of large political, or, indeed, any other than mercantile interest. They were reinforced by some manufacturers in the neighborhood. The first sum of money which they subscribed amounted only to £3,000. This was afterwards increased to £6,000. Delegates from the young association visited London to watch the proceedings of parliament. Agitators travelled, and pamphlets were distributed, all over England. No means were neglected by which the doctrines of free trade could be brought home to the understandings and sympathies of the people. But the legislature and the ministry still remained hostile to them. The year 1841 ended in gloom, uncertainty, and distress. Trade was stagnant, employment interrupted; the pressure of severe destitution was followed by the natural rebound of disaffection and turbulence. Violent partisans of one side tried to turn this crisis to the advantage of the leaguers; partisans equally violent on the other side sought to twist it to their prejudice. But men of modern politics and judicious minds saw that the time was arriving when it would be necessary to adjust the balance between the demands of a formidable agitation and a powerful aristocracy by a peaceful and opportune compromise. We ourselves warned the minister of the consequences which must ensue from a pertinacious rejection of moderate counsels. Those consequences have ensued. At that time, however, apprehensions were derided, and predictions sneered at. The annual motions continued to be made in parliament, and to be made without avail. In 1843 the Free Trade Hall was opened in Manchester, and the subscription of the year announced to be £44,000. Then the meeting of the growing association was transferred from its parent city to London. Covent Garden opened its doors to an unwonted audience and unusual performers. For the first time in our country's history, the presumed representatives of Puritanism were heard haranguing at 10 o'clock at night on the boards of the national drama. Mr. Leader jostled Mr. Fox; Mr. Fox elbowed Mr. Bright; and Mr. Bright fraternized with Lord Radnor. Men of fashion talked democracy; men of rank threatened a revolution. These gatherings gained in attraction, in popularity, and finally in influence. Whilst Mr. Cobden was bearing the brunt of the battle in the house of commons, and by his strong sense and logical faculty unconsciously convincing the prime minister by whom he was opposed, Messrs. Fox and Bright, by the aid of weapons

less powerful over individual intellects, but more mighty to move popular passions, were doing their work in Covent Garden. The year 1844 witnessed similar operations and similar fruits to 1843—lectures, discussions, and public meetings. The subscriptions had increased to £100,000. And then began the last movement—that of the registration. But the effect of this was anticipated. The forces which were thus slowly but surely accumulating were spared the struggle to which they looked forward, and were led to the desired victory by the chieftain whom they were enlisted to fight against.

Such is the outline of a history fraught with many reflections and potent example. The abolition of the corn law is of itself a great achievement. Whoever had done this—whatever minister or whatever party—would have done an act of great importance, and, we firmly believe, of general good. But the mere abolition of duties on corn does not limit the magnitude of the exertions or the example of the league. The league is the first seedling of the reform bill. For the first time an association essentially popular in its origin, and all but exceptionally popular in its composition, has dictated its own terms to a proud aristocracy and an ancient monarchy. Heretofore it has been a section of two leading parties that has made or retarded our great revolutions. The whig peers and proprietors made the revolution of 1688. The tory peers and landowners retarded the revolution of 1833. But the revolution of 1846 is due to the people. It is the first systematic embodiment of the people's will and the people's intelligence. Cobden, the leader and champion of the movement, Wilson, Fox, Bright, are all men of the people, unconnected with influential families, and unassociated with historic names. This is an omen of promise to the strength of the people; and, if the experiment founded on their accordant wishes realize all that has been predicted of it, then it will likewise be a guaranty of their prudence, their justice, and their moderation.

We have said that the consequences of this new development will be traced by future writers and watched by future statesmen. The league falls into a repose which may precede either an expected dissolution or an unexpected revival. But the spirit which has animated it will not sleep. The powers which it has aroused will not relapse into perpetual stupor. A great experiment has been made. The middle classes of England have learned the value and efficacy of an organized union. Hereafter, when the minister lags behind the demands of the people, or the parliament is stubborn in resisting them, the momentous contest of 1846 will infuse hopefulness and determination into the minds of the offended remonstrants, and will teach them that there is something stronger than class interests or parliamentary parties.

For our own part, we confess that we have no desire to see the necessity of such a revival, or the repetition of such an experiment. We have a prejudice in favor of the forms and mechanism prescribed by our constitution. They may be tedious—they may be intricate—but they are safe. The present revolution has been consummated without any loss, without any risk. No blood has been shed. The funds have not fallen. Nothing has been endangered but the ministry by which it was supported. It has been a peaceful crisis—a pacific conquest. But for all this we know who are the

victors, and we recognize the means which made them so; and these we would eschew for the future. We know, indeed, that he who was the life and soul of the present agitation was driven into this course by no vanity, no love of praise, no ambition, but simply by an earnest purpose and a business-like desire to effect a practical remedy of a positive evil; but we do not know that there were not others who took it up, not from any absorbing devotion to free trade, but from interest, ambition, and love of excitement. In all great popular movements there will be two classes of men—the one anxious to make the agitation subservient to the cause they advocate, the other only studious of making the cause subservient to the agitation. As popular movements increase, this latter class will increase also. England will be filled by provincial associations and roving rhetoricians. Every new grievance will give birth to a new society, and every society will diffuse its countless pamphlets and its unprincipled lecturers.

This will be an evil. But it will not be the only one. Two greater evils can be conceived to be not improbable. The one is, that of collision between the people out of doors and the parliament within; the other, that of a capitulation signed by a minister in the eleventh hour, at the expense of a party long deluded into confidence, and the sacrifice of principles long professed with obstinacy. The one would be tantamount to a civil war, the other, to a destruction of public faith. May many years elapse before England witnesses either of these great calamities!—*Times*, 4th July.

GUIZOT AND THIERS.

THE French Chambers are much employed in preparation for the general election, which is expected to take place about the beginning of August. The ministerial strength has been tried, and not found wanting. The great speeches of Guizot and Thiers were electioneering speeches—announcements of the grounds on which the rivals are preparing to appeal to the constituencies throughout France. As orators, Guizot and Thiers are not unequal, though very dissimilar: widely different, both are effective. As statesmen, they perhaps approach more closely than would at first sight appear; both are literary men still more than men of action. This feature, however, is most obvious in Thiers: in him the brilliant and the love of the brilliant predominate, and impart an unreal character to his programmes of policy; he speaks for effect, and says what he thinks will produce an effect at the moment; hence his speech of this year often contradicts that of last year. Affecting the reputation of a dexterous intriguer and daring performer of coups d'état, he is ambitious of being that of which he is only fitted to be the historian or panegyrist. Men admire, but distrust him. With less of brilliancy and more of sentiment, a just estimate of his own powers has made Guizot take a very different line: he is at pains to be consistent and plausible; though the littérateur predominates over the statesman in him equally as in Thiers, he knows better how to act the statesman's rôle. There is on the whole, too, more of sincerity in Guizot than in Thiers. It is the cue of the latter at present to be the leader of a constitutional party: but he is not the man to allow forms to stand in the way of his ambition. Guizot, on the contrary, too clear-sighted to attempt in the young constitutional government of

France the strict observance of constitutional forms which the practice and precedents of a century have made possible in England, will probably be found adhering more closely to such a policy as a constitutional minister ought to pursue. From the majority obtained by the French ministers in the late division in the Chamber of Deputies, it does not follow that they will be equally strong after the elections. When we consider, however, how much of Guizot's strength is attributable to his success in creating an impression that he is a safe minister, the great influence exercised by the executive in the elections by the centralization of appointments, the pacific policy of the king, and the growing importance of the industrial interests, it is scarcely conceivable that the conservative party, the party of the peace minister, can be materially weakened.—*Spectator*.

POPE Gregory the Sixteenth departed this life on Monday the 1st of June. He had long labored under a chronic affection in the legs, in consequence of his habit of remaining during the greater part of the day seated at his desk; and it is reported that the more immediate cause of death was a surgical operation performed on one of his legs, which produced violent inflammation, and terminated fatally in a few days.

The *Journal des Débats* gives the following particulars of his late Holiness:—

“Mauro Capellari was born at Belluno, on the 18th September, 1765. A Camaldolite monk, Capellari had rendered himself celebrated in his order by his ecclesiastical science and his deep knowledge of the ancient and modern languages of the east. A reputation of doctrine and of regularity which had spread beyond the cloister, and the general regard entertained for his character, had secured to the humble monk, long before he was summoned to the Sacred College, a consideration equal to that of the princes of the church. In March, 1825, Leo the Twelfth raised him to the dignity of a cardinal; and soon after, he was placed at the head of the vast and important administration of the Propaganda, for which, by his African and Asiatic erudition, he was especially suited; and the talents he displayed in it confirmed his great reputation for capacity. In the conclave of 1828, Mauro Capellari was one of the cardinals most favored by public opinion, and most violently opposed, in the conclave, by what is called the Austrian party. In the conclave of 1831, Cardinal Pacca, who was supported by that party, the leader of which was Cardinal Albani, had obtained nineteen votes at the ballot before last, and Cardinal Capellari twenty-six; but at the last ballot six or seven votes escaped Cardinal Albani's influence, and Cardinal Capellari obtained the majority. He had been elected Pope on the 2d of February, 1831; and ascended the pontifical throne under the name of Gregory the Sixteenth.”

Cardinal de la Tour d'Auvergne is to proceed forthwith to Rome, to attend the conclave of the Sacred College, which is to assemble immediately, to elect a new pope. At the election of popes, three powers—namely, Austria, France, and Spain—have each the privilege of annulling the first election, should the choice of the Sacred College be disagreeable to them. Cardinal de la Tour d'Auvergne will exercise this power in the name of the French government. It is understood that Spain will act in concert with France on this occasion.

From the Athenæum.

CORAL FISHERY.

THERE is no port on the Bay of Naples which presents so bustling a scene at this season of the year as Torre del Greco. Hundreds, I may say thousands, of mariners are now here, assembled from various parts of the coast, dressed out in their rich Phrygian caps and scarlet sashes, ready to start for the coral fishery. At last, the weather begins to brighten—the tempestuous sirocco and the roystering tramontana retire within their caves; and, a favorable breeze springing up, soon they “are upon the Mediterranean flote,” in little detachments according to their destination. What lamentations may then be heard amongst mothers, or wives, or sweethearts, who have thronged down to Torre to take a last farewell! But courage!—a mass has been said, or a candle offered to the Madonna; and now, to complete the “buoni augurij,” these loving companions throw a handful of sand after the receding bark—exclaiming, “*Possa andare come una nave degli angeli.*” Having lately been in the midst of these scenes, and interested myself in the details of this profitable branch of commerce, I send you what may be called the statistics of the coral fishery.

The coral fishery is a source of more profit than is, perhaps, generally known; and is attended with hardships, the bare thought of which might diminish some of that natural vanity with which the fair one contemplates the glowing ornaments that repose upon and contrast with her white bosom. I was standing on the *marina*, when I witnessed such a scene as I have described—a party of gaily-dressed mariners, accompanied by women weeping and wailing as our northern females know not how to do. Their short and simple story was soon learnt; and the particulars I now send you as the result of my inquiries.

Torre is the principal port in the south of Italy for the vessels engaged in the coral fishery—about 200 vessels setting out from hence every year. They have generally a tonnage of from 7 to 14 tons, and carry from 8 to 12 hands; so that about 2,000 men are engaged in this trade—and, in case of an emergency, would form a famous *corps de reserve*. They generally consist of the young and hardy and adventurous, or else the wretchedly poor; for it is only the bold spirit of youth, or the extreme misery of the married man, which would send them forth upon this service. For two or three months previous to the commencement of the season, many a wretched mariner leaves his starving family, and, as a last resource, sells himself to the proprietor of one or other of these barks; receiving a *caparra*, (earnest-money,) with which he returns to his home. This, perhaps, is soon dissipated, and he again returns and receives an addition to his *caparra*; so that, when the time of final departure arrives, it not unfrequently happens that the whole of his scanty pay has been consumed, and the improvident or unhappy rogue has some months of hard labor in prospect, without the hope of another *grano* of compensation. Nor does the proprietor run any risk in making this prepayment; for as the mariner can make no engagement without presenting his passport perfectly *en règle*, he is under the surveillance of a vigilant police. The agreement between the parties is made from the month of March to the Feast of San Michele (29th September) for vessels destined for the Barbary coast—and from March to the Feast of the Madonna del Rosario (October 2) for those whose

destination is nearer home. Each man receives from 20 to 40 ducats, according to his age or skill, for the whole voyage; whilst the captain receives from 150 to 400 ducats—reckoning 6 ducats to 1*l.* sterling. These preliminaries being settled, let us imagine them now on full wing—some for the coast of Barbary, and others for that of Sardinia, or Leghorn, or Civita Vecchia, or the Islands of Capri, San Pietro, or Ventotene, near which I have often seen them, hour after hour, and day after day, dragging for the treasures of the vasty deep. On arriving at the port nearest to the spot where they mean to fish, the “*carte*” are sent in to the consul; which they are compelled to take again on return. A *piastre* is paid by each vessel for the magic endorsement of his excellenza—another to the druggist, and another to the medical man; whilst the captain, to strengthen his power, and to secure indemnity in case of some of those gentle excesses which bilious captains are sometimes apt to commit, has generally on board some private “*regalo*” for his consul. The next morning perhaps they push out to sea, and commence operations; not to return that evening, or the next, or the next, but to remain at sea for a fortnight or a month at a time, working night and day without intermission. The more humane captains allow half their crews to repose from Ave Maria to midnight, and the other half from midnight to the break of day; others allow only two hours’ repose at a time; whilst some, again, allow no regular time;—“so that,” said a poor mariner to me, “we sleep as we can, either standing, or as we haul in the nets. Nor do they fare better than they sleep: for the whole time they have nothing—literally nothing—but biscuit and water; whilst the captain, as a privileged person, has his dish of dried beans or haricots boiled. Should they, however, have a run of good luck, and put into port once in 15 days or so, they are indulged with a feast of *maccaroni*. These privations make it rather rough work, it must be confessed, for a mariner—especially when it is remembered that it lasts seven months; but if to this be added the brutality of the captains, whose tyranny and cruelty, as I have heard, exceeds anything that has ever been recounted to me before, we have a combination of sufferings which go far to justify the description given to me of this service by one engaged in it, as being an “*inferno terrestre.*”

Now let us view them at work. Every vessel carries about 12 *contaj* (a *contajo* being 200 pounds) of hemp to make the nets, which are changed every week. They are about 7 or 10 *palmi* in width, and 100 or 120 *palmi* in length—worked very loosely, and with large meshes. On being thrown into the sea, the vessel is put before the wind, or else propelled by oars, until these loosely-formed nets have fastened upon a rock. Then comes the tug of war. If they have great good fortune, they will take a piece of 2 or 3 *rotoli* at a haul, (a *rotolo* being 33 ounces,) though this is a rare occurrence. In its natural state, the coral is either white or red, or even black externally, from the action of the sea. The white is very rare and very precious; comparatively a small quantity being sufficient to make a good voyage—especially if it be taken “*ingrosso*,” when it will fetch as high as 100 ducati, or more, the *rotolo*. The red “*a minuto*” is not very valuable; but if it is “*acetta*” and “*ingrosso*,” it can be sold for from 25 up to 60 ducati the *rotolo*. As a rule, however, the round-shaped coral is much more valuable than the tree or the spiral coral.

Full fathoms five thy father lies;
Of his bones are coral made—

So sang Ariel; without, I suppose, intending to lay down any rule as to the depth at which coral may be found. Indeed, it is found at all depths, from 12 to 16 palmi up to 150, or even more. At last, arrives the Feast of San Michael, or of the Madonna del Rosario. As soon as the day dawns, the nets are slackened; no man will work more, even if treasures are in prospect. So, pushing into land, and taking up their "carte," away they set on their return—many as poor as when they departed; some with a few ducats in "sacco," and a new Phrygian cap, or dashing sash, or some article of finery, for the "innamorata"—all, however, being thoroughly tired out, and injured perhaps in constitution. The cargo being deposited in the "magazzin" of the merchant, is sold out to the retail merchants, who flock in from Naples and elsewhere; and is soon transformed into numerous articles of ornament or superstition—crosses, amulets, necklaces and bracelets. And now, these mariners have a long repose, till the spring comes round and sends them out again on this odious service—though there are very few who make two or three consecutive voyages of this nature. Many vessels are lost in the season; owing to their long-continued exposure to all kinds of weather, and to their lying in amongst the coral reefs. However prosperous the voyage, life aboard the vessels "*à la vita d'uno cane*." Yet the service may be regarded as one of the most important in the kingdom of the Two Sicilies; as well for the wealth it annually brings in, as also for the school it offers for training hardy, well-disciplined mariners.

From the Examiner.

Danish Fairy Legends and Tales. By HANS CHRISTIAN ANDERSEN. Pickering.

This is a charming little book of fairy tales, and excellently well translated. But why the tales should be called Danish, we do not perceive; except inasmuch as a Dane is the author. There is an occasional northern coloring, but only so far as it could not be helped. All the rest is so free from everything national or exclusive, that we do not remember to have met with any production so given up to a sense of the variety of being that exists in the universe. At times it is even painfully so. We have so strong a sense given us of the feelings of ducks and ducklings; of swans and storks; of mermen and mermaids; of nightingales, flowers, and daisies; even of slugs and cuttle-fish; and of what all sorts of animated creatures round about us, think, do, and might say if they could speak; that one's consciousness as a human being almost becomes lost in the crowd. We begin to feel as Mrs. Gulliver did, when her husband returned from Houynhnm land; and think we might as well take to being of a different species.

We need not say that it implies a rare and surprising art to convey such impressions as these. When Johnson laughed at Goldsmith for thinking of writing a story in which "little fish" should be the actors, the author of *Animated Nature* very properly told him that it was not so easy a matter as he thought it; and that if he (Johnson) were to write such a story, he would make his little fish talk like "great whales." There is no such con-

fusion of ideas in Mr. Hans Christian Andersen. His whales and his little fish all talk in character. We are not sure that we ourselves, after reading his book, could not have talked at pleasure like sharks, minnows, mermaids, bulls, ducks, or green peas. For his vegetables have as much conversational character as his ducks and geese. Nay, his very peg-tops and balls are full of individuality. There is a pathetic *Daisy*, (in his story of that name,) who is quite a "sweet creature" for the pastoral beauty of her tongue; and in another story there is a *Leather Ball* of so aristocratical a character, that when proposals are made to her by a *Peg-Top* because they happen to have been companions in the same drawer, she indignantly asks him whether he is aware that her "*father and mother were morocco slippers*," and that she has "*cork in her body*."

We are here however, it may be said, confusing the specific and the superinduced character. Mr. Anderson keeps all clear. He has so just a sense of the necessity of adhering to verisimilitude, and of the forgetfulness of it on the part of writers in general, that he introduces one of his stories with a remark that ought to become proverbial: "In China, the emperor is Chinese."

Some of his descriptive touches recall the wonderful observation and exquisitely graphic felicity of Mr. Dickens. There is a wretched little hut in the tale of the *Ugly Duckling*, "so wretched that it knew not on which side to fall, and therefore remained standing."

Admirable is the picture of the stork, parading about on his long red legs, "discoursing in Egyptian, which language he had learned from his mother." Who does not feel that Egyptian is the very language that, by way of accomplishment, a stork would know? The touches of this kind are innumerable.

The fault of the book (if we must find one) is, that all the stories have too much meaning; that they overflow with intention and moral; not always obviously, sometimes obscurely, but still with incessant intelligence. You desire occasionally something more childish and less clever. And some of the stories are too long. But the genius and refinement are undeniable.

We must give an extract, and are somewhat at a loss, so many of the tales have such strong claims. But with all the fairy fancy of the volume in general, perhaps the best story nevertheless is that which is least fairy-like. It is called the *Emperor's New Clothes*; and is so admirable an illustration of the spirit of *Humbly*, and of the way in which the great and small vulgar agree to cant about what they do not believe, that we are tempted to give it entire.

THE EMPEROR'S NEW CLOTHES.

"Many years ago there was an emperor, who was so excessively fond of new clothes that he spent all his money in dress. He did not trouble himself in the least about his soldiers; nor did he care to go either to the theatre or the chase, except for the opportunities then afforded him for displaying his new clothes. He had a different suit for each hour of the day; and as of any other king or emperor, one is accustomed to say, 'He is sitting in council,' it was always said of him, 'The emperor is sitting in his wardrobe.'

"Time passed away merrily in the large town which was his capital; strangers arrived every day at the court. One day, two rogues, calling them-

selves weavers, made their appearance. They gave out that they knew how to weave stuffs of the most beautiful colors and elaborate patterns, the clothes manufactured from which should have the wonderful property of remaining invisible to every one who was unfit for the office he held, or who was extraordinarily simple in character.

"These must indeed be splendid clothes!" thought the emperor. 'Had I such a suit, I might, at once, find out what men in my realms are unfit for their office, and also be able to distinguish the wise from the foolish! This stuff must be woven for me immediately.' And he caused large sums of money to be given to both the weavers, in order that they might begin their work directly.

"So the two pretended weavers set up two looms, and affected to work very busily, though in reality they did nothing at all. They asked for the most delicate silk and the purest gold thread; put both into their own knapsacks; and then continued their pretended work at the empty looms until late at night.

"I should like to know how the weavers are getting on with my cloth," said the emperor to himself, after some little time had elapsed; he was, however, rather embarrassed, when he remembered that a simpleton, or one unfit for his office, would be unable to see the manufacture. 'To be sure,' he thought, 'he had nothing to risk in his own person; but yet he would prefer sending somebody else to bring him intelligence about the weavers and their work before he troubled himself in the affair.' All the people throughout the city had heard of the wonderful property the cloth was to possess; and all were anxious to learn how wise, or how ignorant their neighbors might prove to be.

"I will send my faithful old minister to the weavers," said the emperor, at last, after some deliberation, 'he will be best able to see how the cloth looks; for he is a man of sense, and no one can be more suitable for his office than he is.'

"So the faithful old minister went into the hall, where the knaves were working with all their might at their empty looms. 'What can be the meaning of this?' thought the old man, opening his eyes very wide. 'I cannot discover the least bit of thread on the looms!' however, he did not express his thoughts aloud.

"The impostors requested him very courteously to be so good as to come nearer their looms; and then asked him whether the design pleased him, and whether the colors were not very beautiful; at the same time pointing to the empty frames. The poor old minister looked and looked, he could not discover anything on the looms, for a very good reason, viz., there was nothing there. 'What!' thought he again, 'is it possible that I am a simpleton? I have never thought so myself; and no one must know it now if I am so. Can it be that I am unfit for my office? No, that must not be said either, I will never confess that I could not see the stuff.'

"Well, sir minister?" said one of the knaves, still pretending to work, 'you do not say whether the stuff pleases you.'

"Oh, it is excellent!" replied the old minister, looking at the loom through his spectacles. 'This pattern, and the colors—yes, I will tell the emperor without delay, how very beautiful I think them.'

"We shall be much obliged to you," said the

impostors, and then they named the different colors and described the pattern of the pretended stuff. The old minister listened attentively to their words, in order that he might repeat them to the emperor; and then the knaves asked for more silk and gold, saying that it was necessary to complete what they had begun. However, they put all that was given them into their knapsacks; and continued to work with as much apparent diligence as before at their empty looms.

"The emperor now sent another officer of his court to see how the men were getting on, and to ascertain whether the cloth would soon be ready. It was just the same with this gentleman as with the minister; he surveyed the looms on all sides, but could see nothing at all but the empty frames.

"Does not the stuff appear as beautiful to you as it did to my lord the minister?" asked the impostors of the emperor's second ambassador; at the same time making the same gestures as before, and talking of the design and colors which were not there.

"I certainly am not stupid!" thought the messenger. 'It must be, that I am not fit for my good, profitable office! That is very odd; however, no one shall know anything about it.' And accordingly he praised the stuff he could not see, and declared that he was delighted with both colors and patterns. 'Indeed, please your imperial majesty,' said he to his sovereign, when he returned, 'the cloth which the weavers are preparing is extraordinarily magnificent.'

"The whole city was talking of the splendid cloth which the emperor had ordered to be woven at his own expense.

"And now the emperor himself wished to see the costly manufacture, whilst it was still on the loom. Accompanied by a select number of officers of the court, among whom were the two honest men who had already admired the cloth, he went to the crafty impostors, who, as soon as they were aware of the emperor's approach, went on working more diligently than ever; although they still did not pass a single thread through the looms.

"Is not the work absolutely magnificent?" said the two officers of the crown, already mentioned. 'If your majesty will only be pleased to look at it! what a splendid design! what glorious colors!' and at the same time they pointed to the empty frames; for they imagined that every one else could see this exquisite piece of workmanship.

"How is this?" said the emperor to himself, 'I can see nothing! this is indeed a terrible affair! Am I a simpleton, or am I unfit to be an emperor? that would be the worst thing that could happen—Oh! the cloth is charming,' said he, aloud. 'It has my complete approbation.' And he smiled most graciously, and looked closely at the empty looms: for on no account would he say that he could not see what two of the officers of his court had praised so much. All his retinue now strained their eyes, hoping to discover something on the looms, but they could see no more than the others; nevertheless, they all exclaimed, 'Oh, how beautiful!' and advised his majesty to have some new clothes made from this splendid material, for the approaching procession. 'Magnificent! charming! excellent!' resounded on all sides, and every one was uncommonly gay. The emperor shared in the general satisfaction; and presented the impostors with the riband of an order of knighthood,

to be worn in their button-holes, and the title of 'Gentlemen Weavers.'

"The rogues sat up the whole of the night before the day on which the procession was to take place, and had sixteen lights burning, so that every one might see how anxious they were to finish the emperor's new suit. They pretended to roll the cloth off the looms; cut the air with their scissors; and sewed with needles without any thread in them. 'See,' cried they at last, 'the emperor's new clothes are ready!'

And now the emperor, with all the grandees of his court, came to the weavers; and the rogues raised their arms, as if in the act of holding something up, saying, 'Here are your majesty's trousers! here is the scarf! here is the mantle! The whole suit is as light as a cobweb; one might fancy one has nothing at all on, when dressed in it; that, however, is the great virtue of this delicate cloth.'

"'Yes, indeed,' said all the courtiers, although not one of them could see anything of this exquisite manufacture.

"'If your imperial majesty will be graciously pleased to take off your clothes, we will fit on the new suit, in front of the looking-glass.'

"The emperor was accordingly undressed, and the rogues pretended to array him in his new suit; the emperor turning round, from side to side, before the looking-glass.

"'How splendid his majesty looks in his new clothes! and how well they fit!' every one cried out. 'What a design! what colors! these are indeed royal robes!'

"'The canopy which is to be borne over your majesty in the procession is waiting,' announced the chief master of the ceremonies.

"'I am quite ready,' answered the emperor. 'Do my new clothes fit well?' asked he, turning himself round again before the looking-glass, in order that he might appear to be examining his handsome suit.

"The lords of the bed-chamber who were to carry his majesty's train felt about on the ground, as if they were lifting up the ends of the mantle, and pretended to be carrying something; for they would by no means betray anything like simplicity, or unfitness for their office.

"So now the emperor walked under his high canopy in the midst of the procession, through the streets of his capitol, and all the people standing by, and those at the windows, cried out, 'Oh, how beautiful are our emperor's new clothes! what a magnificent train there is to the mantle; and how gracefully the scarf hangs!' in short, no one would allow that he could not see these much-admired clothes, because in doing so he would have declared himself either a simpleton, or unfit for his office. Certainly, none of the emperor's various suits had ever made so great an impression as these invisible ones.

"'But the emperor has nothing at all on!' said a little child. 'Listen to the voice of innocence!' exclaimed his father; and what the child had said was whispered from one to another.

"'But he has nothing at all on!' at last cried out all the people. The emperor was vexed, for he knew that the people were right; but he thought the procession must go on now! And the lords of the bed-chamber took greater pains than ever to appear holding up a train, although, in reality, there was no train to hold."

Apply this, O ye conventionalists, quacks, and

pretenders of all kinds! to your own everyday proceedings, and endeavor to be little children in the school of Mr. Hans Christian Andersen.

From the Examiner.

Costume in England: a History of Dress from the Earliest Period till the Close of the Eighteenth Century. To which is appended an Illustrated Glossary of Terms for all Articles of use or ornament worn about the Person. By F. W. FAIRHOLT, F.S.A. Chapman & Hall.

THIS is the prettiest Book of Costume, and, at the same time, the most compact and complete, with which we are acquainted. It has manifestly been a labor of love. Its author is a young artist, who has himself drawn the more than six hundred clearly cut figures on wood, which enrich and elucidate its text. The ground-work of the volume was first laid in the *Art Union*, a cheap journal connected with the fine arts, very cleverly conducted by Mr. Hall, and embellished with specimens of engraving and design even less remarkable for their lavish abundance than for their care and fidelity of execution. Here Mr. Fairholt seems to have been encouraged to write a series of notes on costume; to these he has since added later and ampler stores of research; and the result is a volume of six hundred pages, with more of easily accessible information, written in an agreeable manly way, and illustrated as faithfully as abundantly, on a subject for the most part confined to rare and costly publications, than we remember in any similar work. Too much is not attempted; what is done being done thoroughly. There is learning in the book, without pretence; a familiarity with the abstruser points of the subject, without a display of hard words; and altogether as much modesty as merit. Mr. Fairholt's volume will be a most useful popular manual.

The plan is to take a certain succession of periods, and treat them separately. Thus we have divisions on the Early Britons; the Romans in Britain; the Anglo-Saxons and Danes; the Normans; the Plantagenets; the York and Lancaster time; that of the Tudors; that of the Stuarts; from William the Third to George the Third; and from George the Third to 1800. In each period the dress of royalty and the nobility precedes that of the middle classes and the commonality, and the dress of the clergy is described last. The glossary which winds up the volume gives great completeness to it.

It is curious to turn over its pages, studded with these numberless graphic figures, and see at a glance the preposterous changes of fashion. The rude Briton or Saxon melting into the sumptuous Norman; ruffs and puffs becoming cocked hats and waistcoats; stomachers, starch, and farthingales, waxing and waning through all the varieties of dishabilles, hoop petticoats, curls and pomatum, fluance and furbelow. Mr Fairholt is extremely amusing when he gets near to our own time, and his quotations are always lively and to the purpose. But how came he to forget the exquisite description by Dryden of the beau of his day? It is quite a master-piece of humor as well (we doubt not) as of accurate painting.

"His various modes from various fathers follow;
One taught the toss, and one the new French
wallow;

His sword-knot this, his cravat that designed ;
And this the yard-long snake that twirls behind
From one the sacred periwig he gained,
Which wind ne'er blew, nor touch of hat profaned.

Another's diving bow he did adore,
Which with a shog casts all the hair before,
Till he, with full decorum, brings it back,
And rises with a water-spaniel shake."

As we cannot quote the wood-cuts, which we should greatly like to do, we must be satisfied with some agreeable notes from the text. It may be worth mentioning that the Bulwer so often quoted in them (a writer of decided wit and humorous sarcasm) was of the same family with that modern inheritor of the name, who has made it world-famous.

THE TRUNK HOSE.

"The large trunk-hose, now in fashion, appear to have been originally indicative of boorishness, and to have been worn for that reason by the famous comedian whose figure we have just given: they are alluded to in Rowland's 'Letting of Humors blood in the Head Vaine,' Epigram 31:—

'When Tarlton clowned it in a pleasant vaine,
And with conceits did good opinions gaine
Upon the stage, his merry humor's shop,
Clownes knew the clowne by his great clownish slop.

But now th' are gulled; for present fashion sayes
Dicke Tarlton's part gentlemen's breeches playes:
In every streete, where any gallant goes,
The swaggering slop is Tarlton's clownish hose.'

"These trunk-hose were stuffed with wool, and sometimes with bran. Bulwer, in the 'Artificial Changeling,' tells of a gallant in whose immense hose a small hole was torn by a nail of the chair he sat upon, so that, as he turned and bowed to pay his court to the ladies, the bran poured forth as from a mill that was grinding, without his perceiving it, till half the cargo was unladen on the floor.

"Trunk-hose are ridiculed in the following passage of Wright's 'Passions of the Minde,' 1601:—'Sometimes I have seen Tarlton play the clown, and use no other breeches than such sloppes or slivings as now many gentlemen weare; they are almost capable of a bushel of wheate, and if they be of sackcloth, they would serve to carry mawlt to the mill. This absurd, clownish, and unseemly attire only by custome now is not disliked, but rather approved."

PATCHES.

"A fashion was, however, introduced in this reign that met with just reprehension at the hands of the satirists: it was that of patching the face. Bulwer, in his 'Artificial Changeling,' 1650, first alludes to it. 'Our ladies,' he says, 'have lately entertained a vaine custom of spotting their faces out of an affectation of a mole, to set off their beauty, such as Venus had; and it is well if one black patch will serve to make their faces remarkable, for some fill their visages full of them, varied into all manner of shapes; some of which he depicts on a lady's face, which is here copied from his wood-cut, and it is a very curious specimen of fashionable absurdity: a coach with a coachman, and two horses with postillions, appears

on her forehead; both sides of her face have crescents upon them; a star is on one side of her mouth, and a plain circular patch on her chin. These must not be considered as pictorial exaggerations, for they are noticed by other writers: thus in 'Wit Restored,' a poem printed 1658, we are told of a lady, that

'Her patches are of every cut,
For pimples and for scars;
Here 's all the wandering planets' signs,
And some of the fixed stars.
Already gummed, to make them stick,
They need no other sky.'

And the author of 'God's Voice against Pride in Apparel,' 1683, declares that the black patches remind him of plague spots, 'and methinks the mourning coach and horses, all in black, and plying in their foreheads, stands ready harnessed to whirl them to Acheron.'"

A MACCARONI.

"The hair of the gentleman was dressed in an enormous toupee, with very large curls at the sides; while behind it was gathered and tied up into an enormous club, or knot, that rested on the back of the neck like a porter's knot; upon this an exceedingly small hat was worn, which was sometimes lifted from the head with the cane, generally very long, and decorated with extremely large silk tassels; a full white handkerchief was tied in a large bow round the neck; frills from the shirt-front projected from the top of the waistcoat, which was much shortened, reaching very little below the waist, and being without the flap-covered pockets. The coat was also short, reaching only to the hips, fitting closely, having a small turn-over collar as now worn; it was edged with lace or braid, and decorated with frog-buttons, tassels, and embroidery; the breeches were tight, of spotted or striped silk, with enormous bunches of strings at the knee. A watch was carried in each pocket, from which hung bunches of chains and seals: silk stockings and small shoes with little diamond buckles completed the gentleman's head dress."

THE HAT.

"Until the period of the French revolution no very extraordinary change had taken place in male or female costume since the Maccaroni period. The dresses of the gentlemen, which had then become less loose and capacious, so continued, and the waistcoat really went not below the waist; the coat had a collar which gradually became larger, and very high in the neck, about 1786. Wigs had become less 'the rage;' and in 1763 the wig-makers thought necessary to petition the king to encourage their trade by his example, and not wear his own hair: a petition that was most unfeelingly ridiculed by another from the timber-merchants, praying for the universal adoption of wooden legs in preference to those of flesh and blood, under the plea of benefiting the trade of the country. But the French revolution in 1789 very much influenced the English fashions, and greatly affected both male and female costume; and to that period we may date the introduction of the modern round hat in place of the cocked one; and it may reasonably be doubted whether anything more ugly to look at, or disagreeable to wear, was ever invented as a head-covering for gentlemen.

Possessing not one quality to recommend it, and endowed with disadvantages palpable to all, it has continued to be our head-dress till the present day, in spite of the march of that intellect it may be supposed to cover. It is seen in Parisian prints before 1787."

SHORT WAISTS.

"In 1794 short waists became fashionable; and that portion of the body which fifteen years previously had been preposterously long, reaching nearly to the hips, was now carried up to the armpits. This absurdity occasioned a waggish parody on the popular song, 'The Banks of Banna,' which begins with—

'Shepherds, I have lost my love;
Have you seen my Anna?'

The parody began with—

'Shepherds, I have lost my waist!
Have you seen my body?'

The gown was worn still open in front, but without hoops, and fell in straight loose folds to the feet, which were decorated with shoes of scarlet leather. Immense earrings were worn; the hair was frequently unpowdered, and from 1794 to 1797 large ostrich or other feathers were worn, singly, or two and three together, of various bright colors, blue, green, pink, &c., standing half a yard high."

Mr. Fairholt is entirely intolerant of the hoop. And yet there is something to be said for it. It had a "pride, pomp and circumstance," which, when it enclosed a duchess of Devonshire, one might somehow think to be only a kind of proper "hedge" for so bright-eyed and potent a divinity.

From the Athenæum.

The Quizziology of the British Drama. By GILBERT ABBOT & BECKETT. Published at the Punch Office.

THIS is as light and pleasant an hour's reading as the student need desire,—with the thermometer, in the shady corner of his study, marking eighty-six. Its object is, says the author, "1st, to describe the passions as they appear in many of our modern plays; 2ndly, to show the characters most in use by some of our dramatic authors; and, 3rdly, to present examples of those passions and characters in operation, through the medium of scenes supposed to be selected from the works of the most popular writers for the stage." With some portion of the contents of its volumes, its readers may have already made acquaintance elsewhere; but other parts are, so far as our experience goes, new:—and as, in catering for the mental recreation of our own readers, regard should be had to extreme cases of temperature, we can scarcely do better than amuse them with an example under each of the above three several heads.—The following are fragments from the writer's 'Ode to the Stage Passions':—

"Next Anger rush'd—'tis Hicks, by Jove!

Loud thunder in his voice he hurls;

His superhuman rage to prove,

He tears his long black worsted curls.

And now doth wan Despair appear.

He draws his breath—nor draws it mild,

But fiercely asks the chandelier

To give him back his only child.

No sooner had she sang, than, with a frown,
Revenge, that heavy man,
Stalk'd in, and cheering shouts of 'Bravo, Brown!'
Throughout the audience ran.

He gives the orchestra a withering look,
He draws his blood-stain'd sword,
And growls, 'I mark'd it in the leader's book,
You know I want a chord.'

The orchestra wakes up at last,

The double drums they beat,

And the trombone gives a blast,

Lengthening at least six feet.

At every bar, Revenge, with measured stride,

Perambulates the stage from side to side:

Then hides behind the door for some one coming out,

Who walks most unsuspectingly about,

Follow'd by dark Revenge, who very neatly

Contrives to keep out of his sight completely;

Waiting an opportunity to see

Revenge and Victim *enrout*, both o. p.

With eyes upraised and ringlets curling,

Pale Melancholy—Mrs. Stirling—

Came from the prompter's little seat

Her lamentations to repeat;

And while she pours her pensive cries

On all the wings and flats around,

There is an echo in the flies

That seems to mock the mournful sound.

Through box and pit the plaintive accents stole,

Hung o'er the orchestra with fond delay,

Through the house a charm diffusing,

The sound not e'en the gallery losing,

Till in the slips it dies away."

So much for the Passions!—now for one of the characters of the drama:—

"THE STAGE SUPERNUMERARY.

"Alas! there is not in the range of dramatic character a more striking instance of the weakness of theatrical human nature than is presented by the supernumerary; whose career, from the last bar of the overture to the speaking of the 'tag,' is one continued course of feeble-minded vacillation, abject subservience, or abominable treachery. He is led away by a bit of bombast from any ranting hero who will ask him if he is a man, or a Briton, or a Roman, or whether the blood of his ancestors runs through his recreant veins; and he will agree, at a moment's notice, to take part in any desperate enterprise. He will appear at one moment as the friend of freedom, dressed in green baize, pointing with a property sword to the sky borders, and joining some twenty others in an oath to rid his country of the tyrant: but he will be found five minutes afterwards rigged out in cotton velvet as a seedy noble in the *suite* of the very identical tyrant. He will swear allegiance to the house of Hapsburg, at half-past seven, and by the time the second price comes in, he will be marching as one of a select party of the friends of freedom who have taken an oath to roll the House of Hapsburg in the dust. Perhaps, like a perfidious villain as he is, he will be carrying a banner inscribed with the words, 'Down with the oppressor,' on one side, while on the other—which he keeps artfully out of sight in order to hide his treachery from the audience—are emblazoned the arms of the House of Hapsburg, of which the alleged oppressor is the chief. On the field of battle the conduct of the stage supernumerary is contemptible in the extreme; for he either falls down before he is hit, or takes a mean

advantage of a fallen foe by striking an attitude, with his foot resting on the chest of one of the vanquished enemy. Sometimes the supernumerary gives himself up from seven until ten to a reckless career of crime, carousing in a canvass cave, or plundering pasteboard caravans, except at intervals during the evening, when, perhaps, to swamp the voice of conscience, he drinks half and half in the dressing-room with his wicked accomplices. The face of the supernumerary generally shows the traces of a long career of crime and burnt cork; nor is there a feature upon which remorse or rouge has not committed ravages. He frequently has his arms and legs bare; but, as if he had shrunk within himself, his skin or fleshing is frequently too large for him, and forms folds of a most extraordinary kind at the joints of his knees or elbows. Sometimes his chest is left bare, and his skin, as far as the neck, appears to be of a rich orange color; but the throat, which is cut off, as it were, by a distinct line, is of a different shade altogether. Sometimes, when the scene is laid in India, the supernumerary has his skin tied on to him; from which it would seem to be a theatrical theory that the darkness of color peculiar to the negro race is owing to the use of leggins and waistcoats of black worsted. The stage supernumerary is something like the antelope in his facility of descending precipices, and he will make his way with the greatest ease among rocks that appear inaccessible. He will come from the very highest mountain-pass in two or three minutes, and he undertakes needless difficulty by going a round-about way and traversing the same ground several times over; though he knows that the remotest peak is not a minute's walk from the footlights.

Though the stage supernumerary is frequently a ruffian while upon the scene, he is exceedingly harmless and humble directly he gets to the wing; when he is glad to creep into any quiet corner, to avoid being ordered out of the way by the prompter, tumbled over by the call-boy, and sworn at as well as knocked down by a blow from a flat by one or two of the carpenters."

From the Spectator.

MR. DUTTON'S SOUTH AUSTRALIA AND ITS MINES.

For some years past, Mr. Menge, a German naturalist resident in Australia, had predicted that the range of mountains running north from Encounter Bay to nearly the 32d degree of (South) latitude would be found rich in mineral treasures; but, with the usual fate of prophets in their own place of residence. Towards the close of the year 1842, however, the inferences of Mr. Menge were confirmed by an accidental discovery, as singular as any which has taken place in the history of mines; and perhaps more singular in its large results, because it opens up a *national* branch of industry incalculably important to a new colony as supplying it with a ready means of export—if the colonists have the good sense not to waste too much capital and industry in searches after treasures under the earth. The lucky discovery of Mr. Dutton and his friend and fellow-settler occurred in this wise.

"The Kapunda copper mine is situated close to the river Light, forty-five miles due north of Adelaide.

"It was discovered in the latter part of 1842, by

the youngest son of Captain Bagot, whilst gathering some wild flowers in the plain, and shortly afterwards by myself, not far from the same spot, but on a rise or hillock, to the top of which I had ridden in order to obtain a view of the surrounding country; one of our flocks of sheep having been dispersed during a thunder-storm, and I being at the time in search of them. After being out nearly the whole day in drenching rain, and benumbed with cold, I ascended this little hill, prior to returning home, for one last survey of the surrounding country: the very spot I pulled the horse up at was beside a large protruding mass of clay-slate, strongly tinged and impregnated with the green carbonate of copper. My first impression was that the rock was covered with a beautiful green moss; but on getting off the horse, I quickly found, by breaking off a piece from it, that the tinge was as bright in the fracture as on the surface. My acquaintance with mineralogy was not sufficient to enable me to pronounce on the precise character of the rock, but I had little doubt it was tinged with copper, from the close resemblance of the color to verdigris.

"To Captain Bagot, with whom I had long been on intimate terms, I confided my discovery; when he also produced a similar specimen which was found by his son; and on a subsequent visit to the place, we found that the two spots were within close proximity of each other, although at first, from the one being on a hill and the other in the plain, we thought they were two different places. To make a long story short, we soon ascertained that the specimens were undoubtedly copper ores: the discovery was kept of course secret; we got eighty acres surveyed, all the forms as laid down by the old land-sales regulations were complied with; the section was advertised for a whole month in the government Gazette, and we became the purchasers of it at the fixed government price for waste lands of £1 per acre. At that time there were still a number of 'eighty-acre land orders' unexercised in the colony, any one of which might have claimed this section; nor could we attempt to buy one of them without running the risk of exciting attention: and we therefore preferred quietly waiting for the expiration of the usual time required, and then tendering the money, trusting to the general depression of the times, that no one would feel inclined just then to become possessed of any more land; in which we were not mistaken.

"Having secured the land, the next step was to ascertain the value of the ores, and whether they would remunerate us in working them. To ascertain this, we sent a box of specimens to England; and did not begin working the mine till the encouraging report of Mr. Perceval Johnston reached us, which gave an average of 23 per cent. for the surface out-croppings. We then lost no time to begin working with a small body of men.

"Amongst the general population of the colony there were some few Cornish miners, who were quietly following pastoral and agricultural pursuits: when we gave notice of intending to work the mine, the pickaxe was quickly resumed by them; and we gave them a liberal 'tribute' for the first year, (3s. 6d. per l.), to set the thing going. These men were highly successful, and raised a considerable quantity of rich ore."

We need not further pursue the prosperous fortunes of Messrs. Bagot and Dutton, the quantity of ore they raised, its repute at Swansea, its par-

tioular and average prices, with the advantageous site of the mine, its admirable roads and cheap cartage, or the additional 100 acres the partners bought—no longer at the rate of £1 per acre, competition having run up the 100 acres to £2,210. Suffice it to say, that part of the first year's produce (1844) sold for £6,225; the whole colony was set agog after mining speculations; and it may yet turn out that more will be lost in searching for metals than gained by finding them—as has hitherto been the result in every country, mining, according to Adam Smith, being in fact gambling.

Thus far, however, the success has been wonderful. Including Mr. Dutton's or the Kapunda, no fewer than eleven distinct mines have been discovered; of which six are copper, three lead, and two mixed. In description, these are all promising; but the only two whose produce is in the market seem to be the Kapunda and the Montacute—the latter discovered soon after the Kapunda, in as accidental a way, though not managed by such prudent people as Messrs. Dutton and Bagot. Of these two mines, the price of the ore in 1845, at Swansea, was £13 11s. 2d. per ton for the Montacute, and £24 15s. 3d. for the Kapunda; the last being the highest price of any copper-mine in the world. The money returns were—

Montacute, . . . 277 tons, yielding £3,754
Kapunda, . . . 243 tons, yielding 6,017

It is not to be supposed that South Australia has either capital or skilled labor to work these mines with effect, and both are looked for from this country. British miners and British money are to be exported. Some of the mines belong to companies; probably all are open to the purchase of shares; and they are exciting interest in "the city," as considerable as any other legitimate speculation. It is probable that the object of this work is to bring them prominently before the eyes of the world. The mass of mankind, however, should be slow to meddle with such speculations, unless with money they can afford to lose. A new mine, under the best of circumstances, is an uncertainty; and old ones are not over sure, for we know not how soon the supply of ore may diminish or be procured with greater difficulty. It is a speculation very proper for city capitalists, since they have a general knowledge of the subject, and means of attaining particular information; but the annuitant or person anxious to employ surplus capital should ponder very closely before he embarks in schemes, either at his own prompting, or the solicitations of others, unless he is thoroughly persuaded of their judgment and honesty. In fact, the person wishing to invest may take this with him, that whatever he gains beyond the interest of the English funds is got at some risk or expense, or inconvenience equivalent to expense.

Should Mr. Dutton's object have been to get up any South Australian mining interest in this country, it is very skilfully masked; for only a small portion of his book is devoted to this topic. The remainder of the volume contains a general account of the colony, after the usual fashion in which these things are done. There is the story of the original foundation and of the successive governorships of South Australia; a view of its geographical features, climate, and natural productions; with a sketch of the society and present condition of the colony, which has now emerged from its difficulties, if over rash mining speculations do not

entail fresh ones. All this is well enough done; but the general information is not new to those who have given any attention to the subject.

THE LAST MOMENTS OF THE POPE.—On Whit-Sunday the Pontiff determined to have mass said in his chamber, and to take the communion himself. This was opposed, and he was obliged to almost get angry in order to have his wish complied with; and if he had not done so, he would have died without the sacrament. His valet-de-chambre said to him, "But, Holy Father, you will alarm the whole city; they will say that you are very ill." "Certainly," replied he, "I am very ill; I feel it; and do you want me to appear before God without having taken the bread of life? *Io voglio morire da frate, non da sovrano.*" (I wish to die as a monk, and not as a sovereign.) The malady made such rapid progress the following night that the cardinal confessor, whose duty it is to assist dying pontiffs, could not be summoned in time; it was the assistant curé of the Pontifical Palace who gave extreme unction to the Pope, the curé not having arrived. Gregory XVI. had expired when Cardinal Bianchi, his confessor, entered his chamber. The other ecclesiastics, who were summoned according to custom, had only to watch over the mortal remains of their master. The Pope expired in the arms of Cardinal Lambruschini, who had hurried up with all the speed of his horses, and who assisted him in his last moments with the tenderness of a friend and a son. The 'Ami de la Religion' says:—"Pope Gregory XVI. has made two of his nephews his residuary legatees, and appointed Cardinal Matei his executor. The Pontiff has left several legacies to the Propaganda, the convent of St. Gregory, the monks of the Camaldules, and some of his household. The fortune which he has left has been greatly exaggerated. A more just idea of it may be formed when it is considered that the civil list of the papedom does not amount to more than 80,000*l.* a year. A rich library, some valuable paintings, jewellery, and works of art, with other property of unimportant amount, form the whole of the inheritance left for his nephews in the Venetian states, instead of the millions at which it has been estimated."

THE papers announce the death, at Woolwich, of Mr. Marsh, the chemist—whose name has acquired a European celebrity, as the inventor of the test for arsenic now generally used in medical jurisprudence.—*Athenæum.*

GOOD NIGHT.

BY F. A. B.

Good night, but dream not, lest the clinging form,
Which thou didst coldly cast from thy embrace,
Should in thy sleep return, and still and warm
Creep to the breast that was its resting-place.

Good night, but dream not, lest the pleading eyes,
Whose tears thou seest fall down like winter rain,
Should o'er the darkness of thy slumbers rise,
In that long look of helpless, hopeless pain.

Dream not, lest, with the hour of love returning,
Thy former love should to thy heart return.
Alas! as soon might'st thou seek light or burning
In the grey ashes of a funeral urn.

New Monthly Magazine.

From the Edinburgh Tales.

THE ELIZABETHINES. BY MRS. GORE.

Sad as the heart of Ruth, when, sick for home,
She stood in tears amid the alien corn! KEATS.

I HAVE had reason hitherto to complain of ill-fortune in the visits I have made to convents and monasteries. Other travellers are sure to meet with some interesting novice or dignified lady abbess—some celestial sister already “enskied and sainted”—or some wasted votary, bearing the impress of secret and silent affliction—of suppressed passions—of self-resignation! For my own part, I must acknowledge that I never yet chanced upon a cloistered-victim in any way worthy of sympathy. The reverend mother has usually proved a cross old woman much addicted to snuff; with a skin like yellow flannel, and a gait like that of the fairy Carabosse; and I have always found the sister appointed to do the honors of the convent, dull, corpulent, middle-aged, and contented, as well as self-contented. The only nun I ever saw who could lay claim to personal beauty, was a very lovely creature, with whom, some ten years ago, I passed a rainy afternoon at Tournay. Instead, however, of adding the grace of pensive *Eloiseism* to her other attractions, the holy sister proved as arrant a giglet as any reproved by the Lady Beatrice of the Tor Hill; and laughed and crowed like an idiot, while I sat admiring her skill in *trading*—a most unsentimental employment for a heroine!

Henceforward, however, I will make no complaints on this head; for I have recently witnessed a scene within the walls of a religious institution, which has proved the source of many deep and painful emotions. I will not call it *interesting*, for such a term is most unfitly applied to the real right-earnest calamities of human life.

The convent of the Elizabethines, or *Elisabethinerinnen*, is situated in one of the suburbs of Vienna; and was endowed by the Queen of Hungary, whose name it bears, as an hospital for fifty poor women, to be served and attended by as many professed nuns. The institution closely resembles that admirable one founded by Saint Vincent de Paule—the *Sœurs de la Charité*—and maintains the same character of universal benevolence, of self-denying and pious activity. In addition to the fifty objects received into the ward of the hospital, the Elizabethines distribute their charitable offices to such of the neighboring poor as apply for assistance or advice; and the holy sisters are not only adored by those who have been restored to health through their skill and gentle care, but are regarded as the tutelary angels of the quarter in which their convent is situated.

Anxious to observe the internal regulations of an institution I had so frequently heard named with the blessings of gratitude, I presented myself at the *parloir* of the Elizabethines; and having referred my request for admittance to the reverend mother, I was instantly and graciously received.

The sister appointed by the abbess to conduct me over the building, was a cheerful intelligent woman—cheerful from the consoling sense of duties diligently performed, and from the remembrance of a long life spent in the services of her fellow-creatures. She was gentle and even elegant in her address, although slightly deformed in person; but I beg my readers will not despond over this untoward circumstance, for I respectfully forewarn them that Sister Agatha is not the heroine of my adventure.

“This is our laboratory,” said she, throwing open a door which emitted a rich steam of spicy decoctions; and I perceived that the antique oaken compartments within, were closely filled with mysterious jars which appeared to contain all “the syrups of the east.” A little boy beside the polished counter was receiving from the hands of an old nun, a basket of medicines for his sick mother; accompanied by more counsels and injunctions than I thought so small a head might well retain; and in an inner chamber I caught a glimpse of three reverend sisters seated round a table, on which stood an air-pump, an electrifying machine, and a ponderous pair of scales. Their dress—the flowing black robe and milk-white scapulary, worn somewhat after the fashion of a Roman *contadina*—their dignified gravity, which might have become “Tynemouth’s haughty prioress,” formed a strange contrast with their several occupations; which were those of pulling lint, weighing poppy heads, and shelling small seeds for some medicinal purpose.

After exhibiting “an alligator stuffed,” and some other objects of natural history—the marvel and glory of the simple nuns—Sister Agatha led me successively through the wardrobe, where a detachment of the nuns were busily stitching garments for the rest of the community—through the sacristy, where another division was occupied in preparing decorations for their church, to be used on some ensuing solemnity—and finally, into the kitchen of the convent—the neatest and most appetizing, I should think, that exists in the German empire.

Wherever we passed, the nuns crowded round to kiss the hand of my conductress, and to welcome her with loquacious delight. She was evidently a person of importance and a favorite, for even the sisters occupied in the confectionary in preparing delicacies for their convalescent patients, left their sugar to burn while they indulged in a passing gossip with Sister Agatha.

The order and distribution of the extensive building were admirable; and the long spotless corridors paved with polished Salzberg marble—the cream-colored stone used for lithographic engraving—formed a striking contrast with the usually filthy passages of Vienna mansions, and spoke strongly in favor of the superior cleanliness of female occupations.

“You are fortunate,” observed Sister Agatha, as we ascended the stairs, “in having visited us at the hour appointed for the reception of visitors into the ward. It is the bright season of our day, and will diminish the painful impression arising from the sight of the afflicted.”

As she spoke she threw open the door of the hospital—a long gallery containing fifty beds, each bearing a German inscription, purporting that the wants of its sick tenant were relieved “through the love of God.” A murmur of joy and surprise saluted the entrance of Sister Agatha into the ward; and the numerous visitors, many of them belonging to a highly respectable class of life, deserted the beds of their sick friends to salute her with expressions of welcome and gratitude. Many of the poorer order, unable to lose their time, although in the offices of affection, had brought their work; and were diligently knitting or sewing while they listened to the monotonous recitals of the sufferers—the mother, the sister, the friend they were come to visit. On several coverlids a little tokens of interest—a flower, a biscuit

handkerchief—or some other humble offering, bestowed by the poor, in honest good-will, upon the still poorer; and every ghastly countenance among the sufferers was lighted up by an expression of joyful and grateful excitement. There was one among them, old, and apparently heavily afflicted, who was gazing with an intensity of affection, almost painful to behold, upon a well-dressed young man, a student of some German college, who sat beside her bed, holding her poor thin hand.

Their history was evident. She had sacrificed much to secure to a beloved son the education and appearance of more liberal means; and if I might judge by the affectionate expression of the young scholar's countenance, her motherly self-denial was neither unappreciated nor unrewarded. Several of the convalescent were dressed and seated among their friends, and the appearance of some even justified the information I had received, that the poor and needy were detained by the Elizabethines long after their recovery, provided they were unable to work for their maintenance elsewhere.

"It must be highly gratifying to your feelings, dear sister, to see those poor creatures restored to health and usefulness through your ministry," said I to my guide. "There are many here whose looks do equal honor to the skill and to the tenderness of those by whose care they have been tended."

"You must remember, however," replied Sister Agatha, "that we frequently receive incurable patients; and that among so large a number, we have the grief of seeing many die, notwithstanding our most anxious exertions. There," she continued in a whisper, pointing to the last bed we had passed, "there lies one to whom it only remains for us to administer the last offices." I looked, and saw a wasted pallid face, turned towards the pillow, as though to drown the murmur of the crowded ward. Her eyes were closed, and her slight delicate hand lay open upon the sheet in the relaxation of debility. She was young, and as far as I could judge from the adjustment of her linen, was of a better order than the other patients.

As I paused for a moment at the bottom of the bed, to look upon her with the reverence due to one who is about to put on the garb of immortality, my shadow fell upon her face. She unclosed her sunken eyes for a moment, and then shut them, after a look of despair—a shudder of hopelessness, which I can never forget. I passed on hastily; and looked at my attendant for an explanation, as she led me into a little chapel at the end of the gallery, opening into it for the service of the sick.

I observed that the eyes of the compassionate nun were filled with tears; but as we were now before the altar, she knelt down to repeat a paternoster, without replying to my mute inquiry. Some minutes afterwards, as we were descending the stairs towards the church of the convent, I took courage to question her concerning the dying woman.

"You say that she will not long survive; yet of all the hospital, hers was the only bed unsoothed by some kind visitor. The poor creature appears totally deserted—has she no friends in Vienna?"

"She is heavily visited both in mind and body," replied Sister Agatha, evasively. "The Almighty hath been pleased to deal with her as with those he loveth. When she first became our inmate, she was placed next unto the bed of the young student's mother; and the sight of his assiduous filial affection proved so great a trial to the poor crea-

ture's feelings, that compassion induced me to remove her to the end of the ward; where her desolate condition is less apparent to others—less painful to herself."

At this moment we entered the church; and from a feeling, intelligent woman, Sister Agatha became at once the narrow devotee—the blind votary of superstition. Her order, and its dignity—her church and its relics—her director, and his anathemas, became paramount in her mind; and she proudly claimed my admiration for the skeleton of the giant St. Columbus, which sparkled through its glass coffin with ribs set in false stones and tinsel—and for the choir behind whose mysterious curtain, the hymns of the veiled Elizabethines are heard with reverence by the congregation. From the church we passed into the inner sacristy; where the good nun expatiated right eloquently upon the beauties of several gilt calvaries and holy sepulchres, presented to their treasury by Maria Theresa and her successors. Despairing of bringing her back to the subject of the dying woman above, I prepared to take my leave by presenting a trifling offering towards the funds of the institution; and I was indiscreet enough to venture a second donation, with a request that it might be applied to the especial use of the poor deserted woman.

Sister Agatha, who had accepted my first gift with gratitude, put back my hand with indignation when I tendered the second. "Have you observed," she inquired, "any symptoms of partiality in our arrangements—or any want of general comfort? What do our sick require that is not instantly administered? Nay—what fancy or caprice do they express, which is not anxiously gratified by the reverend mother?"

I craved forgiveness for my involuntary offence, which I attributed, and truly, to the heartfelt compassion inspired by the deserted condition of the dying patient; and Sister Agatha, after silently examining my countenance, as if to assure herself what degree of confidence she might place in my discretion, replied, "Well, well; say no more of it—I perceive that the request, however indiscreet, arose from a gentle feeling. Stay!" she continued, leading me back into the sacristy and closing the door after us, "you are young—you belong to the children of the world—and the history of that unfortunate woman may prove a useful lesson. Have you leisure to listen?"

I seated myself by her side with grateful alacrity; and Sister Agatha, taking out her knitting, commenced the following narration.

"I will call the poor soul Cecilia; and as I have no fear that you will discover her real name and title, I will fairly own that she is born of one of the noblest houses of Hungary—her ancestors have even been among the most liberal benefactors of the convent in which her last sufferings have been alleviated. Cecilia became an orphan shortly after her birth; and as her fortune was considerable, she was bequeathed to the guardianship of the head of her father's family. Even now you may judge that she was once a lovely creature; and when I add that her disposition was volatile, and her education totally neglected, you will be the more inclined to look with lenity upon the indiscretion that induced her at the age of sixteen to elope from her uncle's palace, and to bestow her hand and affections upon a very unworthy object.

"It was during the occupation of the army of Napoleon; and at a period when the Austrian

mobility found themselves compelled to admit into their domestic circles many French officers who, at another time, would have been spurned from their society. Among the rest, a colonel of cuirassiers was quartered in the palace of prince — of —, Cecilia's uncle. He proved to be a man of ignoble birth—ignoble character—ignoble habits; but the poor child who had been accustomed to receive among her proud relations only the harshest usage and coldest severity, was too easily touched by the adulation of the wily Frenchman to be sensible to these defects. His anxiety, too, to possess himself of Cecilia's ample dower, taught him to conceal them—if not from her family—at least from her deluded self. To dwell as little as possible upon her errors, permit me to say that Cecilia was induced by her lover to elope from Vienna; and that she became a wife and a mother before she had attained her seventeenth year.

"Were you better acquainted with our national habits, it would be useless to add that she was immediately denounced as an outcast and an alien, by her indignant family; that her name became a forbidden sound, and that she was soon accounted as among the dead. Well would it have been for the unhappy creature, had the Almighty indeed so ordered her destiny! for long before her splendid fortune was dissipated—and a few years enabled her depraved husband to squander it away—Cecilia had become an object of disgust to him for whose sake she had sacrificed her kindred and her country; and neglect and cruelty sufficiently justified the antipathy conceived against him by her relations on their first acquaintance.

"The fortune of war was fated to relieve her from the persecutions of him whose obscure name she bore;—at the age of twenty-one, Cecilia found herself a widow and the mother of three children as destitute as herself! And now, for the first time since her imprudent marriage, she ventured to address her exasperated uncle—for the wants of her innocent babes taught her to overcome the suggestions of her innate national pride—to forget the sensitive delicacy of her character; and in a letter dictated by humility and repentance, she craved the charity of her haughty kindred.

"A tardy and brief reply was vouchsafed to her supplication;—but it contained a small remittance; and in the present relief afforded by the gift, Cecilia forgot the wound inflicted by the terms in which it was bestowed.

"A second time, however, the young mother found herself penniless; and her sufferings were now aggravated by the loss of her youngest child. 'I nursed it,' said she, when she told me her pitiful story, 'and I verily fear it died of famine, for I was well nigh starved myself. But the despair which overcame me when I stretched its little wasted limbs for the grave, gave me courage to apply once more to my cruel uncle.

"A second supply was the result of my appeal; but as it was accompanied by an assurance that it would be the last, I resolved to profit by its temporary relief, and return to my native country. I thought that the sight of my babes, in their destitute condition, might win the compassion of those on whom they possessed other and stronger claims. I longed too to hear the accents of my fatherland, to breathe once more my natal air; for, alas! the country of my adoption had proved but a harsh step-mother. Since I had left my native land, my lot had been one of mortification and misery; and the remembrance of home—even of the unendear-

ing home of my early years, grew sweet by the comparison.

"But on my return to Austria, I found myself a greater alien—a still more reviled, more desolate creature! I was assured by the survivors of my family that in renouncing their name by my imprudent marriage, I had forfeited all claims upon those who bore it; and that by intruding my beggary upon the joys of their prosperity, I had but hardened their hearts towards my wretched children.

"I shall never forget the day," said poor Cecilia," continued the nun, "on which I turned from their lofty portal towards my own obscure retreat; my heart swelling within me as I clasped my lovely children to my desolate bosom. I had then some means of support still remaining—the savings of my frugality;—and I had still strength to work; so that when I shut myself up in my own chamber, I resolved that no extremity of want should induce me to court a second repulse. But I had not duly calculated upon the nature of the trials I should be doomed to undergo. I had thought but of ceaseless labor—of domestic drudgery;—of want of food, of want of rest; and these miseries I could bear, and I *did* bear them cheerfully. But with all my hardships I was unable to earn sufficient bread for my children. I saw the loveliness with which God had gifted them, gradually fade away;—their strength wasted—their little voices grew feeble as they breathed their endearments to their miserable mother—their growth was suspended by want of proper nourishment—and already my fears foretold a still more fatal result.

"Could my heart resist such a suggestion? Oh! no; I addressed myself again and earnestly to my estranged connexions; and my adjuration was so fraught with the expressive wretchedness of my mind, that it could not be utterly disregarded. It chanced also, that my boy had become, through the death of a relation, the heir presumptive to a distant branch of my family; and my uncle, mindful perhaps of this contingency, was moved to offer him his protection. 'Resign the care of your children to me,' he wrote in reply to my petition. 'Your conduct has proved that you are unfit to become the directress of their education; and, by your own declaration, you lack the means for their support. I will provide liberally for them both; if they are permitted to assume my name, and if their mother consents to leave this country at once, and forever.'

"Rather beg their bread—rather perish with them! was my first exclamation on perusing this barbarous request. And I *did* beg—again and again—humbly and earnestly; but perhaps I wanted something of the lowly air of habitual supplication, or hunger and despair might impart a look of repellant ferocity to my countenance, for the hearts of the humane were seldom touched by my supplications. In a few weeks therefore my fears recurred with added force; my pride, my courage failed under the solitudes of a mother's love, and I formed at length the desperate resolution of obeying my uncle's commands.

"It was a heavy morning that which I had fixed for the execution of my project, and my mind was fevered by a night of sleepless horror. I had sat up to render the rags of my poor babes as little revolting as possible to those unto whose mercy I was about to commit their destiny; and when daylight came I roused them gently and tenderly from their calm slumbers. I dared not look upon their

sweet faces as I dressed them for the last time; and when I imprinted a burning kiss upon the glossy curls of their little heads, I felt that the Almighty was dealing with me more heavily than I might bear!

"Perhaps despair had already numbed my heart into endurance, for I gathered courage to tell them that their troubles were over;—that they were henceforward to dwell in a fine house—with sweet food—with soft rest to restore them; and that they must learn to reverence the noble hand from which they derived such gifts, and try to forget—but no—no—no! I could not for worlds have told them to forget me;—and had I done so, the request would have been unavailing. They clung to me—they wept and implored, and finally prevailed. No! I could not part from them that day!"

"I repeat Cecilia's words as nearly as I can remember them," said the nun, after a painful pause; "but I cannot give the expression of a mother's voice to my narration;—I remember that *hers* reached my inmost heart."

"And did she at last gather strength to part with the poor babes?" I anxiously inquired.

"The separation was effected by an unpremeditated meeting with her uncle," continued Sister Agatha. "They were at the moment almost expiring with hunger; and the fine equipages and dainties proffered by the prince, induced the little innocents to consent to what was at first announced as a separation of a few days from their heart-broken mother. Young as they were, they did not notice how frequently the visit was prolonged; and after repeated disappointments of returning home, their restlessness was at length changed into contentment. They were kindly used; and, like all children, they learned in time to forget the absent. The mother who had been so missed and so lamented—for whom they had hoarded their luxuries, and renounced their infantine enjoyments, was soon rarely mentioned—and finally—forgotten."

"In the mean time poor Cecilia, who had accepted a limited pension from the prince, and had fulfilled the necessary condition of quitting the Austrian territories, was for a time reconciled to her miserable destiny by the certainty that her children were rescued from the sufferings and dangers of privation. 'In the grievous loneliness of my existence,' said she, 'I had the consolation of knowing that my treasures no longer fixed the eager eyes of starvation upon the morsel I was unable to purchase to appease their famine. I was supported during the day by a sort of feverish excitation which led me to wish for the return of night, that I might lose in sleep my sense of sorrow: but when the night came, and I missed from my side the little beings who had slumbered there from infancy—I could not rest! And thus long-ing by day for the night—by night for the return of day—long weeks, long months passed over my miserable head. Nothing but my flattering trust that my son's accession of fortune would one day or other enable me to clasp in my arms the precious creatures for whose well-being I had forfeited my own happiness—enabled me to support existence;—and even that hope could not long suffice to smooth the path of self-denial. My mind, fixed with constant and dreadful intensity upon the absent objects of its affections, became enfeebled; my courage relaxed with my judgment—the yearning of my heart grew too strong for mastery—and in a moment of frenzy, I returned to Vienna!"

"My first object was to seek a furtive interview with my children. I was well aware that the greatest caution would be necessary for the accomplishment of my end; and for some days I contented myself with watching, at dusk, under the windows of my uncle's palace. I thought that among the shadows of its inmates, revealed by the lights within, I might perhaps distinguish those of my children. I was aware that they inhabited the same chamber which had been mine in childhood; and I have stood on the bastions beneath it, through rain—through snow—through piercing frost—in the expectation of catching the joyous echoes of their young voices; at length I took courage one morning to watch their coming out for their daily drive."

"I thought I had sufficiently disguised my altered person; and with trembling limbs I slowly paced along the street, when the gorgeous carriage bearing the arms of my family rolled out of the court of the palace, and passed close beside me. I could not refrain from looking up—and in a moment I saw the fair face of my youngest born—glowing with health—radiant with happiness: but the smile of her sweet eyes fell upon her mother without recognition—she had forgotten me!"

"Could I bear this! I fell senseless upon the pavement; and the menials of the carriage, which wounded me as it passed, recognized in the poor wretch they humanely ran to raise from the earth, a rejected daughter of their master's house!"

"This public exposure, irritated—and perhaps justly—the feelings of the prince. He wrote me a letter filled with a torrent of invective—upbraiding me with ingratitude, and threatening me to withdraw his protection from my children, if hereafter I sought, directly or indirectly, to come into their presence. He reminded me of the dangers that would await them in case of my death, under such a desertion. He painted in strong and appalling terms, the perils which poverty and desolation might entail at some future time upon my daughter. But he might have spared his eloquence;—the blow was already struck—the bruised reed bowed unto the dust—and death was about to release the wanderer from her sufferings, and himself from my further intrusion."

"It was precisely at this period," resumed the nun in a more cheerful tone, "that the destitute condition of our poor Cecilia drew towards her the attention of the Holy Father Director of our order. In visiting a sick parishioner, he learned that a young person of interesting appearance was dying in a small attic in the house; to the proprietor of which she was a total stranger. He did not, as you may suppose, hesitate to visit the bedside of the desolate sufferer, whom he found sinking under a slow fever, destitute of the common means of support, and oppressed by all the terrors of mental despair. Within a few hours Cecilia was removed at his suggestion into our hospital; and few were ever sheltered within its walls unto whom its comforts were more vitally necessary. It was my own turn of duty the night of her admission," said the nun, "and her youth and beauty exerted, in the first instance, a blamable influence over my feelings. Other motives of compassion speedily declared themselves. I found that my lovely patient's disorder originated in the exhaustion arising from a long endurance of cold and hunger. She had fasted for many days together during an inclement winter, in order to increase the scanty meals of her children; and during the first night that I watched by her side, I heard the names of those beloved

children, murmured again and again by her parched lips, as though their very sound were a watchword of salvation!"

"And was her case hopeless, even at the time of her admission?"

"The cares lavished upon her failed not to procure a transient revival. In a few days Cecilia recovered her consciousness; and her gratitude for my attention in removing her from the painful position which chance had assigned her in the ward, opened her heart towards me, more than towards her other attendants. It appeared as if her feelings were relieved by confiding to me the history of her afflicted life."

"But surely, surely something might still be done to save her," said I, interrupting the good sister; "surely a malady resulting from temporary privation cannot affect the powers of life."

"We are not reckoned unskilful, even by the faculty of Vienna," answered Sister Agatha, with an air of professional dignity. "The influence of the mind is all-powerful over the body, and we know that few diseases are more important than those arising out of moral causes. You must remember, too, that Cecilia's frame was weakened by want and toil during three entire years—that its powers have been exhausted by prolonged fasts and prolonged vigils; nothing now can save her."

"But you will apply, without doubt, to her family—to her cruel, selfish uncle. Surely you will attempt to bless her dying eyes with the sight of those beloved objects to whom she hath sacrificed her existence!"

"Impossible!" replied the nun with provoking calmness. "The prince is one of the most powerful and liberal benefactors of our convent. Were the reverend mother—to whom, however, I have not thought it expedient to apply on the subject—were the reverend mother to provoke his highness' displeasure by such an appeal, she would be injuring the cause of the poor, and bereaving the many in order to gratify the worldly passions of a single heart. To the suffering multitude we owe an account of our ministry; and their wants and claims, alas! will long survive the sorrows of poor Cecilia."

"At least permit me, who as a stranger can incur no risk, to make immediate application to the prince. His name—his name—I entreat you do not let this victim of maternal love die unrewarded."

"You are an enthusiast," replied the nun with a gentle smile, "and forgot that the slightest motion will extinguish the flame of an expiring lamp; one moment of agitation would destroy Cecilia. Besides, although a heretic, you must be sensible that the consolations of religion alone become the bed of death. It would be cruel to rekindle earthly affections in a heart where the hopes of faith should alone prevail. But I must not loiter here," continued Sister Agatha, respectfully kissing my hand. "Farewell, sister! farewell; may your journey prosper! and when you return to your own remote country, remember that the sick and the poor are comforted by the lowly order of St. Elizabeth, *'through the love of God!'*"

The day following my memorable visit to the convent of the *Elisabethinerinnen*, I departed, not under the influence of Sister Agatha's benediction, "to my own remote country," but on a tour through Hungary, which occupied some months. Previous to leaving the city of Pesth, the principal residence of the Hungarian nobility, I chanced

one morning to enter a bookseller's shop in search of books of instruction for children, written in the national language. The master of the shop, in reply to my inquiries, observed that he could supply me with the newest and best as soon as the Countess Woleska had finished her selection. I looked towards the lady referred to, and saw a slight figure in deep mourning, accompanied by two children—an elegant little girl, and a noble boy about six years of age.

The bookseller whispered that he was the young *Fürst Reussdorf*; and at the same moment the countess turning round to desire her little girl would offer the books to the English lady, discovered to me a face—no! I could not be mistaken!—a face which I had seen but once, to remember forever; and which I had for months past believed to be shrouded in the damps of death—that, in short, of Sister Agatha's heroine. Even as it was, it was totally colorless; and as I was in the very land of Vampirism, I literally shuddered as I fixed my wondering gaze upon the countess, and could not recover my voice to thank the lovely child from whose hand I received the books. I concluded my bargain as precipitately as I could; and walked out into the street, without well knowing what I was about, or where I was going.

My first anxiety on returning home was to question our German courier respecting the family of Reussdorf, and the Countess Woleska; but I received only those vague and tormenting replies which one is sure to extract from such a source.

"The Woleskas," he said, "were a very noble race—very powerful—very wealthy; settled in several provinces of the empire, one branch in Hungary—one in Styria—"

"But the countess?"

"The countess!—the young one or the old? The Countess Dowager of Woleska is of the *Schwarzenwäldchenwesterhofische* family—a lady of the highest descent and—"

"No—no—the young countess."

"The young countess? There are several, *gnädige Frau*; the Countess Wenzl, the Countess Rudolf, the Countess Moritz," &c. &c.

Finding it impossible to come to the point, I resolved to wait for the evening's opera, when I felt sure of learning the gossip of the city from some of the visitors to our box.

"Ah! you have seen the young Countess Woleska," was the ready answer to my inquiries. "A charming woman, although rather *passée*, but still a very interesting ruin."

"Can you inform me whether she has been long resident in Hungary?"

"Scarcely a month—can it be possible that you have not heard her history? a very eventful one, if the *on dits* are accurate. Her little son came suddenly into possession of the principality of Reussdorf, by the death of a relation in whose house he was educated; but the countess, having formed a connexion early in life with a French adventurer, a Bonapartist, which of course had obliged her family to cast her off, was at the time of his unexpected succession, concealed in some obscure retreat, some say a prison, some a mad-house, and was brought forward, to the amazement of all Vienna, by the family confessor; some meddling Capuchin, who had never lost sight of her. She was in a most precarious state of health, and was not at first expected to survive her change of fortunes."

"And what has brought her hither?"

"She remains at Pesth while the family castle in Esclavonia is fitting for her reception—for she has resolved to educate her son upon his patrimony, till he is old enough to commence his studies at the National University. We know nothing of the countess but from report; for she has declined entering into the society of the city, and has had the *maladresse* to refuse an invitation from the palatine himself, on the grounds of ill health and recent affliction. *Entre nous*, I rather imagine that the fair lady is conscious her long seclusion from society has rendered her somewhat unfit to move in the circle to which her descent admits her."

It was not for a stranger like myself to controvert this opinion, or to assure my self-important friend that not even the Countess Téliki, the Lady Jersey of Pesth, might vie with the young Countess Woleska, in a gentle, graceful timidity of address, which cannot become either out of date, or *déplacé*; I ventured, however, to assert that she had

never been confined either in a prison or a mad-house.

"You are acquainted with her then, and have been betraying me into relating anecdotes of your friend. This is not fair, but it affords me at least the pleasure of assuring the countess' enemies that her intimate acquaintance has vindicated——"

"Permit me to assure you that I never interchanged a syllable with the Countess Woleska; but I again repeat, on the authority of those best informed, that there never existed a brighter example of the first virtue of womanhood—motherly affection."

I never saw this interesting woman again; but I was satisfied to leave her in the possession of every earthly blessing; and to know that a life of suffering and resignation had been repaid by moments of joy such as can have rarely fallen to mortal lot. May they be long and frequently renewed!

PASSING UNDER THE ROD.

"It was the custom of the Jews to select the tenth of their sheep after this manner. The lambs were separated from the dams, and enclosed in a sheep-cote, with only one narrow way out; the dams were at the entrance. On opening the gate, the lambs hastened to join the dams, and a man placed at the entrance, with a rod dipped in ochre, touched every tenth lamb, and so marked it with his rod, saying 'LET THIS BE HOLY.' Hence says God by his prophet, 'I will cause you to pass under the rod.'"

I saw the young bride in her beauty and pride
Bedecked in her snowy array,
And the bright flush of joy mantled high on her cheek,
And the future looked blooming and gay,
And with woman's devotion she laid her fond heart
At the shrine of idolatrous love,
And she anchored her hopes to this perishing earth,
By the chain which her tenderness wove.
But I saw when those heart-strings were bleeding and torn,
And the chain had been severed in two,
She had changed her white robes for the sables of grief,
And her bloom to the paleness of woe;
Yet the Healer was there, pouring balm on her heart,
And wiping the tears from her eyes,
And he strengthened the chain he had broken in twain,
And fastened it firm to the ships.
There had whispered a voice—'t was the voice of her God,
"I love thee, I love thee!—*pass under the rod!*"

I saw the young mother in tenderness bend
O'er the couch of her slumbering boy,
And she kissed the soft lips as he murmured her name,
While the dreamer lay smiling in joy.
Oh, sweet as the rose-hud encircled with dew,
When its fragrance is flung on the air,
So fresh and so bright to the mother he seemed,
As he lay in his innocence there!
But I saw; when she gazed on the same lovely form,
Pale as marble, and silent, and cold,

But paler and colder her beautiful boy,
And the tale of her sorrow was told.
Yet the Healer was there, who had smitten her heart,
And taken her treasure away;
To allure her to heaven he has placed it on high,
And the mourner will sweetly obey!
There had whispered a voice—'t was the voice of her God,
"I love thee, I love thee!—*pass under the rod!*"

I saw when a father and mother had leaned
On the arms of a dear cherished son,
And the star in the future grew bright in their gaze,
As they saw the proud place he had won:
And the fast coming evening of life promised fair,
And its pathway grew smoothed to their feet,
And the star-light of love glimmered bright at the end,
And the whispers of fancy were sweet;
But I saw when they stood bending low o'er the grave,
Where their hearts' dearest hope had been laid,
And the star had gone down in the darkness of night,
And joy from their bosoms had fled.
Yet the Healer was there, and his arms were around,
And he led them with tenderest care,
And he showed them a star in the bright upper world—
"T was their star shining brilliantly there!
They had each heard a voice—'t was the voice of their God,
"I love thee, I love thee!—*pass under the rod!*"

MRS. M. S. B. DANA.

AFFECTION OF DOGS.—Dogs have been known to die from excess of joy at seeing their masters after a long absence. An English officer had a large dog, which he left with his family in England, while he accompanied an expedition to America, during the war of the colonies. All the time of his absence the animal appeared very much dejected. When the officer returned home, the dog, who happened to be lying at the door of an apartment into which his master was about to enter, immediately recognized him, leaped upon his neck, licked his face, and in a few minutes fell dead at his feet. A favorite spaniel of a lady recently died on seeing his beloved mistress after a long absence.—*Leslie's Anecdotes.*

VISIT TO JAPAN.

BY C. F. WINSLOW, M. D.

Some account of Captain Mercator Cooper's visit to Japan in the whale ship Manhattan, of Sag Harbor.

It was about the first of April, as Captain Cooper was proceeding towards the whaling regions of the northern ocean, that he passed, in the neighborhood of St. Peters, a small island lying a few degrees to the S. E. of Nippon. It is comparatively barren and was supposed to be uninhabited; but being near it, Captain C. thought he would explore the shore for turtle, to afford his ship's company some refreshment. While tracing the shore along, he discovered a pinnacle of curious construction, which resembled somewhat those he had seen in the China seas. Turning his walks inland, he entered where he unexpectedly saw at some distance from him several persons in uncouth dresses, who appeared alarmed at his intrusion and immediately fled to a more secluded part of the valley. He continued his walk and soon came to a hut, where were collected eleven men, whom he afterwards found to be Japanese. As he approached them they came forward and prostrated themselves to the earth before him, and remained on their faces for some time. They were much alarmed and expected to be destroyed; but Captain C., with great kindness, reconciled them to his presence, and learned by signs that they had been shipwrecked on St. Peters many months before. He took them to the shore, pointed to his vessel, and informed them that he would take them to Jeddo, if they would entrust themselves to his care. They consented with great joy; and abandoning everything they had on the island, embarked with him immediately for his ship.

Captain C. determined to proceed at once with them to Jeddo, the capital of the Japanese Empire, notwithstanding its well known regulations, prohibiting American and other foreign vessels to enter its waters. The captain had two great laudable objects in view. The first was to restore the shipwrecked strangers to their homes. The other was to make a strong and favorable impression on the government, in respect to the civilization of the United States, and its friendly disposition to the emperor and people of Japan. How he succeeded in the latter object the sequel will show; and I will make but few remarks, either on the boldness of Captain C.'s resolution, or its ultimate consequences touching the intercourse of the Japanese with other nations. The step decided on, however, has led to some curious and interesting information relative to this country, whose institutions, and the habits of whose people are but little known to the civilized world.

Captain C. left St. Peters, and after sailing a day or two in the direction of Nippon, he descried a huge and shapeless object on the ocean, which proved to be a Japanese ship or "junk," as these vessels are called—wrecked and in a sinking condition. She was from a port on the extreme north of Nippon, with a cargo of pickled salmon, bound for Jeddo. She had been shattered and dismantled some weeks previous, and was drifting about the ocean at the mercy of the winds, and as a gale arose the following day, the captain thinks she must have sunk. From this ship he took eleven men more—all Japanese—and made sail again for the shores of Nippon. Among the articles taken

from the wreck by its officers, were some books and a chart of the principal islands composing the empire of Japan. This chart I shall speak of in detail hereafter, and it is perhaps, one of the most interesting specimens of geographical art and literature, which has ever wandered from the shores of eastern Asia.

In making land, our navigator found himself considerably to the north of Jeddo; but approaching near the coast, he landed in his boat, accompanied by one or two of his passengers. Here, he noticed many of the inhabitants employed in fishing at various distances from land. The natives he met on shore were mostly fishermen, and all appeared to belong to the common or lower classes of society. They seemed intelligent and happy, were pleased with his visit, and made no objection to his landing. From this place he despatched one of his passengers to the emperor, who was at Jeddo, with the intelligence of his intention or wish to enter the harbor of the capital with his ship, for the purpose of landing the men whom he had found under such distressed circumstances, and to obtain water and other necessities to enable him to proceed on his voyage. He then returned to his ship, and sailing along the coast for many leagues, compared his own charts with the one taken from the wreck. The winds becoming unfavorable, however, he was driven away from the land so far, that after they changed, it took him a week to recover a position near the place where he first landed. He went on shore again, despatched two other messengers to the capital, with the same information that he had previously sent, and the reason of his detention. He sailed again for Jeddo, and the winds proving auspicious, in due time he entered the mouth of the bay, deep within which the city is situated. As he sailed along the passage, a barge met him coming from the city, in command of a person who, from his rich dress, appeared to be an officer of rank and consequence. This personage informed him that his messengers had arrived at court, and that the emperor had granted him permission to come up to Jeddo with his ship. He was, however, directed to anchor under a certain headland for the night, and the next morning was towed up to his anchorage within a furlong of the city.

The ship was immediately visited by a great number of people of all ranks, from the governor of Jeddo and the high officers attached to the person of the emperor, arrayed in golden and gorgeous tunics, to the lowest menials of the government, clothed in rags. All were filled with an insatiable curiosity to see the strangers, and inspect the thousand novelties presented to their view.

Captain Cooper was very soon informed by a native interpreter who had been taught Dutch, and who could speak a few words of English, but who could talk still more intelligibly by signs, that neither he nor his crew would be allowed to go out of his ship, and that if they should attempt it they would be put to death. This fact was communicated by the very significant symbol of drawing a naked sword across the throat. The captain dealt kindly with all, obtained their confidence and assured them he had no inclination to transgress their laws, but only desired to make known to the emperor and the great officers of Japan, the kind feelings of himself and of the people of America towards them and their countrymen. The Japanese seamen who had been taken from the desolate island and from the wreck, when part-

ing from their preserver, manifested the warmest affection and gratitude for his kindness. They clung to him and shed many tears. This scene—the reports of the shipwrecked men, of the many kindnesses they had received—and the uniformly prudent and amicable deportment of the American captain, made a very favorable impression on the Governor of Jeddo. During his stay, this great dignitary treated him with the most distinguished civility and kindness.

But neither captain nor crew of the Manhattan were allowed to go over her side. Officers were kept on board continually to prevent any infraction of this regulation, and the more securely to ensure its maintenance, and prevent all communication with the shore, the ship was surrounded and guarded by three circular barriers of boats. Each circle was about a hundred feet asunder, and the inner one about one hundred from the ship. In the first circle the boats were tied to a hawser so compactly that their sides touched each other, and that nothing could pass between, or break through them. The sterns of the boats were next the ship, and in these were erected long lances and other steel weapons, of various and curious forms, such as are never seen or heard of, among European nations. Sometimes they were covered with lacquered sheaths, at others, they were left to glisten in the sun, apparently for the purpose of informing the foreigners, that their application would follow any attempt to pass them. Among these, were mingled flags and banners of various colors and devices. In the middle of this circle, between the Manhattan and the city, was stationed a large junk, in which the officers resided, who commanded the guard surrounding the ship. The boats composing the second circle, were not so numerous, and those in the third were more scattering still; but the number thus employed, was almost bewildering to look upon. They amounted to nearly a thousand, and were all armed and ornamented in a similar manner. It was a scene of the most intense interest and amusement to the Americans, the most of whom had never heard of the strange customs of this secluded and almost unknown people. As magnificent and wonderful a spectacle, however, as this array of boats presented during the day, decorated with gaudy banners and with glittering spears of an infinite variety of forms—in the night it was exceeded by a display of lanterns in such countless numbers, and of such shapes and transparencies, as almost to entrance the beholders and to remind them of the magic in the Arabian Tales. The character and rigor of the guard stationed about the ship, was at one time accidentally put to the test. The captain wishing to repair one of his boats, attempted to lower it from the cranes into the water, in order to take it in over the vessel's side. All the Japanese on board immediately drew their swords. The officer in charge of the deck guard, appeared greatly alarmed at the procedure, remonstrated kindly, but with great earnestness, against it, and declared to Captain C. that they should be slain if they permitted it, and that his own head would be in danger if he persisted in the act. The captain assured the officer that he had no intention to go on shore, and explained to him clearly what his object was. When it was fully understood, great pleasure was manifested by the Japanese officer. He commanded the crew who were managing the boat to leave it, and set a host of his menials to work, who took it into the ship without allowing it to touch the water.

The Manhattan was at anchor in the harbor of Jeddo four days, during which time the captain was supplied by command of the emperor with wood, water, rice, rye in the grain, vegetables of various kinds, and some crockery composed of the lacquered ware of the country. He was recruited with everything of which he stood in need, and all remuneration was refused. But he was told explicitly never to come again to Japan, for if he did, he would greatly displease the emperor. During these four days, he had many conversations with the governor of Jeddo, and other persons of rank, through their interpreter. In one of these, he was informed by the governor, that the only reason why he was allowed to remain in the waters of Japan, was because the emperor felt assured that he could not be a bad-hearted foreigner, by his having come so far out of his way to bring poor persons to their native country, who were wholly strangers to him. He was told that the emperor thought well of his "heart" and had consequently commanded all his officers to treat him with marked attention, and to supply all his wants.

The day before he left, the emperor sent him his autograph, as the most notable token of his own respect and consideration. It is often said that the greatest men are most careless in their chirography, and in this case, the imperial hand would support the truth of the remark, for the autograph, by the size and boldness of its characters, appeared as if a half-grown chicken had stepped into muddy water, and then walked two or three times deliberately over a sheet of coarse paper, than like any other print to which I can imagine a resemblance.

Among the books taken from the wreck was a small one, in form like a note-book, filled with figures of various and eccentric forms and pictures of spears and battle-axes of strange and anomalous patterns. Under each were characters, probably explanatory of the objects attached to them. Both figure and character were neatly and beautifully executed, and they presented the appearance of having been issued from a press of type copperplate like the plates of astronomical and other scientific works. This little book attracted Capt. Cooper's attention and excited his curiosity to such a degree that, after noticing similar figures embroidered in gold on the tunics of the high officers, he ventured to inquire their explanation. He then learned that it was a kind of illustration of the heraldry of the empire—a record of the armorial ensigns of the different ranks of officers and the nobility existing in the country. Capt. C. allowed me to examine this book and it appeared to me to be a great curiosity both as a specimen of typographical art, and as giving us information of the numerous grades of Japanese aristocracy, and the insignia by which they may be distinguished.

These figures were wrought always on the back of the officer's tunic, and the weapon which appertained to his rank corresponded with the one drawn under the ensign in the book alluded to. Each grade of officers commanded a body of men whose weapons were of a particular and given shape, and those weapons were used by no others under an officer of different grade, or wearing a different badge on his tunic.

In a conversation with the governor, when the latter told our navigator he must never come to Japan again, Capt. C. asked him "how he would wish him to act under the same circumstances." The governor was somewhat disconcerted—shrugged his shoulders—and evaded by replying that "he must not come again." Captain Cooper then

asked him "If he should leave his countrymen to starve or drown when it was in his power to take them from another wreck." He intimated that it would please the emperor more for them to be left, than for strangers to visit his dominions. Capt. C. told him that he never would see them drown or starve, but should rescue them and feed them; and then inquired what he should do with them. The governor replied, "carry them to some Dutch port, but never come to Japan again." This was all spoken by the governor with mildness but with firmness also, as if he uttered the imperial will.

The governor of Jeddo is represented to be a grave and elderly looking man, somewhat gray, with a remarkably intelligent and benignant countenance, and of very mild and prepossessing manners. He appeared interested with Capt. C.'s account of the people and civilization of America, and the latter spared no pains to leave a good impression of the American name and character, especially as a trading people, on the minds of those high officers whose position might carry them into audience with their sovereign.

The day he left the country the interpreter gave him an open letter, without a signature, written in the Dutch language, with a bold and skilful hand. Mr. Lingren, the clerk in the consulate, a gentleman learned in many languages of Northern Europe, has translated it, and stated to me the leading ideas contained therein. This document informs the world that the bearer of it has furnished assistance to Japanese sailors in distress, and had brought them to their native land—and then commands all Dutchmen who may encounter him shipwrecked and in want, to afford him similar services. It further declares, for the information of Holland and China—the only nations in the world with which they have any commercial treaty, or who are allowed within the waters of the empire—that the persons in the foreign ship had been allowed no communication with the shore, and had been strictly debarred from all knowledge of the commodities or commerce of the country. Furthermore that the foreign ship had been a long time at sea, and had become destitute of wood, water and provisions, and that the government had furnished the recruits of which she stood in need.

It was early in April, that Capt. Cooper visited Japan; and he represents the climate and appearance of the country to be pleasant and lovely in the extreme. Wherever he inspected the coast, the whole earth teemed with the most luxuriant verdure. Every acre of hill and dale appeared in the highest state of cultivation. Where the eminences were too steep for the agricultural genius of the inhabitants, they were formed into terraces, so that for miles together they presented the appearance of hanging gardens. Numerous white neat-looking dwellings studded the whole country. Some of them are so charmingly situated on sloping hill sides and sequestered amidst foliage of a fresh and living green that the delighted mariners almost sighed to transplant their homes there—the spots were so sunny, so inviting and so peaceful.

The whole appearance of the landscape indicated a dense and industrious population. Around the capital, the same signs of culture were exhibited as in the country, further north. The city itself was so filled with trees and foliage, that not houses enough could be distinguished from the ship to indicate with certainty that a city existed, or to allow the circuit of it to be defined. The buildings

were white and rather low, and no towers or temples were seen peering above the other edifices.

The harbor of Jeddo presented a maritime population as numerous and industrious as that which appeared to exist on the land. Vessels of all sorts and sizes, from mere shallops to immense junks, were under sail or at anchor, wherever the eye turned on the bay. Jeddo seemed to be the mart of a prodigious coastwise commerce, and the whole sea was alive with the bustle and activity appertaining to it.

The Japanese, from Capt. C.'s observations, are rather a short race of men, square built and solid, and do not possess Mongolian features to the extent exhibited in the Chinese. They are of a light olive complexion, are intelligent, polite and educated.

The dresses of the common people, were wide trousers and a loose garment of blue cotton. Dignitaries and persons of consequence were clothed in rich silks, profusely embroidered with gold and silken thread of various colors, according to their rank. Some of these personages were so splendidly attired, as to excite great admiration in the foreign visitors. No woollen fabric composed any part of their dress, but of this material they seemed particularly curious, and examined it with great attention. It seemed a great novelty, and all the small pieces they could obtain were solicited and taken on shore as objects of curiosity.

But the map of which I spoke, in the early part of this communication, is perhaps one of the most interesting illustrations of Japanese civilization which has come into our possession. It embraces the island of Nippon, all the islands south of it, and a small part of Jeddo on the north. It is four feet long and nearly as broad, and when folded up, resembles a common church music book, handsomely bound in boards. As will be perceived the islands are projected on an uncommonly large scale. The minutest indentations in the coast, with all the trading ports, large and small are laid down, apparently after accurate surveys. Capt. Cooper found the coast which he followed to be correctly delineated, by his astronomical observations, and his own charts of Nippon were altogether erroneous. The tracks of the coastwise trade are traced throughout the whole group, from Jesso to Nangasaki. But the most interesting part of this production is the topography of the interior of the islands. They are laid out in districts, and all variously colored, like the states of our republic in Mitchell's map. The smallest villages are denoted and named. The residence of the governor in each district, and other public establishments occupying less ground are also delineated. They are all embraced in enclosures of different shape and coloring, and from the uniformity of these, in appearance and number in every district, we may suppose the administration of the government of Japan is conducted with great system. This is in accordance with our previous knowledge of the country. The rivers, even their smallest tributaries, are all traced to their source. The number and extent of these streams are surprising. No country of its size can be more abundantly watered than Nippon. The streams are so numerous, that the whole interior has the appearance of being irrigated by countless canals. But they are evidently river channels, and can all be followed from their sources in the valleys to their junction with each other and their termination in the sea. The public roads are exceedingly numer-

ous, intersecting the whole country from shore to shore, and indicating a vast amount of travel throughout the empire. In several parts, high mountains are laid down in dark coloring. These occur occasionally, in small groups, and occupy but little space. The general appearance of the country is that of bold and lofty hills alternating with great numbers of broad valleys. All pour forth rills and streams which fertilize the earth as they flow along, and afford a thousand advantages and encouragements to an industrious population engaged like the Japanese, in agricultural and commercial arts. The whole empire swarms with towns and hamlets. It is almost impossible to conceive its populousness without an inspection of this map.

On one side of the sheet is a large amount of unintelligible writing, which appears to be explanatory of the figures, characters, roads, &c., in the different districts on the map. If interpreted they might furnish us with much novel information.

This map, with several other articles in Captain C.'s possession, was accidentally left in his ship by the Japanese. They desired to give him many things which they perceived were interesting to him, but they assured him they would be in danger of losing their heads should the emperor learn that they had furnished strangers with any means of information relative to their country or its institutions. They showed great and real alarm on this subject, and concealed or destroyed many things as they approached Jeddo, which had been about the ship. Capt. C. took no advantage of their dependent situation, but allowed them to follow their own inclinations in all respects.

Having laid at anchor four days and replenished his stores of wood, water, &c., he signified his readiness to depart, but the winds were adverse and it was impossible for him to get to sea. There seemed to be no disposition manifested by the government to force him away, but there was none for him to remain a moment beyond the time when his wants had been satisfied. A head wind and tide presented no impediments to going away from Japan in the mind of the governor of Jeddo. At his command, the anchor was weighed, and a line of boats was attached to the bows of the ship, so long that they could not be numbered. They were arranged four abreast, proceeded in the greatest order, and were supposed to amount to nearly a thousand. It was an immense train, and presented a spectacle to the eyes of the seamen, approaching the marvellous. The boats, instead of being propelled by rowing or paddles, were all sculled by a single oar, employed however, by several men. In this manner the Manhattan was towed twenty miles out to sea, and the officer in charge of the fleet would have taken her a greater distance, had not further aid been declined. The Japanese then took a courteous leave of our hero, and while his long train of barges wheeled with a slow and graceful motion towards the shore—the latter spread his sails for the less hospitable regions of Kamschatka and the N. W. Coast, highly gratified with the result of his adventure among this reclusive, but highly civilized people.

THE Jews of France, represented by fourteen delegates, and the members of the central consistory, have just elected M. Ennéery, Grand Rabbi of the Paris district, to the post of Grand Rabbi of the whole of France.

CORRESPONDENCE.

From Mr. Walsh's letters to the National Intelligencer.

Paris, June 29, 1846.

THE morning after the date of my last missive, we were inexpressibly relieved and exhilarated by the news of Gen. Taylor's victories over the Mexicans. So much sinister prediction from your side of the Atlantic excited even in my confident mind vague apprehensions for the safety of the general, and absolute despondency in some of my friends. But we are more than indemnified. Europe is impressed in the most beneficial way, by the battles, the subsequent proceedings of congress, and the patriotic manifestations of the whole Union. It is now understood how the immense majority of the American people would act in the event of a rupture with Great Britain or any European power. Before the end of the sitting of the deputies on the 17th instant two eminent members of the chamber (of the opposition) went to Versailles, where I then was, to congratulate me on the *Rio Grande* occurrences, and to describe the effect of the intelligence on the chamber. Lively satisfaction pervaded the assembly; most of the conservatives even betrayed that feeling; Mr. Guizot, two of his colleagues, and a few of his party, the nearest and most devoted, were alone chap-fallen; their disconcertion seemed to amuse the rest. It was added by my visitors that, should war between the United States and England ensue, twenty thousand French volunteers, under the command of experienced officers, would at once endeavor to reach your shores for the purpose of joining in the invasion of Canada. This does not pass from me as an incitement to war, which I deprecate as much as any one, under the proper reserves of honor and right: but it is meant as evidence of the disposition of the French in general. They are far from being reconciled to the British. With a few exceptions, I have not, in my long and various intercourse with Frenchmen, encountered any who entertained for the British, as a nation, other sentiments than jealousy, dislike, and immemorial resentments. Veteran officers of the garrison of Versailles, with whom I have chatted at the reading-room which I frequent there, on the operations of General Taylor, pronounce the most flattering judgment in respect to boldness, skill, and the entire professional process. The French opposition press has been, in the main, liberal, but a slight military jealousy may be deemed natural where temperament and history beget the highest, and in a degree, exclusive belligerent pretensions. Your troops on the *Rio Grande* fought the Mexicans under more disadvantages than did the British the Sikhs on the Sutlej, or the French the Moors at Isly. Further successes, with like moderation in the use of victory, and a language so simple, so unambitious as that of the official despatches, will strengthen and animate the friends of the United States and of republicanism throughout Europe. It strikes me, as I read your reports of the speeches in congress, that the oratory of both houses is more bombastic than heretofore: the question and the transactions of war may have stimulated and inflated the rhetorical vein: in some cases, the intumescence justly provokes European ridicule.

A considerable and rapid diminution in every respect of French shipping has excited a patriotic alarm among the politicians; the subject has been treated with vivacity in both chambers. The *National* recommends the abrogation of the convention

of 1822; I translate for you a part of what was said in the chamber of peers on the 22d instant. Count Beugnot held this language: "The treaty of 1822, with the United States, is one of the main causes of the decay of the French shipping. For twenty-four years past that republic has been changing her tariffs always in a way to affect injuriously French imports. At this moment the modifications proposed to her congress, the substitution universally of the *ad valorem* system for specific duties, must be highly unfavorable to our silks, wines, and jewelry, and what have we done on our side? Remonstrated, complained, in vain. Have we tried with that haughty nation, as I must call her, a language fitted to make her reflect on her proceedings towards us? Not at all. Since we consented to discharge a debt very doubtful at the least, the twenty-five millions of francs, she has imagined that she has but to elevate her voice to obtain from us whatever she desires. For my part, I wish that our government would try to make that people comprehend that, if not gratitude, some little kindness or equity is due to us for the past. I deem it possible to enter on a negotiation, for the purpose not of withdrawing from the United States all the benefit which accrues to them from the treaty of 1822, but of procuring an equal division of it between them and us." The next day Count de Montalembert delivered an elaborate and really eloquent harangue on the French naval forces and interests, the commercial marine, and the paramount importance of an extensive navigation: "The *shipping interest*," he said, "is the first of all national concerns in the question of home industry. It is that which has created great nations in modern times, and without it there can be no real and permanent greatness. To it England owes her prosperity and potency. See how she has fostered it: how it stands first in all her debates, politics, and legislation. Look at the United States. Thanks to their commercial marine, they make head against England: they share with her the empire of the seas. It is not their navy or military marine that constitutes their glory or security; they nobly defended the freedom of the seas from 1812 to 1817; but, after all, they performed nothing very great, and they are very inferior in naval strength. What there is great with them—what enables them to brave England is an admirable mercantile marine, for which everything is done, because the Americans know that it is the foundation of their might, prosperity, and national security. Contrast with America the kingdom of Portugal, that sacrificed her shipping interest to the exactions of England. I declare to you that I agree with Count Beugnot; the primary cause of our decline in that interest is to be found in the conventions of 1822 with the United States, and of 1826 with England. The minister of finance has pledged himself (and the engagement is important) to secure the monopoly of the transportation of tobacco to the mercantile marine of France. We have been told that the American government has protested—not as Count Beugnot said yesterday—against the transportation of coal exclusively under the French flag, but against that of tobacco. I trust that the protest will not be suffered to prevail, because it cannot be well founded." The minister neither admitted nor denied the pledge. On the subject of the convention of 1822, the cabinet have said nothing in either chamber: it will not, I think, be disturbed. The *Courrier* of Havre sets the subject in lights quite sufficient to

deter the government from tampering with the question of *reciprocity*.

Professor Morse had the goodness to send me an account of the recent achievements of the electrical telegraph, with a copy of the *Baltimore Sun* containing the President's message on the Mexican war, as it was magically transmitted to that paper. I sent the communications to Pouillet, the deputy, author of the report heretofore mentioned to you, and he placed them in the hands of Arago, who submitted their very interesting and decisive contents to the Academy of Sciences and the chamber of deputies. In the chamber on the 18th instant, when the proposed appropriation for an electrical telegraph from this capital to the Belgian frontier came under consideration, Berryer opposed it on the ground that the experiment of the new system was not complete; that it would be well to wait for the full trial of what was undertaken between Paris and Rouen. Arago answered: "The experiment is consummate: in the United States the matter is settled irresistibly. I received three days ago the *Sun* of Baltimore, with a letter of Mr. Morse, one of the most honorable men of his country, and here is the President's message printed from the telegraph in two or three hours; the message would fill four columns of the *Moniteur*; it could not have been copied by the most rapid penman in a shorter time than it was transmitted. The galvanic fluid travels seventy thousand leagues per minute." The appropriation, of nearly half a million of francs, was passed with only a few dissenting voices. The minister of the interior observed on this occasion: "We do not mean to consent that the companies to whom we may allow the electrical telegraph shall use it for any other purpose than the service of the railroads. We mean to keep our state secrets; to prevent undue speculation; to allow no commercial advantages." The bill has been reported to the chamber of peers, with a circumstantial and able recommendation from the pen of Gabriel Delessert, chairman of the committee of peers. When the line to the frontier shall be finished, there will be a continuous electrical communication from Paris through Belgium to the northern states of Germany. Monsieur Gounou's *Telegraphic Dictionary* (for the aerial system) was pronounced, in the chamber of deputies, to be "the admiration of the most eminent men of science."

In the chamber of peers, on the 26th instant, in answer to a question about Tahiti, the minister of marine stated that the government intended to make of the group of islands a *strong maritime station*, and concentrate all its stores and *matériel* there. You observe that the *annexation* is complete.

Politicians of the first order here, who understand the European horizon in its aspects towards your Union and your republicanism, are astonished at the hesitation or delay of congress in authorizing the ten additional steam vessels of war.

June 30.

The discourse of the Archbishop of Cambray, at the celebration of the opening of the Northern railroad, is superlative for beauty of diction and enlightened liberality of spirit. I offer you a passage:

"Sound political economy triumphs on these occasions; it sees the diffusion of products and the equality of prices; so does philosophy, contemplating so potent and rapid a vehicle of intellectual light and civilizing sentiments. Religion, too, may well rejoice. Some men, indeed, sincerely

devoted to her cause, have seemed, on her account, to fear this new impetus to human activity, this universal contact of souls and ideas, as if a sensible deterioration of creeds and morals would inevitably result. Let me speak my whole mind on this topic. I do not share in such foreboding: of this I am profoundly convinced, that all the great discoveries which enlarge the old bounds and change the known relations between men belong primarily to the beneficent design and action of Providence, advancing as it does, at epochs marked by its wisdom, our poor humanity a step towards the goal fixed for us at the creation. The true origin of most of those discoveries is hidden in mysterious clouds of remote time: interrogate history for the name of the first inventor, and you remain without a certain response. It is God's secret. What, then, has religion, the daughter of Heaven, to dread from the works of Heaven? Can she admit that the divine author will contradict himself by exposing her to trials stronger than her divine constitution? If steam transports evil as well as good, falsehood as well as truth—if, as did the discoveries of printing and the new world, it should widen indefinitely the arena of the eternal battle between rationalism and faith—still, can we think victory doubtful? Has not God himself pledged his word—the truth of God shall remain forever: Wings are granted to the gospel, not less than to the doctrines called new. Light reaches our eyes by the same medium which the thunder and the storms wildly traverse."

We have various delineations of the new pope Pius IX., but not one quite authentic. Railroads he will admit; he clearly interprets—they say—the signs, and will gradually satisfy the exigencies of the time; his exterior corresponds to the dignity of his station and the amenity of his character.

According to letters from Rome, the new Pope is particularly well affected to France, and immediately manifested a predilection for the French envoy, Count Rossi—an Italian by the way, and late professor of political economy in Paris, in which department of knowledge his publications have repute. Our journals observe that the internal tranquillity of France even depends in a degree on papal action; not so much, however, as in the cases of Belgium, Poland, Spain, and Portugal. In no other community of the same numbers, has the Roman church more bitter enemies and fewer real votaries than here at Paris. The fact is that the papal power for secular objects, has materially declined over the world, and can scarcely commit very grave abuse or provoke distinct disorders in any country. The restraints of new origin and influence forbid its exorbitancy either at home or abroad. Every imperial reader of history will concede that, for many ages it was exercised more beneficially in the correction of evil and the performance of good—with more moderation, mildness, reason, decorum, and refinement—than what legal or laical rule soever.

At the deliberation of the peers respecting the forms of the trial of Lacomte, the assassin, the question emerged whether he could be permitted to wear his military insignia; Duke Pasquier observed that there was a precedent in the instance of Marshal Ney, who was not allowed to appear with them on his arraignment. The duke meant no slur probably on the memory of Ney, but the remark supplied the opposition, and in particular the revolutionary journals, with a rich topic of complaint, as if the

marshal and the infamous Lacomte had been studiously confounded. A son of Ney possesses a seat in the chamber of peers—the Prince de la Moskowa—as a tribute to the paternity. He yielded either to his own impulses of filial love and pride, or to the clamors of the press, and on the 19th instant passionately and at some length called the president to account for his reminiscence, and invoked the condign reprobation of the chamber. In the course of his speech he cried: "Does any one here avow participation in an act (the condemnation of his father) which the upright of all countries now stigmatize? If there be one sponsor, let him venture to rise, and I will yield him due credit, just notoriety, for the extraordinary proof of courage." Instantly, General Count de Castellane, a peer of military and political consequence, stood up: he had already claimed the tribune after the prince: a pause—much commotion—among the peers. The prince only observed that he did not know the trials which might await him in the chamber, and he then continued his main remonstrance. When he had finished, de Castellane, whose father, a general, had voted Ney guilty, entered the tribune, and attempted to speak. The *National's* account of what passed at this stage is not exaggerated. I extract a part of it for you:

"M. de Castellane had not ascended the steps of the tribune before there arose cries from all sides of the chamber of 'No, no!' 'The order of the day!' The president declared that M. de Castellane had received permission to speak, but numerous voices exclaimed 'He shall not have it.' He, however, though pale, was intrepid enough to speak. The storm increased, and raged on every bench. He opened his mouth, but the tumult extinguished his words. He made gestures, showing that he was determined to maintain the responsibility he had assumed in bravado. He was seen, but not heard. Nothing could be distinguished but a confused noise, such as the septuagenary vaults had never before given out. Amidst the rappings made with the paper knives upon the desks, the stamping of feet on the floor, and the vociferation of 'The order of the day,' three or four generals arose, and cried out in indignant terms, 'It is infamous!' One said, 'It is abominable!' 'Come down from the tribune!' 'Enough, enough!' 'Too much!' General Roguet, who was below us, could not resist his feelings; his eye flamed as if he were in battle; his old blood was up, and his voice as if in the midst of conflicting armies. We more than once thought he would rush forward as if mounting to the assault, and make a breach in the dress of his colleague. This extraordinary scene lasted more than ten minutes; all the dignity of the chamber was lost. During this time M. Pasquier stood behind M. de Castellane, now addressing himself to him, now appearing to be struck dumb by the tremendous explosion. He endeavored to obtain silence, but all his authority was gone; the chamber would not allow any one of its members to exhibit the scandalous attempt to show any adhesion, however remote, to the infamous deed of which it had been reminded."

The general published the next day all that he intended to express; he asserted the patriotic spirit and sense of duty which actuated his father, and his own readiness to abide all responsibility. Too many of the judges of Ney remain in the Chamber; and the subject of the judicial murder grates or probes too sorely and excitingly the na-

tional sensibilities to admit, as yet, of that serene retrospect, and that solemn *rehabilitation* which the marshal's descendants should one day or other demand and obtain. "The Republic," remarks a paragraphist, "murdered Louis XVI.:" the Empire, "the Duke D'Enghien; the Restoration, Michael Ney; these are three odious stains on our history: silence and resignation for the present are preferable to outcries. The Revolution of July, thank God, is free from such abominable reactions." The war in Algeria, however, remains and expands on the escutcheon of the July government; its horrors are so uniform and familiar, and so obscured, indeed, by national foibles and passions, that they are seen and felt by comparatively few of any class of Frenchmen. In the chamber of peers, yesterday afternoon, the bill of appropriations for Algeria induced a discussion of the case, highly creditable to some of the orators. Count Boissy, d'Anglas, General de Castellane, General de Cubieres, Baron Merilhou, denounced the fell *razzias* and the whole character and result of the hostilities. The first said: "Must the French nation, that was wont to protect the weak from the strong and practise magnanimity in the use of its superior might, must she, now, changed from her former self, under the sad influences of the policy of July, pursue, with fire and sword, the very same tribes to whom she proclaimed, when she reduced the city of Algiers, that she came not to conquer them, but to deliver them from the tyrants by whom they were oppressed." The second, de Castellane, said: "The *razzias* are a terrible and barbarous means: they cast immorality into the heart of the soldier; he fights and ravages on his own account; his officers are unable to restrain him in the multitude of enormities which he perpetrates before their eyes. If we had, with this system, two hundred instead of our present one hundred thousand troops, they would perish alike in the same gulf." He advised a viceroyalty in Algeria, in the person of one of the king's sons. Merilhou instituted a comparison or contrast between the processes of colonization and territorial acquisition in the United States and those in Algeria, vastly to the advantage of American legislation and practice. He recommended the formal incorporation of the *conquest* with France, that civil policy and guarantees might prevail. The Marquis de la Place contended that the French generals and troops were right and glorious in all their measures; that the hundred millions of francs spent annually, and the one hundred thousand men kept in Algeria, were matters of congratulation; they corrected the effects of a thirty years' peace on the French martial nature; he admired the patience, the forbearance of the army, considering the acts and dispositions of the Arabs! Villemain, the celebrated author and examiner of public instruction, handled the theme like a rival orator to the poet Lamartine, whose eloquent reprobation of the war I have already reported. Villemain regretted the late risings of the Arabs, but the repression of them fortified French domination. It was quite and specially *providential* that there was an Algeria so near to France, nearer than Carthage was to Rome, where France could soon found and accomplish what Roman energies and legions achieved only in the course of centuries. Any system must be good that consolidated French rule on the African soil: France must be powerful for the sake of *humanity* and civilization; the employment of military forces so

considerable was a *principle of humanity*; it caused revolt to despair; it precluded vain and frequent efforts at resistance; no formal incorporation was necessary; *extensions of territory were not decreed and proclaimed, they executed and consummated themselves*. Thus lectured the philosopher and professor; while generals, hardened in the field, and eminently qualified to decide on the nature and course of the war, honestly shuddered, and invoked the disgust, the frowns, and the shame of their brother peers. The havoc made with the rights, morals, and lives of the poor natives of Tahiti might also beget some shame and compunction. Marshal Bugeaud, in a late proclamation, reckons the number of Arabs, prisoners in France, at four or five thousand. In the official bulletins, Abd-el-Kader is styled *l'insaisissable*, the *unseizable*. One commander in pursuit reports that the Emir, though once a lion, is now only a fox to be tracked; another, that he was *nearly* caught on the first of this month. The Russians are preparing a new expedition against the mountaineers of the Caucasus. They have their Abd-el-Kader in Shamil, the Imaum. The recent and pregnant debates in the British parliament are margined for you in my copies of the *Times* and *Morning Chronicle*; but you are too heavily laden to accept a fresh burden. In the recess of Congress, you may be able to admit a general survey of the session of that body, and another of the British ministerial and parliamentary history since the autumn. Permit me to direct your glance at present only to the debates in the House of Lords on the customs' bill, and on the question of bonded corn, (22d instant,) in which are various references to American production, trade, and manufactures. Note Lord Dalhousie's exposition of the tariff reform system, and the subjoined matter quoted by Lord Monteaigle:

"The evidence of Messrs. Ashworth and Greg, two eminent manufacturers examined in the committee of their lordships' house up-stairs, fully explained the views entertained by the manufacturing interests of this country with respect to the effects of competition. That of Mr. Ashworth was as follows:

"Do the Americans run you hard? Yes. In many places they beat us. I believe in almost all parts of South America and the Brazils.

"Do you not think that if the protecting duty were taken off, you would be exposed to their competition seriously in our colonies? I do not know, nor do I care for that. I do not anticipate any injurious competition, or that the American people will ever become exporters of manufactures to an extent to do us serious harm. We are not afraid of them in any market in the world. We have nothing in our skill, we have nothing in our position or manufacture, to make us afraid of any country. We have railways, we have canals, we have river navigation, we have coal, we have iron, we have skill and industry; in fact we have every element to make cheap goods, and we rather challenge competition than otherwise."

The evidence of Mr. Greg was to the same purport:

"In coarse goods, from her water powers and the raw material, America has great natural advantages. She will beat us on her own soil; she will beat us on common ground, and probably will beat us in our own markets. But, when capital, skill, and labor come into large operation, as they do in the finer descriptions of goods, then we

shall beat America in this country, and in every common country in the world, and, if she opens her ports, in her own markets likewise. I think America and this country, will both be benefited by the exchange; we shall get a larger proportion of coarse goods, and she will get a larger proportion of fine goods; both will be able to get a larger proportion of what they want. Yet these gentlemen had been held up as authorities to show that the English manufacturers, under a system of free trade, would be beaten by the foreigners. Could there be a more extraordinary misapplication of evidence? [Hear, hear.]

PARIS, July 2, 1846.

La Revue des Deux Mondes, issued on the first instant, contains no political article of significance, but much interesting literary matter. According to its political chronicle at the end, the Anglo-Saxon race in our Union is destined to become a small minority of the population; the French in the South, the Irish spread everywhere, and "hating the native Americans," and the immense German emigration will absorb that race. Then will come the Mexican generations to cross the breed again; yet "the fusion of the various European nationalities is a singular-admirable fact," by which Providence must intend some glorious issue. If there be anything really wonderful, it is the assimilation of all the *nationalities* to the American type; the final predominance of the Anglo-Saxon nature, by which we see the formation of a national American spirit and unity beyond the mountains, upon which we may rely more than on the motley semi-foreign character of the seaboard. In the chronicle of the preceding number of the Review the military means and prowess of the United States are invidiously belittled, and they are cautioned against attempting to establish themselves now in California, lest they should not prove able to maintain their foothold against Europe.

A French traveller has contributed to *La Revue* thirty-two curious and engaging pages on the women and the slave-market of Grand Cairo. Whoever would learn what the bondage and general condition of the Fellahs, and what the government of Mehemet and Ibrahim are, must consult the new volume (*Egypt in 1845*) of Schœlcher, the philanthropist, who travelled to the East in order to determine whether there existed a slavery worse than that of the negroes in the western world. You shall have from me some account of its details and conclusions.

Honor seems to me due from all Americans to an octavo in French, beautifully printed, which I have just received from Brussels, with the title "*Enquiries into the Situation of Emigrants to the United States of America*," by Baron A. S. Ponthoz, first secretary of the Belgian legation at Washington. A notice of this fair, sensible, authoritative work, the fruit of personal investigation in an extensive well-chosen tour, and of truly humane and patriotic dispositions, which I read in a Belgian journal, induced me to enter the title some weeks ago in my memorandum-book. It entirely corresponds in modest desert and pertinent usefulness to the expectations which that favorable notice raised. It is not often that the leisure of diplomatic secretaries is so happily employed. Mr. Brantz Mayer set a good example in his *Mexico*.

A congress of savans is to be held on the 1st

September next at Marseilles. Among the themes propounded is this: "Had not Dante once the idea of composing the Divine comedy in *Roman Provençal*?" Thank God, he did not pursue the notion—without meaning to disparage that dialect or its poets.

Reinaud, of the Institute, has translated from the Arabic, and published in two small volumes, authentic and curious Arab and Persian travels in China in the ninth century. The *Anthropology* of Bossu—the Influence of the Passions on the Economical Order of Communities, by Villeneuve-Bargemont; Béchard's Abuse of Centralization in France; the Penitentiary System, by Dr. Fourcault; the Treatise of Medical Nosography, five octavos, by Bouillaud; the fourth and last volume of Pictet's Paleontology; the second royal octavo of the principal French Political Economists of the Eighteenth Century; the Report of the Royal Academy of Medicine on the Plague and Quarantines, large octavo; Baron Henrion's General History of the Catholic Missions, are among the new French publications, for the value of which I could undertake to vouch.

Louis Blanc, author of the History of the Government of July, which has passed through many editions, has in the press a History of the French Revolution, in ten volumes, to supersede or rival that of Mr. Thiers, of whom, certainly he does not fall very short in capacity or vogue. We have an octavo, entitled *Oregon*, a geographical, statistical, and political survey, with a map of the Pacific coasts, by Mr. Fedix, who explored British archives. It is quite a handsome volume—rather late. A few days ago the two extant volumes of the Geographical, Statistical, and Historical Dictionary of Spain, by Don Pascual Madoz, came within my ken at Baudry's establishment. The author is a distinguished man of letters and politician; the volumes (in Spanish) sustain the old renown of Madrid for beautiful typography.

The British ambassador, Lord Cowley, has just returned to this capital from a visit to London. His errand—according to the French press—was to vote for Sir Robert Peel's grand measure, and to consult with Lord Aberdeen, after conferences with Mr. Guizot, on the policy of Europe in regard to your Mexican war. The *Paris Sicle* of yesterday says: "Lord Aberdeen has returned to Paris to involve the French cabinet in a joint mediation. If this be refused, England will submit to the annexation of California, and perhaps of Yucatan, as she did to that of Texas." Some of our journalists decide that the necessity or extreme expediency of the incorporation of Texas is demonstrable by the very Mexican war and the Oregon settlement. The propositions of war made by the Mexican cabinet to their congress; the hostile proclamations of Mexican presidents and generals; the formation and march of invading armies; the attacks by the Mexicans on the Rio Grande—are all cited here, as complete exoneration of the Washington government from the charge of aggression. It is wondered how the British editors can venture to prefer this charge, immediately after their vindication of the government of British India in the case of the Sikh conflict, there being a singular parity of alleged circumstances. A journalist adds that the United States are so strong and advantageously situated that they may resolve to settle their own affairs on the American continent, without ever admitting or undergoing European mediation.

The ministry here have refused to license formally and entirely the new society or free-trade league; but they allow it to organize itself and transact business, provisionally. It would be recognized, were not the elections so near at hand. It has an able temporary bureau or committee, consisting of eminent savans, peers, deputies; professors and authors in political economy.

It is noted that Ibrahim Pacha receded from a tour in Ireland, when he had got to Belfast, notwithstanding O'Connell's fond interview with him of three quarters of an hour. The Liberator's antipathy to *slaveholding* disappeared in this instance.

Conformably to arrangements between the late pope and Czar Nicholas, the *status* of the Catholics in Russia is to be satisfactorily determined and secured. The Czar has appointed a committee, at St. Petersburg, to investigate their grievances, rights, and general situation; and one of the members is a Catholic. Nesselrode is the chairman; which is thought of the best augury. O'Connell may lose one of his favorite topics of invective against Nicholas.

Don Henry, the candidate the most popular in Spain for Queen Isabel's hand, has just dined at the Tuileries, after formal presentation by Martinez de la Rosa, the Gallico-Spanish representative. Don Henry is regarded as passing under the scrutiny of Louis Philippe—the Neapolitan match having become forlorn. We have another lion in the Duke of Soto-Mayor, ambassador for England, on furlough, son of the late Marquis of Casa Yrujo, and grandson of the late Governor McKean, of Pennsylvania. When his respectable uncle, of that state, a few months ago, called on him in London, he threw his arms about the relative's neck, and reminded him endearingly of the sports of his childhood in Philadelphia.

The public schools maintained by the state, the departments, and the townships in France are more than forty-two thousand. There are seventeen thousand private schools. The aggregate of pupils is about three millions. The budget for primary education is nearly two and a half millions of francs.

Both chambers have agreed to the appropriation of three hundred thousand francs for the publication, under ministerial auspices, of the work of Botta and Flandin, on the remains discovered on the site of the ancient Nineveh. It was reported, and chiefly advocated in the chamber of deputies, by the Jewish deputy and lawyer, Cremieux, who said: "Luckily, this is a matter of rivalry between France and England; British consuls and artists have been digging, and are preparing a similar work: you cannot refuse." The argument prevailed at once.

I know not to whom I am beholden for the sketch of the Life, Character, and Writings of the late John Pickering, of Salem, contained in the Boston Daily Advertiser of the 10th June. For me it was both welcome and melancholy; I honored the whole being of Mr. Pickering, and my duty will not be fulfilled until the sketch has passed into the hands of some member of the French Institute, by whom it may be used for that body. America possessed few such scholars; his productions and name are of high repute and authority in this meridian. The learned world that appreciated the savant should know what the man was—how worthy of equal esteem and regret. It is only a few months since I received

from him letters which indicated confidence in the accomplishment of new labors in philology, the branch of science in which Europe could hardly signalize a superior to a Pickering, within her numberless circles of learning and authorship.

The main paper of the latest bulletin of the Paris Geographical Society is the report of the distinguished committee of five, on the annual prize for the most important discovery in geography. The committee restrict themselves to the enterprises and labors executed or terminated in 1843. They record several very useful expeditions and works. A liberal paragraph is bestowed on Lieutenant Fremont's performances, and Mr. Jonah Gregg's excursions are described. Nor is Mr. Thomas Falconer forgotten. Particular mention is made of Schomburgk's exploratory travels in British Guiana; M. de Wrede's and those of Captain Haines in Arabia; Don J. de Garay's examination of the Isthmus of Tehuantepec; and of the travels of Theophilus Lefebvre and Dr. Beke in Abyssinia, between whom the annual prize of the academy is divided. In the beginning of the seventeenth century the Portuguese had great influence and considerable factories in Abyssinia. There existed then a great number of Christian churches, dating from the fourth century. Their creed was, in substance, the Roman Catholic, with some difference of rites akin to those of the Greek church. The same religion subsists in a certain number of towns and other inhabited places; it is held sacred so far as to render them inviolable.

Mr. Rochet is thanked for having brought from the kingdom of Choa a considerable quantity of the plant *Brayera anthelmintica*, which most efficaciously expels the *tape-worm*. At Montpellier, Toulon, and even in Paris, the tea-plant has prospered, to the delight of the Royal Society of Agriculture. The traveller Hellert's accounts of the geography of the Isthmus of Darien are commemorated as precious and exact. A member of the French mission to China contributes to this bulletin a minute description of the island of Basilan, the largest of the Solo or Holo groupe, and he represents it to be superior in soil, climate, products, and commercial facilities to any other of the Archipelago. The London Morning Chronicle of the 26th ultimo dwells on the value, for Great Britain, of the island of Labuan, as a naval station or harbor of refuge. You may accept the first paragraph of the Chronicle's article of alarm:

"Events appear at length to be assuming a character in the Indian Archipelago which must command the attention of the British government. Every maritime power is actively at work there but ourselves. The Americans, hitherto, may perhaps be said to be only on the look-out; but the Dutch, whose position gives them many advantages, are proceeding with the utmost vigor and energy to appropriate to themselves all the commanding points, whether for commerce or for political influence. Their projected expedition against Bali will, if successful, give them an undoubted ascendancy over a rich and fertile island, containing at least one million of inhabitants, and supplying the materials of a most lucrative trade. Other encroachments, still further east, are secretly contemplated by them—we mean against the native chiefs, who have neither injured nor molested them."

Viscount Victor Hugo pronounced a magnificent exhortation to the government to endeavor at once to repair and arrest the ravages of the seas on the French coasts, especially northward and in the channel. They are changing, with grievous damage, the whole configuration. Banks, houses, villages are washed away. Here and there a lonely church shows only the steeple and upper windows. From the mouth of the Somme to that of the Seine, the devastation is dreadful. Havre and other ports, Dieppe above all, may soon be ruinously invaded. The fishermen are driven off. A peer wished to know how the Mediterranean could be prevented from receding, as it does, from the French shores; as the ocean from Newfoundland. Within the ten years past the French government has appropriated about a hundred and fifty-six millions of francs to the improvement (*amelioration*) of the maritime ports.

Of the proceedings on Thursday, the most interesting part was, first, a harangue of one of the bureaux of the Free Trade Society, on the wisdom of a revision and modification of the French tariffs, in which I mark these sentences: "Remember the admirable preambles to the ordinances of our kings on liberty of trade in grain. That of 1774, which embraces all the elements of the great doctrines of Adam Smith, preceded by two years the first publication of his work, the *Wealth of Nations*, that has served as a text for the repeal of the British corn laws. Gentlemen, let us restore to our country what belongs to her; let no one of her glories expire by non-assertion." The other important contribution to the debate was from the Baron de Bourgoing, Minister of France for one of the German kingdoms, who related how the troops for the suppression of the Polish insurgents were sent by the railroads, proving the facility of conveying any number of all arms, with the utmost despatch. Seven hundred infantry were placed in twenty-three cars in five minutes, and travelled six leagues the hour.

July 4.

Enclosed are eight pages, *de omnibus rebus*, written at Versailles, yesterday and the day before, in my early morning leisure. At this moment the weather is too hot for the preparation of a formal epistle. What remains in my note-book of historical and political interest you shall have by the steamer of the 19th instant. Let me offer you the compliments of the glorious anniversary. Our country has never had stronger motive or simpler reason to rejoice in its independence and growth. The Americans in this capital are, I believe, all satisfied with the terms of the Oregon convention. The Paris writers decide that our government has achieved, on the whole, a capital bargain. All the London organs profess to be more or less content. The Paris papers of this morning furnish no comments on American matters. I must except the *Siecle*, which repeats that Lord Cowley returned in all haste from London to arrange a joint mediation in behalf of Mexico. As Russia has considerable interests on the Pacific coast, she is solicited to unite in guarantying the Mexican territory. If the Czar should consent, Mr. Guizot will adhere, and the three powers then proclaim a European concert for the maintenance of the American equipoise. No disquisition yet in the Debats on the Oregon adjustment. The British and French cabinets are understood to have grown sick of the La Plata mediation, and to rely on the

mission of Mr. Hood for a compromise. The crops of every description in France are likely to be excellent. Nothing fresh from the new pope. Portugal a chaos; Spain, volcanic; Germany, progressive; Poland, subdued; Switzerland, distracted; Italy, quiet, though discontent. Sir Robert Peel has left an arduous programme for his successors.

THE case of Count Léon against the Countess de Luxbourg was heard again by the civil tribunal of the Seine. The circumstances of this case must be fresh in the memory of most of our readers. It may not be amiss, however, to briefly retrace some of the leading points. Count Léon is the reputed son of Napoleon by the Countess de Luxbourg, formerly Mme. Denuelle de la Plaigne. He was provided for and educated by direction of the late emperor, and a considerable sum of money was invested to create an annual income for his support. The count, having expended his property, applied to his reputed mother for the means of subsistence, and, not meeting with success, he brought an action against her to compel her to allow him 6,000fr. annually. This has been resisted chiefly on the ground that there was no proof of his being the son of the countess. The count, therefore, has since brought forward a number of documents to show that he is the son of Napoleon, and that the Countess de Luxbourg is really his mother. Amongst the papers produced by M. Crémieux, his counsel, was a letter written to the count in 1845, by the Prince Canino, brother of the Emperor Napoleon, in which he speaks of the count as his relation, with an enclosure, being a letter of recommendation from the prince to a female cousin, in which he calls the count his nephew. The court declared that the defendant was the mother of the plaintiff, and adjudged her to make him a provision of 4,000fr. *pendente lite*, reserving the question of 6,000fr. per annum demanded by the count.

THE Minister of the Marine, convinced of the advantages of the galvanization of iron, has ordered a 20-gun brig and another vessel, now being built of iron at Brest, to be subjected to this process.

A LETTER from Vienna states that M. Negrelli, inspector-in-chief of railways, was to set out in a few days to examine the line marked down by the engineer for the Great Gallician Railway, which is to be commenced in the spring. Its length is to be about 350 English miles.

THE coronation of Oscar I. and his consort Eugenia, daughter of Prince Eugene de Beauharnais, as King and Queen of Norway, is fixed to be held on the 15th October next, on which occasion the Storting will be convoked.

THE quarantine question will be seriously discussed among the other important inquiries to be entered upon at the meeting of the Scientific Congress of Italy.

THE Chambers of Commerce are about to be called upon to examine the propriety and advantages of establishing a French factory at Canton, with branch offices of agency at Macao, Manilla, and Java.

THE *France* says: "We are able to state that, in September next, there will be a meeting of the three sovereigns of Russia, Prussia, and Austria, at Vienna."

From the Edinburgh New Philosophical Journal.

ARAGO ON THE WEATHER.

Is it possible, in the present state of our knowledge, to foretell what Weather it will be at a given time and place? Have we reason, at all events, to expect that this problem will one day be solved? By M. ARAGO, Perpetual Secretary of the French Academy of Sciences, &c. &c.

ENGAGED as I am, both from inclination and duty, in meteorological studies, I have often asked myself if we should ever be able, by a reference to astronomical considerations, to determine, a year in advance, what shall be the state, in a given place, of the annual temperature, the temperature of each month, the quantities of rain compared with the ordinary mean, the prevailing winds, &c.

I have already laid before the readers of the *Annuaire* the results of the investigations undertaken by natural philosophers and astronomers, regarding the influence of the moon and of comets on the changes of the weather. These results clearly show, in my opinion, that the influences of both these bodies are almost insensible, and, therefore, that the prediction of the weather can never be a branch of *astronomy, properly so called*. And yet our satellite and comets have, at all periods, been considered as preponderating stars in meteorology.

Since the publication of these opinions, I have regarded the problem in another aspect. I have considered whether the operations of man, and occurrences which will always remain beyond the range of our foresight, might not be of such a nature as to modify climates accidentally, and in a very sensible manner, in particular with regard to temperature. I already perceive that facts will answer in the affirmative. I should have wished, however, not to publish this result till after I had finished my investigations; but I must frankly own, that I wished to have an opportunity of *protesting decidedly against the predictions which have every year been attributed to me, both in France and in other countries*. Never has a word escaped my lips, either in private or in the course which I have delivered for upwards of thirty years; never has a line published with my consent, authorized any one to imagine it to be my opinion that it is possible, in the present state of our knowledge, to announce, with any degree of certainty, what weather it will be a year, a month, a week, I shall even add, a single day, in advance. May the indignation I have felt at seeing a multitude of *ridiculous predictions* appear under my name, not constrain me, by the force of reaction, to give an exaggerated degree of importance to the disturbing causes I have enumerated! At present, I believe that I am in a condition to deduce from my investigations the important result which I now announce; *Whatever may be the progress of sciences, NEVER will observers who are trust-worthy, and careful of their reputation, venture to foretell the state of the weather.**

* This explicit declaration may give me a right to expect that I shall no longer be compelled to play the part of Nostradamus or Mathew Laensberg; but I am far

I repeat, that the readers of the *Annuaire* ought not to expect to find here a complete investigation of the problem which I have taken up. My sole intention is to lay before them a few facts, which, taken in connexion with those which I shall analyze in a second notice, appear to me to lead to this conclusion.

BETWEEN WHAT LIMITS THE MEAN TEMPERATURES OF YEARS AND MONTHS VARY IN OUR CLIMATES.

The meteorological state of a given place, is much less variable than those would be led to believe who judge of it by their personal sensations, by vague recollections, or the condition of the crops. Thus, at Paris, the mean temperature of years ranges within very narrow limits.

The annual mean temperature of Paris, from 1806 to 1826 inclusive, has been $+10^{\circ}8$ centigrade, ($54^{\circ}4$ Fabr.) The *greatest* of 21 annual means does not exceed the general mean by more than $1^{\circ}3$, ($2^{\circ}3$ F.); the *lowest* of the mean annual temperatures has been found below the general mean only by $1^{\circ}4$, ($2^{\circ}5$ F.) As far as relates to *mean annual temperatures*, systematic meteorologists have, therefore, no need of foresight to predict only slight perturbations. The causes of disturbance will satisfy all the phenomena, if they can produce, more or less, $1^{\circ}5$ of centigrade variation, ($2^{\circ}7$ F.)

It is not the same with regard to the months. The differences between the general means and the partial means extend, in January and December, to 4 and 5 centigrade degrees, (7° to 9° F.)

from indulging in any illusion on this subject. Hundreds of persons who have gone through a regular course of university studies, will not fail, in 1846, as they had done on former occasions, to ply me with such questions as the following, which it is truly pitiable to hear in the present day: Will the winter be severe? Think you that we shall have a warm summer, a humid autumn? This is a very long and destructive drought; do you think it is near an end? People think that the April moon will produce great mischief this season—what is your opinion? &c. &c. In spite of the little confidence I have in predictions, I affirm that in this case the event will not deceive me. Nay, for some years past have I not been put to a still severer proof? Has not a work been published, entitled "*Lectures on Astronomy, delivered at the Observatory by M. Arago, collected by one of his Pupils*?" I have protested a dozen times against this work; I have shown that it swarms with inconceivable errors; that it is beneath all criticism whenever the author ceases to employ his scissors on the notices of the *Annuaire*, and is reduced to the necessity of drawing a few lines from his own resources. Vain efforts! These pretended Lectures on Astronomy at the Observatory have, however, reached no less than a fourth edition. The laws have made no provision against what I shall call this *scientific calumny*. What must be done when the law is silent? Submit with resignation? A sensitiveness which will not appear surprising to any who have seen the book in question, will not allow me to be satisfied with resignation. My position having become intolerable, I have made up my mind to publish myself the Lectures which have been so outrageously disfigured. Since it has become necessary, I shall abandon for a time the plans for original investigations which I had formed, and devote the time I wished to employ in delicate experiments, fitted to illustrate points of the science still enveloped in great obscurity, to the preparation of a work intended to popularize astronomy. May this work be in some degree useful.

In consequence of these variations, if we compare the extreme temperatures of each month with the mean or normal temperatures of all the rest, we shall find :—

That the month of *January* is sometimes as temperate as the mean of the month of *March*.

That the month of *February* sometimes resembles the mean second fortnight of *April*, or the mean first fortnight of *January*.

That the month of *March* sometimes resembles the mean of the month of *April*, or the mean of the second fortnight of *January*.

That the month of *April* never reaches the temperature of the month of *May*.

That the month of *May* is pretty frequently, in the mean, warmer than certain months of *June*.

That the month of *June* is sometimes, in the mean, warmer than certain months of *July*.

That the month of *July* is sometimes, in the mean, warmer than certain months of *August*.

That the month of *August* is sometimes, in the mean, slightly colder than certain months of *September*.

That the month of *September* is sometimes, in the mean, colder than certain months of *October*.

That the month of *October* may be, in the mean, nearly 3° (5°·4 F.) colder than certain months of *November*.

That the month of *November* may be, in the mean, about 5°·5 (about 10° F.) colder than the warmest months of *December*.

That the month of *December* may be, in the mean, 7° (12°·6 F.) colder than the month of *January*.

DISTURBING CAUSES OF TERRESTRIAL TEMPERATURE WHICH CANNOT BE FORESEEN.

The atmosphere which, on a given day, rests upon the sea, becomes in a short time, in mean latitudes, the atmosphere of continents, chiefly from the prevalence of westerly winds. The atmosphere derives its temperature, in a great measure, from that of the solid or liquid bodies which it envelops. Everything, therefore, which modifies the normal temperature of the sea, produces, sooner or later, perturbations in the temperature of continental atmospheres. Are those causes, which may sensibly modify the temperature of a considerable portion of the ocean, placed forever beyond the foresight of man? This problem is closely connected with the meteorological question I have undertaken to consider. Let us endeavor to find the solution of it.

No one can doubt that the *ice-fields* of the Arctic pole—the immense frozen seas—exert a marked influence on the climates of Europe. In order to appreciate in numbers the importance of this influence, it would be necessary to take into account at once the extent and position of these fields; but these two elements are so variable that they cannot be brought under any certain rule.

The eastern coast of Greenland was in former times accessible and well peopled. All of a sudden an impenetrable barrier of ice interposed itself between it and Europe. For many ages Greenland could not be visited. About the year 1815 this ice underwent an extraordinary breaking up, became scattered in a southerly direction, and left the coast free for many degrees of latitude. Who could ever predict that such a dislocation of the fields of ice would take place in such a year rather than in another?

The floating ice which ought to act most on our

climates, is that known by the English name of *icebergs*. These mountains of ice come from the *glaciers*, properly so called, of Spitzbergen or the shores of Baffin's Bay. They detach themselves from the general mass, with a noise like that of thunder, when the waves have undermined their base, and when the rapid congelation of rain-water in their fissures produces a sufficient expansion to move these huge masses and push them forward. Such causes, and such effects, will always remain beyond the range of human foresight.

Those who remember the recommendations which the guides never fail to give upon approaching certain walls of ice, and the huge masses of snow placed upon the inclined ridges of the Alps; those who have not forgotten that, according to the affirmations of these experienced men, the report of a pistol, or even a mere shout, may produce frightful catastrophes, will agree in the opinion I have just expressed.

Icebergs often descend without melting, even to pretty low latitudes. They sometimes cover immense spaces; we may therefore suppose that they sensibly disturb the temperature of certain zones of the oceanic temperature, and then, by means of communication, the temperature of islands and continents. A few instances of this will not be out of place.

On the 4th October, 1817, in the Atlantic Ocean, 46° 30' north latitude, Captain Beaufort fell in with icebergs advancing southwards.

On the 19th January, 1818, on the west of Greenspond, in Newfoundland, Captain Daymont met with floating islands. On the following day, the vessel was so beset with ice that no outlet could be seen even from the top-masts. The ice, for the most part, rose about 14 English feet above the water. The vessel was carried southwards in this manner for twenty-nine days. It disengaged itself in 44° 37' latitude, 120 leagues east of Cape Race. During this singular imprisonment, Captain Daymont noticed upwards of a hundred icebergs.

On the 23rd March, 1818, in 41° 50' north latitude, 53° 13' longitude west of Paris, Captain Vivian felt, during the whole day, an excessively cold wind blowing from the north, which led him to suppose that ice was approaching. And, in fact, on the following day, he saw a *multitude* of floating islands, which occupied a space of upwards of seven leagues. "Many of these islands," says he, "were from 200 to 250 English feet high above the water."

The brig *Funchal*, from Greenock, met with *fields of ice* on two different occasions, in her passage from St. John's, Newfoundland, to Scotland; first on the 17th January, 1818, at the distance of six leagues from the port she had left; and afterwards, in the same month, in latitude 47° 30'. The first field was upwards of three leagues broad, and its limit in a northern direction could not be seen. The second, likewise very extensive, had an immense iceberg in its centre.

On the 30th March, 1818, a sloop of war, *The Fly*, passed between two large islands of floating ice in 42 degrees of north latitude.

On 2d April, 1818, Lieutenant Parry met with icebergs in 42° 20' of north latitude.

This year (1845) the English vessel *Rocheport* continued enclosed, at the end of April and beginning of May, for twenty-one consecutive days, in a mass of floating ice, which ran along the bank of Newfoundland, advancing to the south.

The sea is much less easily heated than the land, and that, in a great measure, because the water is diaphanous. Everything, therefore, which causes this diaphaneity to vary considerably, will produce sensible changes in the temperature of the sea, immediately after in the temperature of the oceanic atmosphere, and, somewhat later, in the temperature of the continental atmosphere. Do causes exist, independently of what science discovers to us, which may interfere with the transparency of the sea to a great extent? Let the following be my answer:—

Mr. Scoresby has shown, that, in northern regions, the sea sometimes assumes a very decided *olive-green* color; that this tint is owing to medusæ and other minute animalculæ; and that wherever the green color prevails the water possesses very little diaphaneity.

Mr. Scoresby occasionally met with green bands, which were from two to three degrees of latitude (60 to 80 leagues) in length, and from 10 to 15 leagues broad. The currents convey these bands from one region to another. We must suppose that these do not always exist; for Captain Phipps, in the account of his voyage to Spitzbergen, makes no mention of them.

As I have just stated, the green and opaque portions of the sea must become heated in a manner different from the diaphanous parts. This is a cause of variation in the temperature which can never be subjected to calculation. We can never know beforehand whether, in such and such a year, these countless myriads of animalculæ will be more or less prolific, and what will be the direction of their migration southwards.

The phosphorescence of the sea is owing to minute animals of the medusa kind. The phosphorescent regions occupy very large spaces—sometimes in one latitude, sometimes in another. Now, as the water of the phosphorescent spaces is quite turbid, and as its diaphaneity is almost entirely destroyed, it may become, by its abnormal heating, a cause of notable disturbance in the temperature of the oceanic and continental atmospheres. Who can foresee the intensity of this cause of thermic variation? who can ever know beforehand the place which it occupies?

Let us suppose the atmosphere immobile and perfectly clear. Let us suppose, moreover, that the soil has everywhere, in an equal degree, absorbing and emissive properties, and the same capacity for heat; we should then observe throughout the year, as the effect of solar action, a regular and uninterrupted series of increasing temperatures, and a corresponding series of decreasing temperatures. Each day would have its invariable temperature. *Under every determined parallel*, the days of the maximum and minimum of heat would be respectively the same.

This regular and hypothetical order is disturbed by the mobility of the atmosphere; by clouds more or less extensive, and more or less permanent; and by the diverse properties of the ground. Hence the elevations or depressions of the normal heat of days, months, and years. As disturbing causes do not act in the same way in every place, we may expect to see the primitive figures differently modified; to find comparative inequalities of temperature where, from the nature of things, the most perfect equality might have been looked for.

Nothing is better calculated to show the extent of these combined disturbing causes, than the comparison of *mean epochs*, indicating the maxima and

minima temperatures in different places. The following are some of these results:—

	Maximum.	Minimum.	
St. Gothard, (10 years.)	11th Aug.	24th Dec.	{ 51 and 3 days after the solstice.
Rome, (10 years.)	6th Aug.	8th Jan.	{ 46 and 18 days after the solstice.
Jena, (18 years.)	1st Aug.	3d Jan.	{ 41 and 14 days after the solstice.
Petersburg, (10 years.)	22d July.	8th Jan.	{ 31 and 18 days after the solstice.
Paris, (21 years.)	15th July.	14th Jan.	{ 25 and 25 days after the solstice.

These differences belong to the localities. But when concealed local circumstances exert so much influence, is it not natural to think that the modifications which they receive from the hand of man may sensibly alter, in the interval of a few years, the meteorological type of every town in Europe?

I have shown that local circumstances which are latent, or at least faintly characterized, may exert sensible and constant influences on the manner in which the maxima and minima of temperature are distributed in the year. When science shall be put in possession of exact and comparable meteorological observations, made *simultaneously* in different places; when these observations shall be scrupulously and judiciously digested, we shall very probably find that circumstances of locality will occupy a much more prominent place in science than natural philosophers seem now disposed to attribute to them. It would not be difficult for me, at this moment, to mention circumscribed districts which have completely escaped the severe colds to which the surrounding countries were subjected. The *Sables d'Olonne*, for example, and the neighboring districts, six leagues in circuit, formed, during the winter of 1763 and 1764, a kind of *thermal oasis*. The Loire was frozen near its mouth; an intense cold of -10 degrees centigrade (14° F.) interrupted all agricultural operations in the districts which the river traverses. In the *Sables* the weather was mild: this little canton escaped the frost.

The following is a still more extraordinary fact than the preceding, for it takes place every year.

There is in Siberia, M. Erman has informed us, *an entire district*, in which, during the winter, the sky is constantly clear, and where a single particle of snow never falls.

I am willing to overlook the perturbations of the terrestrial temperatures which may be connected with a *greater or less abundant emission of light or solar heat*, whether these variations of emission depend on the number of spots which are found *accidentally* scattered over the sun's surface, or whether they originate in some other unknown cause; but it is impossible for me not to draw the reader's attention to the obscurations to which our atmosphere is from time to time subject, without any assignable rule. These obscurations, by preventing the light and solar heat from reaching the earth, must disturb considerably the course of the seasons.

Our atmosphere is often occupied, over spaces of considerable extent, by substances which materially interfere with its transparency. These matters sometimes proceed from volcanoes in a state of eruption. Witness the immense column of ashes which, in the year 1812, after having been projected from the crater of the island St. Vincent to a great height, caused at mid-day a darkness like that of night in the island of Barbadoes.

These clouds of dust appear, from time to time

in regions where no volcano exists. Canada, in particular, is subject to such phenomena. In that country recourse has been had, for an explanation, to the burning of forests. The facts do not always appear to agree exactly with this supposition. Thus, on 16th October, 1785, at Quebec, clouds of such obscurity covered the sky, that it was impossible, even at noon, to see in what direction one was going. These clouds covered a space of 120 leagues in length by 80 broad. They seemed to come from Labrador, a country very thinly wooded; and they presented none of the characters of smoke.

On the 2d July, 1814, clouds similar to the above surrounded some vessels in the open sea on their way to the River St. Lawrence. The great obscurity lasted from the evening of the 2d till the afternoon of the 3d.

With regard to the object we have here in view, it is of little importance whether we ascribe these clouds, capable as they are of completely obstructing the solar rays, to the burning of forests and savannas, or to emanations from the earth. Their formation, and their arrival in a given place, will remain equally beyond the predictions of science; the variations of temperature, and meteors of every kind which may be caused by these clouds, will never be pointed out beforehand in our meteorological almanacs.

The accidental darkening of the air, in 1783, embraced so extensive a space, (from Lapland to Africa,) that it was ascribed to the matter belonging to the tail of a comet, which, it was alleged, had mingled with our atmosphere. It is out of the question to maintain that an accidental state of the atmosphere, which enabled us, for a period of nearly two months, to look at the sun at mid-day with the naked eye, was without influence on terrestrial temperatures.

Forests cannot fail to exercise a sensible influence on the temperature of the surrounding regions; because, for example, snow remains there for a much longer time than in the open country. The destruction of forests, therefore, ought to produce a modification in our climates.

In given instances, what is the precise influence of forests, estimated by the centigrade thermometer? The question is very complicated, and has not hitherto been solved.

In all very mountainous regions, the valleys are traversed by periodical diurnal breezes, particularly sensible in May, June, July, August, and September. These breezes ascend the valleys, from seven or eight o'clock in the morning to three or four in the afternoon, the time when they reach their greatest force, and from four o'clock to six or seven in the evening. For the most part they blow with the force of a decided wind, and sometimes with that of a violent wind; they must, therefore, exert a sensible influence on the climates of the countries which lie around these valleys.

What is the cause of these breezes? Everything concurs to show that the cause is to be found in the manner in which the solar rays warm the central mass whence these valleys radiate. Suppose this mass to be naked, then you have a certain effect; substitute tufted forests for arid rocks, and the phenomenon will assume another character, at least with regard to intensity.

This is one of the twenty ways in which the clearing of woods affects climates. Before putting his hand to the task of arranging his predictions,

the manufacturer of almanacs ought, therefore, to enter into a correspondence with all the wood-cutters of every country.

In North America, the interior of the continent does not enjoy, in the same latitudes, the same climate as the coasts. By the influence of lakes, this difference disappears with respect to all the points where the distance from these great masses of water is not considerable.

We must, therefore, expect that the drying up of a lake will modify the climate of the neighboring region; and that a vast inundation, arising from the unexpected rupture of a barrier, will produce for a time an opposite effect.

If any one should exclaim against me on seeing me register causes, each of which, taken by itself, does not seem capable of producing a very great effect, my reply would be—We have to consider an influence as a whole, and in every case the perturbations which it is our object to explain, are far from being so extensive as the *public supposes*.

According to Howard, the mean temperature of London exceeds that of the neighboring country, about a *centigrade degree* (1°·8 F.)

The difference between the two temperatures is not the same at all seasons.

ELECTRICITY.

We could not well avoid arranging electricity among the causes which have a striking influence on climatological phenomena. Let us go farther, and inquire whether the operations of man may disturb the electrical state of an entire country.

Clearing the wood from a mountain is the destruction of a number of lightning-conductors equal to the number of trees felled; it is the modification of the electrical state of an entire country; the accumulation of one of those elements indispensable to the formation of hail, in a locality where, previously, this element was dissipated by the silent and incessant action of the trees. On this point, observations support theoretical deductions.

According to a detailed statistical account, the losses occasioned by hail in the continental states of the king of Sardinia, from 1820 to 1828 inclusively, amount to the sum of *forty-six millions* of francs. Three provinces, those of *Val d'Aoste*, the *Vallée de Suze*, and *Haute Maurienne*, do not appear in these tables; they were not visited with hail storms. *The mountains of these three provinces are the best wooded.*

Of the warmest provinces, that of Genoa, the mountains of which are well covered, is scarcely ever visited by this meteor.

Atmospheric electricity gives rise to phenomena, which are immense from their extent. They seem, however, to owe their origin to causes purely local. Their propagation likewise takes place under circumscribed influences, in particular zones, and these sometimes rather narrow.

On the 13th July, 1788, in the morning, a hail-storm commenced in the *south of France*, traversed, in a few hours, the whole length of the kingdom, and thence extended to the low countries and Holland.

All the districts in France injured by the hail, were situated in two parallel bands, running south-west and north-east. One of these bands was 175 leagues long; the other about 200.

The mean breadth of the most western hail band was 4 leagues, the other only 2 leagues. On

the space between these two bands, rain only fell; its mean breadth was 5 leagues. The storm moved from the south to the north with a rapidity of about 16 leagues an hour.

The damage occasioned in France, in the 1039 parishes visited by the hail, appeared, from official inquiry, to amount to twenty-five millions (one million sterling.)

This, certainly, must be regarded as a considerable atmospheric commotion, whether we regard the material devastation it produced, or the influence which the displacement of the air, and the mass of hail deposited on the surface of two long and broad bands of country, must have exercised on the normal temperature of a great number of places. Could meteorologists, however skilled, have been able to foresee it?

The origin of the two bands was in the district of Anis, and in Saintonge. Why there, and not elsewhere? Why did not the storm commence at another point of the parallel of latitude, passing by its meridional extremities? Because, it will be answered, in Anis and in Saintonge, on the 13th July, 1789, the conditions of electricity and temperature were eminently favorable for the production of a hail-storm, and an accompanying hurricane directed from the south-south-west to the north-north-east. Admitted; but were not these thermal and electrical conditions favorable to the production of a storm, ultimately connected with agricultural operations, with the existence of such and such a mass of trees, with the state of irrigation, with circumstances varying according to the wants and caprice of men? With regard to temperature, no one can hesitate in his reply. In the other particular, the connection will appear not less evident if I bring to mind that evaporation is a fertile source of electricity, and that various natural philosophers have even included vegetation among the causes which generate this same fluid in the atmosphere.

If it be true, as has been alleged, that, in certain cases, the flame and smoke which issue from the mouth of a furnace, or from the chimney of a manufactory, may deprive the atmosphere of all electricity for many leagues around, the *prophets* in meteorology, will be placed in an additional difficulty. It will be necessary that they should know beforehand all the plans of the masters of forges and proprietors of manufactories.

According to all that we most certainly know respecting the physical cause of water-spouts, and according to M. Espy's theory, sometimes no more is necessary than an ascending current produced by the chimney of a manufactory, to give rise to one of these formidable meteors.

RAIN.

It is said to have been remarked in Italy, that, in proportion as rice-fields multiply, the annual quantity of rain has gradually increased, and that the number of rainy days has augmented in proportion.

Can it be imagined, that such circumstances as these can ever be taken into account, in the combinations of the almanac-manufacturers?

In the tropical regions of America, the natives regard repeated shocks of earthquake, as welcome precursors of fertilizing rains. Humboldt even relates, that violent shocks suddenly brought on the rainy season, a considerable time before the ordinary period.

It is not probable that the influence of earth-

quakes is exerted only in the vicinity of the equator. The power of predicting rain must, therefore, suppose an anticipatory knowledge of the number and strength of the shocks, which are to be felt in the region for which the *astrologer* works.

The following passage occurs in Bacon's works:—"Some historians allege that, at the time when Guyenne was still in the power of the English, the inhabitants of Bordeaux and the neighboring cantons made a request to the king of England, to induce him to prevent his subjects of the counties of Sussex and Hampton, from burning the heaths in the end of April, as they usually did; because they thereby gave rise, it was affirmed, to a wind which proved very hurtful to their vines."

I know not how far there were grounds for this request, as the distance of Bordeaux from the county of Sussex is very considerable; but I must not fail to mention, that natural philosophers are now disposed to assign a no less extraordinary part to conflagrations. In the United States, a well known philosopher, M. Espy, adopting the opinions prevalent among the natives of the new continent, from Canada to Paraguay, has recently proposed to produce, in times of drought, *artificial rains*, and his means of doing so is by kindling large fires.* In support of his scheme, M. Espy mentions the following:—

The opinion of the Indians of Paraguay, who, according to the report of the missionaries, set fire to vast savannas when their crops are threatened with drought, and allege that they thus produce even *storms accompanied with thunder*;

The opinion of the colonists of Louisiana, and the *success from time immemorial of burning the prairies* in that State;

The opinion of the population of Nova Scotia, respecting the consequences of burning forests;

The opinion and practice of the colonists of the districts of Delaware and Otsego, &c., &c.

M. Espy says, that he has assured himself, in various ways, that the climate of Manchester has undergone gradual and sensible modifications, in proportion as manufacturing industry has increased. Since that city has become, so to speak, a vast furnace, *it rains there more or less every day*. Those who pretend that the deterioration of the climate is not so considerable, assure us that it does not rain at Manchester more than *six days* in the seven!

Suppose these facts to be as averred. The predictions of rain, in a given place, will often be overturned by accidental fires, and by the fires of manufactories.

Space and time will not allow me to point out the multitude of local causes which may exercise a great influence on the direction and force of the wind. I shall discuss this delicate question in another notice. At present, I shall confine myself to a remark well-fitted to enlighten those who, from want of meteorological instruments, take for their guides the state of the crops and of vegetation. It may be expressed in the following formula.

* It has long been an opinion entertained by the peasantry in the south of Scotland (we know not whether the belief prevails elsewhere,) that *muir-burn*, or the burning, in the spring, of old heather and other plants, in order to produce a more tender and nutritious vegetation, a practice which was once very general, has a decided tendency to produce a change of weather, and to bring on rain.—*Ed.*

lary; the wind exercises a *direct action* on vegetables, often very injurious, and which ought to be carefully distinguished from climatological action. It is against this direct action, that curtains of wood, by forming a shelter, are especially useful.

The *direct influence* of the wind, on the phenomena of vegetation, is nowhere more strikingly exemplified than in the Isle of France. The south-east wind, very healthy both for men and animals, is, on the contrary, a perfect scourge to the trees. Fruit is never found on the branches directly exposed to this wind; none is to be found but on the opposite side. Other trees are modified even in their foliage; they have only half a head, the other has disappeared under the action of the wind. Orange and citron trees become superb in the woods. In the plain, and where they are without shelter, they always continue weak and crooked.*

From the Edinburgh Philosophical Journal.

On the Surface of the Moon. By Captain ROZET.

M. ELIE DE BEAUMONT has already been enabled, by means of the beautiful selenographic delineations of Lohrmann, and of Beer and Mädler, to make some very remarkable comparisons between the forms presented by certain portions of the mountainous masses of the earth, and the annular openings of the surface of our satellite.

During the summer of 1844, one of my friends having directed my attention to the circular forms of nearly the whole of the variations of the lunar surface, I have devoted myself since that time to the study of the phenomena presented by these variations of surface, having, at the same time, called in the aid of the beautiful German maps, and of various works already published on the subject.

The contours of all the great greyish spaces which, for a very long time, have been termed *Seas*, although it is known with certainty that they cannot be masses of water, are formed by arcs of circles which intersect one another. The number of arcs sometimes amounts to two, rarely to one *mare crisium*. These contours present circular escarpments which seem perpendicular, but the inclination of many of which is 45 degrees. The matter composing them appears to be swelled up, and their height often exceeds 4000 metres (upwards of 13,000 English feet.) In the interior of the seas we remark annular openings or perfect rings, whose diameter amounts to 10 myriametres (upwards of 60 English miles,) and the height of whose terminal ridge is 4000 metres. Several of them have a peak in the centre, which is a little less elevated than the edges of the ring.

The large grey spots cover a great portion of the northern, eastern, and western regions of the disc, and leave in its southern part a brilliant space, covered with an infinity of rings of all dimensions. These rings are simple and isolated, complex, or united together, two and two, three and three, &c. When they touch one another, the contours are always rendered imperfect; and it is generally the smaller one which encroaches on the larger. In the interior of the large rings there are almost always present smaller ones, which cut the edges when they touch them. The bottom of the rings seems to be flat, but that bot-

tom often presents elevated portions, arranged in arcs of circles parallel to the external ridge; so that the rings would seem to have been formed at the surface of a fluid mass on which scoræ were floating, by means of a circular undulation, whose amplitude went on diminishing.

The bottom of the great spots, such as the *mare serenitatis*, &c., exhibits the same characters. Simple spots are also to be noticed, or portions having no projection, but whose circular forms are well marked. It cannot, therefore, be called in question, that a general cause, producing these circular forms, has had an immense influence in the formation of the solid crust of our satellite. We can perfectly account for all the facts now enumerated, by supposing a number of whirlpools in the fluid matter, whose amplitude diminished with the fluidity of that matter. Nothing is to be seen on the surface of the moon which reminds us of our chains of mountains with their lateral branches, or of our great valleys with their numerous ramifications, &c. We see, indeed, many well marked fissures, as, for example, at the bottom of the *mare vaporum*; but these fissures are simple; several diverge from one centre, as in Tycho, Copernicus, Kepler, &c., and form radiating cracks, analogous to those in Von Buch's craters of *souletement*, but much more considerable. One of the fissures of Tycho traverses the moon diametrically. A continued study of the various portions of the moon, under all inclinations of the solar rays, enables us to recognize two layers which are quite distinct, but two layers only;—the bottom of the great greyish spaces, which is also that of the rings; and a scoraceous crust, elevated above that bottom to a height which has been measured at a great number of points. These measurements have afforded me the means of calculating the thickness of this crust, and I found that the mean is 642 metres (2106 English feet.)

From all the facts I have ascertained, and from all the deductions to which these facts have led me, I think I may draw the following conclusions:—

1. The lunar globe has originally been in a state of fusion, and has been gradually cooled.

2. During the formation of the external scoraceous pellicle, there existed in the mass whirlpools or circular movements, which, driving the scoræ from the centre to the circumference, formed annular ridges, by the accumulation of those scoræ at the limit of the undulation. When several whirlpools occurred in such circumstances, that the distance of the centres, taken two and two, was less than the sum of the radii, there resulted an enclosed space, bounded by arcs of circles. When the distance of two centres was greater than the sum of the radii, two complete rings were formed.

3. The amplitude of the whirlpools diminished with the fluidity of the surface, but the phenomenon continued throughout the whole duration of the process of consolidation.

4. The mode of formation which we assign to the lunar rings, altogether excludes the idea of craters resembling those of our volcanoes.

5. The surface of our satellite being thus consolidated, no solid or liquid layer coming from the exterior was subsequently deposited upon it; for, otherwise, the small rings and the fissures would have disappeared. The perfect preservation of all these variations in external configuration, shows that no liquid has ever existed in considerable quantity, either at the surface, or even in the atmosphere of the moon.

* *Annuaire pour l'an 1846.*

6 After the complete consolidation of the external envelope, the matter which remained fluid in the interior acted upon that envelope, and fractured it, often giving rise to large radiating cracks. At that epoch, the solid crust must have already been very thick, because the fissures are of large dimensions.

7. As no liquid, in any considerable quantity, has ever existed on the surface of the moon, or in its atmosphere, it results that no organized beings, similar to those of the earth, can ever have lived there; and if that planet, as is pretty generally admitted, has no atmosphere, it can possess no beings in whose organization liquids form a part, and we cannot conceive of organic beings without liquids.

8. Lastly, from the whole of my investigations, there results the following important fact, viz., that the surface of the moon permits us to see all the phenomena of its consolidation, and the traces of the revolutions which it has undergone. On our earth these phenomena are almost all concealed by aqueous deposits; but various regions, in which rocks resulting from fusion have remained uncovered, present forms very analogous to those exhibited by the surface of the moon. It is probable that, if the terrestrial surface were stripped of the seas, and of all the sedimentary deposits which cover it, annular forms would predominate. The same may be said in regard to all the planets of our system; for the circular undulations of matter in a state of fusion, seem to me to be a consequence of the movements inherent in the different bodies, which, by becoming agglomerated round great centres of attraction, have formed those planets.*

POLICY OF THE NEW POPE.

THE Paris journals are unanimous in the expression of their satisfaction at the elevation of Cardinal Mustai Ferrette to the holy see. His election was, it appears, unanimous, and this fact is taken as a proof that the holy conclave were so far impressed with the state of Italy as to deem it prudent not to lose time in the appointment of a successor to Pope Gregory, and so to cut off all pretext for intrigues, both of foreign powers and of discontented parties. The Pope is a man of only fifty-four years of age, and passes for a man of moderately liberal opinions; strong hopes are therefore entertained of his wisdom and firm disposition, and his situation will at once require the exercise of both. He will have to deal with the long promised reforms in the administration of legations. The acute and active Baron Rossi is now clothed with ambassadorial functions, and France, so often twitted for her abandonment of Ancona, will, in accordance with her now settled policy, seek to obtain by firm and persevering negotiation that which she used to seek for by armed menace. Hence it was that Austria and France looked very eagerly to the proceedings of the holy conclave, and France already asserts loudly that, so far, her interests have triumphed. Nor do the interests of France stop there; she is indirectly interested in the settlement of the Spanish negotiation, and directly interested in the consideration of the effect to be produced upon her own clergy by the example of the new pontiff.

*The above is an extract from a memoir which has very lately been referred by the French Academy of Sciences to a committee, consisting of Messrs. Arago, Elie de Beaumont, and Liouville.—*Comptes Rendus*, vol. xxii.

Much has been done by the existing government to win over the clergy to the reigning dynasty, and done successfully, but much remains to be accomplished. The French clergy have never heartily accepted the revolution of July. Even the Archbishop of Paris, who owes his elevation to his once professed liberalism, cannot withhold the pleasure afforded by congratulatory occasions of saying disagreeable things. But with Miguelism, Carlism, and old Bourbonism, the sympathies of the clergy are still shared. A young pope, well disposed towards France, and willing to take lessons from her in regard to his own civil government, is therefore hailed; nor can he be insensible of the fact that his own place as a ruler is rendered, as it were, more respectable by taking his place beside the constitutional thrones of the west in harmonious equality, influencing to a considerable degree their position and their policy, and thus regaining a good deal of lost ground. The late pope was ready, or, at least, was believed to be ready, to beckon on Austrian bayonets; Spain he helped to keep in a state of ferment by haggling for the price of the queen's recognition, and thus exposing the throne to the suspicion of factions. His horror of the French University was only equalled by his hatred of the abominations of steam; and thus the peace of the world was in the hands of a weak, bigoted old man. Whether there was to be interference in Italy, revolution in Spain, or troubles in France, depended upon the conduct of Gregory; and this state of uncertainty is changed by the accession of Pius IX.—so it is believed, and so we hope.—*London Herald*.

From the National Intelligencer.

THE ISRAELITES.

OUR European excerpts offer some interesting paragraphs as to those children of destiny, the Hebrews, once certainly what we seem to take ourselves for—a chosen people. The favor which was extended to them in religion is ours, it appears, in politics; with only this difference, that while they could forfeit it, we cannot.

The fortunes of this singular people, however of special appointment, may also, no doubt, be in part referred to those natural causes by which Providence works in other cases. Examining their position with the eye of a politician, one sees that, placed in the very highway of conquest between the great empires of the old world, which early formed themselves on the Euphrates and the Nile, they were sure to be trampled over, as now the Egyptians and now the Assyrians or Medes went forth, by way of Syria, to "conquer a peace" in Babylon or in Memphis, or to extract some indemnity from weaker powers, or to settle some disputed boundary. So placed, the subjugation and final breaking up of the Jewish nation could scarcely fail to come about, as soon as the assisting hand of Heaven was withdrawn.

As of their military position, so of their commercial, in the great route of trade between the east and the west—between the head of the Mediterranean and the great gulfs that led to India. Thus they early became a nation of traders; and since their dispersion, aliens everywhere, they have everywhere retained their habits of traffic. The Christian Armenians, who have succeeded to their position, have almost equally succeeded to their habits.

At last, a wise monarchy—that of Prussia—has

begun to look upon the body of this people within its states as having the same claim as any other part of its subjects to be dealt with in the manner which shall benefit them the most; and Prussia has set on foot for them a measure which strikes us as likely to accomplish a great change in the condition and character of the large Jewish population spread over that part of her territory which Frederick the Great wrested from Poland. The following paragraphs describe this measure and its progress:

"A letter from Posen, of the 15th, states that a philanthropic society, composed of Christians and Jews, has been formed in that city for the purpose of purchasing lands and establishing farms for the instruction in agriculture of the poorer young Jews of the Grand Duchy, and thus lead them to prefer the occupations of farmers to those of pedlars and publicans, which are at present the employments of most of them, and which has greatly contributed to keep up the animosity of the lower orders of Posen against the Jews. The king has not only given his sanction to the society, but has declared that, if it desired it, his government should let to it several large portions of the crown domains at very low rents.

"A letter from Breslau of the 27th ultimo states: 'The efforts of the Society for establishing Jewish colonies in Silesia, so as to encourage the Jews to cultivate the land instead of leading the wandering life of pedlars, have been crowned with success. Already 1,564 Jewish families of some renown have purchased land in the colonies in question, and cattle and horses requisite to cultivate it; each of these families has subscribed one hundred dollars to form a fund for relieving poor settlers. Numerous applications have been made by Jewish families to be admitted as settlers, and the society has determined on taking advantage of the offer of the King of Prussia to make over to them certain domains of the state in Silesia at a moderate price. Each colony is to consist of from twenty to thirty families, under the direction of a man well versed in rural economy.'"

Russia, however, seems by no means to profit by this wise example. Probably she still preserves that wise idea of the middle ages, that the Jews killed Christian children in order to use their flesh in certain ceremonies.

"A St. Petersburg letter of the 22d states that all foreign Jews, including *those of Poland* now residing in Russia, have been ordered to quit within three months, and in future no foreign Jew can reside in Russia without a special permission."

We find in another place the following agreeable notice of the wife of him whom Byron celebrates:*

* Who hold the balance of the world? Who reign
O'er congress, whether royalist or liberal?
Who rouse the shirtless patriots of Spain,
That make old Europe's journals squeak and gibber
all?
Who keep the world, both old and new, in pain
Or pleasure? Who make politics run glibber all?
The shade of Bonaparte's noble daring?
Jew Rothschild and his fellow Christian, Baring.

Those, and the truly liberal Lafitte

Are the true lords of Europe. Every loan

Is not a merely speculative hit,

But seats a nation or upsets a throne.

Republics also get involved a bit;

Columbia's stock hath holders not unknown

On 'Change; and even thy silver soil, Peru,

Must get itself discounted by a Jew.

"THE JEWS' STREET IN FRANKFORT.—In the Jews' street at Frankfort-on-the-Main, in the midst of Gothic façades, black copings, and sombre alleys, there is a house of small exterior, distinguished from others by its luxurious neatness, which gives it an appearance of singular cheerfulness and freshness. The brass on the door is polished; the curtains of the windows are as white as snow; and the staircase (an unusual thing in the damp atmosphere of this dirty quarter) is always dry and shining. The traveller who, from curiosity visits this street—a true specimen of the times when the Jews of Frankfort, subjected to the most intolerable vexations, were restricted to this infected quarter—will be induced to stop before this neat and simple house, and perhaps ask, 'Who is that venerable old lady, seated in a large arm-chair, behind the little shining squares of the window on the first story?' This is the reply every Frankforter will make: 'In that house dwelt an Israelite merchant, named M. A. Rothschild. He there acquired a good name, a good fortune, and a numerous family; and when he died the widow declared she would never quit, except for the tomb, the modest dwelling which had served as a cradle to that name, that fortune, and those children.' Continued prosperity has attended the sons of the pious and modest widow. Their name is become European, and their wealth proverbial. They inhabit sumptuous palaces in the most beautiful quarters of Paris, London, Vienna, Naples, and Frankfort. But their mother, persevering in her admirable modesty, has not quitted her comparatively humble house, where they come to visit *her* with respect and reverence, and discharge their duties in memory of their estimable father—thus presenting bright examples for the present time.—*Hebrew Tales*."

Finally, without by any means embracing either the opinion of "Young England" that all the great men in the world are Israelites, or that of "Young America" that tillage is everything in a nation, we are nevertheless well convinced that a people cannot flourish, or hardly subsist as a political society, that shall long exclude any one of the great arts of utility. The first of these, and that which extricates man from a state of barbarism, is the regular cultivation of the earth; and next, as the means of a further progress, must come the practice of the handicrafts that supply the comforts of life. They who confine themselves to the former can make little advance even in it: and they who employ themselves only in the secondary arts can never form a society; for that must comprehend them all. And in this lies one of the chief mistakes of the philosophers of free trade, the economists; who hold that commerce (by which they understand one sort only, foreign) is the great and invariable policy of nations: so that their only business is to buy wherever they can buy cheapest. As a question of the instant's gain, this is of course entirely true; but it is false in every permanent sense. For the real interest of a nation is, as we have intimated, not to limit itself to a single and a simple pursuit, availing itself only, through the exchangeable surplus produced in that, of the progress of the arts among other nations, but as fast as it can to domesticate them all, by fostering them; for which purpose, it must forego, for a time, the temporary advantage of the cheapest exchanges.

Peru: Sketches of Travels in the Years 1838-1842.—[*Peru. Reiseskizzen u. s. w.*] By J. J. VON TSCHUDI. 2 vols. St. Gallen, Scheitlin und Zollikofer. London, Williams & Norgate.

THE writer of these volumes is well known in Germany by his contributions to Peruvian zoology. In his preface, he disclaims the intention of adding to the list of "romances of travel;" and, accordingly, writes more of Peru than of himself, giving notices rather of the beasts, birds and fishes of the country than of the breakfasts he consumed there. Yet, his devotion to scientific pursuits did not entirely withdraw his attention from the social circumstances of the Peruvians; of which he gives a portraiture on the whole unfavorable, but too true. In this part of his work there is little novelty; for life in Peru is but a copy of life in Mexico—having all the low and sordid features of Spanish colonization. A mind disposed towards a hopeless view of human affairs may find motives for such a tendency in South America. Over all its splendid natural scenery man's errors have cast their shadows. The memorials here and there scattered of the Incas' dominion, and the equally melancholy relics of a transitory civilization produced by the schemes of the Jesuits—the low and stationary condition of society among the Spaniards and Creoles of Lima—the mines of natural wealth doing so little for man's elevation—the various tribes of degraded Indians whose chief solace is found in the narcotic cocoa-plant—all furnish sad observations for the mind disposed to dream of man as he ought to be.

Our author devotes, we think, too much of his space to Lima; with which preceding travellers have made us well acquainted. Here are some of his observations on the fair Limanese:—

"The fair Limeña rises at a late hour, dresses her hair with jasmine and orange-flowers, and waits for breakfast. After this, she receives her visitors and pays her visits. During the heat of the day her solace is a swing in her hammock, or a cigar. After dinner, she visits her friends; and the day is concluded in the theatre, the great square, or on the bridge. But few ladies employ themselves in needlework or netting, though some are very expert in these arts. In society such work is never introduced—happy city, where we may meet with ladies *not* knitting stockings! * * The pride with which the ladies of Lima cherish their tiny feet can hardly be exaggerated. Whether they walk, or stand, or swing in the hammock, or recline on the sofa, their principal care is to keep their pretty feet in view. No praise of their virtue, their intelligence, or even their beauty, will flatter them so sweetly as a commendation of their delicate feet. A great foot (*patata inglesa*—'an English paw,' as they say) is their horror. I once heard the praises of a fair European from some ladies in Lima; but they ended with the words, *pero que pie! valgame Dios! parece una lancha*!—'but what a foot! Heavens! 't is like a great boat!'—yet the foot in question would have been reckoned of a moderate size in Europe. * * At a certain age, the ladies of Lima generally make a great change in their mode of life. Their bloom is gone, and they no longer charm; or, satiated with the pleasures of an unchastened life, they leave the world, devote themselves to religion, and become so-called '*Beatas*.' They

must attend church twice or thrice daily; confess, at least, once in the week; retire for penance during passion-week; send delicate luxuries to their confessor, or a calash to carry him when he is not disposed to walk; and in many other ways expose their sanctity as a spectacle. This seeming piety, far removed from everything like a sincere devotion, is so much more disgusting as it is generally accompanied by a bitter and uncharitable humor. These devout ladies, having renounced all other pleasures, enjoy the more keenly the luxury of scandal—and turn their venomous stings against their neighbors; so that the '*Beatas*' may be reckoned the most dangerous class of society in Lima."

Of all the inhabitants of Lima, according to our author's observations, the lowest are the free negroes; and he seems disposed to ascribe their faults rather to their organization than to their circumstances. But what can be expected of the lower classes, where the higher can find no better recreation than brutal bull-fights—patronized in Lima, as in the Sierra, on a scale of cruelty far exceeding that of Madrid? It is well known that the pleasantness of the climate of Lima is counterbalanced by the frequency of its earthquakes; and the very transitory moral effects of these most awful of nature's outbreaks might furnish a good hint to some who are disposed to exaggerate the use of fear as a moral influence. Deep-seated and rational veneration is a power widely different from the mere animal terror which may be excited by an earthquake or a thunder-storm.

But we must leave Lima: and notice our author's travels in the Peruvian Cordilleras and the Sierra. There is some indistinctness among geographers with regard to the Andes and the Cordilleras. In the time of the Incas, both these mountain-chains were called by one name, "*Ritisuyu*,"—meaning "the snow region." As the principal tribe of the old inhabitants of Peru had their dwellings along the base of the eastern chain, and explored its hoards of metal, our author conjectures that the name, Andes, took its rise from "*Anta*," the Guichua word for metal; and proposes that the western chain shall be distinguished as the Cordilleras. The Creoles of Peru, however, use the two names indiscriminately. Between these two lines of mountain-peaks lie vast and scarcely inhabited plains, at an elevation of 12,000 feet above the sea-level. These highlands of South America are styled, in the native language, the "*Puna*,"—meaning uninhabited parts. In some districts, the Puna extends as an unbroken plain from the Cordilleras to the Andes; in other parts, it is intersected with deep valleys—which, of course, enjoy a climate far warmer than that of the highlands. These valleys are termed by the Peruvians, "the Sierra;"—but it should be noticed, that the people of Lima give that name also to the whole interior of Peru. Whether the traveller contrasts these temperate valleys with the sultry coast, or with the bleak and inhospitable islands of Peru, he is equally charmed when he first beholds them—and readily adopts the expression of an old traveller (Bouguer,) who called the Sierra "an earthly paradise." The Puna, though bleak, and favored with but a scanty vegetation, is the abode of the principal quadrupeds of Peru—the llama and its relatives the alpaca, the huanacu, and the vicuna. Over these plains, and the peaks of the Andes, the condor hovers in search of its prey. Our traveller confirms the statements of

Humboldt and others—sadly toning down the old marvellous stories which tell of the size and power of this bird. The span of its extended wings sometimes reaches twelve feet. Its general food is carrion; though, when urged by hunger, it will seize the young of sheep, vicunas and llamas; but it cannot rise with a weight of more than eight or ten pounds. The huts of the Indians on the Puna are wretched and filthy; and there is nothing to repay the traveller who visits this lonely and drear region, save a scientific interest, or a delight in nature's wildest scenes. But when he has passed over the elevated plain of Bombon, and gains a glimpse of Cerro de Pasco, he feels that he is again approaching the abodes of civilization. It is but a sordid civilization, however: the love of silver has collected, in a dreary clime bordering on the eternal snow, the men of various nations—Spaniards, Germans, Englishmen, Swedes, Americans and Italians. The first glimpse of a considerable town in such a region is a pleasure and surprise; but little is found on a nearer approach, to please the eye. The beauty of the place is subterraneous—in its rich silver mines. Many a tale of wild speculation belongs to this remarkable town. Gambling is the favorite amusement. The Indians employed in the mines of Cerro de Pasco are among the most degraded inhabitants of Peru. Our traveller relates some stories of the faculty of secretiveness, as developed among these natives, who have been made the slaves of European rapacity. We cannot decide on the probability of these tales; but instances as striking are recorded of the Indians of Mexico:—

"The Indians have discovered that their silver-mines have made their condition rather worse than better. They determine, therefore, to keep secret their knowledge of some rich veins of silver not yet explored by Europeans. Traditions of these mines have been handed down, it is supposed, from father to son, through centuries. Even brandy, which will open the Indian's mouth on any other subject, fails in this case. A few years ago, there lived, in the large village of Huancayo, the brothers Don Jose and Don Pedro Irriarte—who were among the wealthiest mine-proprietors of Peru. As they had reason to suspect the existence of rich unexplored veins among the neighboring hills, they sent out a young man in their employ to examine the country, and use the likeliest means of discovery. Accordingly, he repaired to a village, where he found lodgings in the hut of an Indian shepherd—from whom he concealed his object. In the course of a few months, an attachment had grown up between the young adventurer and the shepherd's daughter; and, at last, the young man succeeded so far in his object as to win from the girl a promise that she would point out to him the mouth of a rich silver-mine. She directed him to follow her, at some distance, on a certain day when she should go out to tend her flock on the hills; and to notice where she dropped her 'manta,' (a woollen shawl.) There, she told him, he would find the entrance of the mine. The young agent obeyed her directions; and, after some digging, found his way into a moderately deep shaft, which led to a rich vein of silver. He was busily engaged in breaking off some specimens of the ore, when he was surprised by the old shepherd, who congratulated him on the discovery, and offered assistance. After working together for some hours, they rested; and the Indian offered to the young man a cup of *chicha*, which he drank.

Soon after drinking, he felt unwell; and, as a suspicion of being poisoned flashed upon his mind, he instantly packed the specimens of ore in his wallet, hastened back to the village, and thence rode to Huancayo. He had only time to explain his adventure to his employers, and point out, as well as he could, the locality of the mine; for he died in the night. Another exploring party was immediately sent into the neighborhood, but without success: the Indian and his family had vanished from the place, and no trace of the mine could be discovered."

Another story is the following:—

"A certain Franciscan monk, a passionate gambler, lived at Huancayo. By his friendly offices, he had become a favorite among the Indians, to whom he often applied when in want of money. One day, when he had suffered losses at the hazard-table, he begged of an Indian, who was his relative, to help him out of his poverty. The Indian promised assistance on the following evening; and arrived punctually at the appointed time, with a bag full of silver-ore for the monk. This process was repeated several times; until the still needy monk earnestly prayed that he might be favored with a view of the source from which his wants had been so often supplied. This request also was granted by the friendly relative: and, accordingly, on the appointed night, three Indians came to the house of the Franciscan—desired that he would allow them to bandage his eyes—and, he assenting, carried him away, on their shoulders, some miles among the mountains. There, they lifted him down—conducted him down a shaft of little depth—and displayed to him a rich and shining vein of silver. When he had amply feasted his sight, and had taken ore enough for his present necessities, his eyes were again bandaged, and he was carried home on the shoulders of his guides. On the road, he slyly untied his rosary; and dropped a bead here and there, that he might have a clue to the mine. Arrived at home, he lay down to rest, in the comfortable hope of exploring the path to wealth on the following day; but, in the course of about two hours, the Indian, his relative, came to the door, with his hands full of beads—'Father,' said he, as he gave them to the monk, 'you lost your rosary on the road!'"

A short extract from the traveller's journal will give some notion of the climate and character of the Puna:—

"I had now reached the high plain, 14,000 feet above the level of the sea. On each side rose the peaks of the Cordilleras clothed in eternal ice—gigantic pyramids towering into the heavens. It seemed to me as if nature, on these snowy plains of the Cordilleras, breathed out her last breath. Here life and death met together; and I seemed to be arrived at the boundary-line between being and annihilation. On which side would my lot fall? I could not guess. How little life had the sun awakened around me; where the dull-green puna-grass, hardly the height of a finger, mingled its hue with the mountain glaciers! Yet here I saluted with pleasure, as old friends, the purple-blue *gentiana* and the brown *calceolaria*. * * As I rode further, life awakened in richer variety around me: animals and birds appeared—few in species, but rich in individuals. Herds of vicunas approached me—then fled away with the speed of the wind. I saw, in the distance, quiet troops of huanacas gazing suspiciously at me, and passing along. * * I had ridden on for several hours,

observing the varieties of life in this elevated plain, when I came upon a dead mule which had been left here by its driver to die of hunger and cold. As I approached the carcass, three condors rose from their repast; and hovered, for a while, in narrowing circles round my head, as if threatening punishment for the interruption. It was now two o'clock in the afternoon, and I had ridden on a gradual ascent since the break of day. My panting mule slackened his pace, and seemed unwilling to toil up an elevation which lay in my route. I dismounted; and, to relieve the beast and exercise my limbs, began walking at a rapid pace. But, in a short time, the rarity of the air began to be felt; and I experienced an oppressive sensation which I had never known before. I stood still, that I might breathe more freely; but there was no support in the thin air. I tried to walk; but an indescribable distress compelled me to halt again. My heart throbbed audibly against my side; my breathing was short and interrupted; a world's load seemed laid upon my chest; my lips were blue and parched, and the small vessels of my eyelids were bursting. Then, my senses were leaving me: I could neither see, hear, nor feel distinctly; a grey mist was floating before my eyes—tinged, at times, with red, when the blood gathered on my eyelids. In short, I felt myself involved in that strife between life and death, which I had before imagined in surrounding nature. My head became giddy, and I was compelled to lie down. If all the riches of the world or the glories of heaven had been but a hundred feet higher, I could not have stretched out my hand towards them. I lay in this half-senseless condition for some time—until rest had so far restored me that I could mount my mule. One of the Puna storms now suddenly gathered, and the snow began to fall heavily. The sun looked out at intervals—but only for a moment. My mule could scarcely wade through the increasing snow. Night was coming on; I had lost all feeling in my feet, and could hardly hold the reins in my benumbed fingers. I was about to yield myself up for lost, when I observed an overhanging rock sheltering a cave. I hastened to explore the spot—and found there a shelter from the wind. I unsaddled the mule, and made a bed of my cloak and trappings. After tying the animal to a stone, I appeased my hunger with roasted maize and cheese, and lay down to sleep. But scarcely had my eyes closed, when an intolerable burning pain in my eyelids awakened me. There was no more hope of sleep. The hours of the night seemed endless. When I reckoned that day must be breaking, I opened my eyes, and discovered all the misery of my situation. A human corpse had served as my pillow. Shuddering, I hastened out of the cave, to saddle my mule and leave this dismal place; but the good beast was lying dead upon the ground;—in his hunger, he had eaten, as it appeared, the poisonous *garbancillo*. Poor beast! he had shared some hard adventures with me. I turned again towards the cave. The sun had risen upon this frozen world; and, encouraged by signs of light and life around me, I ventured to inspect the body of my lifeless companion. It was the corpse of a half-Indian; and several deadly wounds in the head explained that he had been murdered by the slings of Indian robbers, who had taken away his clothes. I seized my gun, and shot a mountain hare—which served for breakfast; then waited for help. It was near

noon when I heard a monotonous, short cry, now and then breaking the stillness. Recognizing the tones, I mounted on the nearest point of rock; and, looking down, discovered the two Indian llama-drivers whom I had met on the previous day. I hastened to them; and persuaded them, by the gift of a little tobacco, to leave one of their llamas with me, to carry my baggage."

The people of the Sierra are noted for hospitality and some other peculiarities. The least favorable feature in their disposition is their love of carousals—where brandy flows too freely for anything like "the feast of reason." The superstitious burlesque of Christianity among the Indians—of which our author gives an account that we should hardly dare to quote—is of the same nature with the performances of the Mexican Indians. Among the least profane of their grotesque theatricals, is the following custom:—

"On Palm Sunday, an image of Christ, seated upon an ass, and followed by the foal, is led through the town. The Indians strew palm-branches in the way; and fight with each other for the honor of spreading their garments to be trodden upon by the ass. The creature is destined to this service from its birth—and must never bear any other burden. It is, indeed, almost esteemed holy, and styled the '*Burra de Nuestro Señor*.' I have seen such favored animals, in some villages, so fat that they could scarcely walk."

The writer devotes a chapter to describe the lonely, Crusoe-like, mode of life which the naturalist must lead when he explores the vast forests of Peru. He gives, too, a long account of the universal use of the coca-plant among the Indians: and, strange to say, recommends the use of this powerful narcotic, as a relief for severe toil and hunger, to European seamen engaged in such services as the Arctic Expedition.

As in many German books of travels, we notice an occasional want of conciseness and precision:—but the volumes are interesting, and contain useful contributions towards the natural history of Peru.

From the Britannia.

GEORGE CANNING.

THE name of the late Right Honorable George Canning has been so prominently brought forward in the late debates, that we are induced to give a sketch, with some of our personal recollections, of that distinguished statesman. A new generation has sprung up since his time; a new policy has superseded the old; new men fill up the position which he and his contemporaries maintained; and, as the most striking distinction of the whole, a new spirit, impulse, and power have been infused into the people, which, already producing many changes, menace the production of more, of a fierce character, of a more headlong career, and of more irreparable evil. (When the history of the fifty years which have just closed over us shall come to be written by some one worthy of the task, Canning will probably be represented as the last figure of the old system, and as the first of the new; standing on the boundary which divides the government by an aristocracy from the government by a populace, and exhibiting the original graces of his early political association combined with the energies essential to eminence as a leader of the people.)

Of all the crimes of man, there is none more un-

pardonable with an old aristocracy than humility of origin. To the latest hour of his career George Canning was called an adventurer. This stigma he retorted in the most effectual style, by the exhibition of talents which they were compelled to praise, and by the possession of power which they were rejoiced to share. Still, even by the populace, he was called an adventurer. But to them he had other modes of appeal. He answered the charge with easy scorn, with indignant ridicule, or with stern contempt.—“Me, an adventurer!” “well, so be it! To such a charge I am willing to plead guilty. I came before you to be your representative. I am one of the people, and I am only the fitter to be your representative. I came to you relying on no other claims than those of character. I look to neither patrician patronage nor party recommendation. Is it in this free country, in this nation, whose boast, and it can have none nobler, is, that the road of honor is open to every man, that I am to apologize for being born in a private station? If—to depend wholly on the people as their representative—if, as a servant of the crown, to lean on no other support than public confidence—if this is to be an adventurer, I plead guilty to the charge. I would not exchange those feelings and that situation to have an ancestry of a hundred generations.”

Those were manly sentiments. Yet the birth of Canning was from a line of gentlemen; and, though he might not reckon the peerage in his genealogy, he had blood in his veins that ascended to the fourteenth century.

The father was a barrister, the son of a family of fortune in Ireland. By falling in love “without his father’s permission,” he alienated his Irish connection, and came to live by his pen in England, his principal dependence being on a wretched annuity of £150 a year. He wrote poetry with some vigor, and political pamphlets with some success. But the French proverb is true. “Il n’y a que bonheur, et malheur.” Ill luck lay on him, and no man, let his abilities be however brilliant, ever broke that spell. All his plans served only to prolong the struggle; he sank year by year. The prefatory lines to an edition of his poems in 1767 contain some expressions of this feeling which it is painful to read even at this distance of time.

They are addressed to a friend his old preceptor:—

“Formed by thy care to hopes of simplest praise,
Taught to pursue the best and safest ways;
The paths to honor, riches, and renown,
How have I fallen beneath fell fortune’s frown!
Hard, if all hope were dead, all spirit gone,
And every prospect closed—at thirty-one.”

In the midst of his difficulties he married. His celebrated son was born on the 11th of April, 1770. But he was now dying, and, on the 11th of April, 1771, the anniversary of his son’s birth, he closed the long and cheerless labor of his existence.

Those are the examples which make us shrink at the abuse of wealth. There must have been many a man of wealth acquainted with the difficulties of this struggling and suffering man. Yet there does not appear to have been a single helping hand put forth to save him from ruin. What was it to them if a being of genius, of accomplishment, and intellectual industry perished before

their eyes? They had other employment for their tens and fifty thousands a year. The rent of an opera box, the purchase of a ring, the price of a racer, might have rescued him from the bitterness of solitude and despair. But he was suffered to sink and die.

The same spirit of sullen apathy and haughty selfishness subsists at this hour. The man will give £500 for his portrait, or £5,000 for a picture to hang in his gallery, who would not give 5s. to lighten the difficulties even of all the genius of the globe. Every object of vanity or folly, of paltry pride or abortive ambition, has its price, and the price is readily paid; but there the account is closed with mankind. There is no habit which calls more powerfully for reform than the apathy of rank and opulence!

George Canning, after receiving the rudiments of education at a school in the neighborhood of Winchester, was sent to Eton, where he joined a boy debating club, was a contributor to a boy periodical paper, and wrote verses of the usual boyish calibre.

Eton has the reputation of making the fortunes of poor students by forming connections with the rich. But Canning’s Etonian intercourse fell among a singularly lacklustre generation. No name of any future distinction is mentioned among them, except those of Ellis and Frere. Even they were twinkling lights, and were soon extinguished in the glow of public life. But in Christ Church, Oxford, he found associations of higher value. Jenkinson, (afterwards Lord Liverpool,) Sturges Bourne, Lords Holland, Grenville, Carlisle, and others of the same rank, all intended for public life, were students of his college; and his graceful scholarship, and still more graceful manners, gained him at once general respect and general popularity.

An initiation of this order naturally led to a life of politics. In those days there were whigs and tories. They are no more. The parties are gone, and the names are almost as obsolete as the parties. The simple object of both was power. The parliamentary contests had lost all their reality since the American war. Public men played their game in parliament almost as exclusively as in the clubs of St. James’ street. Clever men made clever speeches. Fox, once in every three months, charged Pitt with his early propensities to reform, and Pitt as often charged Fox with the scandalous flexibility of the coalition. The public amused themselves with both, stood by as at a match in a fencing school, numbered the hits given and received, and, when both performers were wearied, quietly saw them change their costume, lay by their foils, and walk away from the place of exhibition. And this “passage of arms” they called the noblest privilege of British liberty.

But other times and things were at hand. In a period of the most profound peace known in Europe for a hundred years—in a scene of European progress unexampled since the revival of European knowledge—the age of barbarism seemed suddenly to have returned. If Europe had been instantly overspread with the swamps and forests of the sixth century, and those swamps and forests pouring out a savage invasion of the wolf and the panther by millions, the consternation could not have been more universal, or the resistance more hopeless. The continent was devastated at once. The masters of its thrones either fled or perished,

and the supremacy of brute force seemed to be the destiny of all nations. But the sea was the barrier of England, and she preserved her soil unravaged.

We can now glance back in safety on this period, and see the infinite blunders committed by the most renowned statesmanship, the marvellous shallowness of the most profound political sagacity, the measureless ignorance of the most experienced, and, above all, the astonishing escapes which we had from utter ruin. But terror sobers the vanity even of politicians. The whigs were startled at their own extravagances, and dared play their antics no more; public council, forced by the hazards of the crisis to grow serious, became rational and real. The question was no longer how to displace the minister, but how to preserve the empire. The public would endure the artistical dexterity of the masters of rhetoric no more, and disputation gave way to the demand for national wisdom. The whigs, already reduced to the skeleton of a party, sank from the public eye, and no one dreamed of either exhuming the remains or invoking the spirit. Pitt, in unquestioned power, was now the natural refuge of the state, and every man of opposition who had either property to protect or principle to maintain took refuge under his shadow.

It was at this time that George Canning came into public life. There is a romantic story that Pitt, struck with his talents, sent for him, inquired his political tastes, and proposed to bring him into parliament. But the story belongs to Arcadia more than to Downing-street. No English minister ever selects his young performers like a ballet-master, from their display at a rehearsal. Pitt was the last man to submit to the trouble of temptation, or to the chance of a refusal; and Canning, though never capable of being charged with a dishonorable passion for place, was never destitute of that quickness of vision which sees future office in present zeal, or that niceness of tact which at once discovers on which side of the parliamentary field the soil promises to be most productive. Still, an introducer was necessary, and he could not have a more effective one than his honest and heavy friend Jenkinson.

This son of old Lord Liverpool had been born for office. Every sinew and bone of his frame was long before paid for by the public. With him, if parliament was purgatory, Downing-street was paradise. To do his duty behind his desk—and he did it faithfully—to make an appointed speech once a month, and no man could do it with more toilsome sincerity, and to receive his handsome salary four times a year, and his punctuality in this point was never denied—formed the outline of his political history. And such is the memorable effect of perseverance, that his rise was as uninterrupted as it was unnoticed. The country became so much accustomed to see him in office that it felt no surprise when it at length saw him in the premiership; and there, alike unmoved and unassailed, he remained for eleven years, and would probably have remained for ten times the number if disease or nature had not prohibited his ministerial perpetuity.

Canning had been a whig. Every showy schoolboy is at heart a whig, as every rational man is at heart a Tory. He had been patted on the head when in petticoats by Fox; and had tried on his first principles under the helping hand of

Sheridan; but Fox living on a subscription, and Sheridan living on nothing, might have awakened a hermit to the barrenness of opposition; and Canning, with all the ardor of genius and of proselytism, devoted himself to Downing street forever.

Still it would be injustice to his memory, as well as to a great cause, to doubt that he had taken the side of personal honor and political wisdom. There is now no longer any attempt to defend the rebellion of France. There never was any doubt of its guilt in the mind of any honest man. It was an insurrection against more than the French monarchy; it was an insurrection against all government, against all human rights, against all property, all order, and all principle. If the eye of man could embody the invisible things of that world of darkness from which the evil of the earth is administered, it would have seen in the ascent of that spirit of overthrow a new enemy commissioned to visit human crime with new suffering and new sorrow. While Jacobinism struck the unfortunate king from his throne, and usurped it with a diadem of fire, and the axe for a sceptre, it commenced a reign of havoc in France by a manifesto of havoc to the continent. Once in possession of Europe, it would have been in possession of the world. All property would have been a prey, all life a sacrifice, all religion a fable, all morals a mockery, until some fearful interposition of the great Disposer of man and his destinies vindicated his own providence, and turned the globe into a dungeon or a grave.

Times like those may come again. France is not the only country which may be frenzied by the rabble. It is only wisdom to be prepared against the coming trial, and the noblest preparation is to be found in the voices that still speak from the dust of memorable men. No one will suspect Grattan of a passion for the prerogative. Yet what was the language of this great political prophet in 1795?—

“The speech from the throne goes to three objects—the preservation of Europe, the harmony of the present generation, and the education of the future. We cannot debate the causes of the war; we deliberate on the danger of Europe, and our own. Do not depreciate so much your danger, or your preëminence, as to imagine that you are no more concerned in the evils of the times than to read the *Gazette* which relates them, nor forget that you have raised your head too high on the globe not to encounter the storm. If the continent shall belong to France—if all the coast, from Holland to Brest, shall belong to France—this island (Ireland) must sink to the bottom of the ocean.”

He follows up the view of French physical power by the exposition of the greater peril of her principles:—

“A strip of land, a barren island, a remote and uncultivated tract, the speculation of the produce of a waste, or the vision of a punctilio of honor, do not now, as once, kindle Europe to arms. It is Europe herself and her islands that are at stake—princes, potentates, her orders and degrees, the creature and the Creator. It follows that the present object of the war is not, because it cannot be, to interfere with the internal government of France. It is to prevent her interference with every realm and government, by arms, intrigues, and money—by land and by sea—in consequence

of her great successes, and in pursuance of her elementary decree, passed as a principle, withdrawn as an expedient, but acted on as a maxim."

In a succeeding passage, whose metaphorical richness only increases its logical force and its historic conviction, this great speaker depicts the republican "freedom" of France:—

"As little does the present state of the war attack the liberty of France. I wish that she had liberty, I wish that there was anything in her internal situation that promised liberty to herself or security to Europe. No nation, perhaps, understands liberty better than yourself. But did you, in your struggles, ever imagine such a species of liberty? Her liberty is death, and her state bedlam, where the sceptre is broken into ten thousand scorpions, in the hands of ten thousand maniacs, scourging one another for offences only to be exceeded by the barbarity with which they are punished. The principles of such a revolution, the active nature of its framers, the natural genius of the people, the hopes of acquisition and the love of intrigue, the doctrine which they promulgate and the alarms which they give, find or make an enemy of the rest of Europe. *Such a revolution must be a war!*"

This was the language of a man who saw the truth and had the honesty to speak it. It had been already uttered by the great minister of England. It was now echoed all round the horizon. Fox committed the infinite folly of denying that it was the voice of the people, and was instantly confuted by seeing himself left alone. His character changed from the victorious leader of the aristocracy into the baffled tempter of the populace; living only to show into what political abandonment false principles might throw the most powerful head of the most powerful party, and exiled from power until his great rival was in the grave.

The accession of Canning to the minister was important at the time. The war languished. The animation of the first conflicts had passed away. The pressure of a defence which embraced all Europe was painfully felt. The war had begun to be a war of protocols and pamphlets, and opinion took the place of arms. Canning's dexterity of wit and elegance of scholarship were incomparably fitted for this state of things. The laugh had hitherto been on the side of the whigs. To their utter astonishment they found themselves suddenly assailed by a pungency keener than their own, plied with an activity to which their satire was tardy and languid. The weekly journal, the "Anti-jacobin," was projected by Canning. His easy pleasantry was invigorated by his knowledge of public life; his classic epigrams were pointed by an intimacy with individual character; and his natural elegance of style cut deep without the offence of personal coarseness. The pen in his hand performed less the office of the stiletto than of the sting of some insect, floating on brilliant wings, lightly touching but keenly felt, and leaving the mark of its puncture long behind. The laugh was now against the whigs. The Rolliad was flung by as too heavy for the livelier fashion of the time; and the grave severities of its laborious caricatures were thrown into the dust of the library, while the slight but speaking outlines of "The Anti-jacobin" were the sport of every high-bred table.

But Canning was now to be occupied in efforts of a higher rank. The difficulties of the war

thickened. Ireland had revolted, and been coerced only by force of arms; the channel fleet had mutinied; the revolutionary clubs began to hold more menacing language. The people grew weary of a war, which gave them no subject of national triumph, nor even stimulated their public spirit by casual defeat. All that was not complaint was lassitude. At length Pitt yielded to the cry for peace. A negotiation was begun with France. Its fate might have been easily foretold. For when did a republic ever stop with the prospect of triumph before it? Lord Malmesbury, on whose tomb might be written for his whole history, "A diplomatist who never succeeded," was the negotiator. His fate was to fail. The French demanded conditions which were meant to make the war perpetual, or to bring England on her knees. Tierney, the whig organ, made a motion actually pronouncing the hopelessness of fighting for the cause of Europe, the irrevocable triumph of France, and the necessity of English submission. The speech sealed the fate of the whigs. Canning rose, and, by appealing to the natural manliness of the nation, swept his antagonist from the field. He pointed out the infinite treachery which had rewarded all confidence in the republic; the calamities of its alliance, the plunder, the misery, the insults which followed in its track; and then demanded whether England was to sheath the sword simply to receive the yoke of France—whether she was to give up in the beginning of the contest all that could be exacted from her in the last extremity of ruin, or to surrender the last hope of the recovery of Europe, while she retained all her original strength, while the war had been to her only a succession of victories, and while the indignation of mankind was only awaiting the opportunity of a magnanimous revenge.

From this period he was regarded as the most conspicuous man of the senate, excepting Pitt and Fox; his progress was predicted, and the highest employments of the state seemed only to await the work of time. But nothing is more fallible than the prediction which decides on the fortunes of politicians. It was not till twenty-six years after this period that he attained the natural object of his ambition—the premiership. In the interval he had held various high offices, and, among the rest, that of foreign secretary. Yet it is from this point of his history that those who desire to respect his memory would most willingly be silent. After a life of hostility to whiggism, he allied himself to the whigs; after the most contemptuous exposure of their follies, their fictions, and their perfidy, he restored their fallen party as recruits to his cabinet. The eloquent denouncer of Fox, he imitated his example in a coalition. And for all these unhappy sacrifices he enjoyed the premiership, from the 12th of April to the 30th of August, 1827—four months and a half of mental pain and political trial, which probably hurried this brilliant spirit to his grave. He died at the age of fifty-seven, and was buried in Westminster Abbey, at the foot of Pitt's tomb.

Canning's true destination was parliament. He was an admirable debater, clear, keen, and dextrous. His claims to the higher rank of an orator are more doubtful. We look in vain for those noble bursts of feeling, those raptures of magnificent thought, and that power of rich and original illustration which form the essentials of the great orator. His style, blameless, polished, and exhibiting unwearying refinement, wants the noblest

attribute of eloquence—force; often delighting the hearer, he seldom charms the reader; and we find in his finest efforts but little that speaks to the imagination, and nothing that subdues the heart. He has left us none of those passages which chain the reader to the page, impress the involuntary recollection, and give a spontaneous elevation to the mind.

Canning was a poet, but his poetry was slight and occasional. He wrote with the taste of an educated mind; but he seldom soared beyond *vers de société*. When he attempted higher flights he failed, and his poem of "New Morality" only exhibits the preciseness of Pope without his wit, and the heaviness of Dryden without his power.

But it is remarkable, though not uncharacteristic, in the busy and ambitious life of office, that perhaps no minister since Walpole exhibited so little of ministerial protection or public patronage to literature. Campbell the poet's pension of £200 a year, a scandalous dole for a man of genius, was the gift of Addington. Scott's patronage was the act of the prince. But, in a period of singularly vigorous authorship, the most accomplished member of the cabinet seems to have looked on, meanly insensible to the delight of fostering early ability, heartlessly unmoved by the difficulties of a life of authorship, and unwisely neglectful of the honors which a well-employed patronage reflects on the nation. An under clerk in his office palpably had more merit in his eyes than the whole authorship of England. He might have been an illustrious promoter of national literature; but he did nothing, and thus threw away one of the noblest securities against oblivion.

From the Britannia.

IBRAHIM PASHA IN THE MANUFACTURING DISTRICTS.

THE Egyptian prince has been since our last publication engaged in a tour through the manufacturing districts, where, as in his visits to the public institutions of the metropolis, his attention has been chiefly directed to the useful and practical. We are told that he seemed struck with wonder and admiration as he passed from one to another of the gigantic workshops, frequently exclaiming that he was no longer surprised at the greatness of a country that possessed such machinery and powers of production. It is expected that he will return to London in about a week. A grand review is said to be in contemplation for his entertainment; and he will be taken to see Woolwich, and other metropolitan lions with which he has not yet made acquaintance.

On Saturday, before his departure for Birmingham, Ibrahim visited the Horticultural Society's gardens at Chiswick, where he displayed his usual inquisitiveness, often pushing his interrogatories to the utmost limit of his conductor's comprehension. He was pleased to admire many of the triumphs of gardening displayed to him, and, after making a tour of the tents where the flowers and fruits were displayed, he was conducted by the Marquis of Normanby and the Earl of Auckland to a tent, where a collation had been prepared for his refectory. Here, it appears, he was exposed to some rude curiosity, for a reporter tells us:—"If the person whose official duty it was to make fitting preparations for the commodious privacy of a guest whose presence he had so sedulously

sought had previously determined to make the most of his lion by exhibiting him at feeding time to an admiring public, he could not have contrived this part of his show with greater skill than did the functionary at this establishment. The tent wherein Ibrahim Pasha and his suite sat at table was quite exposed to the public gaze; and, as the gardens were teeming with the multitudes who had been attracted by the notice of his intended visit, a crowd was speedily collected around the spot, and his actions, and every trifling gesture, as well as the quantity and quality of the viands and fruits of which he was partaking, were loudly and pertinaciously scanned and discussed. In vain the policemen in waiting tried to ward off the crowd. At length the Pasha rose from the table, and, being conducted by the Earl of Auckland to his carriage, thanked his noble host, through the medium of Nubar Effendi, for the entertainment he had received, and was conveyed to Mivart's." His highness and suite, except Suleiman Pasha, who remained in town, departed from the Euston-square station of the London and Birmingham railway by the five o'clock afternoon train for Birmingham, where they arrived at eight o'clock. Ibrahim travelled in the carriage built for the accommodation of the Queen Dowager. The Pasha and his party arrived at Birmingham at eight o'clock, and proceeded direct to Dee's hotel. After taking some refreshment he appeared on the balcony smoking his pipe, and enjoying the *dolce far niente* in true oriental style. He retired early to bed.

On Sunday the Pasha visited the castle and grounds of Warwick, and the town of Leamington, returning in the evening to Birmingham, where he again gratified the multitude by appearing on the balcony.

On Monday he commenced his inspection of the principal show-rooms and manufactories of Birmingham, with a visit to the electro-plate works of Mr. Collis, who is Turkish consul at that town. Mr. Collis struck for his highness a silver medal, containing Ibrahim's name in the *exergue*, and the date of his visit, and the operation of gilding this medal by the electro process was subsequently performed in the presence of the prince. In the course of the morning his highness visited successively a pin manufactory, a brass-bedstead manufactory, and a glass-house; in the latter the prince appeared more than ordinarily interested. Glass, from its resemblance to the rarest product of nature, has always excited in the east a peculiar degree of interest; and it is on record that the successful issue of an embassy once turned upon a happy present of this dazzling and brittle material. When the materials of which the glass is composed were shown to the prince, he asked if every sort of sand was equally good for the purpose, when he was told that it required a very peculiar kind in order to produce the species of glass he was inspecting. He seemed interested in being told that arsenic, the deadliest of the mineral poisons, formed an essential ingredient in the composition of glass; and when it was affirmed that if plates of ground glass were placed (without being polished) one upon another, they would adhere together, his astonishment reached the bounds of incredulity. In the afternoon, having lunched and taken his half hour's repose, Ibrahim was conducted by Major Dickson to three other factories—namely, a pen, a papier maché, and a button factory.

Some remarks made on the perseverance with which Ibrahim pursued his researches into our in-

dustrial economy on this day will apply to every other day he spent in the great centre of our manufactures in metal:—"Not all the stinks, heats, closeness of atmosphere, crowding, climbing of narrow stairs, or other concomitants of such researches, could move his Egyptian highness from his purpose. Up he went into the garrets and workrooms, and down again into the cellars, with as much resolution as if he were climbing a breach or undermining a fortification; and, doubtless, he has stored up in his recollection a rich treasury of observation with which to regale his future meditation and to form the subject of conversation with his friend, companion, and faithful officer, Colonel Bonfort, whose assiduity in worming out little odds and ends of facts and statistics, and whose kindness in coming to the rescue of Nubar Effendi (when overcome, which he seldom is, by the difficulties of English operative explanations) is boundless. It may, perhaps, be proper to add that his highness has given some very liberal orders for Birmingham staples."

Ibrahim's sight-seeing on Monday closed with a ludicrous incident. It appears that the Pasha was informed that the skin of a whale was to be exhibited at one of the booths lately erected at the mid-summer fair, and his highness immediately ordered a car to convey him to the exhibition. The proprietor, who had been previously apprised of his highness' intention to honor him with a visit, immediately proceeded to set his house in order, and determined on making the most of his distinguished visitor. In a short time the Pasha and one of his attendants arrived, as they thought, quite privately, and were immediately conducted into the exhibition-booth. The proprietor then made his appearance on the outer platform, and with a stentorian voice announced that he had then for exhibition the monstrous whale, with which he judiciously contrived to couple the name of the Pasha, so as to constitute him a part and parcel of the exhibition. It is needless to say the announcement was successful, and never before was the monster of the deep honored with such a rush of spectators. Money-takers were all the proprietor stood in need of; the place became instantly crowded to excess; and the Pasha, having been informed of the benefit which his visit had conferred upon the showman, good-humoredly enjoyed the amusement, and while the crowds were rushing in through the front entrance he took his departure from the rear of the erection, leaving the proprietor to settle with the company for the non-appearance of one portion of the exhibition which he had ingeniously announced. On his return to the hotel the adventure constituted some good jokes for the evening, which were not lessened by another application from Mr. Showman for the *paushau* to visit him again. A guinea was given as a substitute for his highness' attendance, and the intended honor was declined.

At ten o'clock on Tuesday morning Ibrahim resumed his researches by following his conductor to Mr. Smith's brass lamp factory, where the Pasha exhibited a trait of natural politeness that won the hearts of the operatives. Preparations had been made for casting some brass ornaments, in order to show how the moulds were prepared and the crucibles heated; but Ibrahim, who has witnessed some very gigantic proceedings of this nature elsewhere, was about hastily to go away without stopping to see the molten brass poured into the mould, when suddenly he bethought himself of the workman's disappointment in not being allowed to show

his manual dexterity, and stopped during the process "*pour lui faire plaisir*," as Colonel Bonfort said. The next object of curiosity was a wire-drawing and metal rolling mill, from whence the Pasha proceeded to the corporation gun-barrel proof-house, where the master-proofer had prepared a volley of 120 guns, which were discharged while his highness was in the place. He was very much amused at the Britannia nail factory, which he next visited, where every kind of this article, from the tenpenny nail, so famous in nursery song, down to the smallest tin-tack, is turned by millions out of hand. The celerity of the operation and the vast number of nail-cutting machines driven by one steam-engine appeared to have resolved the difficulty which the prince had previously felt as to how it was possible to sell these useful articles of manufacture at such apparently incommensurate prices. In the afternoon Ibrahim visited the gun factory of Mr. Westley Richards, where firearms of the most costly and admirable workmanship are made, after which he went to the military sword and musket manufactory of Messrs. Sargeant, where the manner in which the gun-barrels are formed out of the huge masses of red hot iron was displayed to him through all its stages. The price of these weapons, as well as of the regulation swords furnished for the naval service, formed a subject of minute investigation.

Wednesday was devoted by Ibrahim to a tour in the vicinity of Birmingham for the purpose of visiting some establishments of a grander character than he had previously an opportunity of inspecting. He was early astir, and after visiting the free grammar school in New-street, where he made a number of minute and intelligent inquiries into the system of education pursued there, he proceeded direct to the Soho works, which still exist in the name of the memorable firm of Bolton and Watts. The process of turning and planing the vast pistons of 500 horse power engines; of forming the screws; of polishing the cylinders, of riveting the huge boilers, and of completing the minutest portions of these wonderful results of human skill were successively explained to his highness, whose imagination seemed for once in a way to be roused at the sight of that ancient factory, which, as his own poetic and figurative language would express it, was the "great grandfather of the steam-engine." From the Soho works his highness was conveyed to the village of Smethwick, wherein are situated the plate and window glass manufactory of Messrs. Chance and Company, which, in point of extent and quantity of work turned out, are unrivalled in England, and consequently in the world. The mode in which the cylinders of glass, after being blown, are cut open and flatted in a heated chamber, was shown to the prince, as also was the polishing department, wherein some eighty machines, each polishing two plates of glass, were at that moment in full operation, forming a very beautiful picture of undisturbed regularity and unremitting industry. From Messrs. Chance's factory the carriages drove onward for some miles through the most busy and industrious district of all England, that, namely, wherein the coal and iron stone lying one above the other offer the ready means of bringing the most valuable mineral into its most tangible and useful form. The prince, seeing the heaps of coal and iron stone piled by the wayside, inquired what they were, and, being told that the two materials were almost always found together in one bed, his highness jocularly exclaimed, "Ah! I see—they beget

the steam-engine between them!" The coal mine to which Ibrahim was conducted was that of Mr. Hunt, of the Brades, who has a very extensive colliery, drawing about eighty tons a day. When Ibrahim arrived at the pit mouth he looked very cautiously into the shaft, holding fast by the iron clamp that is screwed on to the uprights over the mouth. Mr. Hunt, jun., who did the honors on the occasion, asked if his highness wished to descend? but Ibrahim shook his head, and said a few words to Nubar, who, bowing to his destiny, took his place in the descending car; but the placid submission of the devoted *secrétaire interprète* excited the sympathies of Col. Bonfort and of Major Dickson, who both gallantly volunteered to accompany Nubar in his descent into the bowels of the earth, and, thus richly laden, the truck slowly descended into the dark and murky depths (220 yards) of Mr. Hunt's "Khasnah" (treasury) as an Arab would call the mine. As the suite of his Egyptian highness (for every person present in charge of him went down below) vanished from his sight, Ibrahim seemed to get uneasy, and to wish them back again; he called out several times to Colonel Bonfort to take care, and when the rope had ceased to run, and was on its return with a load of coal, the prince pulled out his watch and looked anxiously at it, as if to count the minutes of their absence. Three times did the basket ascend and descend, whilst there was as yet no appearance of the absentees, when at length Ibrahim, who had been pacing to and fro about the pit-mouth, went to the opening, and, holding fast, bawled out as loudly as he could, "Bonfort!" "Bonfort!" Mr. Hunt, seeing his evident anxiety, sent one of the workmen down, who speedily returned with the whole party, who reappeared, (black and begrimed,) much to the satisfaction of their patron. A short visit was paid to Mr. Hunt, at his residence in the valley below the pit-mouth, where Ibrahim was induced to forego his morning rule of abstinence, by the daughter of his host, who brought his highness a glass of champagne, (a very liberal distribution of that agreeable liquid being made amongst his thirsty suite,) which the prince, with an affable bow and a smile, quaffed to her health. Ibrahim returned to his hotel fatigued by his tour, and set out in the afternoon for Manchester.

The Birmingham correspondent of a morning paper winds up his report with these remarks:—"Thus has closed the visit of Ibrahim Pasha to the toy-shop of the world. He came as a private individual, and was received and treated as such. If he had desired greater distinction he could have obtained it. The civic authorities would willingly have paid him all the respect due to his rank, but he appears to have come amongst us for more important purposes than those of mere pomp and pageantry. His desire evidently was to behold with his own eyes those wonders of art of which he had read and heard so much, but which, after all, must be seen and examined to be duly appreciated. When first conducted to the show-rooms, in which some tastefully-designed and ornamented articles were laid out before him, he seemed to pay comparatively little attention to them; but when conducted into the workshops his eyes were presently in all directions, and he quickly recognized the leading machinery and works of importance. To these he gave his attention, and I am sure he never will forget the generous spirit in which the veriest secrets of this great emporium of British art and industry were freely and frankly laid open to him."

By all parties he was treated with kindness and attention; and I believe he leaves the good town of Birmingham fully impressed with a conviction of its commercial and manufacturing importance."

THE CHINESE AND FOREIGNERS IN CHINA.—The following is a summary of a document which has been issued by the Governor of Canton on the 8th of March, and communicated by a member of the French embassy in China, just arrived at Marseilles: First. The native Chinese ought to live in harmony and good friendship with the barbarians of all countries. Second. The subjects of every country are authorized to bring with them their families to the five ports of Canton, Amoy, Ningpo, Puchetoo and Shanghai, and carry on their commerce without interruption. Third. It should be the duty of the consuls to address every year to the local authorities a statement of the exact number of houses let to foreign families, and the rent for which they are let. The condition of these lettings ought to be arranged with justice and equity. The Chinese must not extort money from the foreigners. The Chinese mandarins will see to this. Fourth. The ships of all nations are permitted to carry on commerce with the five ports. Every ship that shall appear elsewhere may be confiscated by the Chinese authorities. Fifth. The Hong merchants of Canton having been established, the merchants of different nations are authorized to transact affairs in merchandize with the before-mentioned five ports, whether for importation or exportation, with the Chinese. If any combination should exist among the inhabitants to establish a monopoly, the consul should make it known to the Chinese authorities, who will prevent it. Merchants belonging to foreign nations, who shall have been established, either permanently or temporarily, in any of the Chinese ports, are not permitted to penetrate into the villages, nor to trade with the interior. The limits which they ought not to pass will be fixed according to the localities and the dispositions of the people. If they venture beyond these limits, the natives may conduct them to the consuls, but without maltreating or injuring them. The dealers of various nations may hire the services of workmen, sailors, &c. It is not prohibited to persons who let out their services to teach the language and literature of the Chinese to these foreigners. Every foreigner may purchase Chinese books of every kind, without any restriction. If any foreign ship shall be assailed by bad weather in the Chinese waters, or shall be run upon the rocks, or shall be sunk, the mandarins on the coast ought immediately to give every aid in their power to save the crew, &c. If the populace or native crews pillage such ship, they shall be rigorously chastised. The same rule holds good respecting any accident in the interior waters of China."

BOMBAY.—A few days ago Baboo Mutty Lall Leul proposed to the Dhurma Subha, a Society of Orthodox Hindoos, to petition government for some enactment in favor of the re-marriage of Hindoo widows. It appears that his proposal caused a great stir in the meeting, and was loudly exclaimed against, which is not to be wondered at, when it is remembered that the society was originally established to oppose the abolition of *Suttee*. You may not have heard that this same Mutty Lall, some time ago, offered a premium of 10,000 rupees to any Hindoo who would marry a widow.

From *Tait's Magazine*.

SIR EDWARD BULWER LYTTON.

BY GEORGE GILFILLAN, AUTHOR OF "A GALLERY OF LITERARY PORTRAITS."

PERHAPS the leading authors of the age may be divided into three classes. 1st, Those who have written avowedly and entirely for the few. 2dly, Those who have written principally for the many. And, 3dly, Those who have sought their audience in both classes, and have succeeded in forming, to some extent, at once an exoteric and an esoteric school of admirers. Of the first class, Coleridge and Wordsworth are the most distinguished specimens. Scott and Dickens stand at the head of the second; and Byron and Bulwer are *facile principes* of the third. Both these last named writers commenced their career by appealing to the sympathies of the multitude; but by and bye, either satiated by their too easy success, or driven onward by the rapid and gigantic progress of their own minds, they aimed at higher things, and sought, nor sought in vain, a more select audience. Byron's mind, in itself essentially unspeculative, was forced upwards upon those rugged and dangerous tracts of thought, where he has gathered the rarest of his beauties, by intimacy with Shelley, by envious emulation of his Lake contemporaries, and, above all, by the pale hand of his misery, unveiling to him heights and depths in his nature and genius, which were previously unknown and unsuspected, and beckoning him onward through their grim and shadowy regions. He grew, at once, and equally, in guilt, misery, and power. An intruder too, on domains, where some other thinkers had long fixed their calm and permanent dwelling, his appearance was the more startling. Here was a dandy discussing the great questions of natural and moral evil: a *roué* in silk stockings meditating suicide, and mouthing blasphemy on an Alpine rock; a brilliant and popular wit and poet, setting Spinoza to music, and satirizing the principalities and powers of heaven, as bitterly as he had done the bards and reviewers of earth. Into those giddy and terrible heights where Milton had entered a permitted guest, in privilege of virtue; where Goethe had walked in like a passionless and prying cherub, forgetting to worship in his absorbing desire to know; and on which Shelley was wrecked and stranded, in the storm of his fanatical unbelief; Byron is upborne by the presumption and the despair of his mental misery. Unable to see through the high walls which bound and beset our limited faculties and little life, he can at least dash his head against them. Hence, in "Manfred," "Cain," "Heaven and Earth," and "The Vision of Judgment," we have him calling upon the higher minds of his age to be as miserable as he was, just as he had in his first poems addressed the same sad message, less energetically, and less earnestly, to the community at large. And were it not unspeakably painful to contemplate a noble mind engaged in this profitless "apostleship of affliction," this thankless gospel of proclamation to men, that because they are miserable, it is their duty to become more so; that because they are bad, they are bound to be worse; we might be moved to laughter by its striking resemblance to the old story of the fox who had lost his tail.

In the career of Bulwer, we find a faint yet traceable resemblance to that of Byron. Like

him, he began with wit, satire, and persiflage. Like him, he affected, for a season, a melodramatic earnestness. Like him, he was at last stung into genuine sincerity, and shot upwards into a higher sphere of thought and feeling. The three periods in Byron's history, are distinctly marked by the three works, "English Bards," "Childe Harold," and "Cain." So "Pelham," "Eugene Aram," and "Zanoni," accurately mete out the stages in Bulwer's progress. Minor points of resemblance might be noted between the pair. Both sprang from the aristocracy; and one, at least, was prouder of what he deduced from Norman blood, than from nature. Bulwer, like Byron, is a distinguished dandy. Like him, too, he has been separated from his wife. Like him, he is liberal in his politics. And while Byron, by way of doing penance, threw his jaded system into the Greek war, Bulwer has with better result leaped into a tub of cold water!

Point and brilliance are at once perceived to be the leading qualities of Bulwer's writing. His style is vicious from excess of virtue, weak from repletion of strength. Every word is a point, every clause a beauty, the close of every sentence a climax. He is as sedulous of his every stroke, as if the effect of the whole depended upon it. His pages are all sparkling with minute and insulated splendors; not suffused with a uniform and sober glow, nor shown in the reflected light of one solitary and surpassing beauty. Some writers peril their reputation upon one long difficult leap, and it accomplished, walk on at their leisure. With others, writing is a succession of hops, steps, and jumps. This in general is productive of a feeling of tedium. It teases and fatigues the mind of the reader. It is like crying perpetually upon a hearer, who is attending with all his might, to attend more carefully. It at once wearies and provokes, insults the reader, and betrays a fear of conscious weakness on the part of the author. If in Bulwer's writings we weary less than in others, it is owing to the artistic skill with which he intermingles his points of humor with those of sententious reflection or vivid narrative. All is point: but the point perpetually varies from gay to grave, from lively to severe; including in it raillery and reasoning, light dialogue and earnest discussion, bursts of political feeling and raptures of poetical description; here a sarcasm, almost worthy of that "inspired monkey," Voltaire, and there a passage of pensive grandeur, which Rousseau might have written in his tears. To keep up this perpetual play of varied excellence, required at once great vigor, and great versatility of talents: for Bulwer never walks through his part, never prosés, is never tame, and seldom indeed substitutes sound for sense, or mere flummery for force and fire. He generally writes his best; and our great quarrel, indeed, with him is, that he is too uniformly erect in the stirrups, too conscious of himself, of his exquisite management, of his complete equipment, of the speed with which he devours the dust; and seldom exhibits the careless grandeur of one who is riding at the pace of the whirlwind, with perfect self-oblivion, and with perfect security.

Bulwer reminds us less of an Englishman Frenchified, than of a Frenchman partially Anglicized. The original powers and tendencies of his mind, his eloquence, wit, sentiments, and feelings, his talents and his opinions, his taste and style, are those of a modern Frenchman. But these, long subjected to English influences and long trained

to be candidates for an English popularity, have been modified and altered from their native bent. In all his writings, however, you breathe a foreign atmosphere, and find very slight sympathy with the habits, manners, or tastes of his native country. Not Zanon alone, of his heroes, is cut off from country as by a chasm, or if held to it, held only by ties, which might with equal strength bind him to other planets: all his leading characters, whatever their own pretensions, or whatever their creator may assert of them, are in reality citizens of the world, and have no more genuine relation to the land whence they spring, than have the winds, which linger not over its loveliest landscapes, and hurry past its most endeared and consecrated spots. Eugene Aram is not an Englishman; Rienzi is hardly an Italian. Bulwer is perhaps the first instance of a great novelist obtaining popularity without a particle of nationality in his spirit, or in his writings. We do not question his attachment to his own principles in his native country; but of that tide of national prejudice, which Burns says, "shall boil on in his breast till the floodgates of life shut in eternal rest," he betrays not one drop. His novels might all have appeared as translations from a foreign language, and have lost but little of their interest or verisimilitude. This is the more remarkable, as his reign exactly divides the space between that of two others, who have obtained boundless fame, greatly in consequence of the very quality, in varied forms, which Bulwer lacks. Scott's knowledge and love of Scotland, Dickens' knowledge and love of London, stand in curious antithesis to Bulwer's intense cosmopolitanism, and ideal indifference.

Akin to this, and connected either as cause or as effect with it, is a certain dignified independence of thought and feeling, inseparable from the motion of Bulwer's mind. He is not a great original thinker; on no one subject can he be called profound, but on all, he thinks and speaks for himself. He belongs to no school either in literature or in politics, and he has created no school. He is too proud for a radical, and too wide-minded for a Tory. He is too definite and decisive to belong to the mystic school of letters; too impetuous and impulsive to cling to the classical; too liberal to be blind to the beauties of either. He has attained, thus, an insulated and original position, and may be viewed as a separate, nor yet a small estate, in our intellectual realm. He may take up for his motto, "*Nullius in verba magistri*;"—he may emblazon on his shield *Desdichado*. Some are torn, by violence, from the sympathies and attachments of their native soil, without seeking to take root elsewhere; others are early transplanted in heart and intellect, to other countries; a few, again, seem born, rooted up, and remain so forever. To this last class we conceive Bulwer to belong. In the present day, the demand for earnestness, in its leading minds, has become incessant and imperative. Men speak of it as if it had been lately erected into a new test of admission into the privileges alike of St. Stephens and of Parnassus. A large and formidable jury, with Thomas Carlyle for foreman, are diligently occupied in trying each new aspirant, as well as *back-speering* the old, on this question: "Earnest or a sham? Heroic, or hearsay? Under which king, Bezonian? speak, or die." Concerning this cry for earnestness, we can only say, *en passant*, that it is not, strictly speaking, new, but

old; as old, surely, as that great question of Deborah's to recreant Reuben—"Why abodest thou among the sheep-folds to hear the bleating of the flocks?" or that more awful query of the Tishbite's—"How long halt ye between two opinions?" That it is, in theory, a robust truth; and sometimes, in application, an exaggeration and a fallacy; and that, unless preceded by the words "enlightened" and "virtuous," earnestness is a quality no more intrinsically admirable, nay, as blind and brutal, as the rush of a bull upon his foe-man, or as the foaming fury of a madman. Bulwer is not, we fear, in the full sense of the term, an earnest man; nay, we have heard of the great modern prophet of the quality, pronouncing him the most thoroughly false man of the age; and another of the same school christens him "a double distilled scent-bottle of cant." In spite of this, however, we deem him to possess, along with much that is affected, much, also, that is true, and much that is deeply sympathetic with sincerity, although no devouring fire of purpose has hitherto filled his being, or been seen to glare in his eye. And, as we hinted before, his later writings exhibit sometimes in mournful and melancholy forms—a growing depth and truth of feeling. Few, indeed, can even sportively wear, for a long time, the yoke of genius, without its iron entering into the soul, and eliciting that cry which becomes immortal.

Bulwer, as a novelist, has, from a compound of conflicting and imported materials, reared to himself an independent structure. He has united many of the qualities of the fashionable novel, of the Godwin philosophical novel, and of the Waverley tale. He has the levity and thorough-bred air of the first; much of the mental anatomy and philosophical thought which often overpower the narrative in the second; and a portion of the dramatic liveliness, the historical interest, and the elaborate costume of the third. If, on the other hand, he is destitute of the long, solemn, overwhelming swell of Godwin's style of writing, and of the variety, the sweet, natural, and healthy tone of Scott's, he has some qualities peculiar to himself—point, polish—at times a classical elegance, at times a barbaric brilliance—and a perpetual mint of short sententious reflections—compact, rounded, and shining as new-made sovereigns. We know no novelist from whose writings we could extract so many striking sentences containing fine thoughts, chased in imagery, "apples of gold in pictures of silver." The wisdom of Scott's sage reflections is homely but commonplace; Godwin beats his gold thin, and you gather his philosophical acumen rather from the whole conduct and tone of the story, and his commentary upon it, than from single and separate thoughts. Dickens, whenever he moralizes, in his own person, becomes insufferably tame and feeble. But it is Bulwer's beauty that he abounds in fine, though not far gleams of insight; and it is his fault that sometimes, while watching these, he allows the story to stand still, or to drag heavily, and sinks the character of novelist in that of brilliant essay-writer, or inditer of smart moral and political apothegms. In fact, his works are too varied and versatile. They are not novels or romances so much as compounds of the newspaper article, the essay, the political squib, the gay and rapid dissertation; which, along with the necessary ingredients of fiction, combine to form a junction, without constituting a true artistic whole.

Reserving a few remarks upon one or two other of his works till afterwards, we recur to the three which seem to typify the stages of his progress; "Pelham," "Eugene Aram," and "Zanoni." "Pelham," like "Anastasius," begins with a prodigious affectation of wit. For several pages the reading is as gay and as wearisome as a jest-book. You sigh for a simple sentence, and would willingly dig even for dulness as for hid treasure. The wit, too, is not an irrepressible and involuntary issue, like that from the teeming brain of Hood; it is an artificial and forced flow; and the author and his reader are equally relieved, when the clear path of the tale at length breaks away from the luxuriant shrubbery in which it is at first buried, and strikes into more open and elevated ground. It is the same with "Anastasius;" but "Pelham," we must admit, does not reach those heights of tenderness, of nervous description and of solemn moralizing, which have rendered the other the prose "Don Juan," and something better. It is, at most, a series, or rather, string, of clever, dashing, disconnected sketches; and the moral problem it works out seems to be no more than this, that, under the corsets of a dandy, there sometimes beats a heart.

In "Eugene Aram," Bulwer evidently aims at a higher mark; and in his own opinion, with considerable success. We gather his estimate of this work from the fact that he inscribes a labored and glowing panegyric on Scott with the words, "The Author of Eugene Aram." Now, probably he would exchange this for "The Author of Zanoni." Nor should we, at least, nor, we think, the public, object to the alteration. "Eugene Aram" seems, to us, as lamentable a perversion of talent as the literature of the age has exhibited. It is one of those works in which an unfortunate choice of subject neutralizes eloquence, genius, and even interest. It is with it as with the "Curse of Kehama," and the "Cenci," where the more splendid the decorations which surround the disgusting object, the more disgusting it becomes. It is, at best, deformity jewelled and enthroned. Not content with the native difficulties of the subject—the triteness of the story—its recent date—its dead level of certainty—the author has, in a sort of daring perversity, created new difficulties for himself to cope withal. He has not bid the real pallid murderer to sit to his pencil, and trusted for success to the severe accuracy of the portraiture. Him he has spirited away, and has substituted the most fantastic of all human fiends, resembling the more hideous of heraldic devices, or the more unearthly of fossil remains. Call him rather a graft from Godwin's Falkland, upon the rough reality of the actual "Eugene Aram;" for the worst of the matter is, that, after fabricating a being entirely new, he is compelled, at last, to clash him with the old pettifogging murderer, till the compound monstrosity is complete and intolerable. The philosopher, the poet, the lover, the sublime victim fighting with "more devils than vast hell can hold," sinks, in the trial scene, where precisely he should have risen up like a "pyramid of fire," into a sophister so mean and shallow, that you are reminded of the toad into which the lost archangel dwindled his giant stature. The morality, too, of the tale, seems to us detestable. The feelings with which you rise from its perusal, or, at least, with which the author seems to wish you to rise, are of regret and indignation, that, for the sin of an hour, such a noble being should perish, as if he would insinuate the

wisdom of quarrel (how vain!) with those austere and awful laws, by which moments of crime expand into centuries of punishment! It is not wonderful that, in the struggle with such self-made difficulties, Bulwer has been defeated. The wonder is, that he has been able to cover his retreat amid such a cloud of beauties; and to attach an interest, almost human, and even profound, to a being whom we cannot, in our wildest dreams, identify with mankind. The whole tale is one of those hazardous experiments which have become so common of late years, in which a scanty success is sought at an infinite peril; like a wild-flower, of no great worth, snatched, by a hardy wanderer, from the very jaws of danger and death. We notice in it, however, with pleasure, the absence of that early levity which marked his writing, the shooting germ of a nobler purpose, and an air of sincerity fast becoming more than an air.

In saying that "Zanoni" is our chief favorite among Bulwer's writings, we consciously expose ourselves to the charge of paradox. If we err, however, on this matter, we err in company with the author himself; and, we believe, with all Germany, and with many enlightened enthusiasts at home. We refer, too, in our approbation, more to the spirit than to the execution of the work. As a whole, as a broad and brilliant picture of a period, and its hero, "Rienzi" is perhaps his greatest work, and "that shield he may hold up against all his enemies." "The last Days of Pompeii," on the other hand, is calculated to enchant classical scholars, and the book glows like a cinder from Vesuvius, and most gorgeously are the reelings of that fiery drunkard depicted. The "Last of the Barons," again, as a cautious, yet skilful filling up of the vast skeleton of Shakspeare, is attractive to all who relish English story. But we are mistaken, if in that class who love to see the Unknown, the Invisible and the Eternal, looking in upon them, through the loops and windows of the present; whose footsteps turn instinctively towards the thick, and the dark places of the "wilderness of this world;" or who, by deep disappointment, or solemn sorrow, have been driven to take up their permanent mental abode upon the perilous verge of the unseen world, if "Zanoni," do not, on such, exert a mightier spell, and to their feelings be not more sweetly attuned, than any other of this writer's books. It is a book not to be read in the drawing-room, but in the fields—not in the sunshine but in the twilight shade—not in the sunshine, unless indeed that sunshine has been saddened, and sheathed by a recent sorrow. Then will its wild and mystic measures, its pathos, and its grandeur, steal in like music, and mingle with the soul's emotions; till, like music, they seem a part of the soul itself.

No term has been more frequently abused than that of religious novel. This, as commonly employed, describes an equivocal birth, if not a monster, of which the worst and most popular specimen, is "Cælebs in Search of a Wife," where a perfect and perfectly insipid gentleman goes out in search of, and succeeds in finding a perfect and perfectly insipid lady. It is amusing to see how its authoress deals with the fictitious part of her book. Holding it with a half shudder, and at arm's-length, as she might a phial of poison, she pours in the other and the other infusion of prose criticism, common-place moralizing, sage aphorism &c., till it is fairly diluted down to her standard of utility and safety. But a religious novel, in the

high and true sense of the term, is a noble thought: a parable of solemn truth, some great moral law, written out as it were in flowers: a principle old as deity, wreathed with beauty, dramatized in action, incarnated in life, purified by suffering and death. And we confess that to this ideal, we know no novel in this our country, that approaches so nearly as "Zanoni." An intense spirituality, a yearning earnestness, a deep religious feeling, lie like the "soft shadow of an angel's wing," upon its every page. Its beauties are not of the "earth earthy." Its very faults, cloudy, colossal, tower above our petty judgment-seats, towards some higher tribunal.

Best of all is that shade of mournful grandeur which rests upon it. Granting all its blemishes, the improbabilities of its story, the occasional extravagancies of its language, let it have its praise, for its pictures of love and grief, of a love leading its votary to sacrifice stupendous privileges, and reminding you of that which made angels resign their starry thrones for the "daughters of men;" and of a grief, too deep for tears, too sacred for lamentation, the grief which he increaseth that increaseth knowledge, the grief which not earthly immortality, which death only can cure. The tears which the most beautiful and melting close of the tale wrings from our eyes, are not those which wet the last pages of ordinary novels: they come from a deeper source; and as the lovers are united in death, to part no more, triumph blends with the tenderness with which we witness the sad yet glorious union. Bulwer, in the last scene, has apparently in his eye the conclusion of the "Revolt of Islam," where Laon and Laone, springing in spirit from the funeral pile, are united in a happier region, in the "calm dwellings of the mighty dead," where on a fairer landscape rests a "holier day," and where the lesson awaits them, that

"Virtue though obscured on earth, no less
Survives all mortal change, in lasting loveliness."

Amid the prodigious number of Bulwer's other productions, we may mention one or two "dearer than the rest." The "Student," from its disconnected plan, and the fact that the majority of its papers appeared previously, has seemed to many a mere published portfolio, if not an aimless collection of its author's study sweepings. This, however, is not a fair or correct estimate of its merits. It in reality contains the cream of Bulwer's periodical writings. And the *New Monthly Magazine*, during his editorship, approached our ideal of a perfect magazine; combining as it did impartiality, variety, and power. His "Conversations with an Ambitious Student in ill health," though hardly equal to the dialogues of Plato, contain many rich meditations and criticisms, suspended round a simple and affecting story. The word "ambitions," however, is unfortunate; for what student is not, and should not be ambitious? To study, is to climb "higher still, and higher, like a cloud of fire." Talk of an ambitious chamois, or of an ambitious lark, as lief as of an ambitious student. The allegories in the "Student," strike us as eminently fine, with glimpses of a more creative imagination, than we can find in any of his writings, save "Zanoni." We have often regretted, that the serious allegory, once too much affected, is now almost obsolete. Why should it be so? why should not more heads be laid down upon John Bunyan's pillow, to see more visions and dream more dreams? Shall truth no more have

its amounts of transfiguration? Must Mirza no more be overheard in his soliloquies? And is the road to the "Den," lost forever? We trust, we trow not. In the "Student," too, occurs his far-famed attack upon the anonymous in periodical writing. We do not coincide with him in this. We do not think that the use of the anonymous either could, or should be relinquished. It is, to be sure, in some measure relinquished as it is. The tidings of the authorship of any article of consequence, in a review or magazine, often now pass with the speed of lightning, through the literary world, till it is as well known in the bookshop of the country town, or the post-office of the country village, as in Albemarle or George street.

But, in the first place, the anonymous forms a very profitable exercise for the acuteness of our young critics, who become, through it, masters in the science of internal evidence, and learn to detect the fine Roman hand of this and the other writer, even in the strokes of his t's, and the dots of his i's. Besides, secondly, the anonymous forms for the author an ideal character, fixes him in an ideal position as it were, projects him out of himself; and hence many writers have surpassed themselves, both in power and popularity, while writing under its shelter. So with Swift, in his "Tale of a Tub;" Pascal, Junius, Sydney Smith, Isaac Taylor, Walter Scott; Addison, too, was never so good as when he put on the short face of the *Spectator*. Wilson is never so good, as when he assumes the glorious *alias* of Christopher North. And, thirdly, the anonymous, when preserved, piques the curiosity of the reader, mystifies him into interest; and, on the other hand, sometimes allows a bold and honest writer, to shoot folly, expose error, strip false pretension, and denounce wrong, with greater safety and effect. A time may come, when the anonymous will require to be abandoned: but we are very doubtful if that time has yet arrived.

In pursuing, at the commencement of this paper, a parallel between Byron and Bulwer, we omitted to note a stage, the last in the former's literary progress. Toward the close of his career, his wild shrieking earnestness, subsided into Epicurean derision. He became dissolved into one contemptuous and unhappy sneer. Beginning with the satiric bitterness of "English Bards," he ended with the fiendish gaiety of "Don Juan." He laughed at first that he "might not weep;" but ultimately this miserable mirth drowned his enthusiasm, his heart, and put out the few flickering embers of his natural piety. The deep tragedy dissolved in a "poor pickle herring," yet mournful farce. We trust that our novelist will not complete his resemblance to the poet, by sinking into a satirist. 'T is indeed a pitiful sight that, of one who has passed the meridian of life and reputation, grinning back in helpless mockery, and toothless laughter, upon the brilliant way which he has traversed, but to which he can return no more. We anticipate for Bulwer a better destiny. He who has mated with the mighty spirit, which had almost reared again the fallen Titanic form of republican Rome; whose genius has travelled up the Rhine, like a breeze of music, "stealing and giving odor;" who, in "Paul Clifford," has searched some "dark bosoms," and not in vain, for pathos and for poetry; who in "England and the English," has cast a rapid but vigorous glance upon the tendencies of our wondrous age; who, in his verse, has so admirably pictured the stages of romance in

Milton's story ; who has gone down a "diver lean and strong," after Schiller, into the "innermost main," lifting with a fearless hand, the "veil that is woven with Night and with Terror;" and in "Zanoni," has essayed to relume the mystic fires of the Rosicrucians, and to reveal the dread secrets of the spiritual world ; must worthily close a career so illustrious. May the clouds and mists of detraction, against which he strove so long, not fail, (to use the words of Hall,) to "form, at evening, a magnificent theatre for his reception, and to surround with augmented glories, the luminary which they cannot hide !"

THE NEW COLONIAL OFFICE.

HABITUAL readers of the *Spectator* will have understood that, at the time of writing the suggestions last week, under the title, "Some Things which the Russell government might do presently, for the public good and its own," we were not aware of the present composition of the colonial office. It was then supposed that Lord Grey would not be a member of the Russell government ; that Mr. Charles Buller likewise might continue out of office ; and that Mr. Hawes would probably be the under-secretary for the home-department. So far as the *personnel* of the new government gave hopes of great improvement in the administration of colonial affairs, the sole reliance was upon Lord John Russell. But although Lord John Russell's proceedings as colonial minister six years ago, and his recent declarations on the subject of colonial government, made it likely that he would endeavor to promote valuable colonial reforms, still it was to be feared that, as prime minister, his hands would be full of other business ; and there was no assurance that the colonial office would not continue to prove an impediment to changes of any importance. Presto, the scene changes, and we behold the very colonial office itself composed of three out-and-out colonial reformers.* Lord John Russell's address to the electors of London contains a promise of colonial reform : he has already fulfilled it to the uttermost of his power within the time, by making Lord Grey colonial minister, and letting him choose such assistants as Mr. Hawes and Mr. Buller. For this act Lord John Russell will obtain some of that credit which is just now the most conspicuous feather in Sir Robert Peel's cap : he will be honored for having made a personal sacrifice to the public service. For Lord John Russell's reputation as a practical statesman rests chiefly on his brief administration of the colonial office ; and there can be no doubt that if he had now placed at the head of that department a person not conversant with colonial questions, and had himself as prime minister directed the changes of policy and practice which were at all events inevitable, he would have consulted his own immediate interest more than he has done by handing over the task to Lord Grey. The changes would have been less complete and valuable, but they would have been Lord John Russell's. Considering Lord Grey's intimate acquaintance with the subject in its two main divisions of colonization and government of colo-

nies, his settled and proclaimed opinions, his industry, and the earnestness not to say wilfulness of his character, we may be very sure that he will put his own mark on whatever may be done. The Russell government and the public will gain by the superior efficiency of the office under Lord Grey as an instrument of colonial reform ; but Lord John Russell individually will not gain the particular increase of reputation which he might have secured. He would find, however, if he could get at Sir Robert Peel's feelings at this time, that the other sort of fame is by much the more agreeable of the two ; not to mention the comfortable whispers of an approving conscience.

The public-spirit evinced by Lord John Russell in this matter seems to pervade the arrangements by which the new colonial office has been composed. If Lord Grey had thought only of himself, he would have chosen an under-secretary from the numerous class of "sticks ;" would have performed himself, as he is very capable of doing, all the most important business within the office ; and would have monopolized the pleasant work of planning improvements and expounding them in parliament. He would not have deliberately shared with others an occupation so sure to be agreeable to a man of his ambition and capacity. He obtains an under-secretary known for laborious habits, and for having opinions of his own on all the questions which the present colonial office will have to decide. Those opinions, it is true, are the same as Lord Grey's ; but Mr. Hawes has a position in the house of commons which will enable him to give utterance to his views, and take an important share in making the public acquainted with the policy, the objects, and the plans, of the new colonial office ; whilst his habits of business and unusual powers of labor must procure him work and consequence in Downing street.

Lord Grey and Mr. Hawes would have been a capital colonial office without help from anybody else : they appear to have concurred in wishing to make a perfect one, by giving to Mr. Charles Buller that large share of the work in hand, and of the honor of its success, which must necessarily, under the arrangement they have made with him, fall to one as familiarly versed as he is in colonial subjects, and whose name is even more before the public in connection with those subjects than either of theirs. We cannot help saying that it is a striking proof of freedom from jealousy of disposition on the part of Lord Grey and Mr. Hawes, to have wished that Mr. Buller should be associated with them in the performance of their official and parliamentary duties. Mr. Hawes, in particular, might have been excused as a son of Adam for objecting to an arrangement which so obviously tends to diminish his merely personal consequence in the house of commons, and of which the suggestion would have been taken as an affront by the common run of aspiring politicians. One observes now and then a peculiar moral nature as ignorant of jealousy as Nelson's was of fear ; but we must confess that it never occurred to us till now to entertain for Mr. Hawes the deep respect which this character commands. Nor is Mr. Buller quite distanced in the race of generosity. Whatever merit in this respect may be awarded to Lord John Russell, Lord Grey, and Mr. Hawes, a considerable portion belongs to Mr. Buller, who, with his complete mastery of the subject of colonization and colonial government, with the reputation acquired by his great speech of 1843 and in subsequent de-

* It is known in the official and political circles, though not formally stated in any list of the new appointments, that the place of judge-advocate-general is not to be almost a sinecure as heretofore, but that Mr. Charles Buller is to perform the duties of an additional parliamentary under-secretary for the colonies.

bates, and with his command of the ear of the house of commons, might have hesitated to undertake irregular and undefined official functions in relation to that subject, as the subordinate of even so eminent a person as Lord Grey. All the four, however, seem to have thought only of getting the public work done in the best way, without regard to personal considerations. We have now, at all events, a thoroughly competent colonial office: thanks to Lord John Russell. After waging for sixteen years a scarcely interrupted war with the great house at the bottom of Downing street, the *Spectator* declares itself not merely satisfied but delighted. We venture to add, that this avowal will be the signal for many an illumination in the distant portions of the British empire, and for no little rejoicing among the colonizing and commercial classes at home.

For this case has no parallel with regard to hopes of performance by a department of government, resting on the bare fact of certain appointments. On every question connected with colonies and the progress of colonization, the views of Lord Grey, Mr. Buller, and Mr. Hawes, are matured, definite, and so completely in unison as to form one policy. The combination of various talents in the official triunity, as well as their appropriate distribution for conception and command, for exposition and persuasion, and for practical efficiency, is most singular. And the opinions of the new colonial office are not merely speculative or theoretical: they consist of specific and earnest purposes. What Lord Grey and his assistants may be expected to do, having the power, is just what they have for years been vainly striving to get done by other hands which had the power but not the will. The will and the power are now conjoined: and we may be as sure of what is going to happen with respect to the extension and government of colonies, as we should have been of the nature of coming changes in the post-office if Rowland Hill had been put at the head of St. Martin's-le-Grand just before the adoption of his plan. Nay, more sure; for the scheme of a uniform penny-postage must at all events have met with formidable opposition on the score of revenue: whereas Lord Grey's plans of colonial reform, being cordially supported, as there is every reason to suppose they will be, by Sir James Graham and Sir Robert Peel, have now only to be proposed in order to be carried into effect.

What these plans are is not generally known, but simply because public opinion in this country takes little heed of colonial questions. *Hansard* must be searched, by most people, before they can even comprehend what colonizers and colonists have long expected as results of Lord Grey's much-desired accession to power in colonial matters. Hence a singular property of the task which he has undertaken: the public at large will estimate its importance solely by its fruits. Lord Grey's position resembles that of the general in battle, whose capacity will be measured by the event; who will bear the whole blame of failure, or obtain nearly all the honor of success. Vain would be any attempt on his part to induce the public to share responsibility with him by sanctioning his plans before trial. If his plans are as sound and great as those believe who have cared to understand them, it is a happy accident that self-reliance and active energy unite in his character with the contemplative faculties.—*Spectator*, July 11.

SUGAR TRADE—WEST INDIES.

OUR West Indian colonies, the great producers of sugar for the British market, are threatened with damage from competition with countries still employing slaves, after we have forbidden the West Indian planters to possess slaves. They have never believed it possible that the English government could be guilty of that practical inconsistency; forgetting that the English government is not immortal—does not last through a generation—has not the average life of a cab-horse: nor have they believed till now, when the event has come. It is not generous, therefore, but simply just, to give them time to prepare for the unexpected competition. Time is not unneeded. The West Indian planter possessed a certain number of black laborers, all of whom, under the institution of slavery, he could keep at the appointed work of sugar-making. As soon as slavery was abolished, the blacks were free to take their choice in a wider range of employments; many abandoned the sugar-fields, and those who remained have bestowed only a portion of their time. It has become necessary for the planter not only to supply the deficiency of hands, but also as much as possible to diminish his own dependence on mere human labor by improved implements and methods of cultivation or manufacture. Both processes take time; up to this moment, both have been impeded by official obstructions. But the allowance of time would not be inconsistent with the immediate settlement of the question: a bill, passed next week, may provide for the prospective and gradual abandonment of the differential sugar-duties; just as Sir Robert Peel's corn bill provided for the prospective abandonment of corn-duties. With free trade to their detriment, the West Indians justly demanded free trade to their advantage—free admission to this country of their rum at duty equal to that on home spirits; free admission for their molasses, at an equivalent (say) to our malt-duty, to be used in British manufactures. And above all, they have a right to a free supply of labor, whencesoever they can procure it. Simultaneously with the new sugar bill, let them have Lord John Russell's promise that free trade shall extend its benefits also to them. New regulations for the free ingress of tropical labor might at once be adopted by the executive government without troubling the parliament.

The other great risk involves moral considerations touching slavery and the civilization of the negro race. When once slave-sugar is admitted to the British markets, its value will rise; with it will rise the value of slave-labor, the premium on the slave-trade. Yes, unpleasant as it is, that fact must be admitted. The confession, however, is but another term for admitting a truth which has gradually been creeping on the conviction of all unbiassed observers—that the pertinacious attempt of this country forcibly to suppress the slave-trade carried on by other countries, alien to our laws, is impracticable. Our devices to effect it, our resources to disguise the ruinous cost to ourselves, are exhausted. But we need not abandon our generous aspirations in despair: there is still hope. Those of our readers who are new to the subject will find suggestions for relinquishing the crusade against the slave-trade, without abandoning the emancipation of the negro race, fully developed in a Supplement which we published on the 15th of

April, 1843.* Suffice it here to say, that slave-labor must be discouraged by encouraging free-labor, that the West Indies must be strengthened to complete the experiment which we forced upon them—to show that free trade in sugar is not incompatible with prosperity for the employers of free African labor. The pestilent atmosphere renders Africa inaccessible to the European; frustrating every effort that he makes to penetrate that continent as the herald of civilization. In the West Indies the European and African meet on common ground: the African is there free—protected—cherished—admitted to participate in European arts. A more perfect school could not be provided for him: he finds European styles of agriculture, European commerce, in active operation; and his lessons in both are practical. He finds European training, intellectual and moral, with access even to the highest and most varied literature of England. He finds the freest political and municipal institutions, inviting him to take an active part in them. The negro laborer of the West Indies is on an equal footing of freedom with any member of the working classes in England itself. And it is satisfactory to learn by experience, that the scholar is rapidly trained in that practical school; inasmuch that it would not be difficult, nay, it would be most easy, to rear a whole army of negroes to carry, by reémigration, the arts and blessings of civilized life back to their native continent. It is in the West Indies that Africa may be civilized.—*Spectator*.

THE PRESS IN MATAMORAS.—The *Picayune* says, we have received the first two numbers of the *Republic of the Rio Grande and Friend of the People*. The first number is dated June 1st, and the second, June 8th. The motto of the paper is "Fear not—the brave and generous soldier is only to be dreaded in the field of battle." The paper is edited by H. McCleod. The leading articles are printed both in English and Spanish. The purpose is to convince the people of Tamaulipas, Coahuila, New Leon, and Chihuahua of the futility of resisting American arms, and to throw upon the administration of Paredes the responsibility of the war. A separation of the departments named above from the central government of Mexico is the distinct aim of this new paper. In the first number of the paper there is an earnest appeal, which concludes as follows:

"Rise, then, and shout for the *Republic of Rio Grande*. Abandon the Mexican vulture that preys upon your vitals—the fitting symbol of a government that has no deeper commiseration for your sufferings, than the voracious bird upon her crest feels for the serpent that writhes in his beak. Assemble your delegates within the American lines, organize your provisional government at once, and declare your independence to the Sierre Madre. At your leisure you can debate a constitution, and arrange the details of your government. Rid your new republic of that horrid incubus, the Mexican tariff, which has ruined her treasury and demoralized her people—open your ports and trade freely with all the world—get the most for what you have to sell, by having the world for buyers—get what you want to buy at the cheapest rates, by having the world for sellers—educate your children, protect the liberty of the citizen,

* "Cheap Sugar by Free Labor."

and the rights of property—ally yourselves to the great Mother of Republics, and imitate those qualities which have made her great. Do this, and you will be great and happy yourselves—fail, and your fate is fixed forever.

"Long live the United States of America!

"Long live the Republic of Rio Grande!"

"WORK WHILE IT IS DAY."

Up, Christian! up! and sleep'st thou still?
Daylight is glorious on the hill!
And far advanced the sunny glow
Laughs in the joyous vale below;
The morning shadow, long and late,
Is stretching o'er the dial plate.

And are thine eyes, sad waker, say,
Filled with the tears of yesterday?
Or lowers thy dark and anxious brow
Beneath to-morrow's burdens now?
New strength for every day is given,
Daily the manna falls from heaven.

Link by link the chain is made,
Pearl by pearl the costly braid,
The daily thread of hopes and fears,
Weaves up the woof of many years;
And well thy labor shall have sped,
If well thou weavest the daily thread.

Up, Christian! up! thy cares resign!
The past, the future are not thine!
Show forth to-day thy Saviour's praise,
Redeem the course of evil days;
Life's shadow in its lengthening gloom,
Points daily nearer to the tomb.

TRUE REST.

SWEET is the pleasure
Itself cannot spoil,
Is not true leisure
One with true toil!
Thou that would'st taste it
Still do thy best,
Abuse it not, waste it not,
Else 't is no rest.
Would'st behold beauty
Near thee, all round?
Only hath duty
Such a sight found.
Rest is not quitting
The busy career,
Rest is the fitting
Of self to its sphere.
'T is the brook's motion,
Clear without strife,
Fleeing to ocean
After its life.
Deeper devotion
Nowhere hath knelt,
Fuller emotion
Heart never felt:
'T is loving and serving
The highest and best,
'T is onward, unswerving,
And this is true rest.

Christian Register

From the Foreign Quarterly Review.

1. *Bibliothèque de Mémoires relatifs à l'histoire de France pendant le 18me Siècle.* Vols. 1 and 2. 8vo. 1846. Didot.
2. *The Miscellany of the Spalding Club.* Vols. I. II. Aberdeen. Printed for the Club. 1841-2. 4to.
3. *Auto-biography of Sir Simonds D'Ewes.* London. 1845. 2 vols. 8vo.

"THE study of records and other exotic monuments of antiquity," says Sir Simonds d'Ewes, "is the most ravishing and satisfying of all the parts of human knowledge." And, indeed, without excusing for a moment those unhappy persons, who, like d'Ewes himself, are perpetually poring over trivial facts, of which they cannot discern either the causes or the bearings, it must be frankly allowed that there are few things less "ravishing" or less satisfactory than that sort of regular history which long passed current; exhibiting, no doubt, the more striking results of the passions or the virtues of persons in eminent station, and recording the transactions of a nation in its collective capacity; but telling little of its past existence; not disclosing the nicer shades of its moral and social progress, scarcely touching upon the private life of those dignified persons, whose public acts it records, and not attempting to show in the least what ordinary men and women were doing and thinking, what they believed, what they loved, what they hated, how they lived, or how they died. And yet that which is thought, and said, and felt, is as real history, and, at least, as important to be known, as that which is visibly done by man to man. The written memorials, public and private, from which the dignified conventional "history" is constructed, almost invariably contain more of the spirit of times gone by, than the history itself; but they are rarely capable of being woven into a continuous narrative, and, therefore, the historian often fancies himself compelled to reject them, though they become more valuable than ever, in an age when national peculiarities are vanishing so rapidly.

The French have always been celebrated for their abundant details of ancient life, and the recent commencement of a republication of ancient memoirs, shows the high value they set upon this branch of knowledge. The appearance, too, of the "*Grands Jours de Clermont*," which we lately noticed (an important work, and strongly illustrative of the ultimate causes of the revolution,) suggests the hope that much valuable information may yet be derived from similar sources. And the other publications, whose titles are prefixed to this article, are merely two among many proofs that Europe is alive to the importance of this subject.

In America, a considerable taste for the study of antiquity has lately appeared, and it is not long since general interest was excited by the publication of the witch trials at Salem, among the early settlers, who carried out from the mother country very strong opinions and feelings on the subject, which may in some degree be illustrated by reference to the publications of the Spalding Club. Witches indeed have played an important part in their time, and it is impossible to say that they invariably misemployed their power; since among the records of the Court of Chancery (in the reign of Henry VI., if we recollect aright) there is a bill which states that the art had been exercised by a certain man upon an attorney who had conducted

a lawsuit successfully against him. The attorney, therefore, prays the chancellor to restrain the defendant, by the injunction of the court, from practising witchcraft upon him. It is doubtful whether lawyers have ever partaken largely of the popular feeling on the subject of witchcraft, though they have failed to oppose it with vigor. Sir George Mackenzie, the celebrated lord-advocate of the days of Charles II., though he asserts that the existence of witches is not to be doubted, exhibits no disposition to exaggerate their powers, or those of their master.

"The devil," says Sir George Mackenzie, "cannot transform one species into another, as a woman into a cat, for else he behoved to annihilate some of the substance of the woman, or create some more substance to the cat, the one being much more than the other; and the devil can neither annihilate or create, nor could he make the shapes return, *nam non datur regressus à privatione ad habitum*." This opinion, however, does by no means hold true of the women and cats of Scotland in the days immediately succeeding the Reformation, when the public, being peculiarly sharp-set for the detection of the subtlest processes of satanic agency, ascertained to its entire satisfaction that the whole land was enchanted; that the shapes of women and cats (to say nothing of dogs, hares, and coney) were, under certain influences, interchangeable at pleasure; while evil spirits hopped about in the likeness of magpies, scratched and bit as cats, lowed as calves, bleated as lambs, or pranced as chargers. Our admiration is not more due to the proverbial acuteness which enabled the people of Scotland to arrive at these great truths, than to the energy with which they gave effect to their convictions.

With regard to the general history of this popular delusion, little remains to be learnt, but the strange details, preserved with curious minuteness in the documents printed by the Spalding Club, impart a painful reality to these transactions, which seem more and more incredible and absurd, in proportion to their undoubted and lamentable certainty. It appears that in the town of Aberdeen alone, twenty-four or twenty-five persons were burnt for the crime of witchcraft in the spring of 1597, and there are various notices of others who had suffered previously. The persons accused were generally placed in irons, and confined in the vaults under the town church, and sometimes lay in prison for six months or a year before they were brought for trial. Their judges were the sheriffs, and the magistrates of the town, acting under a special commission.

Public curiosity having been strongly excited upon this subject, the unfortunate witches were eagerly resorted to during their confinement, and they are alleged in many instances to have communicated their evil arts to persons consulting them through the bars of their prisons. It seems reasonably clear, that many of them affected (as some persons still do) to use charms, and were desirous of acquiring the influence which a necromantic reputation never failed to confer; but the long imprisonment, and the variety of mental and bodily torments to which they were subjected, generally produced in the end any kind of a confession which was desired; or if an acknowledgment of guilt could not be extorted from them, witnesses were always ready to support any charge whatever. The confession of Andrew Man (himself a witch, and known as a witch-trier of such exquisite skill,

that he had no difficulty in pronouncing, upon examination, not only whether the person accused was a practitioner of witchcraft, but also, how long he or she had been so) affords an example of the delusions under which those unfortunate persons labored, or of the impressions which they wished to convey to others. It appears, that when he was a young boy, the devil, his master, came to his mother's house, in the likeness and shape of a woman, called the Queen of Elphen, and promised that he should know all things, and should help and cure all sorts of sickness, short of actual death, and that he should fare well, yet (with the ill luck invariably attendant upon such gifts) should have to beg his bread before he died, "as *Thomas Rymour* did." When he grew up, he became a regular votary of the black art. By his witchcraft and sorcery, he was enabled to effect various cures, both of people and of cattle. In one case, the disease was transferred to a cat, which instantly died. A certain spirit, whom he termed *Christsonday*, and supposed to be an angel, and God's godson, although he is at variance with God, (but whom the accusers knew from excellent private information to be the devil,) came to him in the likeness of a fair angel, clad in white clothes, and said that he was an angel, and bade him put his trust in him, and call him his lord and king, and marked him on the third finger. Moreover, the Queen of Elphen "has a grip of all the craft," but *Christsonday* is the good man, and has all power under God. "He" (Andrew) "knows sundry dead men in their company and the king that died in Flowdown, and *Thomas Rymour* [both of whom died mysteriously, and left their fate to be related in different ways by popular tradition] are there." Upon the rood-day in harvest in the current year, which fell on a Wednesday, he saw *Christsonday* come out of the snow, in likeness of a stallion. The Queen of Elphen was there, and others with her, riding upon white hackneys;* and if he had been allowed to have kept the convention on All-hallow even last, he would have told of all those who should have been in company with them. The elves have shapes and clothes like men, and they will have fair covered tables, and they are but shadows, yet are "starker" [stronger] than men,† and they have playing and dancing when they please, and the queen is very pleasant, and can be old or young when she pleases, and she makes any one king whom she pleases. The elves will make one appear to be in a fair chamber, and yet he will find himself in a moss on the morn; they will appear to have candles, and lights, and swords, which are nothing else but dead grass and straws; yet he, Andrew, is not afraid to go among them, and has associated with them all his days. At the day of judgment, the fire will burn the water and the earth, and

make all plain, and *Christsonday* will be the notary to accuse every man, and will be cast into the fire, because he deceives worldly men.

The charges of witchcraft generally relate to some alleged practising against the health of men, or cattle, or the growth of crops, and there is a remarkable uniformity in the description of the sickness caused by witches, which seems to indicate the prevalence of violent fever and ague. To cure, was as dangerous as to cause disease. In some cases the imputations are so childishly absurd, that we are lost in amazement at their being entertained.

Thus, against one woman it is alleged, and proved, that one night, while her husband was lying in bed, and she dressing, a cat came in upon the husband, and cried "wallawa!" (a mode of expression not very unusual among the cat kind) and worried one of her own kittens; whereupon he slew the cat, and immediately thereafter both his horse and his dog ran mad. And as a proof that this woman's son and daughters are "quick ganging devils," it is stated (in the son's indictment) that on the day of the mother's trial, there came to the father's house an evil spirit, in likeness of a magpie, and struck the youngest daughter out of the house, and would have plucked out her eyes and destroyed her, had not the neighbors in the street come in and "dang" that foul spirit forth from the house, and closed both doors and windows on her. A second attack was made upon the girl the same day, by an evil spirit, in likeness of a *kae*, but the neighbors again interposed, and by their earnest prayers to God, expelled the demon. And these things are considered to be evident tokens and demonstrations, seen and known to all the world, that there is none of their father's house free from the devil's service, but all are his subject slaves. In another case it is alleged, but not proved, that a certain man going home at eleven o'clock in a winter night, found the woman accused, or a devil in her likeness, sitting on a stone; when she gaped and "glowered" upon him, and vomited fiery brands out of her mouth, which frightened him so much, that he became sick, and was forced to go back again, instead of proceeding to his own house. *Ellen Gray* was indicted as a notorious witch and sorcerer, because during all the preceding year she was seen going with one *Mergie*, her consort (who had since fled;) one in the likeness of a dog, the other in the likeness of a cat, betwixt her house and that of *Mergie*.

It is impossible to imagine any transaction of life into which sorcery might not enter. Thus, in the case of *Helen Fraser*, it happened that a married man found his affection violently and extraordinarily drawn away from his wife, to a certain widow, for whom he had been sowing corn, (and in whose house *Helen Fraser* was residing,) there having always been great love between him and his wife theretofore, and no breach of love, or discord, falling out or intervening on either side: which thing the country supposed and spake to be brought about by the unlawful labors of the said *Helen*. This was testified by the false husband himself, and *Helen Fraser* was convicted. Against another woman it was a charge that she, by her witchcraft, caused *George Barclay* "to marry a poor hussy, whereat all men wondered, seeing he was a man so good like and rich, and came of honest parents, and she an ugly harlot quean, come of so base degree, and who had since *depauperat* both." The

* "In olde dayes of the king Artour,
Of which that Bretons speke, gret honour,
All was this land full-filled of faerie;
The Elf-queene, with hire joly compaignie,
Danced full oft in many a grene mede.
This was the old opinion as I rede;
I speke of many hundred yeres ago;
But now can no man seee nor elves mo."
The Wife of Bath's Tale.

† "Tells how the drudging goblin sweat
To earn his cream-bowl, duly set,
When in one night, ere glimpse of morn,
His shadowy flail hath thresh'd the corn,
That ten day-laborers could not end."
Milton, F. Allegro.

devil appeared to his servants, sometimes as an aged man, bearded (an "old white-bearded Satan") with a white gown and a "thrummit" hat; sometimes as a black man, a lamb, a calf, a horse; sometimes he rose from the ground in the midst of his worshippers, in the shape of a black beast, waxing larger by degrees. He loved to display himself in assemblies of witches, to receive their homage, to commend the fare they offered him, and to promote their mirth by the exercise of his musical talent; a notion admirably illustrated by Burns in *Tam o' Shanter*. It was, of course, a heinous act of witchcraft to take part (as many persons confessed they had done) in these orgies.

Thomas Leyis was accused of having come upon Halloween about midnight, accompanied by his mother (since burnt) and many other sorcerers and witches, to the market and fish-cross of Aberdeen, under the conduct and guiding of the devil, present with them all in company, playing before them on *his kind of instruments*, when they all danced about both the said crosses and the meal market, a long space of time; in which devil's dance the said Thomas was foremost, and led the ring, and *dang* (struck) Katherine Mitchell, because she spoiled the dance, and ran not so fast about as the rest. This was testified by the said Katherine Mitchell, who was present with them at the time foresaid, dancing with the devil. In the margin of the indictment is written, "Provin;" and Thomas Leyis was burnt. He is said to have confessed his guilt, and to have named his accomplices. This dance is noticed in several other indictments: in that of a woman, who was also burnt, we read that in the said dance she was the ringleader next to Thomas Leyis, and because the devil played not so melodiously and well as she wished, she took his instrument out of his mouth, then took him on the chops therewith, and played herself thereon to the whole company; and it was proved that they were, accompanied by their devilish companions and faction, transformed, some into hares, some into cats, and some in other similitudes. There were dances of the same kind on Halloween in several places. At a gray stone at the foot of the hill of Cragleauche, nine persons were, under the conduct of their master the devil, dancing in a ring, and he played melodiously upon an instrument, albeit invisible to them. Margaret Bane, who was burnt for taking part in this revel, confessed that the devil was there in the likeness of a beast, and caused them all to worship him. Christian Mitchell confessed, that three years before her trial, on the Rood-day, early in the morning, she and certain other witches, her devilish adherents, conversed upon St. Katherine's Hill, in Aberdeen, and there, under the conduct of Satan, present with them, playing before them on his form of instruments, they all danced a devilish dance, riding on trees, for a long space.

Persons merely suspected of witchcraft were frequently branded on the cheek, and banished from the town. But the sentence pronounced upon actual convicted witches generally was either that they should be "wirreit," i. e. strangled, "at the stake till they were dead," and should then be burnt; or "that they should be had out of the town and burnt to ashes." It does not appear that they were actually burnt alive. The editors of the Spalding Club Miscellany have preserved an account of

"The debursements made by the comptar, at command and by virtue of the ordinance of the

Provost, Bailies, and Council, in the burning and sustentation of the witches.

Item, the 23rd of February, for peats, tar-barrels, fire and coals, to burn the said Thomas, and to Jon Justice for his fee in executing him

3 13 4."

William Dun, Dean of Guild, was excused the payment of a sum of money due from him to the town, because he had shown faithfulness in the discharge of his duty, and, besides that, had taken extraordinary pains in the burning of the great number of witches burnt that year, as well as in other official business. All this is exceedingly revolting, and we are tempted to exclaim against the barbarity and ignorance of the age and nation. Yet the age is not solely to blame, since Sir George Mackenzie, nearly 100 years later, observes, "That there are witches, divines cannot doubt, since the word of God hath ordained that no witch shall live; nor lawyers in Scotland, seeing our law ordains it to be punished;" nor was the nation only in fault; for the English parliament, by a statute of James I. (drawn with such absurd minuteness, that, well known as it is, it deserves to be repeated) enacted that it should be a capital felony "to use, practise, or exercise invocation or conjuration of any evil and wicked spirit, or to consult, covenant with, entertain, employ, feed, or reward any evil or wicked spirit, to or for any intent or purpose, or to take up any dead man, woman, or child, out of his, her, or their grave, or any other place where the dead body resteth, or the skin, bone, or any part of a dead person, to be employed or used in any manner of witchcraft, sorcery, charme, or enchantment; or to use, practise, or exercise any witchcraft, enchantment, charm, or sorcery, whereby any person should be killed, destroyed, wasted, consumed, pined, or lamed, in his or her body, or any part thereof." This statute but too well represented the prevailing views on the subject; and with reference to them, and also to the opinion of King James, who has been supposed to have been an early and zealous persecutor of witches, it may be worth while to cite a letter of Howell's written in London in 1647, fifty years after the witch trials at Aberdeen. After stating various cases of undoubted sorcery practised on the continent, Howell says:

"But we need not cross the sea for examples of this kind; we have too many (God wot) at home: King James a great while was loth to believe there were witches, but that which happened to my Lord

Francois of Rutland's children convinced him; who were bewitched by an old woman that was servant at Belvoir Castle, but being displeased, she contracted with the devil (who conversed with her in the form of a cat whom she called Rutterkin) to make away those children, out of mere malignity and thirst of revenge.

"But since the beginning of these unnatural wars, there may be a cloud of witnesses produced for the proof of this black tenet: for within the compass of two years, near upon 300 witches were arraigned, and the major part executed, in Essex and Suffolk only; Scotland swarms with them now more than ever, and persons of good quality executed daily." And in a previous letter of 1646, after Charing Cross and the other crosses which stood in various parts of London had been removed, (to the great scandal of all but the puritans,) and a great change effected in all outward appearances and symbols, he says, "The devil may walk freely up and down the streets of London now, for there is not a cross to fright him anywhere; and it seems he never was so busy in any country upon earth, for there have been more witches arraigned and executed here lately, than ever were in this island since the creation."

In thinking of the cruel treatment of these unfortunate people, we must not forget that the age was a harsh one. Even to a much later period, the Scotch criminal law* was very strict, especially against the poor; and was enforced, when enforced at all, with great severity. In the law of theft, there was a curious gradation of punishment. Thus, it is said, if a thief be taken with bread worth a farthing, and from one farthing to four, he should be scourged: for four farthings, he should be put in the jogs and banished; from four to eight, he should lose an ear; and if the same thief be hereafter taken with eight pennies, he should be hanged; but if any thief should be taken with thirty-two pennies and a farthing, he may be hanged. And we find† that upon the 25th of July, 1623, two fellows, called Raith and Deane, are ordained to be hanged, for no greater offence than breaking into gardens and stealing bee-hives, and sybows or young onions. Much, however, was left to the discretion of the judges, who could, for instance, in cases of false swearing or forgery, order the guilty person to be banished, to be scourged, or to have his tongue pierced, according to their view of his case. In one case, a gentleman was only imprisoned for forgery, because he was ingenuous (*i. e.* of good family) and in necessity; though other forgers, about the same period, were capitally punished. Torture was allowed, but judges could not torture children under fourteen, or very old persons. This exemption was in some countries extended to women, sick persons, and such as had been eminent in any nation for learning, or other arts. "But," says Sir George Mackenzie, "all this is arbitrary among us!" a too significant observation. Surely it is to this period that we must assign the story, which represents a judge to have been so much amused with the varying emotions expressed in a suitor's countenance, during the pleading of a cause, that he proposed to "decern against him, and see how he would look then."

But to return to earlier times. The crown was so feeble, and the great nobility so strong, that no man could be safe without the protection of some

powerful lord. To obtain this protection, almost every landowner connected himself with some feudal chief, by a bond of Manrent, by which he obliged himself, in terms, to become man and servant to his protector, in peace and war, (with the nominal exception of his allegiance to the crown,) to ride and go with him when required, to warn him of any harm intended against him, to advise him faithfully, and to keep his secrets.

The leading nobility, again, entered into bonds of friendship among themselves, agreeing to stand by each other in all actions, quarrels, questions, and debates whatsoever; and that if it should happen that they, or any of them, should be pursued, molested, or troubled in person or estate, by any person or persons whatsoever, in that case all would take part in resisting such proceedings; against all persons except the king; an exception not always practically observed.*

Individuals thus protected could bid defiance to all attempts to enforce the law by any orderly and peaceful process. But persons who did not come in to stand their trial on any criminal charge, were liable to Letters of Fire and Sword; that is, to a commission, directed to the most deadly enemies of the accused, and charging the commissioners to convoke the lieges in arms, and to seek, take, and imprison, and in case of resistance or hostile opposition to pursue to death, the parties accused; and if the latter, in their defence, should happen to flee to strengths or houses, then the commissioners were empowered to besiege the strengths or houses, to raze, fire, and use all kinds of force and warlike engines that could be had for winning thereof, and apprehending the rebels and their accomplices; and if, in pursuit of the rebels and their accomplices, or in such sieges, there should happen (which after this hint, was not unlikely to happen) fire-raising, mutilation, slaughter, destruction of corn or goods, or other *inconveniences*, it was declared that the same should not be imputed as a crime or offence to the commissioners or the persons aiding them.

The commission might seem stringent enough, and fully equal to any emergency, especially as it was usually granted to persons interested in executing it, and sometimes even issued against parties who had never been cited to appear; and it was the chief instrument employed in the ordinary government of the Highlands; but in the Miscellany of the Spalding Club we find a document, in comparison with which the ordinary Letters of Fire and Sword appear a friendly, benignant, and paternal communication.

The Clan Chattan (a numerous race, comprising various septs, which, though differing in name, were allied in blood, and agreed to a great extent in their armorial bearings, and especially in bearing the mountain cat, as their common crest) occupied the central Highlands of the counties of Kincardine, Aberdeen, Moray, Banff, and Inverness. This wild tribe, having quarrelled with the Earl of Moray and his dependants, invaded the lowland parts of Morayshire, and ravaged the country; and, in particular, (according to the statements in the document about to be quoted,) they went to the lands of James Dunbar, of Tarbert, in the Bray of Moray, and were there guilty of fire-raising, slew six men and two women, and maimed other five men, and made great pillage of cattle, sheep, horses, goats, swine, &c., whereupon the Earl of Moray

† Arnot's Criminal Trials.

* Many bonds of this sort, as well as bonds of Manrent, are to be found in the publications of the Spalding Club.

obtained, in 1528, the king's letters commanding the Earl of Moray, lieutenant, "to pass upon the Clan Chattan and Badenoch, for to destroy them *alutherie*."

These dreadful letters state that the king and his council (this was under the dominion of the Douglasses, during the minority of James V.) advisedly considering the great harms and contemptions done by the Clan Chattan and their assisters against the common weal, have determined to make *utter extermination and destruction* of all that clan, their assisters and part-takers. They command the Earl of Moray, as lieutenant of the north, and the sheriffs of the northern counties, to go up in full force, in military array, upon the Clan Chattan, and invade them to their utter destruction, by slaughter, burning, drowning, and other ways, and to leave no creature living in that clan, except priests, women, and children. The destroyers are to take to themselves, for their pains, all the goods of the Clan Chattan which they can seize; and are promised in addition a reward from the king for good service. All who take part with the Clan Chattan are to be treated like them; and not only are the persons executing this decree to be free from all question in respect of the intended invasions, slaughters, burnings, taking of goods, and other mischiefs done to the Clan Chattan or their assisters; but all sharpness done, and to be done upon them, shall be deemed to be lawfully and righteously done. The women and children of the clan are to be taken to the coast, where ships shall be provided, at the public expense, to sail with them forth of the realm, and land with them in Jesland, Zealand, or Norway, because (oh! exquisite tenderness of the royal mercy!) it were inhumanity (!) to put hands in the blood of women and children.

The Earl of Moray,* having provided himself with this commission, assembled an army, and surprised the Clan Chattan. He took about 200 of them, together with William, the brother of Hector Macintosh, who had commanded in the incursions. They were all hanged; and William, after his death, was quartered, and his head was fastened upon a pole at Dyke, in Morayshire. His quarters were sent to Elgin, Forbes, Aberdeen, and Inverness, there to be set up for an example to others. Not one man of all the 200 could be induced to confess where Hector was, though life was severally promised to every one of them upon this condition, as they were led along to the gallows. Their faith was so true, that they could not be persuaded, either by fair means, or by any terror of death, to betray their captain. Thus were these gallant and true-hearted men destroyed by a stretch of tyrannical wickedness not surpassed in history.

Innumerable were the deeds of violence and bloodshed everywhere in those days. Many such acts, public and private, are confusedly chronicled in a sort of rambling diary and obituary kept by one Cullen, Vicar of Aberdeen.† Thus, (not to mention the conflicts among the great nobles at court,) on the 10th of October, 1571, the field of Tulliangus was stricken, between Adam Gordon and Arthur Forbes, brother to Lord Forbes, where the said Arthur was slain, with sundry others of his kin: on the other side, John Gordon, of Buckie, with divers hurt on both sides. On the 20th day of the succeeding month, the field of Craibstane

was stricken by John Master, of Forbes, and Adam Gordon, brother to Lord Huntly, where the said John lost the field, and was taken, and sundry of his kin and friends slain, to the number on both sides of threescore, or thereby; and good Duncan Forbes slain the said day. Gilbert Knowis, elder, Burgess of Aberdeen, was slain by James Gordon, brother to the Laird of Abergeldy, at the causeway end, going to the Cross, on the 1st of December, 1574. Gilbert Knowis, his son, also was slain on the same day, by the said James, having in company with him William Davidson, Burgess of Aberdeen. Among the many other private murders which Cullen mentions, we find that John Wishart, cordwainer, was slain by James Paterson, hangman of Aberdeen; and the said James hanged, and his head set on the port, therefor. But slayers and slain were generally people of condition, and in such cases we do not perceive that any punishment was inflicted.

The massacre of St. Bartholomew is especially noticed: "On the 24th day of August, in the year of God 1572 years, Jasper Cullen, (as the chronologer thinks proper to style Coligny,) great admiral of France, was cruelly murdered in Paris, under color of friendship, at the King of Navarre's bridal, and under night, by the most cursed King of France, Monsieur his brother, and by the device of the pope, cardinals, bishops, abbots, priors, monks, friars, canons, priests, nuns, and whole rabble of that devilish sort of papists, devised at the Council of Trent, whose cruel murder we pray God to revenge. So be it."

The country gentlemen appear to have been very glad to serve the offices of provost and bailie, and the borough equally glad to secure their assistance. There was even some struggle for the supremacy in town politics, and a conflict between the open and the close system of elections. Moreover there was a sort of aristocracy among the citizens themselves, consisting of those who were of "the old blood of the town." A deficiency in this kind of gentility was apt to be made matter of reproach against persons in high office. Thus, when Mr. Alexander Jaffray was chosen provost, many held cheap both the man and the election, as he was not of "the old blood of the town," but the grandson of a baxter, (baker;) "and, therefore, was set down in the provost's deass, before his entering, and baken pye to sermon:"* but he had the good sense to take no notice of the indignity.

The ancient acts of the Scottish parliament contain interesting notices of what was passing in public and in private life. They evince great solicitude for the public defence. All classes are to be prepared with arms according to their degree; and in order to promote skill in archery, (the great accomplishment of the English yeoman and the vital want of the Scotch, by which they frequently suffered in war,) the old Scottish games of football, and golf, are actually prohibited, and the regular practice of archery is commanded in every parish. It is ordered that there shall be made at each parish church a pair of butts, and that shooting shall be practised every Sunday; that each man shall shoot six shots at least, and those who do not come to shoot, shall be fined twopence a piece, for the archers to drink. There is abundant evidence that the country was extremely poor and unsettled. Lepers formed a numerous class, and they are ordered to remain (except at

* See Sir R. Gordon's History of the House of Sutherland.

† Spalding Miscellany, vol. ii.

* Spalding's History of the Troubles.

stated times) at their hospitals and other places without the boroughs. Statute after statute enjoins the king's justices to take inquisition of *sornars*, i. e. persons who forcibly took up their quarters in the houses of others;—bards, (Oh Helicon!) masterful or sturdy beggars, and feigned fools; and either to banish them the country, or to send them to the king's prison. If *sornars* or masterful beggars have any property, it is to be applied to their support in prison as long as it lasts; their ears are then to be nailed to the trone, or some tree, and cut off; after which they are to be banished, and, if found again, to be hanged. No direction is given as to the property of bards; probably because the law did not contemplate the possibility of their having any. Copyright, apparently, had not acquired any great value.

Familiar as we are with the early extinction of wolves in England, it is startling to find the Scottish legislature providing in the fifteenth century that wolves' whelps should be hunted by every baron, four times a year, or as often as a wolf appeared; any man who failed to go to the hunt was liable to a fine, while he who brought in the head of a wolf or a fox was entitled to a reward, for the crime of vulpicide, so justly odious in the nineteenth century, was actually encouraged in the dark ages! All birds of prey are to be slain, in order that wild fowl may be preserved; not for sporting, but "for the sustentation of man:" partridges, plovers, gray hens, and moor-cocks, are not to be taken with any manner of instrument from the beginning of Lent until August, and a penalty is fixed for the killing of hares or conies in snow time. The preservation of salmon was also most anxiously provided for; and we have heard of an enactment that the openings in all cruives should be wide enough for a sow (dimensions not stated) to turn in without touching either side with snout or tail! Absenteeism was common, owing to the concentration of estates in a few hands, a process which many of the great families continually carried on, by every kind of fraud and oppression. Proprietors are, therefore, required to repair their castles and manor-houses, and to occupy them either in person or by their friends, so that the produce of the estate may be spent upon it. The planting of trees and hedges, and even the sowing of broom, are from time to time commanded, with an anxiety which shows that little deference was paid to the injunction.

It was hardly to be supposed that in such a state of society it could be thought necessary to enact laws to restrain excess in personal expenditure; yet so it was: for all rude governments fall into the error of attempting to govern too much; and at a time when the law was not strong enough to give anything like safety to life or property,* all persons except noblemen and their heirs were forbidden to wear embroidery, pearls, or bullion, under pain of escheat of the "array" to the king. And in another act the lords of parliament, after declaring that the realm in each state is greatly impoverished through sumptuous clothing, both of men and women ("Tis pride that pulls the country down," says the old ballad; and so thought that economical sovereign King Stephen, when he complained of his tailor's charges,) proceed to lay down a vestimentary code with edifying minuteness. People in boroughs, living by merchandise, (with the exception of persons in dignity, as aldermen,

ballies, and other good men who are of the council of the town, and their wives,) are not to wear cloths of silk, or costly scarlet in gowns, or expensive furs; and the men are directed (a difficult, if not impossible task) to make their wives and daughters be habilitated according to their estate; that is to say, on their heads short curches with little hoods, such as are used in Flanders, England, and other countries. As to gowns, it is commanded that no woman wear "tails" of unbecoming length, nor gowns furred under, except on holidays.

These rules are prescribed not only to burghesses, but also to poor gentlemen and their wives, living in the country, and having less than a certain income. Workpeople are restricted on work-days to clothes of gray and white, and on holidays to light blue, green, and red; and the women's curches must be of their own making, and not exceeding the price of forty pence the ell, and no woman is to come to kirk or market with her face muzzled or covered, so that she may not be known, "under pain of escheat of the curch! The clergy are forbidden to use robes and furred gowns, with the exception of persons "constitute in dignity" in cathedral or college kirk, persons spending 200 marks a year, great nobles, and doctors. These regulations are to be obeyed under pain of the escheat of the habit. It is to be feared, however, that they were not much attended to, for even in the article of "tails" it appears that in the time of James IV. the utmost lawlessness prevailed—since Dunbar speaks of the ladies' trains as

"Sic foul tails, to sweep the causeway clean;"

and it may be doubted whether the practice has ever yet been brought into conformity with the law. The dainties of the table in Dunbar's time, are noticed by him as follows. He wishes for the king's return from his penance at Linlithgow.

"To eat swan, crane, partridge, and plover,
And every fish that swims in river;
To drink with us the new fresh wine
That grew upon the river of Rhine;
Fresh fragrant clarets out of France,
Of Angers, and of Orleans."

It was not till a much later period, that the word claret became restricted to the wines of Bordeaux. There were savans about the court in those days, and, in particular, a native of Lombardy,* who caused the king to believe, that he, by his chemical skill, would make fine gold of other metal, which science he called the Quintessence, whereupon the king made great cost, but all in vain! That age aspired, like our own, to the accomplishment of flying, for the king, having despatched an embassy to France on the 27th of September, 1507, the Lombard philosopher took in hand to fly with wings, and to be in France before the ambassadors. And to that effect, he caused a pair of wings to be made of feathers, which being fastened upon him, he flew off the Castle of Stirling, but shortly fell to the ground, and broke his thigh-bone. This accident he ascribed, not to any imperfection in his theory, but to the circumstance that there were some hen-feathers in the wings, which naturally yearned for and coveted the dunghill, and not the skies. In this attempt, it seems he imitated one Bladud, king of England, who, as histories mention, decked himself in feathers, and

* A. D. 1429.

† A. D. 1457.

* See Bishop Lesley's History.

presumed to fly in the air, but falling on the temple of Apollo, broke his neck.

A very lofty theoretical view was taken at first of the conscientious obligations of an advocate. Advocates and for-speakers in temporal court pleading, and also the parties that they plead for, if they be plaintiffs, are ordered,* before they be heard in any cause, to swear that they believe the cause they are to plead is good and lawful; and if the principal party be absent, the advocate must swear in his stead, according to the sentiments contained in the following "metres":

"*Illud juretur, quod his sibi justa videtur,
Et si queretur, verum non inficietur;
Nil permittitur, nec falsa probatio detur;
Ut lis tardetur, dilatio nulla petetur.*"

It is directed by the same parliament, that when a man wished to appeal against a sentence, he was *not* to use strong language, but "*only* to say that the doom is false, stinking, and rotten in itself." It is to be observed, with reference to modern habits of speech upon similar subjects, that this license is only given by the statute where the decision is subject to appeal. But indeed the phraseology of those days of chivalry and romance was rather energetic. The language of the legislature itself is on one occasion a little to the north side of civil towards the king of England. "And because it is verily trusted and supposed that the revare (robber) Edward [IV.] calling himself King of England, through burning avarice, and for false reif (rapine) and conquest, not dreading God, nor the effusion of Christian blood, nor having respect or remembrance that he was obliged and sworn to have kept the truce, but postponing the bond of his loyalty and honor that he should have had, is absolutely set to continue in the way that he has moved and begun, and by all his power tends and shapes to invade and destroy, and, in so far as he may, to conquest this realm," the three-estates grant to King James III. supplies for the defence of his kingdom. King Edward, after this, could scarcely inform his parliament "that he continued to receive from all foreign powers assurances of their friendly disposition."

It appears from the following act of parliament,† which is no doubt familiarly known to Lord Campbell, the reformer of the law of libel, that, at a later period, the licentiousness of the press, and its free discussion of questions, sacred and profane, alarmed and irritated the priesthood and the government:—

"Inasmuch as there are divers printers in this realm who daily and continually print books concerning the faith, ballads, songs, blasphemations, rhymes as well of churchmen as of temporal persons, and tragedies as well in the Latin as in the English tongue; not seen, viewed, and considered by the superiors, and tending to the defamation and slander of the lieges of the realm; to put a stop to such inconveniences, it is ordained that no printer presume to print any books, ballads, songs, blasphemations, rhymes, or tragedies, either in the Latin or the English tongue, in time to come, until the same be seen, viewed, and examined by some wise and discreet persons, deputed thereunto by the ordinaries, and thereafter a license had and obtained from our sovereign lady,‡ by the lord governor, for printing such books; under pain of confiscation of all the printer's goods, and banishing him from the realm forever."

* Statute of 1429. † 1551. ‡ Mary, then in France.

Alas for all sovereign ladies, and alas for all lords governors! the doom was gone forth—it was too late to interfere with the publication of "books, ballads, songs, blasphemations, rhymes, and tragedies;" that fierce contest of pen and tongue, and hand and heart, had begun, by which Scotland was so long to be distracted, and which was to exhibit such wonderful traits of good and evil, and to develop so remarkably the character of her people. Of the extent to which the spirit of theological discussion pervaded society during this great struggle, an amusing instance is given in one of Howell's letters, written from Edinburgh in 1639, during the sitting of the General Assembly:

"The bishops are all gone to wrack, and they have had but a sorry funeral; the very name is grown so contemptible, that a black dog, if he have any white marks about him, is called Bishop. Our Lord of Canterbury is grown here so odious, that they call him commonly in the pulpit, 'The priest of Baal,' and 'the son of Belial.'"

"I'll tell your lordship of a passage which happened lately in my lodging, which is a tavern: I had sent for a shoemaker to make me a pair of boots, and my landlord, who is a pert, smart man, brought up a chopin of white wine (and for this particular there are better French wines here than in England, and cheaper; for they are but at a groat a quart, and it is a crime of a high nature to mingle or sophisticate any wine here.) Over this chopin of white wine, my vintner and shoemaker fell into a hot dispute about bishops. The shoemaker grew very furious, and called them 'the firebrands of hell, the panders of the whore of Babylon, and the instruments of the devil,' and that 'they were of his institution, not of God's.' [In short he had a quarrel with episcopacy altogether.] My vintner took him up smartly, and said, 'Hold, neighbor there, do not you know as well as I, that Titus and Timothy were bishops? that our Saviour is entitled the bishop of our souls? that the word bishop is as frequently mentioned in Scripture, as the name pastor, elder, or deacon? then why do you inveigh so bitterly against them?' The shoemaker answered, 'I know the name and office to be good, but they have abused it.' My vintner replies, 'Well then, you are a shoemaker by your profession, imagine that you, or a hundred, or a thousand, or a hundred thousand of your trade should play the knaves, and sell calfskin leather boots for neat's leather, or do other cheats, must we therefore go barefoot? must the gentle craft of shoemakers fall therefore to the ground? It is the fault of the men, not of the calling.' The shoemaker was so gravelled at this that he was put to his *last*, for he had not a word more to say; so my vintner got the day."

The tone and temper of the Assembly of 1638, are strikingly depicted in "Gordon's History of Scots Affairs," printed by the Spalding Club:

"How soon the commissioner was gone, candles were brought into the Church, and the moderator began for to exhort the members of the Assembly that since kings were Christ's subjects, no members of that meeting should suffer themselves either for fear of a favor to any man for to be reduced from the obedience to Christ's commands in the least; that now they were to rely upon Christ's immediate presidency amongst them, whom from the very beginning of their business they had found going favorably along with them; that Christ bids all expect that things shall come for best to those who commit themselves to him for their guide; that

they needed not for to be discouraged, for any blocks that should be cast into their way, specially with those whereby it was manifestly discovered how prejudicial this work they were about was to the kingdom of *Satan and of Antichrist*, as also how acceptable it was to Christ, the general of this combat, for to rebuild the ruins of his beloved Zion."

This was spoken in 1638, not in 1843, by covenanters, not by non-intrusionists. We are not disposed to argue the questions then or now under discussion, which, indeed, are vitally different from each other; but it is impossible not to observe how closely the style of the covenanters has of late been imitated; with what quiet assurance it is still assumed that the regulations of an infallible assembly are equivalent to immediate declarations of divine will, and that opposition can only proceed from the worst agency and the worst motives.

The recent troubles of the presbytery of Strathbogie are well known. It is odd to find their predecessors two centuries ago, in a very similar dilemma. Gordon says that "after the rising of the assembly, the two commissioners for the presbytery of Strathbogie went to the king's commissioner, humbly desiring his grace to tell them what they should do, they being cast in two extremes, betwixt disobedience to the king's command, and the members of the assembly, who were resolved all to sit, with whom they would gladly concur, if they thought the hazard were not great to follow."

But let us touch no longer upon controversial matters. It will be remembered that the feudal sovereigns seldom had much money at their disposal, and that their only means of exercising any extensive hospitality was by putting in force their rights of purveyance and levying contributions on their loyal subjects and vassals. Accordingly, King James VI., his marriage being concluded, writes to the Laird of Arbuthnot on the "penult" day of August, 1589, stating his hourly expectation of the arrival of his queen, and the necessity of receiving her, as his ambassador had been received in Denmark, with honorable entertainment. To this end he throws himself upon the good will of his loving subjects, and earnestly desires the laird to send him, in aid of the honorable charges to be made in this action, such quantity of fat beef and mutton, wild fowl, and venison, or other stuff, meet for the purpose, as he could possibly provide or furnish of his own, or procure from others. The royal feast, however, did not take place so soon as was expected; for King James's single and solitary act of gallantry, his voyage to Norway, placed him at the mercy of the northern storms, raised "by the conspiracies of witches and such devilish dragons," (several of whom were executed for this crime), which detained him for a whole winter. He consoled himself by a free participation in Scandinavian merrymaking, as we learn from his famous letter of promise to Sir Alexander Lindsay, which is dated "from the Castle of Croneburg, where we are drinking and driving over in the auld manner." [Dunbar says in *The Tua Maryit women and the Wedo*, "Thus drave they over that dear night with dances full noble."] But on his return to Scotland, he again addresses the Laird of Arbuthnot, on the 11th of May, 1590, as hungrily as ever; and requests him, since the voyage has been prosperous, and the day of the queen's coronation is approaching, to bring up "such support of stuff and provision" as the laird had already got, or

was able to get, according to the king's former letters and requests; and to make true report, by writing, of every man's forwardness and good will in this behalf.

Nothing, probably, that ever wore a crown was addressed with more outward forms of reverence than the "most dread sovereign" King James; and the following letter from his chancellor, the Earl of Dunfermline, displays a thorough acquaintance with his learned tasks and the other peculiarities of his character, which, however, were more in accordance with the prevailing habits of the age, than we are wont to imagine.

"Most sacred Sovereign,

"I crave your majesty's favor that it may be lawful to me give entry to this letter, with some report of the antiquity. I think to a man that has delighted all his days in letters, writing to the most learned and wise king in the world, it cannot be imputed to great animus, albeit some memory of learning be intermixed therein. I read that Marcus Scaurus, a man of great renown among the Romans, *fiorente republica*, being accused by Quintus Varius of a very odious crime, that he should have received money from the King Mithridates for to betray the affairs of Rome: after his accuser had deduced all arguments and probations he could devise, he used no other defence than this, *Quintus Varius ait, Marcum regia pecunia corruptum, rempublicam prodere voluisse. Marcus Scaurus huic culpæ affinem esse negat; utri magis credendum putatis?* Which defence was followed with the acclamations of the whole people, condemning the accuser as a calumniator and a liar, and acknowledging the defender's undoubted virtue and honesty. Master John Forbes, a condemned traitor for his rebellious and seditious conventicles, holden as general assemblies against your majesty's authority and command, accuses your majesty's chancellor to have given advice, counsel, or consent to the holding of the said mutinous assembly. Your majesty's chancellor says it is a manifest lie, and if it might stand with his honor and dignity of his place to enter into contestation with such a condemned traitor, could clearly verify the same. Master John Forbes and all his colleagues abide still at the maintenance and justification of that their assembly, as a godly and lawful proceeding. Your majesty's chancellor, by his public letters, discharged and countermanded the said assembly; he has since condemned the said assembly as a seditious and unlawful deed, and all the partakers and maintainers of the same as mutinous and seditious persons. Your sacred majesty has to judge which of those two is most worthy of credit. Further, I think not needful to trouble your majesty in this matter, but some information I have sent to Mr. Alexander Hay, which it may please your Highness to accept and hear of, when best leisure from more weighty affairs may permit the same. So most humbly taking my leave, and praying the eternal God long to preserve your majesty in all felicity, I rest,

"Your sacred majesty's most humble and obedient subject and servitor,

"Edr. 25 May, 1606." "Dunfermline.

It is well known that persons in high station were in many cases most carefully educated. The Earl of Gowrie, who perished in that fatal mêlée in his castle at Perth, the victim probably of his own vindictive ambition, had lately returned from the continent, rich in all the learning and accom-

plishments of Europe. The Earl of Aboyne, son of the Marquis of Huntly, has left lines sufficiently graceful and sprightly, of which a specimen follows.

EARL OF ABOYNE'S LINES.*

1.

"It's not thy beauty nor thy wit,
That did my heart obtain;
For none of these could conquer yet
Either my breast or brain;
And if you'll not prove kind to me,
Yet true as heretofore,
Your slave henceforth I'll scorn to be,
Nor doat upon you more!"

* * * * *

4.

"Think not my fancy to o'ercome
By proving thus unkind,
Nor soothing smile, nor seeming frown,
Can satisfy my mind."

* * * * *

6.

"I mean to love and not to doat,
I'll love for love again;
And, if ye say ye love me not,
I'll laugh at your disdain!
If you'll be loving, I'll be kind,
And still I'll constant be;
And, if the time does change your mind,
I'll change as soon as ye!"

A very favorable account is given of the Chancellor Dunfermline, in a little piece of autobiography by his brother-in-law, John, second Earl of Perth.† The "chancellor," he says, "was instructed with most virtues, learned, and heroic qualities, as having spent a great part of his youth in the best towns of Italy and France, where all good literature was professed. A man most meek, just, and wise, deserving greater commendation than paper can contain."

The Earl of Perth's account of his own life possesses that interest which a minute and naturally-written record of occurrences, and, still more, of thoughts, must always in time acquire. He was originally a younger brother. Special care was taken of the education of the eldest, James, Master of Drummond, who was sent to France for his education, like all Scotchmen of condition; and who turned out very well. John was all this time little regarded, and was sent to the school of Dunblaine, where he was but carelessly looked to for seven or eight years, his teachers being ignorant persons, "using their slavish discipline, conform to their own humors, teaching Ramus his grammar unprofitable." After two years spent in Edinburgh at college, he obtained leave to go to France upon a very mean allowance. This was in his nineteenth year, in the end of 1603. After a very tedious voyage he made his way to Bordeaux, where he met with his countryman, Monsieur Balfour, principal of the college, and a great mathematician, who used him kindly, and with whom he remained three years, and more. He then went to Toulouse, a fair city, and stayed in company with Monsieur Cadan, or Kid, a learned doctor in the laws, and with Monsieur Red, a doctor in physic. For nearly a year he frequented the public lectures on the laws, not understanding anything else, nor hav-

ing any friend who could inform him how the world went; so that he saw many things, but observed little; for though he always was in good company, yet his companions were unfit for managing affairs, as being mere scholars, and not caring for anything else. At length he went, in 1609, to Paris, "where more was to be seen than in all France else, by reason of the king and court's abiding there with all that great dependence." In the next spring, Henry IV. perished by the hand of Ravaillac, in the midst of his warlike preparations, and Drummond in the same year returned home, where he soon after succeeded his brother in the earldom. The estate was but small, yet by the help of friends and honest management, it proved better than was expected. At that time the Highland district where he lived was much disquieted by the Macgregors, and he exerted himself against them. "One of the clan," he says, "for reasons known to himself, alleging that his comrades and followers were to betray him, was content to take the advantage and let them fall into the hands of justice. The plot was cunningly contrived, and six of that number were killed upon ground, where I with certain friends was present. Three were taken, and one escaped, besides Robin (the traitor) and his man. This execution raised great speeches in the country, and made many acknowledge that these troubles were put to an end, wherewith King James himself was well pleased for the time." After this not very glorious exploit the earl married, and lived an easy life, but lost his wife after a few years. He sent his two eldest sons to France, Dr. Oliphert being their governor: his daughters were bred with his sister, the Countess of Roxburgh, sometimes at home, and then at court, till they were married. He says that

"Though all men were then quiet, yet wanted we not our own particular grievances; sometimes for one cause, and sometimes for another; so that in this life no man with reason can propose rest or security for himself, vexation of spirit and vanity often molesting us. I had much difficulty in settling of differences among friends and neighbors, to keep marches right, [the ancient and modern source of discord in Scotland: Dandie Dinmont's plea is familiar to our readers;] whereupon there arose cumber and debates. I sold some lands and bought others for commodity of our house, and lived reasonably well, according to the times, without debosh or drinking, by diet, an intolerable fault, and too much approved in this unhappy age. Happy are they who can eschew it in time, with other enorme vices whatsoever!"

He then laments the king's dethronement, and the ruin and confusion of the country, and he concludes by complaining that he had been severely fined, and his son subjected to a long imprisonment, and that only for a visit made by the son to his cousin Montrose! Montrose, however, was not such a man that the usurping government could well set down the visit to the score of cousinship only.

"No contentment had I all this while, but continual losses either at home or abroad; so that in presentia, annum agens septuagesimum tertium, senectutis malis quasi fractus, portum exoptans requiem in Christo sempiternam expecto, 20 June, 1657." He died five years afterwards, having survived the Restoration.

It is to be regretted that the Earl of Perth did not give us any of the details of rural life, or notice

* Published in the Spalding Club Miscellany.

† Spalding Miscellany, vol. ii.

the changes which he must have witnessed in his long and not uncreditable life. We are more fortunate in this respect at a later period. We learn from the reminiscences of Sir Archibald Grant, of Monymusk, in Aberdeenshire, that in his early days, soon after the Union, husbandry and manufactures were in low esteem. Turnips in fields, for cattle, grown by the Earl of Rothes and a very few others, were wondered at; wheat was almost confined to East Lothian; enclosures few, and planting very little; no repair of roads; all bad, and very few wheel carriages; no coach, chariot, or chaise, and few carts to the north of Tay. Colonel Middleton was the first person who used carts or wagons at Aberdeen; and he and Sir Archibald were the first to the north of Tay who had hay, except a very little at Gordon Castle. Mr. Lockart of Carnwath, the author of the memoirs, was the first who attempted raising or feeding cattle to size. A Mrs. Miller was the first who attempted thread or fine linen; and the Miss Walkenshaws the first who succeeded; these manufactories were first established about Glasgow and Renfrew, by which, and other industry, those towns made rapid increase; Edinburgh and most other towns having at that time but little retail trade. Aberdeen was then poor and small, having some Dutch and French trade, by salmon, and stockings, and serges, and plaiding; it had the first use of tea, then very scarce and little used at Edinburgh; it supplied Edinburgh with French wines, where, notwithstanding the town duties, it sold in retail in and from taverns, at tenpence per choppin, or English quart. Few families, except dealers, had it in cask for use; it was generally sent in from taverns, which were then much used. Table and body-linen were seldom shifted, and were but coarse, except for extraordinary occasions; moving necks and sleeves of better kinds being then used by the upper classes of society. Many wooden, mud, and thatched houses were to be found within the gates at Edinburgh, Glasgow, and Aberdeen; few houses of any better kind stood without the gates. [It should be mentioned, however, that a letter in the "Spalding Miscellany," dated so early as 1693, speaks of a design at Edinburgh to cast a bridge of stone over the North Loch, to build on the other side, and to enclose the new taken-in ground with a wall, and extend the city privileges to the enclosure.] The churches, abbeys, castles, and all large stone edifices, the existence of which might be thought inconsistent with a state of poverty and depression, are said by Sir Archibald to have been reared "by foreign contributions, or the slavery and want of other employ of the people, and all in friendship aiding each other." Nobles and chiefs the thinks were tyrants under the old Scottish government, and so, by their means, were the kings. He remarks, that after the union of the crowns, before that of the nations, the privy council was tyrannical, and neither fixed property nor liberty existed. He states in conclusion, that "all improvements of security, husbandry, manufactures, commerce, or police, are since 1707, with which literature in any extensive degree, except school jargon, hath kept pace." Sir Archibald Grant's account of his own paternal estate, is exceedingly important, (the county of Aberdeen, in which it is situated, was by no means behind the greater part of Scotland.) "By the indulgence of a very worthy father, I was allowed, 1718, though then very young, to begin to enclose, and plant, and provide, and prepare nurseries. At that time,

there was not one acre upon the whole estate enclosed, nor any timber upon it, but a few elm, sycamore, and ash, about a small kitchen-garden adjoining to the house, and some straggling trees at some of the farm-yards, with a small copse-wood not enclosed, and dwarfish, and browsed by sheep and cattle. All the farms ill-disposed and mixed; different persons having alternate ridges; not one wheel carriage on the estate, nor indeed any one road that would allow it, and the rent about £600 sterling, per annum; grain and services converted to money. The house was an old castle, with battlements, and six different roofs, of various heights and directions, confusedly and inconveniently combined, and all rotten, with two wings, more modern, of two stories only; the half of windows of the higher rising above the roofs, with granaries, stables, and houses for all cattle and of the vermin attending them close adjoining, and with the heath and moor reaching in angles or goushets to the gate, and much heath near, and what land near was in culture belonged to the farms, by which their cattle and dung were always at the door. The whole land raised and uneven, and full of stones, many of them very large, of a hard iron quality, and all the ridges crooked in shape of an S, and very high and full of noxious weeds, and poor, being worn out by culture, without proper manure or tillage. Much of the land and moor near the house, poor and boggy; the rivulet that runs before the house in pits and shallow streams, often varying channels, with banks always ragged and broken. The people poor, ignorant, and slothful, and ingrained enemies to planting, enclosing, or any improvements or cleanness; no keeping of sheep, or cattle, or roads, but four months when oats and beans, which was the only sorts of their grain, was on the ground. The farm-houses, and even corn-mills, and manse and school, all poor, dirty huts, pulled in pieces for manure, or fell of themselves, almost each alternate year. Peter the First of Russia had more trouble to conquer the barbarous habits of his subjects, than in all the other great improvements he made."

It is stated in "Burt's Letters from the Highlands," written previous to the Forty-Five, that the further north you go, the smaller the cattle are. At the present day, among the largest and finest fat cattle in the London market are those which come direct by steam from the north of Scotland. The learned and intelligent editors of the "Spalding Miscellany" observe, that

"The judicious measures adopted by Sir Archibald Grant for the improvement of his estate are in nothing more observable than the noble masses of plantations, which, under his fostering care, arose on hill and dale. The appearance of the country must have been wonderfully changed for the better as these woods advanced. Indeed, it is difficult now to conceive that bleakness of which Sir Archibald complains; and among the many thousands of acres of wood which were planted by this indefatigable improver, there are trees of a size so gigantic, that few, if any, can be found to equal them in Scotland."

Sir Archibald's account of the carriages and roads receives some countenance from Lord Lovat's account* of a journey from Inverness to Edinburgh in 1740, twenty-four years later.

"I came off on Wednesday, the 30th of July, from my own house, dined at your sister's, and

* Miscellany published by the Spalding Club, vol. ii.

did not halt at Inverness, but came all night to Corribrough, with Evan Baillie and Duncan Fraser, and my chariot did very well. I brought my wheelwright with me the length of Avimore in case of accidents, and there I parted with him, because he declared that my chariot would go safe enough to London; but I was not eight miles from the place, when, on the plain road, the axletree of the hind wheels broke in two, so that my girls were forced to go on bare horses behind footmen, and I was obliged to ride myself, though I was very tender and the day very cold. I came with that equipage to Ruthven late at night, and my chariot was pulled there by force of men, where I got an English wheelwright and a smith, who wrought two days mending my chariot; and after paying very dear for their work, and for my quarters two nights, I was not gone four miles from Ruthven, when it broke again, so that I was in a miserable condition till I came to Dalnakeardach, where my honest landlord, Charles McGlassian, told me, that the Duke of Athol had two as good workmen at Blair as were in the kingdom, and that I would get my chariot as well mended there as at London. Accordingly I went there and stayed a night, and got my chariot very well mended by a good wright and good smith. I thought then I was pretty secure till I came to this place. I was storm stayed two days at Castle Drummond by the most tempestuous weather of wind and rain that I ever remember to see. The Duchess of Perth, and Lady Mary Drummond, were excessively kind and civil to my daughters, and to me; and sent their chamberlain to conduct me to Dunblaine, who happened to be very useful to us that day; for I was not three miles gone from Castle Drummond, when the axletree of my fore-wheels broke in two in the midst of the hill, betwixt Drummond and the bridge of Erdock, and we were forced to sit in the hill with a boisterous day, till chamberlain Drummond was so kind as to go down to the Strath, and bring wrights, and carts, and smiths to our assistance, who dragged us to the plain, where we were forced to stay five or six hours, till there was a new axletree made; so that it was dark night before we came to Dunblaine, which is but eight miles from Castle Drummond; and we were all much fatigued. The next day we came to Lithgow, and the day after that we arrived here, so that we were twelve days on our journey by our misfortunes, which was seven days more than ordinary."

This truly disastrous journey was undertaken, not only for the purpose of executing an entail of the Lovat estate on which "my Lord Grange had labored for three years, till he could say that it was one of the best entails in Scotland," but also with a political object. Lord Lovat, known in England for the audacity of his death, and long remembered in Scotland as having practised, in various situations in life, every iniquity which each successive stage admitted of, was at this time the tyrant of the north, and, aged as he was, expected to receive a great increase of dignity and power, as Duke of Fraser and Lieutenant of the North, whenever the house of Stuart should be restored. But in the mean time, he was regarded with great suspicion by the government, and he felt desirous to secure himself by joining one of the great political connexions of the day. His letters to his cousin, Fraser of Inverallochy, explain the game he was playing, and strongly mark the craft and violence of his character. The Earl of Ilay, brother of the Duke of Argyll, was

in effect minister for Scotland under Sir Robert Walpole; to his levee, therefore, Lovat repaired, but Lord Ilay received him coldly, and after the first greeting, allowed him to remain several days unnoticed, and intimated, when he at length granted an audience, that the prime minister had intelligence from abroad of his correspondence with the pretender; and notwithstanding that Lovat "answered with a little warmth, that those stories were but damned calumnies and lies, and that I did not for many years write a letter beyond sea; *which indeed is true*," yet Lord Ilay did not say a word of politics to him, and they did not meet again. The Duke of Argyll, on the other hand, who was in opposition, saw Lord Lovat frequently, and so won his heart, that the latter declares he would rather serve that worthy great man without fee or reward, than others with fee and reward; and although when he came to Edinburgh he was not determined to dispose absolutely of himself for some time, yet, when he found the Duke of Argyll at the head of the greatest, the richest, and the most powerful families in the kingdom, openly proclaiming and owning in the face of the sun, that he and they were resolved in any event to recover the liberty of their country, enslaved by a wicked minister, his heart and inclination warmed very much to that side; and being at the same time discouraged and cast off by the government, from whom he found that he had nothing to expect, he would at once have joined the country interest, "which he always loved."

It appears, however, that he had great difficulties to encounter, as he was regarded with avowed enmity and suspicion by the leaders of the party, the heads of the great houses of Hamilton, Montrose, Buccleuch, Queensberry, Roxburgh, Tweeddale, Annandale, Aberdeen, and Marchmont. He considered, however, that if he could but effect a cordial union with them, it would make his family a leading family on all occasions for the future, so, after many serious thoughts and mature deliberations, he resolved to join himself to the great body of the nobility of Scotland, provided they would receive him as their faithful brother and friend. The junction was negotiated by Lovat's cousin and faithful friend, Lord Grange, who had belabored so long at his entail; (the judge who spirited away his own wife at St. Kilda, because she threatened to betray his Jacobite intrigues;) and though some of the party, at first, could hardly believe his intelligence, yet when they were convinced of the truth they received Lovat very readily, and he writes to his cousin, in great delight, "that he is now embarked over head and ears with the noble army of the patriots, (most of whom were whigs and revolutioners,) so that he thinks that by God's help he had done the greatest possible service to his son and family, which he hopes will redound to the interest, honor, and glory of his kindred." As an earnest of his good will to the great men who had received him with open arms, he told them that he would not only give them his vote, but that he hoped to gain them the shire of Inverness, by choosing his cousin, the Laird of Macleod, as member. This election then being his affair more than Macleod's, he begins to create votes with the utmost zeal and activity. "I wish with all my heart," he says, "I had made you, and Strichen, and Farlane, barons two years ago; I would not be so much troubled as I am now about the election of Inverness. It was the fault of my damned lawyers that it was not done. However, I am re-

solved that the Lord Lovat shall be always master of the shire of Inverness in time to come. I have signed, a fortnight ago, a disposition to Strichen, to you, and to Faralane, to be barons of the shire, and your charters will be expedie in February."

The Laird of Grant was at the head of the opposite interest in the county, and Lovat tells, with great glee, a disparaging story of him.

"The Laird of Grant and Dalrachany, and one or two more having drunk a hearty bottle, Grant received a letter by express from the earl of Murray; and after reading it, he said that it was an impertinent insolent letter; and Dalrachany, thinking to mitigate and soften the laird, said that there were some things in that letter that were not so much amiss. Upon which the laird called him rogue and rascal, and took up his hand, as some say, with a cane, and gave Dalrachany a blow. Dalrachany got up, and told him that *he would suffer that blow from him as his chief*, but that he would not suffer the second blow of any subject; and the laird, redoubling his blow, Dalrachany engaged with him, and took him by the collar, and endeavoring to throw him down, he tore the laird's coat, waistcoat, and shirt down to his breeches; and when he threw him down, he thrashed him most heartily, till the laird roared and cried. Upon which Lady Margaret that was in the next room, came in, and seeing her husband in that pickle, she roared and cried, and was so frightened that her head turned, and is since delirious."

In the great contest in which he was now engaged, Lord Lovat met with an unexpected defection which roused him to unextinguishable wrath and indignation. He naturally thought himself, he says, very sure of all his own clan, the Frasers, "and particularly of Fairfield, whom you know I always treated like a brother, and his lady like my sister. But" (alas for the falsehood and ingratitude of man!)

"He took his journey by Castle Grant, and for a promise that the laird made him of an ensigncy to his son, the poor, covetous, narrow, greedy wretch has renounced his chief and his kindred, and forgot all the favors that I did him. When he came to this town, he came to my house with the same affectionate behavior that he used to have, and with the greatest protestations of friendship, and I received him with open arms, and thought I was very sure of him, since McLeod had writ to me, that he swore to him that he never would do anything contrary to his chief's inclinations; and that Thomas of Gortuleg, who is my ballie and chamberlain, and chief trustee in that country, whom I sent about to speak privately with my friends in favor of McLeod, had writ to me that Fairfield desired him twice to acquaint me that when he came up to Edinburgh he would be absolutely determined by me as to the election. But I was surprised that, some days before he went away, having come here with his cousin, Mr. Cumming, the minister, who I believe has likewise poisoned him very much, for he is a sworn creature of my Lord Ilay's, who made him professor of church history in this university, [Edinburgh,] he then discovered himself to be an unnatural traitor, an infamous deserter, and an ungrateful wretch to me, his chief, who had done him such signal services. And if I never had done him any other service but getting him one of the best ladies in the world, your worthy sister, to be his wife, (which cost me both pains and expense,) who had borne him good children, he should be hanged

for deserting of me to serve any Grant that ever was born, or any Scotsman. William Fraser, my doer, having told me that the Laird of Grant had promised him an ensign's commission for his son, providing that he would vote for his father, and that he believed if I would secure an ensign's commission for his son, that he never would vote for the Laird of Grant, this made me resolve to speak to him before his cousin, Mr. Cumming, and my doer William Fraser. I told Fairfield that I was far from desiring his loss or any hurt to his family; that since the Laird of Grant promised him an ensign's commission for his son, that I would do better. Grant's promise was precarious, but that, that moment, before his cousin, Mr. Cumming, I would give him my bond for 500*l.* sterling, obliging myself to get his son an ensign's commission in two months, or to give him the full value of it in money to buy it for his son. He then *most insolently and villainously*" (we do not remember to have met with so strong a moral denunciation of the villany of refusing a bribe) "told me that he could not accept of it, that he was under previous engagements to the Laird of Grant, and that he must keep them. I own that put me in some passion, and told him, with some warmth, that which he said was impossible, because I had a letter in my pocket from the Laird of McLeod, wherein he says that Fairfield swore to him that he never would do anything against his chief's inclinations. I took it out of my pocket and showed it to Mr. Cumming, which stunned him very much. I told him that Gortuleg likewise wrote to me that he desired him twice to acquaint me, that when he came up to Edinburgh, that he would be entirely determined by me. The gentleman was so insolent as to tell me that both these letters were false. I told him that he durst not say so to the gentlemen that wrote them, who were men of honor and integrity, and I bade him go to the devil, and call himself a Grant, and live in Strathspey; that I would resent his behavior as far as I could by law. I doubt not but Fairfield will tell all this to the Laird of Grant, and that Mr. Cumming will write it to the Earl of Ilay, his patron, so I may expect all the resentment that they are capable of; and so he went away. Mr. Cumming and William Fraser seemed very much concerned for his behavior." Their morality probably was shocked. But instead of wishing any evil to Fairfield, (except that he is determined immediately to enforce a certain old claim of considerable amount against his estate,) the meek and patient chief is only solicitous for the personal safety of his mutinous clansman.

"All my *fear* at present is, that my cousin Gortuleg, who certainly is the prettiest fellow of my kindred in the Highlands, [and who was also his 'ballie and chamberlain, and chief trustee,'] will fall foul of Fairfield, who, I believe, is stout, which is the only good quality that I can imagine he has; and in all events if they fight, Fairfield is undone, for if Gortuleg kills him there is an end of him; or if he kills Gortuleg, the universe cannot save his life if he stays in this island; for Gortuleg has four cousin-germans, the most bold and desperate fellows of the whole name, who would take off Fairfield's head at the cross of Inverness, if they were to be hanged for it next morning. I know them well, for they have been very troublesome to me by their bloody duels. I beg you ten thousand pardons, my dear cousin, for this very long letter; but I entreat you seriously

consider of all that is in it, and after mature deliberation, I beg you may send an express to your sister, and write to her and to Fairfield, what you think proper upon the subject of this letter."

Again—

"There is no man that has betrayed, deserted, and forsaken his chief and his kindred, but the ungrateful renegade Fairfield. If my information from Inverness, from honest men there, holds true, he is as mad as ever his brother Jonathan, or John was. But I do assure you it is not him that I regret, though he was drowned in the river of Ness, or in Lockmurrie, *where it was said his brother Jonathan was drowned; by which he saved his portion;* for, [observe Lovat's conscientiousness!] when great narrowness and greed are joined together in one man, and come to a height with him, there is no crime but that man is capable of. A little money, or an advantage to his private interest, would not only make him sell all mankind, but Christ Jesus, if he was again upon earth; for he has no belief in God, nor in a future being. My great concern is for your dear sister, who is one of the best women in the world, and for her children, for they must be all ruined by this madman's villanous behavior; and if it had not been for my *positive and express orders*, he had been cut in pieces before now, for it is impossible to express the zeal and the violence with which he is hated by all the kindred. But, besides that I could never allow a drop of the *Fraser's* blood to be shed, of those very men that were contriving to take away my life, I know that the meddling with him now would wrong our affair, and if an Arabian killed him, it would be called *my deed*. But I hope to live long enough to see him chastised with as great a punishment as death would be to him at present.

"If I thought that the miserable wretch could be retrieved, I would beg of you to go and see your sister for a day or two, and try what you and she can do with him; but as he is an ignorant, obstinate blockhead, as most madmen are," &c., &c. * * * "Upon reflection, I am afraid I must put you to the trouble and expense of going for two or three days to Inverness, to see what you can do with that obstinate greedy brute; and if you and your sister cannot retrieve him and bring him back to his *duty*, I humbly beg that you may wash your hands of him; for I am very certain that you'll never put him in balance with me; and when you abandon him I shall leave him to the resentment of his kindred, which *I am afraid* will be fatal to him." [It would seem, however, that Fairfield was quite irreclaimable, for it is stated, somewhat later, that] "Fairfield is the only renegade of the lordship of Lovat, to the great dishonor of the clan. Duke Hamilton and several other lords, asked me, in a *joking way*, whether that fellow that has deserted his chief and his clan is still alive or not. I answered that he was, *by my precise and express orders*, and I said but what was true."

And this is the man full of moral sayings, pious and patriotic sentiments—the man who talks of "belief in God, and a future being," who could console himself in the pangs of gout, by repeating Buchanan's Translation of the First Psalm, "*Felix ille animi, quem non de tramite recto*," &c.—the man who laid his gray head on the block with "*Dulce et decorum est pro patria mori*!"

When a great chief, like Lord Lovat, could think, and write thus, it is not surprising that

humbler persons continued to despise "King George's laws," and we need wonder the less at their rising so readily against him, when we consider how very little they enjoyed of that protection of life and property which constitutes the chief claim of a government upon the allegiance of its subjects. Where there is no protection, attachment cannot exist. The inhabitants of the Highlands generally, and of the country adjacent to them, were grievously oppressed by gangs of lawless thieves and robbers, inhabitants of the remote Highlands, who stole or openly carried off their horses and cows; and as Badenoch, in particular, lay near the seats of those ruffians, great numbers of its inhabitants had been entirely ruined and reduced to beggary. The gentlemen of that district made several attempts to obviate this evil by a watch kept up at their own expense, but they could not support a sufficient force for their protection. Feeling the absolute want of that security which the government was too negligent to afford them, they held a general meeting, and applied to Macpherson of Cluny,* Lovat's son-in-law, but a man of a very different character. Cluny told them that unless his majesty would protect them, he saw no means for their relief, but one, viz., a subscription of all the suffering districts towards making a sufficient fund for setting up a strong watch for the mutual security of all; the fund to be paid to one *undertaker*, and the undertaker to become liable for the losses of all contributors. Cluny himself became undertaker, though the fund was very small. He set out his watch on the 22nd of May, 1744, all picked men, and stationed them to watch night and day at all the passes and inlets used by the robbers, and to intercept, seize, and imprison the villains, not suffering them on any pretext to pass or repass, even to or from the districts which were not included in the league. The thieves, finding themselves intercepted by land, began to convey the stolen cattle in boats across Loch Ness, but Cluny set guards on all the ferries, he recovered and restored the cattle of persons living far beyond the bounds of his district, and he reduced the robbers to such straits that they proposed in vain to give him security for the safety of his own country of Badenoch, if he would give up being concerned for any other district. In short he acted strictly upon the *theory* of the old black-mail system, which had never been practically adhered to before. This species of engagement, says Sir Walter Scott,† was often undertaken by persons like Rob Roy,‡ who prosecuted the trade of a freebooter, and was in the habit of stealing at least as many cattle as he was the means of recovering. But Cluny pursued the plain and honorable system expressed in the letter of his contract, and by actually securing and bringing to justice the malefactors who committed the depredations, he broke up the greater part of the numerous gangs of robbers in the shires of Inverness and Aberdeen. So much was this the case, that when a clergyman began a sermon on the heinous nature of the crime of theft, an old Highlander of the audience replied

* See Account of Cluny's Watch, Spalding Miscellany, vol. ii.

† Prose Works, vol. xxvi., p. 103.

‡ Though justice compels us to adopt Sir Walter's remark, we mean no disrespect to Rob Roy, who was an eminent patron of historical literature, as appears by his name being on the original list of subscribers for Spottiswoode's History.

that he might forbear treating of the subject, since Cluny with his broad sword had done more to check it than all the ministers in the Highlands could do by their sermons.

Gibbon mentions* a valiant tribe of Caledonia, the Attacotti, who are accused by an eye-witness of delighting in the taste of human flesh, and of whom it is said in the scandalous chronicles of the times, that they hunted the woods for prey, they attacked the shepherd rather than his flock. "If," he continues, "in the neighborhood of the commercial and literary town of Glasgow, a race of cannibals has really existed, we may contemplate in the period of the Scottish history, the opposite extremes of savage and civilized life. Such reflections tend to enlarge the circle of our ideas, and to encourage the pleasing hope, that New Zealand may produce, in some future age, the Hume of the southern hemisphere." We will not speculate upon the literary destinies of the New Zealanders, nor can we bring in contrast, like the great historian, the two extreme points of the national existence of Scotland. But so far as materials serve, we have ventured to glance along the stream of time: exhibiting at intervals some of those detached specimens of Scottish life from which its general spirit may be inferred; stating some of the original evidence upon which the reader may find that unwritten history, that systematic historical belief, which is gradually constructed by a thinking mind, which matures itself insensibly in the understanding, and exercises, unperceived, a control over the feelings, long after dates and names, and all the mere scaffolding of history have been, not perhaps forgotten, but dismissed from the mind. How many days would we not give for the privilege of living but a day in each century that has gone by, and testing the progress, physical and moral, of a whole nation. During many ages, the progress of Scotland was tardy enough; there was less difference than might have been looked for between the country for which the early Jameses legislated, and the country which Sir Archibald Grant recollected; between the men of Cullen's day, and the men whose excesses were prompted by Lovat, or repressed by Cluny. But within the last hundred years how rapid has been the national advancement! The brown heath has become green, and the barren hill waves with foliage; nor have the inhabitants been without their share of moral and social improvement. May their course ever be onwards.

CLASS ODE.—JULY 16TH, 1846.

FAIR HARVARD.

FAREWELL to thee, Harvard! Adieu to thy shades,

The scene of our youth's golden days;
We leave thee forever, and here at thy shrine
The hymn of our parting we raise.
Though linked to each other, as ever to thee,
By ties round our hearts close entwined,
The morrow shall scatter us wide as the leaves
Of the autumn before its chill wind.

Friends! brothers! we pause with our souls running o'er

* Chap. 25.

With emotions our lips may not tell,
But the hand's fervent clasp and the glistening eye

Must silently speak our farewell.
The sunshine of friendship fell not on our hearts
With a radiance fading away,
Not a beam of its light but has faithfully traced
There an image which will not decay!

The past comes before us, and fain would we stay
Yet a little to pensively dwell
On the shadowy forms that are gathering fast
At the conjurer memory's spell.

There were voices that welcomed, and faces that smiled,

When we met, that we looked for in vain;
They but tasted the sweetness and freshness of life,

And left us the goblet to drain.

Long and earnest our gaze as each moment returns,

With a thousand dear memories fraught,
Enchanted we linger, as pictures of youth
Pass by in the mirror of thought.

But it is not for us, with our hand on the plough,
To look back on the pathway of life;
Our watchword is "forward," and onward our march,

With to-day and to-morrow our strife!

D. S. C.

A STUDENT'S FANCY.

OH! could I write as I can think,
My words would burn the very soul—
Promethean fire must furnish ink,
And earnest mind afford the scroll.

No worldly song should wake my lyre,
No Pæan to please wayward youth;
The master-hand should still aspire
To tune the chords to hymns of truth.

As David soothed the Jewish king,
At first I'd calm the troubled mind,—
Some dear domestic ballad sing,
Whose echo childhood leaves behind.

And when the storm of rebel thought
Had spent its force in contrite tears:
And mem'ry had the picture brought
Of all the hopes of early years;

I'd bid prophetic record tell
God's promise to the race of Shem,
And sing the marvels that befell
Upon the plains of Bethlehem.

My fingers, which at first might creep
With thoughtful pauses o'er the strings,
Anon with fuller burst would sweep
A torrent of imaginings.

The mighty tide of perfect love
Would overwhelm imperfect words,
And Feeling's voice soar far above
The cold response of Music's chords.

From Punch.

THE LIFE AND ADVENTURES OF MISS ROBINSON CRUSOE.

CHAPTER II.

BEING booked as a married lady about to return to her husband at Hyderabad, I was particularly cautious in my conversation with many of the female passengers, the greater number of whom were really the wedded wives of officers and state civilians; ladies who had really left their little ones in England, and were returning to their Indian firesides. I say I was reserved in my speech, lest I might betray my inexperience. Besides the married ladies, there were a dozen young gentlewomen, consigned to the captain for the same purpose as I proposed to myself; namely, for instant marriage on their arrival. I will confess it, that the number of spinsters a little disconcerted me; as I had picked out from newspapers something about the harmony of demand and supply, and therefore knew that if only twelve officers came off in the yam and cocoa-boats for a wife, there must, by every rule of arithmetic, remain one virgin unwedded. I will not attempt to describe my perturbation when I reflected that this one might be myself! However, after I had well surveyed the whole twelve, I took great heart. Three had very red hair; four irregular teeth; two—but no; it is a melancholy, a thankless task to number the imperfections of our fellow-creatures. Let it suffice that, with the ingenuousness of a woman's soul, I knew myself to be the most attractive of the lot. Thus, I would not despair should even a general officer come off in the cocoa-boat.

Much that I saw and heard, naturally enough, surprised and disconcerted me. I was a week at least before I could reconcile myself to the frequent order to "put the ship in stays." At first I believed it was nothing but Captain Biscuit's wit; but as nobody laughed, I of course looked as grave as the rest. When, too, the captain declared that "he knew we should have a squall before night," I, innocently enough, asked him, "which lady among us he thought most likely to scream?" Silly creature that I was! But I was soon to learn the difference between a feminine scream, and the scream of Boreas. A warning this, I trust, to all roving young ladies who, not content with the chance of steady and sober husbands (as my dear mother, with tears in her eyes, used to call 'em) at home, must even take ship for the Indies to marry officers in regimentals, and so—but I will not anticipate the sorrows that overtook me.

We had sailed for many days with the wind, as they told me, south-west by west; which, as well as I could then make out, was as much as to say the Elephant and Castle by St. James' Church. Thus, after my own fashion, did I make out the theory of the winds. When we had been at sea a week, Captain Biscuit with peculiar emphasis declared that we were at last "in blue water." It was not of course for me to contradict him: but, looking over the ship, the color appeared exactly what I had often bought at the mercer's for a sea-green. But Captain Biscuit was an old man.

We had been at sea, I think, twenty-seven days, when we killed a dolphin. The sweet creature died beautifully. As I stood contemplating the brilliant hues of the expiring fish, beholding how the colors burned and intermingled, a tear stole

into my eye, and the words involuntarily escaped my lips—"What a lovely shot for a dress!" And this is human vanity! Alas! how little did I dream of the terrors of the coming night. The sun went down like a ball of dull fire, in the midst of smearing clouds of red-currant jam. The winds began to whistle worse than any of the lowest orders of society in a shilling gallery. Every wave was suddenly as big and high as Primrose Hill. The chords of the ship snapped like bad stay-laces. No best Genoa velvet was ever blacker than the firmament; and not even the voices of the ladies calling for the stewardess were heard above the orchestral crashing of the elements.

For myself, with one hand clutching the side of my berth, lest I should be rolled into the bosom of a whole family lying in disorder before me, and the other grasping a smelling-bottle, my thoughts—what could they do?—flew backward, home. Then I saw my father, mildly sipping his one glass of toddy ere he departed for bed; my mother making believe to knit; Tib, the cat, upon the hearth; Joss, the pug, upon the stool; and my sampler—yes, so roused was my fancy, I saw my own sampler—with the row of yew-trees, in green silk, framed and glazed above the chimney! And then my father's words, "I'll get you a sober and steady husband," rang in my brain; and—so quick is imagination in moments of peril—I absolutely saw that interesting man, saw him as my wedded lord, and beheld myself in a very sweetly furnished house, surrounded by I know not how many happy children. The thought was too much for me. I wept.

I know not how long I had remained in this sad condition, when I heard the voice of Captain Biscuit shouting down into the cabin—"Tumble up, ladies! Ship's going down!" I leapt from my berth, and with wonderful presence of mind seized a favorite handbox. Nor, even in that hour of terror, were the curls (spoken of in my last chapter) forgotten. I will not dwell upon the scene that met my view when I rushed upon deck; though the patterns of some of the nightcaps I saw never can go out of my mind.

As I was about to rush by the gangway, I was seized—I know not by whom—and literally flung into the barge below. This violence struck the handbox from my hand; and I saw it borne away forever by the remorseless deep. Ere, however, I could express my feelings upon this bitter loss, I heard a shout—the voice, I think, of Captain Biscuit—the barge gave a lurch, and when I was next conscious, I found myself alone upon the deep—miraculously supported by my garments—and in this manner passed along from wave to wave. This, however—I knew it—could not last. Gathering my senses about me, I therefore began to swim.

And here let me bless my prudence that had turned a month's visit to Margate to profit, teaching me to swim. I might, with the thoughtless and vain, have raffled at libraries—I might have sat whole hours upon the beach pretending to read the last new lovely tale—but no, I knew—I felt—that life was made for better things; and therefore, once a day, launched out into the deep, and—in flowing garments, learned to swim. The curious world might be gathered on the beach; I cared not, but struck out. And now, at the most eventful moment of my life, I found the value of my skill. Therefore is it, that I hope my example

will turn some of my sex from dancing in all its variety of vanity to a more worthy and enduring accomplishment. True, dancing may obtain a husband; but swimming saves a life. Happy, then, the woman who quits the ball-room for the deep—who turns from cork-soles for a cork-jacket. To return to my story.

After much swimming, a mighty wave threw me ashore; but Neptune, doubtless for some unknown purpose, sent a bigger wave to fetch me back again; fortunately, however, my flounces—they were worn then very full—catching among the rocks, held me fast ashore. Taking advantage of this circumstance, I rose and ran away from the next billow.

I looked about me. It was plain I was upon some island. Yet, although my father had been regularly charged for my learning the use of the globes at the Blackheath school, the fault was either in the teachers or myself, that I could not possibly guess upon what part of the world I was landed.

Not wearing pockets, I had secured nothing about me, except a pair of scissors, a smelling-bottle, and a box of peppermint drops.

CHAPTER III.

I continued to walk about on the shore, much wondering at the fortune that had saved me, and grateful to my own discernment, that at Margate had prompted me to shun the meaner pleasures of the place, to learn to swim. And then I suffered alternations of happiness and despair. I thought of my female comrades; and believing them to be in the deep, all thoughts of rivalry charitably died within me. I thought of ardent hair and irregularity of teeth with a pity—a sympathy that surprised me. So true it is that no trouble, however great, has not, in the core of its very greatness, some drop of comfort—for the human heart, like a bee, will gather honey from poisonous blossoms)—that from my very solitude I snatched a triumph. Should I meet an Indian prince—and, for what I knew, I might be in the empire of the Mogul—there was no lady to contest with me his royal affections. And again, this feeling was saddened by the thought that no other woman could witness my conquest. For all my acquaintance were gone; I never saw them, or any sign of them afterwards, except a jaconet muslin nightcap (the horrid pattern!) and a wave-tossed rouge-pot.

And still my feelings of satisfaction began to abate, for looking about me, I saw no habitation; and though I listened—my sense of hearing sharpened by my peril—I heard not the sound of a muffin-bell. I therefore concluded that I was in a land to which the blessings of civilization were utterly unknown. And besides this, I began to feel that my feet were very wet; and—though I struggled long—I at length burst into tears when I thought of my evening blue buried in the bosom of the deep. And then I began to have confused feelings of hunger. A sea-bird screamed in the distance, and I thought of the liver wing of a chicken. This threw me into terrible disorder. Only that I knew nobody was there to catch me, or what could I have done but faint?

As a child, I always screamed at a spider. As a woman—I throw myself upon the sympathy of my sex—though fond of milk, I always ran into the first shop or door-way, or grasped the first arm of the first gentleman on meeting even a cow.

What, then, were my feelings when I thought of wild beasts!—beasts that revenged the wrongs of the beasts in cages, by eating the unprotected travellers on their shores? I had read horrid tales of bears and apes; and when I remembered I had nothing but a pair of scissors (with one point blunt too) to protect me, how I wept—how I repented of my folly, that had brought me in search of a military husband, coming in a boat with coconuts and yams, to perish at last, perhaps, in the claws of some wild and foreign animal.

Daylight, as if in mockery of my terrors, waned fast away. Where was I to sleep? That I, who at the least dusk had never walked from number nine to the Thompson's at number six, without the man or the maid—that I should sleep out all night, I knew not where, shocked me past words to paint! Respectability seemed sinking with the sun! Suddenly, I heard a sound—whether the voice of a tiger or a frog I knew not; but equally alarmed, I ran to a tree. Instinctively looking about to see that nobody observed me—and, for the moment, (silly creature that I was.) thinking only of the country stiles of happy England—I put one foot upon the lowest bough, and with an agility that surprised even myself, continued to climb. At length I threw myself into the umbrageous arms of a young hawthorn, and prepared myself for rest. I put one peppermint drop in my mouth, and soon sank to sleep. Even at this lapse of time I wonder at myself; but I never even thought—vain as the thought would have been—of paper for curling my hair.

I awoke, as usual, about eleven o'clock. It was a love of a day. The sun shone beautifully hot, and the sea was like a looking-glass. For the first few minutes—ere fully awake—I thought I was at Margate; and, so were images mixed and confused, that as the small shingle was moved and shaken by the advancing and receding wave, I thought I heard the rattling of the library dice. Moving, a sharp thorn—the tree was full of them—brought me, as adversity lowers pride, instantly to myself. With a heavy heart I descended the tree, feeling it vain to wait for the breakfast bell. Again and again I looked around me—I was such a figure! It was foolish, weak; but nevertheless, it showed the beauty of the female character. I dreaded least even some savage should see me in my horrible *déshabillé*. And then—though my noble reason told me it could not be so—I shrank at every motion of the sea and air, lest the Indian prince, or general officer, should suddenly rise before me, and then—in such a dress what *would* he think of me! In such a state, it seemed to me a blessing when I could really think that I was upon a desert island, all alone! Solitude was bad, but to be caught with my hair in such a fright—with all my flounces limp, (much starch was then worn,) and my gown as though waxed about me—I felt it, I should have died upon the beach.

After a time my pride abated as my hunger rose. I could not have believed it, but I thought less of my hair and more of my breakfast. A lesson to human arrogance—for did I ever believe that the human soul could so have hungered for a twopenny twist? I walked upon the beach: it was strewn with oysters. Nevertheless, though there were thousands about me, it was June, and I knew that oysters were not in. "At least," I thought, "and whatever fate in its bitterness may have in store for me, as I have lived in the fashion

in the fashion I'll expire." And this determination—mere men cannot conceive its deliciousness—comforted me exceedingly. Nevertheless—for I write down here every then emotion of my soul—though I abhorred the thought of oysters in June as food, I could not forget them as the probable depositaries of precious pearls. Famished and destitute, I thought, being in the Indian seas—as I believed I was—I might be destined to be one of those lucky people of the world, who have pearls washed ashore at their feet, and never run the risk of diving for them. Though I was as hungry as the sea, the thought like a sunbeam played about me, that I might be destined to wear my own head-dress of pearls, obtained from the living fish by my own hands, at some future drawing-room! And whilst I thought this, my hunger was in abeyance! Cleopatra dissolved *her* pearl, as ill-nature dissolves the treasures of life, in vinegar; but I enriched *my* pearls by honeyed thoughts. (What would I give had either of the Misses Whalebone, principals of the Blackheath Seminary, lived to read *this*—this from their pupil!)

From the Spectator.

LORD JOHN RUSSELL'S MINISTRY.

LORD JOHN RUSSELL'S ministry is completed. Its character, no doubt, is determined by the principals—Lord John Russell, Viscount Palmerston, and Earl Grey; but even those chiefs appear under greatly altered circumstances. Lord John Russell seems to act under the influence of new views; so does Lord Palmerston. Lord Grey is in a position to give his views better effect. Although the range of Lord John's search for assistance may be said to have extended from conservatives to radicals, it was not found easy to "infuse new blood" into the administration. Nevertheless, some excellent names have been added in the subordinate posts; and it must be allowed that the premier sets out with a considerably greater amount of talent in the working departments than Sir Robert Peel could command. When "the Tories" returned to office, great expectations were formed of their administrative ability, based on traditions of their practice; but in fact the practised men had died off, or had, like Sir Robert Peel himself, been promoted; and the expectations were disappointed. It is to be hoped that the expectations now based on greater personal talent will be justified.

Many of the new ministers have gone through the form of reflection; for in most instances it has proved to be little more than a form. The *Morning Chronicle* exultingly imputes that political phenomenon to popular "confidence in the men;" but our able contemporary draws somewhat too largely on obliviousness of facts not yet ancient. It was notorious in December last, that an election for a whig government, even with free trade, would have been hazardous in the extreme: it was even stated by an intended member of that evanescent ministry, that the whigs at their outgoing in 1841 had not a rag of popularity left. Now the men who come before the constituencies are identically the same; and the striking difference in their public reception must be found in the altered circumstances, and in the popular confidence that those circumstances will work out desired ends. In December, even the liberals deprecated the whig accession to office; because the chief anxiety was, that the protective corn-law should be abolished, and Sir Robert Peel alone was believed, and justly

believed, the statesman likely to carry the abolition: now, that measure is accomplished, facilitating the whig return, and removing from their path many old sources of embarrassment. There is no necessity to revive past reproaches on that score; but it is not salutary quite to forget so cardinal a point in the new position. Another favorable circumstance lies in the utter disruption of parties and the confounding of party tactics. The antagonism which, in other circumstances, the whigs would have encountered from various quarters, is thus for the time destroyed; besides which, even if there were in any one party the strength to oppose, all are baffled to strike out, on the spur of the moment, a policy at once effective and safe. Spite, too, against the departed minister, instigates a sort of transient kindness for his quondam antagonists; and the protectionists are patronizing the whigs, in such a temper as that of a splenetic woman, who, after scolding the husband that will not be her slave, falls to hugging the children with unwonted caresses, before his face, by way of reproachful contrast. So we see even the *Post* and *Standard* patting Lord John Russell on the back. There may, however, be some sly hope of conciliating his remains of aristocratic predilection, and enticing him to do as little as possible. But a parting blow was given to faction by Sir Robert Peel's farewell speech; which aroused more generous sentiments in the well-disposed of all parties. One of its fruits is the remarkable address to the constituents at Pontefract, in which Mr. Monckton Milnes signifies that, for the present, and for as long a time as possible, he shall give a cordial support to Lord John Russell's government.

We have now attained the third stage in the great national movement which began with the reform bill. The first stage was the struggle to develop the germ of a real representation of the people; which, however imperfect in its extent, was actually established and put in operation. The next stage was the struggle to abolish the ascendancy of class interests, which were assailed in the "monster monopoly" of the corn-laws. Sir Robert Peel gave the crowning stroke to that struggle, and smoothed the way for the third stage—the social ameliorations promised by Lord John Russell. This stage has just begun.

ROME.—Like our premier, the Roman pontiff has completed his government, and constructed it well. Cardinal Gizzi, who was too liberal to command a majority of suffrages in the sacred college, has been appointed secretary of state; Cardinal Amati, friend to M. Rossi, the French Ambassador, has also taken office. Divers measures for the improvement of the state are said to be under consideration, and among them are projects for railroads.

Meanwhile, a movement has been going on about the country beginning at Bologna. Petitions, numerous signed, pray that effect may be given to the memorandum which certain foreign ambassadors laid before the high pontiff in 1831, giving to the people such representation as enables them, not to legislate, but to declare their wishes, and admitting laymen to official employ. These petitions have been signed by several influential persons, and among them by the pope's elder brother. There are, therefore, signs of a healthy activity among the people, and of an unprecedented disposition to advancement in the ruling body.—*Spectator*.

THE MORMON CAMP.

THE Hancock Eagle of the 10th July notices the arrival there of Mr. S. Chamberlain, who left the most distant camp of the Mormons at Council Bluffs on the 26th ultimo, and on his route passed the whole line of Mormon emigrants. He says that the advance company of the Mormons, with whom were the *Twelve*, had a train of one thousand wagons, and were encamped on the east bank of the Missouri river, in the neighborhood of the Council Bluffs. They were employed in the construction of boats for the purpose of crossing the river.

The second company had encamped temporarily at station No. 2, which has been christened Mount Pisgah. They mustered about three thousand strong, and were recruiting their cattle preparatory to a fresh start. A third company had halted for a similar purpose at Garden Grove, on the head waters of Grand River, where they have put in about two thousand acres of corn for the benefit of the people in general. Between Garden Grove and the Mississippi river Mr. Chamberlain counted over one thousand wagons *en route* to join the main bodies in advance.

The whole number of teams attached to the Mormon expedition is about three thousand seven hundred, and it is estimated that each team will average at least three persons, and perhaps four. The whole number of souls now on the road may be set down in round numbers at twelve thousand. From two to three thousand have disappeared from Nauvoo in various directions. Many have left for Council Bluffs by the way of the Mississippi and Missouri rivers; others have dispersed to parts unknown; and about eight hundred or less still remain in Illinois. This comprises the entire Mormon population that once flourished in Hancock county. In their palmy days they probably numbered between fifteen and sixteen thousand souls, most of whom are now scattered upon the prairies, bound for the Pacific slope of the American continent.

Mr. Chamberlain reports that previously to his leaving, four United States military officers had arrived at the Mount Pisgah camp, for the purpose of enlisting five hundred Mormons for the Santa Fe campaign. They were referred to headquarters at Council Bluffs, for which place they immediately set out. It was supposed that the force would be enrolled without delay. If so, it will furnish Col. Kearney with a regiment of well-disciplined soldiers, who are already prepared to march.

Mr. Chamberlain represents the health of the travelling Mormons as good, considering the exposure to which they have been subjected. They are carrying on a small trade in provisions with the settlers in the country, with whom they mingle on the most friendly terms.

VARIETY.

IRELAND.—The *Nation*, the organ of the "Young Ireland" party, indulges in a hopeful prophecy of Sir Robert Peel—

"Peel, the future premier, bids for Ireland. His price is the highest liberal or radical, whig or precursor, ever ventured to demand. He offers full identification in all respects with England. The Irish franchises, representation, and municipal powers, the national religion, and the educa-

tion of the people—all to be put on a footing with England. That is Peel's offer—the first instalment of a subsidy paid to the repeal agitation. And, by and by, when the whigs have fretted their little hour upon the stage, Peel will *do* all this. For he has tasted the blood of monopoly, and he will hound it to the death. A few places secured, a few titles bestowed, a few jobs perpetrated, a general election tried and lost, and the whigs will stagger out of office, to make room for the destroyer. England is calling for him already by the non-official voice of meetings, and newspapers, and London crowds; she will call for him by and by in a less equivocal manner—in a manner not to be disputed; and the doom of monopoly will be accomplished.

"For Ireland all this augurs excellently well—better than the wisest could have altogether foreseen, or the hottest anticipated. Whatever the whigs accomplish, more or less—all Peel can, and assuredly will do, to sweep away the monopoly of the church, of the bench, of the jury system, of the executive, clears our path to repeal. Monopoly is the rampart which keeps the Irish race asunder—which constitutes two nations on one soil. That gone, there will remain but one nation, one hope, one interest, and hence one purpose, in all Ireland."

After reviewing in a similarly exalted style the political changes which have occurred in Ireland during the last twenty years, and the present position of parties in both countries, the *Nation* infers that all things are working together for repeal. This is Ireland's only hope—"Whatever Russell or Peel may accomplish neither can give us our five millions of taxes, and other five millions of absentee rent, or the strength, and glory, and security of a nation, which will come only with repeal."—*Spectator*.

INDIAN CORN.—The Irish are so fond of this new article of food, that they are in a fair way to give up potatoes. At Limerick, ten days since, a riot was created by a false rumor that the millers intended to stop the issue of meal. In Cork the government sells ten thousand pounds (say nearly fifty thousand dollars worth) each week at one penny per pound; and private dealers sell a great deal besides at a lower price, about four fifths of a penny.

A LETTER from Vienna mentions that the States of Lower Austria held their first sitting on the 23d ultimo. Amongst other objects to be submitted to their consideration are the means of putting an end to the obligatory service of the peasants; the establishment of a rural police; and the creation of provincial banks.

THE Minister of the Interior has addressed another circular to the Prefects of the departments, on the subject of the emigration of persons of the working-classes to Algeria. He states that a gratuitous passage will be afforded only to workmen in the useful arts, such as masons, carpenters, smiths, painters, &c., and to no females except seamstresses, cooks, dairy maids, silk-winders, and other useful persons.

WE understand (says the *Presse*) that Mehemet Ali has formally authorized the foreign consuls residing at Alexandria to inform their sovereigns of his intention to proceed to Constantinople. Every one at Alexandria thinks that, on quitting Constantinople, Mehemet Ali will make an excursion to Western Europe.

A LETTER from Madrid states that a very extensive Joint Stock Company has been formed there, for renting from the State, for twenty-five years, the Philippine Islands, Annobon and Fernando Po—paying for the first, a rent equal to double their present returns to the government, and engaging to form manufacturing and commercial establishments in the others.

THE last returns of the manufacture of beet-root sugar in France show a great improvement over the preceding returns. At the end of May there had been manufactured forty millions of kilogrammes of sugar, or nearly four millions more than in 1845. Out of this quantity, upwards of thirty-two millions and a half had been delivered to public consumption, which exceeds the proportion of last year by more than three millions. In this quantity, nine millions sent to the depot of Paris have not been reckoned. Up to May 31 the home-made sugar had produced to the treasury eight millions of francs, or two and a half millions more than the preceding year at the same period. There were then 306 establishments at work. There is this year an augmentation of 30 manufactories at work.

MEXICAN PUNISHMENT OF THEFT.—From what we had heard and knew of the thieving propensities of the Mexicans, we were under the impression that theft was considered inherent with them, and was therefore allowed to pass unpunished; but we were undeceived as to this the other day, by witnessing the infliction of a severer punishment for this crime than is meted out to it by the laws of any other country we are acquainted with. The culprit, with his hands tied behind him, and a chain with a heavy iron ball attached to it, fastened round his leg, was paraded through the streets, and after a sufficient exhibition, was led to the ferry at the crossing of the river, placed in the ferry-boat, and when it had attained the middle of the stream, with his hands thus tied and the heavy weight suspended to his leg, he was made to plunge into the rushing torrent. The poor devil managed, even in this situation, to keep his head above water for several moments, and shorten the distance considerably between himself and the shore, but the ball at length touching the muddy bottom, he could swim no further, and was dragged under and passed into eternity.—*Matamoros Flag.*

AMUSING SCENE IN MATAMOROS.—The high price of cotton goods in Matamoros, in consequence of the Mexican tariff, is well known. Several enterprising "Yankees," since General Taylor has taken possession of the city, have "moved in," opened stores and are selling goods on "cheap principles"—about one third of the usual Mexican prices, but double the usual American prices. It is an amusing scene to witness the crowd around these stores, composed of the mixed people of the city. Finely dressed women, rancheros, naked Indians and negroes, all eager to purchase goods, and jabbering good, bad and indifferent Spanish, with a rapidly truly appalling to a phlegmatic Anglo-American. This species of warfare is rapidly converting the people over to American notions, and they have only to fully learn that they can have cheap goods, and the enjoyment of life and liberty, to abandon their government as rapidly as they have their high-priced stores.

SIR ROBERT PEEL, before quitting office, conferred a pension of 100*l.* a year on the Quaker-poet, Bernard Barton.

THE founder of Chemistry, Lavoisier, was, as our readers know, snatched away, by a violent and premature death, ere he had found time to collect and arrange his works. In 1843, the minister of public instruction consulted the Academy of Sciences as to what works of that philosopher should be included in a national publication; and a committee was appointed to examine, and report, on the matter. This committee has now made its report; and recommends that the chamber of deputies be asked for a sum of from 40,000 to 60,000 francs for the purposes of the publication according to its suggestions. It is only with the view of giving a national character to this edition of Lavoisier, as the committee observe, that they apply to the State for its cost; for a member of the illustrious chemist's own family would gladly take upon himself the entire expense, and renounces his right to do so only because of the greater glory redounding to Lavoisier from the sponsorship of the government.

THE *Voice of Jacob*, an Anglo-Jewish periodical, announces a loss which the cause of Hebrew literature has sustained, at Hamburg, in the sudden death of Heyman Joseph Michael, a celebrated collector of works relating thereto. Dr. Isler, of that city, says the paper in question, "afraid lest his magnificent library should be lost to Germany, even as that of the celebrated Oppenheim (now in Oxford) was lost, has issued an appeal to his Jewish townsmen, calling upon them to preserve this treasure to their city."

PARIS ACADEMY OF SCIENCES.—July 6.—A paper was read by M. Payen, on the chemical analysis and general properties of coffee.—M. Séguier gave a description of a machine for the cleaning of seed corn, so as to remove the inert and useless portions.—MM. Piobert and Morin presented another paper on turbines, giving an account of the various ameliorations of which they are susceptible.—The next paper read was a report by M. Duviver, in the name of a committee, earnestly recommending the minister of public instruction to bring into the chamber of deputies a bill for the publication of a national edition of the works of Lavoisier.—M. Cauchy informed the Academy that the obstacles which had occurred to prevent the realization of a plan, by the charitable society of St. Regis, for the civil and religious marriage of persons of the poorer classes living together without the bonds of marriage, have been removed, and that arrangements have been made for such persons to have the marriage rites performed without cost to themselves.

CHINESE MAP.—Amongst the articles brought from China by the Commission who have just returned from that country—and which are exhibited at the ministry of commerce—is a map of the world, presented to the Commission by the head mandarin of Canton. The Chinese geographer has arranged the earth quite in his own way. With him, there are no isthmuses, no peninsulas; the Isthmus of Suez is replaced by a magnificent arm of the sea, which detaches itself from the Mediterranean to fall into the Red Sea. We see nothing of the Isthmus of Panama, and the two seas on that side are connected in the same way. There are neither Pyrenees nor Alps, and hardly are the vast mountains of America indicated. On the other hand, however, China is liberally dealt with by the geographer; for upon this point it occupies not less than three quarters of the whole globe.—*Galvani.*

Mesmerism in India, and its Practical Application in Surgery and Medicine. By JAMES ESDAILE, M.D., Civil Assistant Surgeon, H.C.S. Bengal. Longman and Co.

THIS is one of the most notable works that have yet appeared on the curious subject of Mesmerism. It is remarkable not only for the facts it contains, but for its freedom from anything like passion or advocacy. Dr. Esdaile does not seem to have had any natural love of the marvellous, and has become a believer in the wonders of Mesmerism in opposition to a strong tendency to doubt whatever cannot be accounted for upon known principles. Indeed, it is with reluctance he admits there is anything really unaccountable in the matter; and he tries again and again to persuade himself and his readers that it may all be resolved into a modification of ordinary phenomena. We cannot say, however, that we look upon his reasoning to that effect as the most successful portion of his speculations. It seems to us that if Mesmerism is to be admitted as true, even to any extent, it must be received, at least for the present, as the development of a power or principle distinct from any hitherto known.

The main purpose of the book is to detail a long series of cases in which Mesmerism has been recently employed by Dr. Esdaile in India, with the effect of extinguishing for the time all nervous susceptibility, and in which operations, many of them of a most formidable character, have been successfully performed upon mesmerized patients without any pain being felt by them. Seventy-three such cases were reported as having occurred in the hospital at Hooghly in the last eight months of 1845, besides eighteen cases of cures effected by Mesmerism alone, without any surgical operation. We will not inflict any of these narratives upon our readers, who, not having the advantages of being mesmerized, might many of them suffer from Dr. Esdaile's knife what his patients were spared. Those of them, however, who have a taste for such sanguinary reading, may be conscientiously recommended to procure the volume itself, not a page of which they will find tedious or uninteresting. It will be sufficient to quote Dr. Esdaile's summary of the general results which he conceives the cases have established:

"From the foregoing facts it is allowable to conclude, I hope, that Mesmerism is a natural power of the human body. That it affects directly the nervous and muscular systems. That in the mesmeric trance the most severe and protracted surgical operations can be performed, without the patients being sensible of pain. That spasms and nervous pains often disappear before the mesmeric trance. That it gives us a complete command of the muscular system, and is therefore of great service in restoring contracted limbs. That the chronic administration of Mesmerism often acts as a useful stimulant in functional debility of the nerves. That as sleep, and the absence of all pain, is the best condition of the system for subduing inflammation, the mesmeric trance will probably be found to be a powerful remedy in local inflammations. That the imagination has nothing to do with the *first* physical impression made on the system by Mesmerism, as practised by me. That it is not necessary for the eyes to be open: I always shut them as a source of distraction; and blind men are as readily mesmerized as others. That water can be charged with the mesmeric

fluid, and has a powerful effect on the system when it has been previously affected. That the mesmeric influence can be transmitted through the air to considerable distances, and even pass through dense materials."

All this, it must be admitted, is at least something very well worth the proving; the things asserted, if they can be established, certainly do not want importance. Any one, then, who takes an interest in such matters will do well to consult the evidence Dr. Esdaile has brought forward. We do not profess to offer an opinion upon it, either way.

The book, let us add, is by no means a mere history of scientific and humane bloodshed from beginning to end. The cutting and carving is agreeably relieved by much ingenious disquisition, and also by several mesmeric performances and adventures of the author's in which the knife plays no part. The most remarkable of these last is a singular story of a boy and a barber—a new exemplification of the Scotch song, "I'll make you be fain to follow me"—but it is too long for our space. As a more commodious specimen we will take the following:

"July 29th.—I made a man senseless and cataleptic at a great distance, in the presence of a large number of gentlemen, who had come from Calcutta and elsewhere; among them were six doctors, in whose hands, and in those of the rest of the company, he was left as long as they pleased, without my approaching till I was requested to awake him, after they had all tried in vain. This I did, but only to the extent of enabling him to walk and follow me. I then said, that I would try to clear up his perceptive organs sufficiently to permit him to understand my wishes, with which he would implicitly comply; I did not wish to leave him the power of speech even, at this stage. Having attracted his ear, I ordered him to do what I did, and this he very faithfully performed by throwing himself, on the instant, into every attitude I assumed; but I required to be careful, for if I threw him much out of balance, he was in danger of plunging head foremost against the floor. Those who did not see him, may imagine how little the poor fellow knew what he was about, when they are told, that he took the 'longitude' of the judges of the Supreme Court with the cool impudence and precision of a cabman, and the gravity of an astronomer. I then proceeded to free his voice, but only to the extent of making him my echo; he was told to repeat whatever I said, and he showed his intelligence by *repeating the order*. He then gave us 'Ye Mariners of England,' and if the pronunciation was not very perfect, he seemed to me to reverberate exactly my tones, and my gesticulations were also faithfully copied. We passed suddenly from 'grave to gay,' and he did such justice to 'Hey diddle diddle,' that I lost my gravity and burst into a laugh; he joined me in full chorus, and I heard it remarked 'he can't help laughing himself;' and some were now quite satisfied that he was found out! Upon this I stopped laughing, and, on the instant, his features relapsed into the most awful repose, and I pointed out that it was no joke to him, but purely imitative laughter, and this, I should think, became evident to all. He also sang 'God save the Queen,' as well, or rather as badly, as I, for he is capable of much better things, under a more skilful music master. I now awoke him up a little more, and made him capable

of answering questions. He was asked if he could fence : he said that he could ; and I bid him show me. He began to cut the preliminary capers of the native fencers, but, in the act of stooping, a fit of rigidity shot through him, and he would have fallen with dangerous violence against the floor, if his fall had not been fortunately broken. I am always alarmed, and on the look out, when this man is experimented on, from this tendency to instantaneous rigidity of the body. A profound trance, from which it is very difficult to awake him, succeeds such exertions, and usually lasts for four or five hours. I showed another step in the mental phenomena, on other subjects ; enabling them to answer simple questions correctly, and extinguishing and releasing the power at pleasure. All reflection being dormant, they feel a natural impulse to give a direct answer to a direct question, and in this way tell me frankly whatever I choose to ask. We are assured that common sleepers can also be played upon in the same way by patient and skilful persons, and that this is well known to the secret police of France."

"You may fret me," says *Hamlet*, "but you shall *not* play upon me!" The melancholy prince, though conscious of more things in heaven and earth than our philosophy dreams of, had not sounded the wonders of Mesmerism.—*Examiner*.

WARNER'S INVENTION.

LORD INGESTRE'S motion on the subject of the invisible shells and the long range has brought Mr. Warner's claims again before the public. The inventor had unfortunately proceeded so much in the style of charlatans that he has thrown a strong degree of doubt over the whole transaction. This doubt, however, will be quickly extinguished by the trial which has been assented to by the chancellor of the exchequer. The objections hitherto made must be suffered no longer. The demand for so monstrous a sum as nearly half a million of money, the demand to have his own selection of the officers who were to try the experiment, and the various objections which were made to every attempt to bring the question to a brief and direct trial, altogether enveloped the whole affair in such a tissue of apparent equivocation, that the public grew utterly weary and dismissed the matter from their minds. A trial is now to be given, and, if Mr. Warner will not exhibit fairly the results which he avers his secret to be capable of effecting, he must expect the natural consequence. We must hear no more on his part of the hazard of communicating his secret, or his right to bargain for a remuneration. Nothing can be more easy of apprehension than the reality of his discovery if he chooses to convince the public.

He has only to make the experiment before their eyes. He states that he is in possession of a discovery by which he can infallibly destroy a ship of war at a distance of six miles ; and that he also has an invisible shell, by which, without any communication with a ship, he can instantly sink it. The former experiment is the more important and peculiar one. Let him take his apparatus into the Channel and destroy any vessel anchored six miles off, and there will remain no doubt of his dis-

covery. It has been even said that he disregards all obstacles, such as ground, or intervening heights, and that he could destroy vessels at Spithead by any apparatus behind the Isle of Wight. But let him sink a vessel at six miles range, and he will have sufficiently substantiated his claims.

The invisible shell is altogether an inferior proposal. It is much more within the power of trick ; and the shattering of the vessel at Brighton was managed with so much artificial arrangement that it produced no conviction whatever. Torpedoes, submarine shell, and explosions by galvanic wires, have been so common that their effects produce no interest, and their secrets are not worth the name of a discovery. As to the long range, we must hear no more scruples from the fear of developing the secret too suddenly. All that is necessary for either the officers or the public to know is, that the thing can be done. This is not like the secret of the congreve rocket, or of any other combination of explosive materials. It can only be necessary, in the first instance, that the officers should use their eyes and see whether the ship is actually destroyed by a projectile, or whatever may be the means at the proposed distance. If the effect is produced, there can be no doubt of the importance of the secret.

As to the triflings on the subject of inhumanity if this power should be attained, they are not worth listening to for a moment. Whatever increases the power of defence renders a service to humanity. The "long range," if it should ever be effective, would, for example, not merely destroy an invading fleet, which would be an obvious service, but it would prevent the existence of an invading fleet altogether, for no sovereign would think of constructing a fleet at the enormous expense which naval preparation demands, and manning it with thousands of his subjects, where its certain fate was to be total destruction. Thus the lives which must be spent in any invasion at the present day would be saved, for invasion would be attempted no more. It is true that every nation might have a Warner apparatus to defend its coasts and harbors ; and what would be the result ! That nations would have no power of injuring each other ; and thus the very excess of danger would produce the excess of safety.

On the same principle we regret the imperfection of Perkins' steam gun, because, if it had fulfilled its objects, it would have made defence irresistible, by rendering assault utterly ruinous. After the first evidence of its powers, assault would be felt to be massacre, and, therefore, no assault would be made. A gun discharging 500 balls a minute, capable of sustaining that discharge for any length of time, and throwing its shot with the precision of artillery, would render the musket utterly useless, and mow down an enemy's line without suffering it to advance a step, when the range was once found. Therefore no assaults would thenceforth be attempted. This would be a great triumph of humanity, and the next step would probably be the extinction of war altogether. But to this fortunate consummation we must acknowledge that we see no approach at present, and, in the mean time, we must wait for Mr. Warner's unequivocal evidence that he can sweep a fleet from the seas at twice the range of a six-and-thirty pounder !—*Britannia*, July 18.

From the *Britannica*.

The Modern Orlando. Cantos I. to VII. Colburn.

THIS work comes at a happy time to silence the reproach that the spirit of poetry has been smothered by steam. Every one will acknowledge here the rising of a new star, destined to move with brilliancy in an orbit of its own. "*The Modern Orlando*" is by turns striking, picturesque, pathetic, witty, and grand, and displays in all the true soul of genius—originality. Should it fail to become popular it can only be from one defect—a great defect it must be admitted with a certain class of readers—the absence of personality and viciousness."

When it was thought all veins of poetry had been exhausted, and the mine worn out, this author appears to show that invention is limitless; and that where there is true ability there will never be wanting novelty in style and subject.

For the idea of his production, and the idea merely, the writer is indebted to Ariosto. His hero is a traveller, but a traveller in modern fashion—by rail and by steam-boat, by yacht and by post-chariot. All his adventures are of the day, all his characters of the time. His plan of painting is the plan of Pope. His canvass is a summer cloud, his colors rainbow hues, and his subject "*the Cynthia of the minute*." His motto is the mirror of his spirit:—

"Travel! travel! travel! The mind stagnates at home. The flower dies unless it is transplanted. Hear all things—see all things—write all things, and write them on the spot. Give the world your thoughts, fresh, fast, and fair, as they come. Make your pen a pencil, your ink colors, your paper a canvass, and Nature your sifter. Say what you think; tell the truth, and fear not. Cherish woman, and castigate man. Be bold of heart, quick of eye, and pleasant of tongue. Carlo mio—where then is the true poet to be found? By the Madonna, I know not. Let the world, which decides everything, decide that too. I follow none—I ask none to follow me. This is the only boast of your friend Ludovico.—Farewell; may all the graces hover round your pillow, Carlo mio." *Lettere Scelte*, v. 2.

It is not a little surprising that the verse of this young writer should display the finish of that of a veteran poet. The vigor of his thought goes hand in hand with the music of his rhyme. He is neither careless nor labored; a slovenly line or a false cadence never slips from his pen. Poetic expression seems so natural to him—whatever his theme, however changeful his subject—that one is tempted to think the stanza he manages with so much ease and grace must be his every-day language.

Visiting all lands, and passing rapidly from grave to gay, our "*Orlando*" sees some objects that call forth serious reflections, some that move him to smiles and ridicule. In Paris, the city of strange contrasts, he finds food enough for his varying humor. The character of the capital is splendidly struck out in a single stanza:—

"Paris, thou strangest thing, of all things strange;
Young beauty, superannuated flirt;
True to one love alone, and that one, change:
Glittering, yet grim; half diamonds, and half dirt;
Thou model of—two ruffles and no shirt!
Thy court, thy kingdom, and thy life, a game;

Worn out with age, and yet, by time unhurt;
Light without lustre, glory without fame,
Earth's darkest picture, set in earth's most gilded frame."

His dinner at "*Vatel's*" and his supper at the "*Trois Frères Provençaux*" are succeeded by graver themes. His visit to Fontainebleau and the picture gallery of the palace draw forth the powers of his sarcastic wit. Here are a couple of *his* portraits:—

MOLIERE.

"Whose is that visage, sportive, yet severe;
That lip of laughter, yet those piercing eyes;
That brow so bright, yet careworn?—Ah, Molière!

I see the hand, that stripped the soul's disguise,
Forced monks to feel, and monarchs to be wise;
Dared the court whisper, and the Jesuit's knife;
Yet (all we honor, all that we despise,) leading, poor fool, an ultra-henpecked life,
And dying on the stage! Verdict—'A dashing wife!'"

TALLEYRAND.

"One place is vacant, which but *one* can fill,
Prince of imperial craftsmen, Talleyrand!
Where is thy cold grey eye, thy visage chill,
Thy sneering lip, thy smile supremely bland?
Thou first and last of that imperial band,
Who swindled monarchs, mobs, and all mankind!
Thy craft, so sweeping, that 't was almost grand!

Thy galley making way with every wind,
Shunning all rocks and shoals, yet *never* left behind!

Yes! 't was delightful, from thy features placid,
To see such firefly sparks of satire dart!
Thy wit a drop of death—pure prussic acid—
A flash of lightning, killing without smart!
Tell me, thou man of brain without a heart—
Prince Scapin! in what courtly *escritoire*
Hast thou locked up thy never-failing chart,
That steered thee safe through council and *boudoir*;
Till France's blazing torch was buried in the Loire!

France has for thee *no* rival—Rome but Sylla;
Yet, strip the classic gilding from the name,
What was *his* lazy life, his Baian villa,
His Senate, craving for the bread of shame,
To *thy* keen course, through France's tide of flame;

Thy path, beset with faction's serpent-stings!
Thine was the longer and the harder game—
When Europe's thrones were made the tombs of kings.
But politics, avaunt!—I turn to wedding-rings!"

One presence pervades all Fontainebleau, but especially fills

THE CHAMBER.

"One glance at thy bronze bust, Napoleon!
Ere all are hurried from the little room,
Where Europe's lord was tumbled from his throne.
There stands his couch;—the table, hid in gloom,
Where his own pallid fingers signed his doom;
The chair, in agony of spirit scored:
King-maker! I ask not, *where* stands thy tomb!

Though thousands round it wept, or cannon roared.
Here was Napoleon's tomb; here vanished crown
and sword!

I am not 'playing moralist;' and yet,
Where has the world a teacher—like that bust?
Why, shall the heart through half a century fret,
Stake life, and love, and peace—to turn to dust?
Like *thee*, if mighty, from a throne be thrust,
The scoff and victim of its ransomed slaves!
If lowly, take posterity on trust,
Dream dreams, build castles upon winds and
waves,
And, after all—lie down among earth's wormy
graves."

The Provençal hills recall to mind another character, hardly less celebrated:—

MIRABEAU.

"Now, rise before me the Provençal hills;
Glory of novels, 'Paradise of France!
Where wine from every highway hedge distills,
And life's sole labor is, to sing and dance!
Alas, for all the honors of romance!
The morning cuts your midriff with the *Bise*!
Noon burns your cuticle, and blinds your glance!
The evening dews your very heart-veins freeze!
Night is despair—the reign of Pharaoh's plague
of flies!

And yet, I paused, to see an old château;
Now but a heap of ivy-mantled stones;
The fortress of thy father's Mirabeau!—
Thou man of contradictions!—prop of thrones,
Yet, the hot marrow in rebellion's bones;
The monarch's hireling; yet the rabble's king!
Courtier, yet brazen trump of faction's tones!
Thy genius, half swine's hoof, half eagle's wing!
Bold, coward, patriot, slave, tool, traitor—everything!

These are the men one hates, and yet admires;
The base, yet brilliant, actors on life's stage;
The Titan-brood, with serpents for their sires;
The shame and scorn, but, wonder of their age;
Wild mixture of the savage and the sage;
Fierce summoners to that consummate fray,
Which tainted thrones with maddened nations
wage;
Dark heralds of the last avenging day,
When diadems are crushed, and those who crush-
ed them—clay!

Those are the tribe whose mission is, to teach,
Not learn;—interpreters of fate to men.
Instinct, their thoughts; their tongues, of mighty
speech;
Too fiery for the slow performing pen.
There never rushed the lion from his den,
Rousing the forest echoes with his roar;
More marked by nature for the fight; than
when
This tribe their way to sanguine triumph tore,
Leaving the world in doubt, to dread them, or
adore."

Monarchies, in our poet's opinion, have little to fear from revolutions. There is truth in these reflections on

THE STABILITY OF THRONES.

"I always bet on thrones; they fall, like cats,
On their four paws! they 'escape, like ducks, by
diving!

Or, like your old cathedrals—spite of rats—

Ten centuries of purple deans surviving!
Nay, like your bankrupts, by their ruin thriving!—
While commonwealths, however free and furious,
Are smothered, once for all; like hornets
biving!

Paying for power an interest usurious—
Blood, cent. per cent.! I leave the problem to the
'curious.'

I think republics are, like London fires,
Got up, to help your 'men of parts' to rob!
The blaze burns out its fuel, and expires,
Just by the time the rogues have done the job—
(A fact at which I have no heart to sob!)
Then comes the course of nature, and a king!
As sure as Moslems love a hot *kabob*.
The lucky knaves get rich—the luckless swing!
Thus runs this mill-horse world, in one eternal
ring!"

These sketches, by so masterly a hand, have some public interest; but they do not constitute the most amusing part of the volume. Anecdotes of society, tales of romance, jests, pictures of manners, descriptions of travel, adventures by sea and land, follow each other in rapid succession. The last canto is filled with a strange story, in which the writer shows his power over the mysterious, and his talent for narrative.

Speculation will, of course, strive to fix this poem on some established writer. But we rather think the force and finish it displays are the result of natural ability rather than of long practice. There appears in it too much freshness of feeling and originality of style to countenance the supposition that it belongs to any of the writers with whom we are acquainted, though it is undoubtedly true that genius has little difficulty in assuming a disguise, and that veterans in literature have sometimes been able to throw the keenest critics off the scent of their track.

NUTRIMENT IN SUGAR.—The nutritive properties of sugar are much underrated in this country. As an aliment, Dr. Rush, of Philadelphia, maintains that sugar affords the greatest quantity of nourishment, in a given quantity of matter, of any subject in nature. Horses and cattle were fed wholly on it at St. Domingo for some months, when the exportation of sugar and importation of grain were prevented from want of ships. During the crop time in the West Indies all appear fat and flourishing. The cattle fed on the cane-tops become sleek and in fine condition. The negroes drink freely of the juice, and become fat and healthy. Sir George Staunton observes, that many of the slaves and idle persons in China hide themselves among the canes, and live entirely on them for a time. In that kingdom the emperor compels his body-guard to eat a certain quantity of sugar every day, that they may become fat, and look portly. Sugar and rice constitute the common food of the people, and every kind of domestic animal is fed on sugar. Plagues, malignant fevers, and disorders of the breast, are unknown in the countries where sugar is abundantly eaten as food. The celebrated Dr. Franklin used to drink syrup every night before he went to bed to alleviate the agonies of the stone.—*Popular Errors Explained*.

MRS. MAGEE, of Dublin, has left £20,000 to trustees for the erection of a Presbyterian college in Ireland.—*Athenæum*.

FROM Copenhagen, we learn that, on the 21st ult., the inhabitants of Denmark, Sweden, and Norway, to the number of 8,000, met on the little island of Hvéen, to celebrate the three hundredth anniversary of the birth-day of the illustrious astronomer, Tycho-Brahé. The flags of the three Scandinavian kingdoms floated from the fleet of steamers which bore the pilgrims, from the opposite points, to the place of rendezvous—a government war-steamer conveying the professors of the universities of Copenhagen and Kiel, the members of the Royal Academy of Sciences and of the Royal Northern Society of Archæology, other personages of the Danish capital distinguished for literature, art, or science—and a colossal bust in white marble of the subject of the day's celebration. The principal ceremonial was the inauguration of this monument, beneath a triumphal arch erected amid the ruins of the old palace of Uranienburg, where the philosopher was born and spent most of his life. The brow of the image was encircled with a laurel crown; and then, a thousand young voices raised, in honor of him whom it represents, the national songs of the three Scandinavian countries—and the Philharmonic Society of Copenhagen executed a cantata, written for the occasion. The monument was solemnly handed over to the guardianship of the people of Hvéen; and left to its solitude of ages on an island which numbers not more than a hundred inhabitants.—The two hundredth anniversary of the birth-day of the Philosopher Leibnitz was celebrated with great pomp, a few days ago, by the University of Leipzig; of which city he was a native.—*Athenæum*.

CORRESPONDENCE.

From Mr. Walsh's letters to the National Intelligencer.

Paris, July 14, 1846.

WE received yesterday afternoon the advices from the United States by the *Great Western*. We have a mere summary in the *Journal des Débats* of this morning; but an ample report and intelligent discussion of the whole in *La Presse*, and a good exposition in the *Constitutionnel*. The Oregon treaty and the President's new message touching a war-tariff are warmly commended. Stress is laid on the profession of readiness for peace, in case Mexico should propose reasonable terms. "According to the London papers," observes the *Constitutionnel*, "England has given a lesson of prudence and moderation to the United States; if so, the United States have, on their side, given one of firmness to the other powers having relations and controversies with England." The idea of dissent by Lord Wellington and Sir Robert Peel, in the cabinet, to the terms of the treaty, is held to be refuted by Sir Robert's language in announcing the event to parliament. My impression, from the epoch of the disclosure of Sir Robert's anti-corn law project to the latest period, has uniformly been that he meant to yield in the Oregon question what he believed could not fail to be accepted. He seemed, in all his public proceedings, to have put himself entirely at ease on that question. Some of the Paris editors now remark: "After all, the British naval preparations were not intended for the United States; France must have been in the eye and calculations of England." The "preparations" were, we may pre-

sume, no more than a general refitting—an armament adapted to national security and pretensions; just what the restoration and reorganization of the French maritime forces are proclaimed. A story travels in the opposition journals that Louis Philippe, in several letters, urged Queen Victoria to persuade or command Sir Robert Peel to postpone the dissolution of his ministry until after the French elections; and that her majesty (unavailing of course) exerted herself to that end. The notion obtained here, in all quarters, that the accession of the whigs would operate in France unfavorably for the conservative canvass; but it is now dissipated. It was argued that France would no longer consent to be dragged in tow by England; that there must be in both countries cabinets who could treat with each other on equal footing. All the deputies are included in a series of biographical sketches published in many numbers of the ministerial organ, the *Epoch*. Those in opposition are not spared in the least, but handled with very amusing and pungent sarcasm and disparagement of one kind or other. The truth of most of the lives and traits heightens the effect and promotes the purpose, in all the denominations of deputies.

We are informed from Rome that the new pope (the 258th) has not yet appointed the secretary of state—the functionary who enjoys more control over the foreign relations and internal policy than his holiness, in whose case the maxim, reign and not govern, is usually realized. A higher congregation, or council of state, of six eminent cardinals, of different political attachments and sentiments, has been formed to examine all matters of civil administration. Meanwhile no changes occur, no reforms are announced; and Pius IX. incurs blame for tardiness. His name, you know, is Mastai-Feretti. The Romans play upon it thus: "You are very handsome and good—*ma-stai*," which means "*but stationary*." His election, however, has proved more popular in the provinces than even in the capital. In authorizing railroads to Civita-Vecchia, Ancona, and Bologna, he has restricted the granting to natives and the employment of laborers also, when natives can be obtained. Pasquinades abound at his expense. He is said to join in the public merriment. A French writer well remarks: "A politically ambitious or personally immoral pope is now impossible." It is a subject of complaint in the London prints that England has no diplomatic representative—avowed or in form—at the court of Rome: the consul at Ancona has served as political agent.

The present summer teems with gigantic calamities—the destructive earthquake in Messina—another at Smyrna; the fire at St. Johns; submersions in mines; the burning of the theatre at Quebec, so like the old calamity at Richmond; more deaths and conflagrations by lightning, more *coup de soleil*, more suicides, atrocious murders, and mutilations; more sudden visitations of body and mind, are recorded for France, within the two months past, than in any former year for this generation. The extraordinary and protracted heat of the weather has a large share in the assigned causes. At Stockholm, on the 26th ultimo, it was so cold that ice was formed in the open grounds. Extensive strikes, popular tumults, sanguinary affrays, romantic or curious trials, have been frequent in a rare degree.

From the Edinburgh Review.

Gottfried Wilhelm Freiherr von Leibnitz—eine Biographie. (Life of G. M. Leibnitz.) Von Dr. G. E. GUHRAUER. Zwei Bände. 2 vols. 12mo. Breslau: 1842.

SAGES and poets have vied with each other in the invention of significant symbols by which to express the littleness of all earthly greatness, and the vanity of all human ambition—not always superior themselves to a secret ambition of obtaining fame even by showing it to be nothing—of being remembered for the beauty and the excellence wherewith they have typified vanity. Like the sculptor employed to ornament the tomb, they have hoped to be celebrated for their eloquent images of death, and their graceful emblems of mortality. Yet neither amongst the devices feigned by art, nor the objects presented to us by the ravages of time—the broken column, the sarcophagus empty even of ashes, the stone inscribed with a silent history, or with half legible characters—is there any memento of these truths more expressive or more touching, than that which presents itself in the tarnished decorations of a series of portly folios or quartos of a past age, the product of some capacious and restless intellect, which toiled, as was fondly thought and hoped, for immortality—which aspired to be remembered, not merely in biographical dictionaries—those crowded cemeteries of mind—but to hold active and familiar converse with the mind of successive generations—to live in perpetual citation on the lips of grateful and admiring readers. Yet are these misjudging aspirants for fame often consigned to the “dust and darkness of the upper shelf;” rarely opened except by some chance visitor, out of idle curiosity—not from any wish to hold communion with their spirits, or to emancipate even for an instant their imprisoned wit and wisdom. These remains are guarded, it is true, with jealous care, and kept safe behind handsome doors and gratings; but the page is as mute as the voice of him who wrote it; and that supplementary body of ink and paper by which the fond authors hoped to perpetuate their existence, and secure a second and longer life on earth, is dead as the first tenement of flesh and blood, and without a hope of resurrection. To traverse an old library filled with such remains, is like walking through the catacombs of a great city. Could the thought of the utter want of sympathy, the “cold oblivion” which awaited him, have obtruded itself on the imaginings of those who wrought for immortality, it had been enough to paralyze all their energies, and make the pen drop from their nerveless hands.

We have been led into these gloomy reflections by the lot of that great and shining man, on whose life and genius we are about to offer a few remarks. His name is no obscure one; on the contrary, he has achieved, if ever man did, a high European reputation, and his name is laid up with those of the great of all time; and yet we believe there are few, even of the utterly obscure, who, having written so much, are read so little. It is the smallest possible fraction of his works that

even those who have troubled themselves to peruse anything, are acquainted with; while the immense majority, who yet know him renowned for mathematical discoveries and metaphysical theories, have never read a syllable of him.

For this comparative neglect there are more reasons than one. To a certain extent he shares but the lot of all great philosophers. Their condition, in this respect, is far less enviable than that of great poets. The former can never possess so large a circle of readers under any circumstances; but that number is still further abridged by the fact, that even the truths they have taught or discovered, form but stepping-stones in the progress of science, and are afterwards digested, systematized, and better expounded in other works composed by smaller men. The creations of poetry, on the contrary, remain ever beautiful, as long as the language in which they are embodied shall endure: even to translate is to injure them. Thus it is, that for one reader of Archimedes, (even amongst those who know just what Archimedes achieved,) there are thousands of readers of Homer; and of Newton it may be truly said, that nine tenths of those who are familiar with his doctrines have never studied him except at second-hand. Far more intimate, no doubt, is that sympathy which Shakspeare and Milton inspire; “being dead, they yet speak;” and may even be said to form a part of the very minds of their readers.

But this is not the only cause of the almost total neglect of the works of Leibnitz. As he wrote often with great beauty, and on a great variety of subjects, there should be no reason, one would imagine, why he should be less read than many other philosophers whose claims to be remembered is far inferior to his. The cause, we are inclined to think, is owing, in part, to the fragmentary character of his productions: though enormously voluminous, there is almost nothing except his *Theodicæ* and his *Remarks on Locke* that can be considered systematic; and he has nowhere, not even in these pieces, given a complete digest of his philosophical system. The great mass of his works consists of occasional papers:—such as his contributions to the *Acta Eruditorum* of Leipsic; and the immense remains of that Literary Correspondence in which he was actively engaged throughout his life, and which included the name of almost every eminent scholar and thinker of the age. In these letters he continually repeats (as was most natural) fragments of his opinions; so that the reader finds that he has got most of what Leibnitz thought, long before he has read all that Leibnitz wrote, and might here, if anywhere, take a brick as a specimen of the house.

But yet another cause of this comparative neglect is, that with all his intellectual greatness, few other men have ventured to expound metaphysical theories which depend so absolutely on mere conjecture, or which are less adapted to invite disciples. His *Monad*s are unintelligible even to his most devoted commentators; his *Preestablished Harmony* has long since been dissolved; and a score of other theories, and rudiments of theories, which were suggested to his ever active genius,

lie scattered in gigantic ruins over the vast field of his labors.

Nor is this all. A very large portion of his writings, as already said, consists of his letters. Now, not only is the Latin in which he often writes far from being Ciceronian; not only are the theories he defends exploded, or the truths he develops rendered elementary in the subsequent progress of science; but the books cited are long forgotten, the very names of the authors never heard of: even the *doctissimus Hackmannus* and the *illustrissimus Kettwigius* have somehow become obscure:—the allusions are unintelligible, the incidents without interest, the pleasantries insipid.

These causes are at least sufficient to show why we ought not to wonder that Leibnitz for more than a century has been but little read.

But it is well that those illustrious men, whose voluminous writings, for the reasons above assigned, will never be remembered equally with those of the great poet, should have their periodical commemoration; when the achievements by which they benefited their own generation and all time shall be honorably recounted, their portraits brought out of the dust and dampness where they were fading away, and the lineaments retouched and vivified; when some of their most pregnant thoughts and weighty maxims shall be repeated in the ear of mankind; and some fragments of their wisdom rescued from the sepulchre of their *opera omnia*. Even this is better than sheer oblivion. They have influenced the mind of the species some generations back, and through that *indirectly* forever. It is something more to be permitted to do this *directly*, in modes however limited, and for intervals however transient. Yielding to the instinct of immortality, each grateful shade, thus honored, will triumphantly exclaim, *Non omnis moriar!*

Such a festival in honor of Leibnitz seems to be now in course of celebration in Germany. "Old Mortality" is there going his round, and reviving the imagery and inscriptions on the philosopher's tomb; and we could hardly hope to find a more favorable juncture for offering our homage than the present, when his works have just been republished at Berlin, and a new biography composed by Dr. Guhrauer.

We shall commence with a sketch of his life, the rather that it is more varied than that of the generality of literary men; so much so, indeed, as to increase in no small degree that wonder which his prodigious attainments are calculated to excite. It is difficult to reconcile so much activity and locomotion with such severe study. He must have learnt that useful lesson of losing no time "in changing his hand," as Adam Smith expresses it: and of bringing his faculties to bear with resolute promptitude on whatever, for the moment, exacted attention.

The principal sources of the biography of Leibnitz are the materials left by his friend Eckhart—his life by Brucker, in the *History of Philosophy*—his well-known *Eloge* by Fontenelle—that by Bailly, first published in 1768, and republished in his *Discours* in 1790—that by Kästner, published in 1769—the *Memoir* prefixed to several editions of the *Theodicæe*, by M. Jaucourt, originally published under the feigned name of M. Neufville—a piece possessing considerable merit, and praised by no less an authority than Lessing—and the recent work of Dr. Guhrauer. This last author has diligently availed himself of every source of information; and has not only corrected some previous

errors, but has brought to light some facts hitherto unknown. Many fragments also of the philosopher's writings, which had remained buried in obscurity, enrich Erdmann's recent edition of them. It would seem, indeed, as if these writings were a mine which could not be exhausted. Consisting for the most part of miscellaneous papers and correspondence, they were widely scattered, and were recovered only at intervals. In 1765, appeared a quarto volume of his posthumous works, under the editorship of Raspe. The principal of these was the commentary on Locke's great work, and is entitled *Nouveaux Essais sur l'Entendement Humain*. This volume is of rare occurrence. The edition of Leibnitz's works by Dutens, in six large quartos, published in 1768, was vainly styled *Opera Omnia*. It does not contain the pieces published by Raspe, for which Dutens, in his general preface, offers no very sufficient reason. In 1805, appeared an octavo collection of unpublished letters, under the editorship of I. G. H. Feder.

Dr. Guhrauer's work has considerable merit; but it might have been judiciously comprised in one volume, by omitting not a few digressions on collateral subjects, in which, *more Germano*, the author has freely indulged. We shall also have occasion to point out some examples of prejudiced statement, into which the customary idolatries of a biographer have betrayed him.

One of the most curious things contained in Dr. Guhrauer's work is a fragment of *Autobiography*. Fragment as it is, it gives a striking account of the author's childhood and youth, throws a flood of light on his intellectual history, and exhibits all the prominent features of his character—even to its foibles—with a vivacity as amusing as can be found in any composition of a similar kind. As this fragment has never appeared in English, we shall take occasion to gratify the reader by a free translation of two or three paragraphs. Most of the facts are repeated, again and again, in different portions of Leibnitz's miscellaneous writings, but perhaps nowhere else so connectedly or so fully.

Gottfried Wilhelm Leibnitz was born at Leipsic, on the 21st of June, 1646. He may be said to have been a foster-child of literature. His father, Frederic Leibnitz, was professor of ethics in the university of Leipsic. His mother was the daughter of William Schmuck, another professor in the same university. His mother's sister was married to John Strauch, professor in Jena, a celebrated jurist.

The father of Leibnitz was married thrice. He had one son by his first marriage, and one (the subject of this sketch) by the second. He died September 5, 1652, when the future philosopher was only six years old. He left a moderate fortune, and a valuable library, which last the young Leibnitz soon began to consider the best part of his inheritance. It is with his introduction to these treasures that we commence our brief extracts from the *Autobiography*.

He was sent early to the Nicolai school at Leipsic; but his real education seems to have been carried on by himself, and is described in a whimsical manner in the following paragraph:—

"As I grew in years and strength I was wonderfully delighted with the reading of history, and having obtained some books of that kind in German, I did not lay them down till I had read them all through. Latin I studied at school; and no doubt should have proceeded at the usual slow

rate, had not accident opened to me a method peculiar to myself. In the house where I lodged, I chanced to stumble on two books which a certain student had left in pledge. One, I remember, was Livy, the other the Chronological Thesaurus of Calvisius. Having obtained these, I immediately devoured them. Calvisius, indeed, I understood easily, because I had in German a book of universal history which often told me the same things; but in Livy I stuck no longer; for as I was ignorant of ancient history; and the diction in such works is more elevated than common, I scarcely in truth understand a single line. But as the edition was an old one, embellished with woodcuts, these I pored over diligently, and read the words immediately beneath them, never stopping at the obscure places, and skipping over what I imperfectly understood. When I had repeated this operation several times, and read the book over and over—attacking it each time after a little interval—I understood a good deal more; with all which, wonderfully delighted, I proceeded without any dictionary till almost the whole was quite plain.”

These self-acquired accomplishments having disclosed themselves at school, Leibnitz tells us that his master was much shocked that his pupil should be making such unauthorized progress in learning.

“My master, dissembling the matter repairs to those who had the care of my education, and admonishes them that they should take care lest I should interrupt my studies by a premature and preposterous kind of reading; that Livy was just as fit for me as a “buskin for a pigmy;” that books proper for another age should be kept out of the hands of a boy, and that I must be sent back to Comenius or the lesser catechism. And without doubt he had succeeded, if there had not been present at the interview a certain erudite and well-travelled knight, a friend of the master of the house. He, disliking the envy or stupidity of the master, who, he saw, wished to measure every stature by his own, began to show, on the contrary, that it was unjust and intolerable that a budding genius should be repressed by harshness and ignorance; rather, that a boy, who gave no vulgar promise was to be encouraged, and furnished with every kind of help. He then desired me to come to him; and when he saw that I gave no contemptible answers to the questions he put, he did not rest till he had extorted from my relatives permission to enter my father’s library. At this I triumphed as if I had found a treasure. I longed to see the ancients, most of whom were known to me only by name—Cicero, Quintilian, and Seneca, Pliny, Herodotus, Xenophon, Plato, and many a Latin and Greek father. These I revelled in as the fit took me, and was delighted with the wonderful variety of matter before me; so that, before I was yet twelve years old, I understood the Latin writers tolerably well, began to lisp Greek, and wrote verses with singular success. * * *

Indeed, in polite letters and in poetry, I made such progress that my friends feared lest, beguiled by the sweetness of the flattering muses, I should acquire disgust for studies more serious and rugged. But the event soon relieved them from this anxiety. For no sooner was I summoned to the study of logic, than I betook myself with great delight to the thorny intricacies which others abhorred. And not only did I easily apply the rules to examples, which, to the admiration of my preceptors, I alone did, but expressed my doubts on

certain points, and already meditated some novel views, which, lest they should escape me, I committed to paper. Long after, I read some things which I had written at the age of fourteen, and was wonderfully delighted with them.”

As to his *doubts*, he tells us that none of his masters satisfied him, but only admonished him that “it did not become a boy to busy himself with novelties, in things which he had not sufficiently studied.” Meantime his friends were possessed by a new fear.

“Those who had the care of my education—to whom my greatest obligation is, that they interfered as little as possible with my studies—as they had before feared lest I should become a poet, so they now dreaded lest I should stick fast in scholastic subtleties; but they did not know how little my mind could be filled with one class of subjects; for no sooner did I understand that I was destined for the study of the law, than, dismissing everything else, I applied myself to that. * * * And in this way I reached my seventeenth year, happy in nothing more than this, that my studies were not directed according to the judgment of others, but by my own humor; for which reason it was that I was always esteemed chief among those of my own age in all college exercises, not by the testimony of tutors only, but by that of my fellow-disciples.”

He graduated as Bachelor of Philosophy in 1663, at the early age of sixteen, and proceeded to his Master’s Degree in the same Faculty in the following year. On both these occasions, and on others of a like nature, he manifested the precocity of his metaphysical talents by the subjects selected for the customary disputations.—After giving an account of the dispute which prevented his offering himself for his Doctor’s Degree at Leipsic, and sent him to the University at Altdorf, Leibnitz proceeds—

“There,” says he, “I took my doctor’s degree in my twenty-second year, *maximo omnium applausu*; for when I maintained my public thesis, I discoursed with so much facility, and explained myself with so much clearness, that not the auditors only wondered at this new and unusual ἀρετή, specially in a lawyer, but even those who had engaged to respond, publicly acknowledged that I had excellently well satisfied them.”

Refusing an offer of a professorship at Altdorf, Leibnitz repaired to Nuremberg. While there, he happened to hear of a Society of Alchemists, who were prosecuting, with the usual success, the search after the “philosopher’s stone.” He was seized with a strong desire to become acquainted with these adepts; but, as he was absolutely ignorant of all their terms of art, he knew not how to negotiate an introduction. Happily he recollected that their ignorance must be quite equal to his own; and so, boldly extracting from the writings of the most celebrated alchemists, all the most obscure terms he could find, he composed a letter, of which he did not understand a syllable; and from that moment became, if one may indulge in the paradox, as knowing as themselves. What was dark to himself was happily quite clear to these illuminati, who, following their usual instinct for nonsense, or afraid to be supposed ignorant, professed to augur favorably of one who could write so profoundly. They invited him to assist at their conferences, introduced him to their laboratory, and made him their secretary.

While at Nuremberg, he met with a valuable

friend and patron in the Baron de Boineburg, Chancellor of the Elector of Mentz. Chance (some say) brought them together at the hotel where Leibnitz was lodging. The Baron, who amidst his official duties, had never ceased to cultivate science and literature, was struck with the talents and attainments of his young acquaintance. He gave him his counsel—advised him to attach himself to Jurisprudence and History, as the studies which would furnish him the best means of advancing himself in life, and exhorted him to repair to Frankfort-on-the-Maine for the further prosecution of those studies: meantime, he promised to endeavor to procure for him some office worthy of his talents in the Court of the Elector. With this advice Leibnitz complied, and at Frankfort abandoned himself entirely to the studies thus recommended. It was there, amidst many distractions, that he composed, in 1667, his little treatise entitled, “A New Method of Learning and Teaching Jurisprudence.”* This early work displays all his principal characteristics—his vast reading, the acuteness, originality, and comprehensiveness of his mind, and his propensity to form projects too vast for fulfilment, and to make promises which sound something like presumption. This little treatise was in the press when the Baron de Boineburg summoned him to the service of the Elector of Mentz; and the young author, with the new developed instinct of a courtier, dedicated his work to his patron. In 1668, he followed up his *Nova Methodus*, by his *Ratio Corporis Juris reconcinandi*—a “beautiful project,” as M. Jaucourt calls it—“un beau projet”—nothing less in fact than a new digest of Universal Law.

But the author we have just cited might well ask, “can we believe that Leibnitz (then little more than twenty-two years of age) had sufficient light for a reform of this gigantic kind?” *A faire un bon livre*, as M. Jaucourt says, is all that could be expected of the splendid talents of any young philosopher—even of a Leibnitz—engaged on such a subject.

In the same year, he also published his treatise *De Arte Combinatoriâ*; in which, though he advances many things which he afterwards saw cause to reject, he displays much of the analytical skill, and originality of conception, which afterwards made him so famous in the field of pure mathematics. The abdication of John Casimir, King of Poland, in 1668, when the elective throne was besieged by a crowd of aspirants, afforded Leibnitz his first opportunity of signaling his talents in political discussion. Amongst the claimants was the Prince of Neuburg, and Boineburg engaged Leibnitz to support his pretensions. In this, as in one or two other cases, our author was perhaps too easily led to accept the office of advocate, before exercising that of philosopher; to accept a thesis and then examine how it could be supported. Once engaged, however, his philosophic habits of mind soon appear in this as in similar instances; and, rising above the transitory and limited subjects proposed, he expatiates on the condition of Poland, its principles of government, and the qualities it should seek in the monarchs of its choice. Though this *brochure* did not attain its end, Leibnitz was not without his reward. At the instigation of Boineburg he was made a member of the Council of the Elector, a

post which he held till 1672. Without neglecting its duties, his ever active mind found time to produce numberless pieces on the most diversified subjects, which secured him extensive reputation, but which it is beyond our limits even to enumerate. One of his greatest projects at this period, but, like many others, never executed, was to revise and remodel the *Encyclopædia* of Alstedius, according to a new method, founded on the relations of the various sciences to each other. A curious publication, which appeared in 1670, was very characteristic of his literary habits. He had long been of opinion that Aristotle had been depreciated below his real merits, in the necessary recoil against the tyranny of the Scholastic Philosophy. Instead of treating this subject systematically, in the shape of a distinct dissertation, he contents himself with republishing a work *against* Aristotle, written by Mario Nizoli, a native of Modena, so early as 1553, to which our author adds a letter to Thomasius, a preface and notes!

In 1672, Leibnitz went on a political mission to Paris, where he spent a considerable time, and in a very different way from the generality of foreign visitors of that gay metropolis. He pursued his studies with his usual intensity, but particularly applied himself to mathematics, in which he frankly represents himself as up to that time, comparatively uninitiated. At Paris, in 1672, he became acquainted with Huygens; and the perusal of some of his writings, together with the study of those of Galileo and Descartes, and the Mathematical Fragments of Pascal, inspired him with a zeal in his new pursuit, which, combined with his great inventive talents, soon put him not only in possession of all that had been hitherto discovered, but prompted him to make discoveries for himself.

On the all but exhausted controversy of the Differential Calculus, and of Leibnitz's claims to be considered an inventor, we have little to say in addition to what has been already often repeated; and that little has been suggested solely by the observations which Dr. Guhrauer has, in his recent biography, thought proper to make. Our remarks on his statements will occur farther on.

Whilst prosecuting his mathematical studies, Leibnitz noted certain imperfections in the Arithmetical Machine which Pascal had endeavored to construct; and with his characteristic ambition of attempting all things difficult, he conceived the idea of improving and perfecting it. To this task he devoted considerable time, thought, and money; and he has left a brief account of his success in the third volume of his works.* But he was at length obliged to abandon it; and it thus forms one of the huge pile of projects which he has left incomplete, and which serve only to show the activity and universality of his genius.

In the year 1673 Baron de Boineburg died; and as official duties no longer confined Leibnitz to Paris, he took the opportunity of visiting England, and there became acquainted with Bbyle, Oldenburgh, Gregory, Wallis, Newton, and others. Several of the literary and scientific acquaintances he here made, were added to the contributors to his already vast correspondence.

Shortly after his arrival in England, his patron, the Elector of Mentz died, (1674,) and Leibnitz resolved to return to Germany, and to push his fortunes in some other direction. Previous to his leaving England, the Royal Society honored him,

* *Nova Methodus discendæ docendæque Jurisprudentiæ.*

* Duten's edition, vol. iii., p. 413.

and did themselves honor, by enrolling him amongst their members. As soon as he arrived in Paris, he wrote a letter to John Federic, Duke of Brunswick-Lunenbourg, to inform him of his situation; and that prince immediately offered him a place at his court, a pension, and, what was as much prized, the liberty of remaining in foreign countries as long as he pleased. Availing himself of this permission, Leibnitz remained at Paris five months, chiefly engaged in the prosecution of his mathematical studies. He then returned for a brief interval to England, thence paid a visit to Holland, and took his place at the court of his sovereign at Hanover, in 1676; and with this prince and his successors he spent the remainder of his life.

The tastes of the duke so happily coincided with those of Leibnitz, that he must have been here perfectly in his element. He commenced his duties with the agreeable task of enriching the ducal library with important works and manuscripts. His patron often joined him in his physical and chemical studies; and thus Leibnitz doubtless found it less tedious to play the courtier, than a philosopher in that situation may be supposed apt to find it.

The prince died in 1679, but Leibnitz lost nothing by his death; as his successor, Prince Ernest Augustus, then Bishop of Osnaburg, cherished towards him the same sentiments, and retained him in the same employments. He engaged him, however, in one new task, which, had it not been for the eccentric manner in which Leibnitz most characteristically performed it, would have involved a mere waste of time, and, as it was, must have grievously interrupted studies far more important and congenial. It was that of writing the History of the House of Brunswick. Here, as in all like cases, he broke away from the comparatively narrow limits assigned to him; and in the course of his very comprehensive researches, in which he amassed an enormous quantity of materials, (some of them very remotely connected with his proposed subject,) his active mind suggested many novel and sometimes brilliant speculations, in various branches of science; more especially in relation to geology, (of which he may, in virtue of his *Protogæa*, be called the founder,) comparative philology, and the whole philosophy of history and antiquities. For an ample collection of materials he travelled during the years 1687, 88, 89;—visiting Franconia, Bavaria, Suabia, Austria, and subsequently Italy.* Libraries, monasteries, convents, abbeys, tombs, public documents, manuscripts, rare books, were all laid under contribution. On his return in 1690, he reviewed the treasures thus acquired, and was surprised to find he was so rich. In collecting materials for the history of Brunswick, his huge drag had brought up all sorts of fragments of antiquity, many of them highly curious. From these accumulations, and from the treasures in Wolfenbützel, recently committed to his care, he selected the materials of a great work,

* It was during these travels that a curious incident happened to him. He was once overtaken in a small vessel on the coast of Italy by a furious tempest, which the sage skipper attributed to the presence of the heretical German. Presuming him ignorant of the language, he and his crew began to deliberate on the propriety of throwing the "Lutheran Jonas" (as M. Jaucourt expresses it) overboard. Leibnitz, with much presence of mind, took out a rosary, which he happened to have with him, and began to tell his beads with vehement devotion. The *ruse* succeeded.

which he calls *Codex Juris Gentium Diplomaticus*. It is in fact a collection of treaties, declarations, manifestoes, contracts of royal marriages, and public documents of a similar nature. It extended to two folio volumes, the first of which appeared in 1693; the second volume, enriched by communications from Oxenstiern, not till 1700. To the first volume is prefixed a preface, indicating as usual the activity and diffusiveness of his genius, his power of eliciting general truths from the most unpromising facts, and of throwing unexpected light on subjects but little connected with one another.

Another work which originated in the task imposed upon him by the elector, consisted of his *Accessiones Historiæ*, published in 1698. It is in fact a mass of the odds and ends of his multifarious collections; many of them rare documents, which had been buried in public libraries, and had escaped the vigilance of previous inquirers. In order to finish here all notice of the series of publications which had their origin in the request of the elector, we may remark, that it was not till 1707, nearly twenty years after he set out on his travels, that the first portion of any work exclusively bearing on his subject saw the light; and that consisted only of a collection of the writers on the affairs of Brunswick.* The second and third volumes appeared in 1710 and 1711. This extensive work was to have been succeeded by a work on the History of Brunswick itself and its illustrious house; that is, by the work which for twenty years he had been preparing to write, but of which, alas! only the plan has been published; the unfinished manuscript still lying in the dust of the royal library of Hanover.†

In truth, his plan was so whimsically extensive, that it would have taken his life fully to have completed it. The work was to have commenced by a dissertation on the possible state of Germany some thousands of years before the creation; in other words, on its geology. He has recorded his general opinions in an essay entitled *Protogæa*, which appeared after his death, and an abstract of which was inserted in the Journal of Leipzig, 1693.

Having thus settled the state of Germany as it was before the creation of man, he was to proceed to a copious account of what it was after that era, but still long before the dawn of authentic history;—to trace the migrations and settlements of the remote tribes and nations which have successively occupied it—treating, by the way, of their languages and dialects;—topics of which it may be difficult for anybody but Leibnitz to see the connexion with the history of Brunswick, but which were doubtless infinitely more to his taste.

Having thus, as it may be thought, laid a moderately solid foundation for the pyramid of his projected work, Leibnitz was to set about the history of Brunswick in earnest; of course commencing with the very remotest times, gathering materials from the obscurest sources, gently deviating to the right and left as occasion might or might not require, to take in the history of the various branches of the house of Brunswick, as well as that of all the houses with which they might have formed alliances, and pleasingly diversifying the matter with callateral disquisitions on various points of heraldry, genealogy, and especially chronology; all which subjects were to be illustrated by an ample

* *Scriptores Rerum Brunsvicensium illustrationi insertiones.*

† Dr. Guhrauer gives us reason to expect that this Fragment will soon see the light.

appendix of suitable engravings of medals, arms, ancient monuments, and so forth. In short, the work would doubtless have been publishing in successive volumes to this day, if Leibnitz and his patron had lived as long: and subscribers or their heirs would still have been able only to predict the appearance of the *last* volume. We have been more minute than the generality of the biographers of Leibnitz on this subject; because the mode in which he prosecuted his task, the immense gyrations of thought in which he indulged, the number of subjects which were successively taken up, the eagerness with which he pursued each, the gigantic scale on which he framed his plan, and not least of all, the scanty fragments he left of the whole, are so remarkably characteristic of his genius and his habits.

Let us now resume the sketch of his history. In 1699 he was chosen member of the Royal Academy of Sciences at Paris; and in the following year he induced the Elector of Brandenburg, afterwards King of Prussia, to found an Academy of Sciences at Berlin, of which he was made perpetual president. The publications of this society he afterwards enriched with various valuable contributions.

A communication from Bouvet on the Chinese characters, suggested to Leibnitz another of his life-long projects, doomed like so many others, to be left incomplete—that of a universal language. On this project, more than one able man had toiled before Leibnitz, and more than one has toiled since, but all fruitlessly. It seems in truth to be one of the most hopeless of human schemes. But its very difficulty had charms for Leibnitz; and he expresses himself in many parts of his writings with a confidence of success which is as characteristic as his boldness. He did not think “that the great men who had preceded him had been on the right tack. He contemplated the invention of a totally novel system, of which the characters should resemble as much as possible those of algebra.” He seems in truth to have expended immense thought upon this subject; yet nothing was found in his papers after his death, except some trifling hints.

He had, it is true, directed a young man to devise and arrange exact definitions of all sorts of ideas—in itself not one of the least difficulties of the projected enterprise, and which Leibnitz had better have reserved for his own shoulders. “Though he applied himself,” says M. Jaucourt, “to this investigation as early as 1703, his life, dissipated by a hundred different occupations, was not long enough for the execution of this design.” That man would in truth have a long lease of life who should live till he had invented a universal language.

In the year 1710, Leibnitz published his *Theodicæ*—properly speaking, his only complete work; certainly the only one which gives a just image of the whole intellect of the man. Its principal object is to refute the skeptical views which Bayle had inserted in his *Dictionary*, touching the goodness of God, the liberty of man, and the origin of evil.

We shall make a few remarks on this work in a future page. In the mean time, we may observe that such doubts were entertained of the orthodoxy of Leibnitz, that several able men—amongst the rest, Plaff and Le Clerc—were persuaded he was of the opinions of Bayle himself, and that the *Theodicæ* was but a *jeu d'esprit*. Never was there a more extravagant charge preferred against any

man; it is contradicted alike by the whole internal evidence of the book, by the circumstances which had elicited it, and by the general tone in which he refers to it throughout his correspondence. The accusation could have been founded only on some misconceived ironical expressions, and on the very courteous and charitable tone adopted towards opponents.

In 1711, he was invited to a conference with Peter the Great at Torgau, whither the Russian monarch had come, to be present at the celebration of the marriage between his son Alexis and the Princess of Wolfenbüttel. Leibnitz was highly gratified, and with some reason. In addition to honors and a pension conferred, there was held out the flattering prospect of being associated in the formation of the future code of that great empire, which the czar was meditating creating, and on the provisions of which that prince consulted him.

In 1714, Queen Anne died. Leibnitz was at Vienna when the king left Hanover for his new dominions, but had an opportunity of paying his homage in 1715, when George I. again visited the electorate.

From this period the health of Leibnitz, already shattered by frequent attacks of gout, which had grievously tormented him for many years, rapidly declined. As he knew much of most things, and something of everything, so he had not entirely neglected medicine, and was a little inclined, as many such men are, to play the doctor in his own case. It is said by some, that the immediate cause of his death was an unhappy experiment with an untried remedy. This event took place, on the 14th of November, 1716, in the seventieth year of his age.*

Leibnitz has left behind him a sketch in Latin of his principal physical and mental peculiarities, expressed with his usual frankness, and we might say with a characteristic egotism. From this sketch we extract the following traits. After some whimsical remarks on his temperament and that of his family, he tells us that his “stature is of the middle height and graceful, his face pale, hands generally cold, &c., &c.; his eyesight keen, his voice rather shrill than strong; that he had some little difficulty in pronouncing the gutturals, especially *k*.” He tells us that “his night’s rest was uninterrupted,” for which he gives us a curious reason—“*Quod sero cubitum it, et lucubrationes studiis matutinis longe præfert.*”† There are many students who, with the same habits, have not experienced the same happy results from them. His mode of life from childhood was sedentary; from a boy he read much and meditated more, and in most things was self-taught, *αὐτοδίδακτος*. The next is certainly a characteristic trait, but would have been as well recorded by somebody else. “He was ambitious of more profoundly investigating everything than is customary with the vulgar, and of inventing new things.” He also tells us “he was endowed with a most excellent invention and judgment;

* Dr. Gubrauer has given a full account of his last illness, vol. ii., pp. 328–330.

† He often did not retire to his couch at all, but sat till a late hour, took two or three hours’ sleep in his chair, and then proceeded to his work again at early dawn. This plan he is said sometimes to have pursued night after night for weeks together. No wonder he had gout, and, towards the close of life, ulcerated and cedematous extremities!

and found it no matter of difficulty to apply, in immediate succession, to the most varied employments; reading, writing, speaking extempore, and investigating any intellectual subject, when necessary, even to the bottom.* He further tells us "that he was easily made angry, and easily pacified; that he was neither very sad nor very merry; that his joy and grief were alike moderate, and that he more frequently smiled than laughed. *Risus frequentius deducit, quam pectus convertit.*"

One or two other traits may be amusing to the reader as parts of a great man's portrait of himself. We give them below.†

The intellectual character of Leibnitz is very remarkable, and well worthy of careful analysis. He has been called, and with much justice, "an universal genius." His powers were most various and versatile, harmoniously proportioned one to another, and individually vast; each colossal, and all symmetrical. If he failed, and fail he often did, it was not from a deficiency in the powers requisite for the prosecution of science in almost any direction, but from the ambition of universal conquest—of knowing everything, and achieving everything. In his desire of gaining new victories, he was too apt to leave behind him provinces but half conquered. Such was his versatility, that, as Fontenelle and Jaucourt have observed, he really does not seem to have manifested any predilection for any one branch of science more than another, though it was unquestionably in mathematics that he was most fitted to excel. His powers of acquisition were astonishing; his memory, like that of most great men, was equally rapid in appropriating, and tenacious in retaining whatever was presented to it. At the age of seventy, he could recite hundreds of lines of *Virgil* without an error; and such was his knowledge of books and their contents, that George I. was wont to call him his "living Dictionary."

His attainments corresponded with his versatile powers, and his ever active industry. In every department of science and literature—in metaphysics, physics, jurisprudence, theology, philology, history, antiquities, the classics, and polite letters—he seems to have been almost equally versed, and in all deeply. Realms of learning even then almost neglected, as the Scholastic Philosophy, or merely professionally studied, as the writings of the fathers, had charms for him. The ancient languages he knew well, and was tolerably acquainted with more than half a dozen of the modern.‡

And this versatility, as it appears in his acquisitions, so does it also in his writings, wherein he successively appears in the character of a philosopher, theologian, mathematician, jurist, historian, antiquary, and even—poet. It is true, that in this last character, he takes no very high rank. His

imagination, though sufficiently active to supply apt illustrations to his argumentative prose, wanted the activity and the brilliancy which can alone make the poet. Yet he evidently regarded with some complacency this feature of his mind; and often mentions a certain feat of his early years with considerable satisfaction—the composition of three hundred verses in one day, and without making a single elision. In another sense of the word, we may say with more justice than Ben Johnson said of Shakspeare, "that it would have been well if he had made a thousand."

One striking peculiarity in the case of Leibnitz is, that his ceaseless activity in the accumulation of knowledge, and his great powers of original speculation, vast as they both were, seem to have been indulged in almost equal measure. Usually it is not so. A mind distinguished by much inventiveness, generally subordinates to that one quality all the powers of acquisition; and determines the direction, as well as limits the extent, of all mere reading exclusively in relation to it. This is especially the case in minds which, like that of Leibnitz, are distinguished by inventiveness in the departments of abstract science, and most of all in mathematics; where the demands on the excogitative faculty are so great as to leave comparatively little time or inclination for the accumulation of miscellaneous knowledge. Books, in these cases, are merely used as aids to thought; they are tools to work with, and nothing more. Leibnitz loved them for their own sake; he read as much as he thought, and thought as much as he read, and seemed to take equal delight in both, and in all directions. In him the love of knowledge, enormously as it was indulged, was never a mere passive principle; devouring all kinds of books, he yet never mechanically appropriated their contents, but made them his own, by subjecting them to the powerful assimilative processes of his own intellect. The appetite was scarcely disproportionate to the activity of digestion.

It is true, that as it is not given to the human intellect to expatiate over the whole surface of science with the same success with which it can cultivate some one portion of it, so, even in the case of Leibnitz, there can be no doubt that the experiment was attended with a diminution of power; and that, great as he is in several departments, he would have appeared greater still in some one, had he surrendered himself to it with the same diligence and energy with which he abandoned himself to all. No rapidity of association, no fecundity of invention, no acuteness of intellect, can make amends for the want of prolonged and patient meditation concentrated in one direction; and it was to this that Locke probably alluded when, in a letter addressed to Molyneux, dated April 10, 1697, he says of Leibnitz—"Even great parts will not master any subject without great thinking, and even the largest minds have but little swallows."

In physics and metaphysics his success was not eminent; nor was this to be wondered at. It arose, assuredly, from no want of subtlety or comprehensiveness; but from his love of hypothesis, his fondness for the purely abstract, and his impatience to arrive at a solution. All these prevented a docile observance of the maxims of the inductive philosophy. Any theory that plausibly accounted for the phenomena was apt to find favor in his eyes. Indeed, he never seems to have attained any clear views of the limits within which

* "Whence I infer," says he, "*cerebrum ei esse siccum et spirituosum*," "that his brain is dry and spirituous."

† "Conversatio appetentia non multa; major meditationis et lectionis solitariae. Implicatus autem conversationi satis jucunde eam continuat, sermonibus jocosis et gratis magis delectatus, quam lusu, aut exercitibus in motu consistentibus. * * * Timidus est in re aliqua inchoanda, audent in prosequenda."

‡ "Cette lecture universelle," says Fontenelle with his customary elegance, "jointe à un grand génie naturel, le fit devenir tout ce qu'il avait lu; pareil en quelque sort aux anciens qui avaient l'adresse de mener jusqu'à huit chevaux attelés de front, il mena de front toutes les sciences."

the human understanding can hopefully speculate at all; and pronounces with as much assurance on the ultimate constitution and properties of his *Monads*, as he would upon any commonplace facts whatever. "Monads," says he, "are simple substances which enter into the constitution of composite. * * * Each is a mirror representing the universe, though obscurely. * * * Each soul (âme) knows to infinity, knows everything, but confusedly."*

His very notions on this subject, though frequently repeated in his works, he has never been able to express so as to convey a clear idea of his meaning to his disciples; who, as Brucker has justly remarked, have been involved in hopeless perplexities in their attempts to interpret their master's language. It is obvious, however, mean what he would, or nothing at all, that neither Leibnitz nor any one else could know anything upon this subject. A man might as well put down any incoherent dream that visited him in the night, and call it philosophy. Who could not philosophize at this rate? Can anything, indeed, more gratuitous be imagined, if it can be said to be intelligible, than that the universe is full of these ultimate monads, each of which is—obscurely omniscient, a mirror of the universe, and reflects in infinitely multiplied forms the infinitude of changes throughout universal being? It were less strange to say, that every flutter of a gnat's wing was propagated to the utmost limit of the sphere of the fixed stars. In a like strain of confidence does Leibnitz uniformly speak of his *Preestablished Harmony*; he is just as certain of its truth as of the truth of his differential calculus. Indeed, in all departments of science, except the mathematics, it is rather in his comprehensive suggestions of a possible law or principle, than in rigidly establishing it by induction—rather in his sagacious anticipations of a great truth, than in ascertaining its exact limits, that his chief merit consists. And it is curious to observe in how many different departments of science this tendency of the mind of Leibnitz was manifested. Thus in his *Protogæa*, he throws out thoughts which, as Dr. Buckland observes, contain the germ of some of the most enlightened speculations of modern Geology. In the department of Philology he often makes the most sagacious observations on the history and affinities of languages, and on the proofs of their identity of origin; and was probably the first to predict the important connexion—so fruitful of results—which would be found to subsist between philological and historical researches; and the light which the former might be made to shed on the latter. In various parts of his writings, he judiciously points out the best methods of improving medical science. In one of them—a Letter, *Sur la manière de perfectionner la Médecine*—he suggests the importance of a system of complete statistics of public health and disease; in his controversy with Stahl, he urges the study

of anatomy, then in its infancy; and expresses his confident belief that the time would come when surgery would be capable of dealing with many diseases that were then the opprobria of medical science.* In other places, he indicates the important bearing of his favorite science, mathematics, on various branches of political and economical philosophy. The merit in all these cases consists in the first germinant thought, (evinced the active and inventive quality of his mind,) rather than in the exact application or full development of it. We may say of such proofs of sagacity, as Sir James Mackintosh said of Horne Tooke's theory, "the beauty was in the original conception, rather than in the accuracy with which it was applied." But it is in these prophetic glimpses of great truths, in almost every department of science—truths which it was left for after ages fully to evolve and establish—that this great man entitled himself to a place with almost all the very greatest minds—with Aristotle, with Bacon, and with Newton—in all of whom the same quality was remarkably exemplified. It is given to such minds alone to predict and foreshadow the coming dispensations of philosophy;—to catch from the mountain heights of their contemplations (if we may modify a thought which has occurred to more than one writer) the first radiance of the rising sun, when to the rest of this world's inhabitants he is still below the horizon.

In the variety and grandeur even of his unfinished projects, embracing such different objects, and grappling with such tremendous difficulties, we see the sublime audacity and versatility of his genius; as well as a proof that not even the intellect of a Leibnitz can prosecute successfully half a score of pursuits at once. The manner in which he speaks of these unfinished projects, of which he seems hopeful even to the last, no less displays the hardy confidence of his nature—often degenerating into an appearance of ostentation and vanity; and, in truth, it requires all our knowledge of what he has accomplished to induce us to pardon his unfilled promises. His never completed calculating machine—his fragment of an universal alphabet—his improved watches which were never constructed—his hydraulic and pneumatic engines, which existed only in theory—his swift carriages,† which existed only in imagination, were monuments alike of his enterprise and his temerity.

We have said that Leibnitz was equally distinguished by his love of amassing knowledge, and his capacity for original speculation. It is curious to see the intensity with which the purely literary element operated upon him, and the manner in which it is perpetually manifested. Even his closest and most novel reasonings are continually interrupted by references to authors, and citations from their works. He abounds in curious anecdotes of past literature, and takes almost as eager an interest in the history of philosophy and science, as in the extension of their limits. This quality, in con-

* See *Principia Philosophiæ*, and *Principes de la Nature et de la Grâce, fondés en Raison*: passim. Dutens' Edition. Tom. ii., pp. 20–39. Sir James Mackintosh, with his usual charity, endeavors to find a meaning for Leibnitz, and supposes that when he says that each Monad is "a mirror of the universe," and "knows everything confusedly," he means nothing more than that "all parts of the universe are connected," and "that no part remains the same, when that of any other is changed." If this be so, we ask, first—What business has a metaphysician to deliver his doctrines in extravagant metaphor? And, secondly, Whether mere change of relation can be called knowledge, (whether distinct or confused,) without the grossest abuse of language?

* "Spes est, aliquando aquam interi cutem aliaque noxia non minore certitudine sublatum iri, aliasque aperturas, separationes, reparationes, correctiones, in potestate fore, quæ nunc habentur desperatæ; itaque reipublicæ interest nihil omitti, quod ad spem futuri progressus facere possit."—*Opera Omnia*. Tom. II., Pars ii., p. 147.

† In our railroad era, it is curious to find that one of the extravagancies charged upon Leibnitz by one of his traducers, is that of having conceived it possible to construct carriages by which the journey from Hanover to Amsterdam (about 160 miles) might be accomplished in four-and-twenty hours. Leibnitz in his defence affirms that this is too extravagant a charge to be believed! M. Jaucourt says, "that Leibnitz was not altogether a fool!"

junction with the suavity of his temper, has given one great charm to his general manner. With one unhappy exception—we refer, of course, to the contest respecting the differential calculus—it is impossible to imagine a controversial spirit more fair and candid; nor was there ever a taste in literature more catholic than his. He ever seems to differ from others with reluctance—to diminish the interval of disagreement as much as possible—and to discover resemblances, where none but himself can perceive them. He has given an amusing account of his efforts, when a youth of only fifteen, during long solitary walks in the wood of Rosenthal near Leipsic, to adjust the claims of the ancients and moderns—of Aristotle and Des Cartes; and the reluctance with which, when conciliation was impossible, he was compelled to make an election. His spirit was truly eclectic; and so far from exaggerating the originality of his own conceptions, he is generally anxious to show that there are some traces of them, more or less faint, to be found in the preceding history of philosophy. Even when threading his way through the most intricate and untrodden wilds of speculation, his truly social spirit loves not to be alone; he delights in searching for traces, however faint, of footsteps that have been there before him, and to follow the *trail* of humanity, as the Indians would say, even though it be only by a broken twig, or the down-trodden grass, or the ashes of a long-extinguished watch-fire.

This fair and liberal spirit certainly forms one of the greatest charms in his controversial writings. It uniformly appears in his judgments on books, in all of which, however worthless, or however opposed to his own views, he is sure to discover some merits; and indeed it was one of his *maxims*, that no book was ever written that was altogether without value.

We must now say a few words on his principal writings and opinions.

The *Theodicæ*, originally written in French, is the work on which the fame of Leibnitz as a metaphysician and theologian principally rests; indeed, it is almost the only composition of his which has any pretensions to be considered complete. Most of what he wrote, as before mentioned, was fragmentary: this work certainly has a beginning, a middle, and an end. It is true that, in accordance with that irresistible bias of his nature on which we have already commented, he manages to interweave many topics which are but remotely connected with his principal subject, while his exuberant learning wells forth in every page. On the whole, however, and looking upon it merely as an intellectual effort, it is certainly not unworthy of his name. Unsatisfactory as may be the main argument, much light is thrown on collateral subjects, and many important, though subordinate, topics are treated with great ability. Full of subtlety and acuteness, we admire the originality, even if we do not admit the conclusiveness, of the reasoning. Almost everywhere we find reflections characterized by German depth of thought, and turned with French vivacity of expression, and these are enlivened by perpetual anecdote, and allusions to literary history. Not only are all the aids of learning, but not a few of the graces of imagination, employed to increase its attractions; while the style, everywhere perspicuous and elegant, shows the mastery which Leibnitz had attained in the use of a language not his own.

Not the least recommendation of the work is,

that, strange as it may seem, the reader may there get a scarcely less ample, and far more connected view, of Leibnitz's whole system of metaphysics and theology than from all his other writings put together. From the inseparable connexion which his principal speculations in both these domains of science maintained in his own mind, (however we may fail to perceive it, or even doubt whether he always clearly perceived it himself,) and from the wide circuit of thought in which he habitually indulged, almost all his characteristic doctrines come under review in one part or other of this singular work. Not only have we in it his theory of moral and physical necessity, (which might be looked for,) but his doctrine of monads, his pre-established harmony, his law of continuity, his sufficient reason, his notion of the origin of souls, of generation and dissolution, of space and time.

As to his main hypothesis, constructed to account for the origin of evil, and "justify the ways of God to man," that has long ago been exploded as unsatisfactory; but it is so, only for the reasons which have made every other attempt of mortals to penetrate that great mystery equally unsatisfactory. We believe that no man ever rose from the perusal of any work on the subject, (if we except the author,) without feeling the conviction that it lies beyond the limits of the human understanding, and that we are absolutely without data for its solution. That evil should have been permitted to enter the universe under the absolute dominion of infinite power, wisdom, and goodness, is a mystery* towards the explanation of which man has not made the very smallest conceivable advance. When we are told that this is the "best of all possible worlds,"—meaning thereby, as Leibnitz takes care to explain, the Universe—that the absolute exclusion of evil was impossible, and that the least possible mixture of it has been admitted, the appeal, in fact, is to faith and not to reason. The answer to the argument is, "it may be so; we may perhaps even conjecture some grounds of probability for thinking it is so; but who shall assure us of it?" As a matter of pure reasoning, the argument against this hypothesis may be put in a form which we may defy all philosophy to encounter. First, would not a universe without any evil at all be preferable to a universe with some, however little—to say nothing of a universe in which it

* The Editor of the *Living Age* desires his younger readers to consider, that the "origin of evil" is not a greater mystery than any other part of *creation*. Why there should be a *wicked* man, is not more mysterious than why there should be a *man* at all. And if we ponder upon this, marvelling why, instead of a creature so dull and blind, there had not been an archangel—we have but stepped to another stage of the same mystery, and may just as well wonder why the archangel himself was made so infinitely below his Maker. It is just as difficult to know why animals *inferior* to man are created; why there should be reptiles and insects hurtful to *him*; why there should be beyond them the infinity of which the microscope shows us only the beginning. Making a "mystery" of the origin of evil seems to us an impertinence like the talk of "mysterious providences." It appears to imply that they are exceptions to the ordinary course of things; and that we are able generally to understand "Him who is unsearchable, and whose ways are past finding out." Everything which occupies the mind stretches into the infinity which is incomprehensible;—and the moral is that, reverently feeling our ignorance, blindness and disobedience, we should cast ourselves unreservedly upon the mercy and love which have been revealed to us, humbly and joyfully trusting that we shall be raised to a state of happy obedience, and that *some* of the things which we "know not now, we shall know hereafter."

cannot be said there is very little? and, secondly, can we say that we see any reason why such a universe *could* not be constructed by irresistible power, under the guidance of an infinite wisdom, and both impelled by a goodness equally infinite? We affirm that the *reason* of men can reply to the first of these questions only in the affirmative, and to the second only in the negative. Leibnitz, on the other hand, says "no" to the first, and "yes" to the second. But few will discern his *ratio sufficiens* in either answer. It is evident that he, like every other man who pretends to solve the mystery, arrives at his conclusions by a gross *petitio principii*; or rather the whole work is an example of the *ὁρεγορ ἀντιρεγορ*. The very problem is to reconcile the consistency of the attributes of infinite power, wisdom, and goodness with the phenomena of physical and moral evil; and Leibnitz solves it, by saying in effect that God is infinitely wise and good, and therefore cannot but have chosen out of all possibilities, the best; *therefore* a universe free from all evil, or even from less than exists, is a contradiction—the very thing, that is, which is required to be shown.

It is very possible that evil may be absolutely inevitable—we *believe* so, because it has been permitted;—it is even possible that we might see this, if we knew all, and that, when we ask that a universe of sentient, intelligent, responsible beings should be created from which evil should be infallibly excluded, we are demanding an impossibility. All we mean is, that this cannot be proved, but is always taken for granted, in every pretended solution of the difficulty. To the considerations which mitigate the difficulties of the subject, we are not blind, but we deny that they remove them. We are promised a cure of our malady, and we are treated with palliatives; we are told that we shall walk in sunlight, and we find ourselves only in starlight. So it is with the *Theodicæ*.

That he is in fact appealing not to reason but to faith, Leibnitz himself often virtually confesses, and never more explicitly than in the following passage:—"Il est vrai qu'on peut s'imaginer des mondes possibles, sans péché et sans malheur, et on en pourroit faire, comme des Romains, des Utopies, des Severambes; mais ces mêmes mondes seroient d'ailleurs fort inférieurs en bien au nôtre: je ne saurois vous le faire voir en détail: car puis-je connoître, et puis-je vous représenter, des infinies, et les comparer ensemble! mais vous le devez juger avec moi *ab effectu*, puisque Dieu a choisi ce monde tel qu'il est."* After this, one is only puzzled to think how it was possible to fill two volumes on the subject.

It is curious to observe how apt are all writers on this subject to fall into the same fallacy, and beg the question in dispute—even though they may clearly perceive the rock on which others have wrecked their logic. Thus, Lord Brougham, after having, in perhaps the most profound of his writings, very clearly exposed the fallacy of Archbishop King and others;—after fairly acknowledging that the problem is insoluble, and stating with much lucidity and beauty the mitigations founded on the immense preponderance of indications of benevolent design—falls into precisely the same error, the moment he ceases to demolish theories, and begins himself to build one. After admitting that death is an evil, he says,† "That man might have been created immortal is not denied; but if it were the will of the Deity to form a limited being,

and to place him upon the earth for only a certain period of time, his death was the necessary consequence of this determination." Certainly: but why it should have been the will of God to create—not a limited being, for that was inevitable—but a being subject to death and pain, is the very question;—not whether, if God determined to create such a being, his death was inevitable. In such a way we might get rid of the whole difficulty of the great problem, by saying, that if it were the will of God to admit evil into the universe, its admission was the necessary consequence of that determination. Again, his lordship says, (p. 72.) "To create sentient beings devoid of all feelings of affection, was no doubt possible to Omnipotence; but to endow those beings with such feelings as should give the constant gratification derived from the benevolent affections, and yet to make them wholly indifferent to the loss of the objects of those affections, was not possible even for Omnipotence; because it was a contradiction in terms equivalent to making a thing both exist and not exist at one and the same time." Certainly: but, as before, how is it shown to be necessary that these beings should have been subjected to such a loss, or a contradiction to suppose them exempt from it? for this is the very question on which we want light. This sharp-sighted writer has, in a word, been betrayed into the very sophism which he has himself so clearly exposed in Archbishop King, (p. 34.) "The difficult question then," says the Archbishop, "whence comes evil? is not unanswerable. For it arises from the very nature and constitution of created beings, and could not be avoided without a contradiction."

But, though we certainly cannot *demonstrate* that this is the "best of all possible worlds," and that it was *necessary* that some evil should be admitted, we are far enough from affirming that that faith to which, as we have said, the appeal is sure to be ultimately relegated, is a faith entirely without reason; or that it is destitute of those grounds of probability upon which alone an intelligent reliance on the truths, whether of natural or revealed theology, can be maintained. And here the immensely prevailing character of benevolent design, which pervades the universe, contrasted with the fact that evil always appears either simply concomitant, or involved as a consequence, never as an ultimate end, and that an apparent evil is often found to be connected with real good, is of incalculable benefit as suggesting an approximate solution. And this confidence is yet further increased, when we see that in proportion as our knowledge advances, many of the ancient objections against the wisdom, and some against the goodness of the constitution of the universe disappear;—that they were in fact nothing more than the offspring of ignorance. We thus learn to believe that all would vanish in like manner if we were but omniscient. The course of reasoning is much the same as that by which we experimentally establish the first law of motion; it is but an approximate solution, yet conclusive: or we are led to suppose that the anomalies which we behold, are like those regressions of the planets which so much perplexed the early astronomers, and which arise from our seeing them from a false centre of observation. Place us in the true centre of the system, and, as science has now shown, all these irregularities disappear. Thus may it also be in the moral world.

"All discord, harmony ill-understood,
All partial evil, universal good."

* *Essais sur la Bonté de Dieu*, Part I., § 10.

† *Dissertations on Paley*, vol. ii., p. 71.

But, to believe this is one thing ; to prove it, is another.

So strong, however, is the conviction arising from these presumptions, in every well-constituted mind, that probably no man ever reflected, in moments of health, on the exquisite organization of his body and mind, and their evident adaptation to promote his happiness, or looked from them outwards and upwards upon the earth and the sky, and saw how there too almost everything was adjusted to that organization ; that every object was accommodated to our senses, and every sense an inlet of delight : how to the eye all is beauty, and to the ear all music—without feeling a triumphant consciousness that the universe must be under the dominion of paternal love ; without recoiling from the supposition, as from a most revolting absurdity, that such an universe can have been the product of malevolence ; or that if so, such power and such wisdom should so signally have failed of the end. Nor, probably, has there ever been a skeptic—even he who has brooded longest and most darkly on this most mournful mystery—who has not at times joyfully surrendered himself to this instinctive consciousness—and felt, with a gush of rapture, that it has at once swept away, as with a pure and healthful breeze, the vapors which a hypochondriacal metaphysics had diffused over his soul. We confess that we lay more stress upon this instinctive consciousness, for baffling this difficulty, than on the subtle and profoundest metaphysical reasonings which man ever framed.

Apart from his main hypothesis, Leibnitz states the alleviations of this overwhelming difficulty, and the probabilities which may justify the supposition that “partial evil is universal good,” with characteristic comprehensiveness ; and has illustrated them with much vivacity. Thus he remarks, that many things which once appeared only evil, appeared so only to a shallow philosophy, and that as science enlarged, the asserted anomaly vanished ; that some infusion of evil may be necessary to give us the highest possible appreciation of the good ; as only he who knows what sickness is, can enjoy the exquisite sensations of health in all their rapture—a point which he illustrates with a liveliness which reminds the reader of the celebrated passage at the close of Paley’s “Treatise on Natural Theology ;”—that two ingredients, one bitter and one sweet, in the cup of destiny, may make a more pleasant draught than the sweet alone. “Un peu d’acide, d’acre, ou d’amer, plait souvent mieux que du sucre ; les ombres rehaussent les couleurs ; et même une dissonance, placée où il faut, donne du relief à l’harmonie.”*

Leibnitz makes the remark, that each man in effect admits, that his share of good in life preponderates over the ill ; a fact which he supports by the universal reluctance of men to die ; and in reply to the objection that no man is willing to live his life over again, he makes this original and just observation, “that no one would object to take a new lease of life with but a new series of events to vary it.” “On se contenteroit de varier sans exiger une meilleure condition que celle où l’on avoit été.”†

Nor does he forget to insist very largely on the fact, (an essential point in his hypothesis, maintaining, as it does, that some evil was inevitable,) that the amount of evil in the whole universe, em-

bracing the ample domains of innumerable worlds, the vast *civitas Dei*, may be as nothing compared with the amount of good ; even though that evil may be absolutely fearful in extent, and eternal in duration. The great speculatist treats this tremendous theme with all the coolness of a veteran geometer. The *ratio* of the good to the evil is everything with him ; he deals with the latter, just as he would with a vanishing quantity in his differential calculus. It is sufficient with him, that, be the evil ever so great, the good is infinitely greater ; and thus disease, death, sin, and hell only enter as infinitesimals into his processes of moral (if we may use the phrase) differentiation. We confess that, conclusive as is the reasoning which represents mere geometrical magnitudes as nothing, which are to be compared with quantities “as many times greater as we please,” we never could derive any consolation from such a species of argument, as applied to those peculiar quantities called “happiness” and “misery :” nor be at all more reconciled by it to “the origin of evil.” Each of the beings to whom this logical solace is applied, is a sentient creature, a little world in himself, to whom his weal or woe is no vanishing quantity, no infinitesimal, but a most serious matter ; and, as it would be little comfort to such a being, if miserable, that he was but individually a martyr for the universal good—(on Leibnitz’s theory, that his misery was involved in the choice of the “best possible world,” and that God could not but choose the “best,”)—so we confess we can derive as little comfort from this mode of viewing him.

We might perhaps modestly suggest to the metaphysician, that each of such beings must have before him an *infinity* of misery ; but it would be of no use ; for he would still have at hand his doctrine of ultimate ratios, and his differential calculus. He would say that the individual was but an unimportant function of the universe ; that the increment of happiness on the whole would be infinitely greater than the increment of misery—though it is true that in each case the weal or woe might be absolutely infinite ; and that of two quantities which increase without limit, one may increase so much more rapidly than the other, as not only to increase without limit absolutely, but without limit in the ratio in which it is a multiple of the other.

“The heart of a genuine metaphysician,” says Burke, “is harder than a piece of the nether millstone.” The heart of Leibnitz was not a hard one ; but he was too apt to treat of such matters as these, just as he would have treated problems in the higher geometry.

It is, we confess, no alleviation to us to consider as the *final cause* of the permission of evil, that it may possibly augment the joys of seraphim, or in some ineffable way give a piquancy and gusto to the delights of paradise ; though, how it can do so, is surely as great a mystery as the “origin of evil” itself. One would think that those pure and benevolent spirits would consent even to be taxed of some portion of their felicity, if they might thereby but obliterate all evil from the universe ; or rather, that this obliteration of evil must necessarily be an augmentation of their happiness. The supposition that any beings could by possibility derive gratification from its *presence*, would, one should think, rather apply to the opposite quarter of the universe, and form the characteristic, not of angels, but of demons.

* Essais sur la Bonté de Dieu, &c., Part I., § 12.

† Ibid., Part I., § 13.

It is true, indeed, that when Leibnitz asserts that the permission of evil is essential to the constitution of his "best of all possible worlds," he does not expressly say that it is the "best" inasmuch as it involves the largest possible amount of purity and happiness, and that *therefore* evil was permitted that these might be augmented; but he everywhere implies it; and as the preponderance of these elements is the only intelligible criterion to us of one system of things being "better" than another, so the supposition that there is *some* other unimaginable sense in which it can be said that some possible world is the "best," and that for *this* reason evil was permitted, is wholly gratuitous."

Viewed in any light, this argument of the permission of so much moral and spiritual evil to many, for the *purpose* of securing the happiness of a greater number, is unsatisfactory. For we shall only have the old difficulty reappearing under a new form, and at another stage; and shall be just as much perplexed as before, to reconcile with our notions of justice and goodness the destination of myriads to misery, for the *purpose* of enhancing the happiness of some multiple of those myriads. The only answer that could be given would be that conclusive one of the apostle—"How unsearchable are his judgments, and his ways past finding out,"—an answer with which, for aught we can see, we might just as well have rested satisfied a step earlier in the controversy. The question of the "origin of evil" is like a great cavern, to which there is no second outlet; we may pass through passages and labyrinths, but we are obliged to turn back at last, and grope our way out by the same way we got in.

On the supposition that evil was absolutely inevitable, or that the Divine being resolved to permit it, for some reasons consistent with all his attributes, but totally unknown to us, then indeed it is not unworthy of the character of Him whose prerogative it is "to call light out of darkness," to subordinate the evil to good, and to yoke the great demon to some useful labor; but to suppose it the *object* of suffering some worlds to be miserable, to render more worlds happy, will always leave a difficulty as trying as the original knot, and not less requiring the sharpest logical shears to cut it.

Leibnitz endeavors to show that evil *was* inevitable—*natural*, as a certain consequence of moral evil, and *moral*, as a possible consequence of metaphysical imperfection. But we must confess that, in our judgment, he wholly fails to show it. Even Omnipotence, says he, cannot work contradictions. The cause of evil is *privation* of perfection, and that which is finite cannot have perfection. Most learnedly said, profound metaphysician! But where is the difficulty, especially on your favorite hypothesis of moral necessity!—in other words, that the only freedom which man can possess, or which is intelligible, is, that he should have the power of acting as he wills, while the *will* itself is infallibly determined by motives—where, we ask, is the difficulty of supposing all intelligent beings so constituted, as that, while still perfectly free on this hypothesis, those motives only should determine them which should determine them for uniform good? They cannot be otherwise than free, you say, while they do not act from physical constraint; and in supposing them so morally constituted as uniformly to obey the dictates of reason, where is there any difficulty, which can be shown to

amount to a contradiction, or to limit even Omnipotence? If there be such difficulty, show it. Myriads of beings, Leibnitz admits, *must* have been so constituted to ensure that vast excess of good, which reduces his evil to a vanishing quantity; and why might not *all* have been so constituted?

In this point of view, the advocates of the doctrine of moral necessity, or in other words, (for it is a pity that the ambiguous term necessity was ever admitted into the controversy,) of the certainty of all volition as being dependent on motives, do not, to say the least, alleviate the difficulties connected with the "origin of evil." That hypothesis was, perhaps, first systematically and fully exhibited by Leibnitz; certainly no previous metaphysician, in as far as we know, had made such strenuous or rational efforts to reclaim it from the charge of encouraging vice as inevitable, or to exempt it from the liability to be confounded with vulgar fatalism.* Again and again does he show that, admitting the doctrine in full, it leaves human conduct just under the same laws and influences as before; impairs no sanction of the one, and diminishes no title of the other. Hence exhortations, counsels, persuasion, discipline, chastisement, are full as necessary as ever. Throughout his metaphysical writings, his favorite views on this subject appear; in his *Theodicée*, in his appendix to that work, in his annotations on Locke's *Essay*, especially on the chapter on power; and in the masterly criticisms in both these works on the theories of Hobbes* and other necessarians. So comprehensive is his survey of this subject, that there is hardly a fragment of Jonathan Edwards' great work on the *Freedom of the Will*, which may not be found stated with almost equal clearness in some part or other of the writings of Leibnitz; if not with such rigid logical concatenation, yet with a far greater fecundity and aptness of illustration. The great transatlantic divine does not, more completely than Leibnitz, demolish that great phantom of the "liberty of indifference," which

* We cannot think that Mr. Dugald Stewart, in his truly admirable remarks on Leibnitz, has done justice to the views of the latter on this subject, when he attempts to identify his doctrine with vulgar fatalism. He says, "the scheme of optimism, as proposed by Leibnitz, is completely subversive of the cardinal truths of man's free-will and moral agency." He admits, "that it was viewed in a very different light by the author," but affirms that "in the judgment of the most impartial and profound inquirers, it leads, by a short and *demonstrative* process, to the annihilation of all moral distinctions." *Preliminary Dissertations to the seventh edition of the Encyclopædia Britannica*, p. 127.

It does not appear to us impossible for any one to hold the opinions of Leibnitz on this subject, and yet consistently to deny that *demonstrative* process to which Mr. Stewart refers; nor do we think that the latter (habitually candid as he is) has duly appreciated Leibnitz's jealous caution, which breaks out even in the preface to his *Theodicée*, where he has stated, (pp. 14—19,) with great clearness and eloquence, the differences between the *fatum Mahometanum* and his scheme of moral necessity. He even goes to the verge of what some may think a self-destructive candor. "Il est faux que l'événement arrive quoiqu'on fasse; il arrivera, parcequ'on fait ce que y mène: et si l'événement est écrit, la cause qui le fera arriver est écrite aussi. Ainsi la liaison des effets et des causes, bien loin d'établir la doctrine d'une nécessité préjudiciale à la pratique, sert à la détruire." Sir James Mackintosh has made some most judicious observations on this subject, in his admirable Review, in this Journal, of Mr. Stewart's above-mentioned *Dissertation*. He concurs with us in thinking, that justice has not been done to Leibnitz on this point.—*Edinburgh Review*, vol. xxxvi.

asserts the will to be free only when it acts absolutely without motive, and its highest prerogative to consist in its emancipation from all reason; which, in fact, makes man, as a condition of his responsibility, act in such a way, that if he could act at all, his acts would be absolutely destitute of all moral quality. Whether Jonathan Edwards ever read the *Theodicæ* we know not; but if so, he must have been under no little obligations to it.

It may be thought at first, that if we could but admit that chimera of "a liberty of indifference," it were easy to account for the origin of evil, or indeed the origin of anything else; for who could account for the acts of a will which would be a synonym for caprice; or wonder that man, poised for a moment in such a state of "unstable equilibrium," should fall? But then, alas! we fear there would be just as much difficulty in proving the existence of this nonentity, or the possibility of its existing in a sentient and intelligent creature surrounded with such enticing forms of real and apparent good, or the moral quality of the blind volitions decreed by it, or the propriety of punishing or rewarding its absurdities—as can be found in the Origin of Evil itself. It would be appealing to that "Anarch old,"

"Who, by deciding, more embroils the fray."

Thus are we reduced to inextricable difficulties on all sides. But let us be comforted. We are in no worse condition with respect to this great mystery of the "origin of evil," except that it is connected with misery, than with similar inextricable difficulties in every other field of speculation; and which, wherever we speculate, introduce us at last to two propositions, which seem almost parts of a contradiction; but of which we are assured there must be a reconciling harmony, though we cannot detect it. We are inclosed in a narrow prison, shut in with adamant bars and impassable walls; and when we gaze through the chinks which here and there let in what is after all but a mental twilight, we gaze into the depths of infinity. This every speculator finds. The chemist analyzes material substances, and analyzes again the products of his analysis, but cannot come to an end. He seems ever almost on the brink of discovering the ultimate organization of matter, which yet eludes and will probably ever elude him; he finds, as Bacon truly said, that "the subtlety of nature far surpasses the subtlety of either sense or intellect." The arguments for the infinite divisibility of matter, and for its not being infinitely divisible, are both unanswerable, and yet answer one another. That there is something we call a Cause, we believe, but cannot perceive or trace anything more than uniform antecedence and sequence. How two substances, such as mind and matter—if they be supposed essentially different—can act upon one another, is an inscrutable mystery; and yet those find themselves pressed with difficulties equally insurmountable, who, to get rid of it, annihilate matter and substitute ideas for it, or annihilate mind and make matter think. In like manner, we cannot refute the doctrine of the absolute certainty of human volitions, as dependent on motive; and can as little eradicate the consciousness which proclaims us to be free, and responsible for our freedom. We see the reasonableness of either assertion, but the *nexus* which binds them in harmony entirely baffles our perceptions.

Happy is he who, recognizing the limits im-

posed on the speculative powers of man, refuses to chafe at those narrow limits; and, instead of wearing his strength by fruitless efforts to shake the iron portals, or dashing himself against the walls of his prison, is willing to believe it possible that there are many things true which now sound like contradictions; and instead of "being wise above what is written," whether in the volume of Revelation or of Nature, (which, as Bishop Butler has shown, is inscribed with hieroglyphics equally dark,) commits himself to probabilities where demonstration deserts him, and, in the meantime, awaits that glorious dawn which shall let in, on the child of dust, the light of eternity; and either clear up the mysteries which baffle him, or leave him contented with his ignorance. Ignorant, indeed—infinately ignorant—with all his knowledge he will ever be; for it is the necessary condition of a finite intellect, that it will never comprehend those problems which demand an infinite intellect to solve; and it is possible that the full comprehension of the "origin of evil" may be of the number.

In the present scene of things, at all events, we must acquiesce in something less than demonstration; and most cordially do we concur with Leibnitz, when he says, "The harmony which is found in all the rest of the universe, forms a strong presumption that we should also find it in the government of man, and generally in that of the entire spiritual world, if all were but known to us. It becomes us to judge of the works of God not less wisely than Socrates judged of those of Heraclitus, when he said, 'What I understand pleases me well; and I believe that the rest would please me no less, if I understood it.'" Nor are even the hypotheses men may frame on this without their use, if, without pretending to remove every difficulty, they but assist us in conceiving that there may be methods of explaining this terrible mystery though we cannot perfectly comprehend them. We fully appreciate, for this reason, the sublime passage with which Leibnitz thus closes the first part of his *Theodicæ*:—"Those attempts of our reason, in which there is no necessity of absolutely confining ourselves to certain hypotheses, only serve to make us conceive that there may be a thousand ways of justifying the conduct of God; and that all the evils we see, and all the difficulties we suggest to ourselves, ought not to prevent our believing (when we cannot know by demonstration) that there is nothing so exalted as the wisdom of God, nothing so just as his judgments, nothing so pure as his holiness, and nothing more immense than his goodness."

With such lofty feelings as these, few can sympathize with the ridicule which is poured on the *Theodicæ*, by the author of *Le Candide*; even if its mocking author (Voltaire) had confined himself to what was really sophistical in that celebrated work, and had not extended his satire to the whole order of the Universe. If we are reduced to the melancholy alternative of choosing between an ennobling but illogical faith, and a logical but debasing reason, nowhere better than here could we say—It is wiser to be wrong with Leibnitz than right with Voltaire.

Fond as philosophers in general are of their favorite theories, perhaps there never was an instance of this paternal instinct more striking than Leibnitz's affection for his *Præestablished Harmony*. Of the many theories which have been invented to account for the phenomena of perception, and to

get rid of the supposed connection of mind and matter, none was ever more groundless than this; and yet to none of them have their authors attached the hundredth part of the importance which Leibnitz attached to it. The supposition that the movements of body and of mind are as totally distinct (to use his own favorite and oft-repeated illustration) as those of two timepieces exquisitely correct, and that the former, like the latter, agree only in the perfect simultaneity with which they are performed, is really one of the most monstrous and even self-destroying hypotheses ever framed. According to that theory, to adopt the illustration of Bayle, "the body of Cæsar must have performed all its acts, though it had pleased God to have annihilated Cæsar's soul the day after it was created;" or as Dr. Thomas Brown puts it, the soul of Leibnitz would, though his body had been annihilated at birth, have felt and acted as if with its bodily appendage—studying the same works, inventing the same systems, and carrying on with the same warfare of books and epistles the same long course of indefatigable controversy;—and the body of this great philosopher, though his *soul* had been annihilated at birth, would not merely have gone through the same process of growth, eating and digesting, and performing all its other ordinary functions, but would have achieved for itself the same intellectual glory, without any consciousness of the works which it was writing and correcting—would have argued with equal strenuousness for the principle of the Sufficient Reason, claimed the honors of the Differential Calculus, and labored to prove this very system of the Pre-established Harmony, of which it would certainly, in that case, have been one of the most illustrious examples."*

Now, what proof can we ever have of the existence of a material world, if we accept a theory, the precise object of which is to sever all connection between it and the percipient mind? The very machinery of that material world, and its whole series of movements, are supposed to be concealed behind an impenetrable curtain, and to be wholly independent of the world of mental phenomena. The existence of a material world, therefore, is entirely assumed by the very terms of the theory; and the theory itself is consequently far more naturally connected with a purely ideal system. Indeed, Leibnitz himself seems much more inclined to adopt some modification of that system, than to admit the real existence of the material world, in the ordinary sense of these words. Some curious statements to this effect may be found in the *Eclaircissements*, by which, not without reason, he attempts to remove objections to his theory.† We shall not insist upon

* Lectures on the Philosophy of the Human Mind. Vol. ii., p. 116.

† "Nous concevons l'étendue en concevant un ordre dans les coexistences; mais nous ne devons pas la concevoir, non plus que l'espace, à la façon d'une substance. C'est comme le *tems*, qui ne présente à l'esprit qu'un ordre dans les changemens. Et quant au *mouvement*, ce qu'il y a de réel est la force ou la puissance, c'est-à-dire, ce qu'il y a dans l'état présent, qui porte avec soi un changement pour l'avenir."—*Opera Omnia*, vol. ii., p. 79. But he expresses himself yet more strongly towards the close of his career. In the last year of his life, in a Letter to M. Dancicourt, he says—"Je suis d'opinion qu'à parler exactement il n'y a point de substance étendue. C'est pourquoi j'appelle la matière non 'substantiam' sed 'substantiatum.' J'ai dit en quelques endroits (peut-être de la *Theodicée*, si je ne me trompe) que la matière n'est qu'un phénomène réglé et exact, qui ne trompe point quand on prend garde aux règles abstraites de la raison."

other arguments against a theory on which, though it may have found some advocates in the age of Leibnitz, certainly has not a single adherent in our day. To suppose a material world, all the movements of which, so to speak, are parallel and coincident with those of mind, but totally disconnected with them, and created to answer no assignable or imaginable purpose, is surely to impute to the Deity a clumsy, cumbrous, irrational method of procedure. Yet Leibnitz principally values himself on having excogitated a system, which opens to us the most sublime views of the Omnipotence which could thus effect an entire harmony and parallelism, in the infinitely complicated and varied functions of two perfectly heterogeneous and separate substances. And if mere intricacy and superfluous complexity of apparatus were the highest trophy of wisdom, there would be some force in this reasoning; but as long as it is true, that simplicity in the means conjoined with variety in the ends is an attribute of the works of the Supreme Being, we may well doubt whether this theory be any such notable compliment to the Deity. In this system, as well as in every other which the impatience of philosophers has suggested, for the purpose of ridding themselves of a supposed interaction of two totally different substances, our sages forget, while magnifying the sublime views which their respective theories give us of the Divine Power and Wisdom necessary to realize them, that there is a very simple way of still more effectually doing justice to that power and wisdom; namely, by supposing it possible that the Divine Being may effect a mysterious connection between two perfectly distinct substances, though the philosopher cannot conceive it possible; and in a way which may far more transcendently display the infinitude of the Divine resources, than the realization of any complicated scheme of his could do. But this would just be humbly to admit certain ordinary facts which all the world admits, and few are the philosophers who can submit to that. It is much more pleasant to them, having condescendingly decided for the Deity the question of what is possible and what is impossible, and having relieved Him from the necessity of performing the latter, to devise a scheme which will still afford ample scope for His omnipotence.—On the moral difficulties which beset this and every other theory which would get rid of a material world, we have not spoken. But we cannot help thinking that the Ideal Theory is hardly consistent with the most worthy views of the Creator. Considering the deep, universal, indelible impression of an external world of matter, we can scarcely reconcile it with the supposition of His perfect truthfulness, to imagine Him the projector of a general system of illusion. So strong is the impression of the existence of a material world, that immaterialists have acknowledged that they find it impossible to eradicate it; and we have known disciples of Bishop Berkeley who have ingenuously confessed, that, somehow, the conviction haunted them, that "the solitary Palm still exists in the desert after the traveller has passed it, and is not an ideal phenomenon, to be reproduced after a certain interval to another mind." We regard this invincible belief, like the voice of conscience in the moral world, to be a species of revelation.

Extravagant as the system of *The Preestablished Harmony* may now appear, certain it is that Newton himself would not have ventured to predicate such glorious things of his true system of the Uni-

verso, as Leibnitz does of his supposed sublime discovery. It was to be the grand reconciling principle of at least half a dozen different, and in some respects contradictory, theories; it was to bring Aristotle and Plato, Des Cartes and Malebranche into happy harmony; and at once to redound to the glory of God, and silence the controversies of man. It is thus he speaks of it under his assumed name of *Theophile*, in an amusing passage of the first chapter of his *Dialogues on Locke's Essay*. "J'ai été frappé d'un nouveau système, dont j'ai lu quelque chose dans les journaux des savans de Paris. * * * Depuis, je crois voir une nouvelle face de l'intérieur des choses. Ce système paraît allier Platon avec Democrite, Aristote avec Descartes, les scholastiques avec les modernes, la théologie et la morale avec la raison. Il semble qu'il prend le meilleur de tous côtés, et que puis après il va plus loin qu'on n'est allé encore." And so he goes on for two or three pages, with equally or more extravagant promises of this wonder-working theory. The other imaginary dialogist, *Philalethe*, may well say, "Vous m'étonnez en effet avec toutes les merveilles, dont vous me faites un récit un peu trop avantageux pour que je les puisse croire facilement."

Into the long controversy between Leibnitz and Newton, which so much embittered the latter years of both, we have already declared our intention of not entering further than is rendered necessary by the remarks of Dr. Guhrauer; who is disposed, in his zeal to do justice to the memory of his great countryman, to urge those claims not a little unwisely.

Most persons of the present day, who have investigated the subject, have pretty well made up their minds as to the following points: first, that the system of fluxions is essentially the same with that of the differential calculus—differing only in notation; secondly, that Newton possessed the secret of fluxions as early as 1665—nineteen years before Leibnitz published his discovery, and eleven before he communicated it to Newton; thirdly, that both Leibnitz and Newton discovered their methods independently of one another—and that, though the latter was the prior inventor, the former was also truly an inventor.

With regard to the *first* of the three points above mentioned—the alleged identity of the two methods—Dr. Guhrauer is disposed to demur, and contends that the claims of Newton and Leibnitz could not interfere, as they respected two *different* discoveries. Speaking of Sir David Brewster's affirmation, in his *Life of Newton*, that the latter was the *first*, and Leibnitz the *second* inventor, he says, "There is, in truth, no *first* and no *second* in the discovery of similar things." * This we cannot but think uncandid, though he endeavors to justify his views by quoting the opinion of M. Biot, that "were the discovery of Leibnitz to be made even now, it would be considered a surprising creation, and must still be acquired, supposing nothing more than the method of Newton, as it is contained in his works, existed." This is not precisely the same as saying that the two things are "dissimilar," as Dr. Guhrauer boldly affirms; neither do the assertions of Euler, Lagrange, Laplace, Poisson, also referred to by him, amount to as much.

We do not think that the advocates of Leibnitz wisely consult his fame, by advancing claims that

certainly are not tenable. To whatever point of perfection beyond Newton, Leibnitz may have carried his Calculus,* we need not hesitate to say, that a decision as to whether the two methods be *essentially* the same or not, may be regarded as a test of controversial candor or perverseness. Any one competently acquainted with both, and not afflicted with polemical *strabismus*, would as soon affirm, that German printed in the German type was a different language from German printed in the Roman type, as affirm that the method of fluxions and of differences were essentially distinct things; or he would as soon affirm that two systems of stenography, each employing the same principles of abbreviation, and differing only in the characters, were essentially different. Whether Leibnitz was truly an independent inventor of this method—in principle identical with that of fluxions—is the only question, in our judgment, that really affects his fair fame; and that he *was* so, is now, we may say, all but universally regarded as indisputable. Involved and complicated as the question has been through the passions and prejudices of contemporary controversialists, its solution really depends upon one very simple question, which we are in a much better position to answer fairly than the heated disputants of that age. It is this—Was Leibnitz capable of committing the vilest literary larceny, and persisting, to conceal it, in a detestably mean and deliberate falsehood? If not, (and there are few but will acquit him, who consider the general frankness and openness of his nature, the freedom with which he communicated his own discoveries, and the candor with which he congratulated others on theirs,) he is entitled to the honors of independent invention. If he *was* capable of such conduct, then no evidence can satisfy the doubter; for there was assuredly one period during which there was a possibility of deriving advantage from the previous discovery of Newton. The matter stands briefly thus. In the year 1666, Newton, when but twenty-four years of age, was already in possession of the system of fluxions. Either wishing to exhibit his method in a more perfect form than he had then leisure to impart to it, or desirous of reserving his discovery for his own exclusive benefit, he did not publish it—though he communicated the outlines of it to some of his friends, and, amongst the rest, to Dr. Barrow. The papers were lent by Barrow to Mr. Collins, who, unknown to Newton, took a copy of them, and who showed them to Oldenburg; and as these gentlemen, to use the language of the Royal Society, were very free in communicating to continental mathematicians what was going on at home;—as the latter was certainly in communication with Leibnitz as early as the year 1673, when he visited England; and lastly, as both of them saw him in his subsequent visit in 1676, it has been surmised that Leibnitz might thus have either obtained a glance of these papers, or some significant hints as to their contents. Now this is precisely the weak point in Leibnitz's case; but we venture to say, that it ought not to weigh against the repeated protestations with which he affirms that he had derived no such advantage; and that he was absolutely ignorant of the name, notation, and nature of Newton's system till some time after 1684, when he published his own first exposition of his

* Es giebt nemlich keinen ersten, und keinen zweiten, in der Erfindung unähnlicher Dinge. Vol. i., p. 180.

* See some excellent remarks on this subject, in Professor De Morgan's *Differential and Integral Calculus*, p. 32-34.

Calculus. He repeatedly makes this statement; and, amongst other places, in his correspondence with the Abbé Conti, who was anxious to reconcile the angry disputants. It was precisely this charge against his *honor*, implied in the statement of Dr. Keill, of which Leibnitz most bitterly complains.

There is one part of the statement just alluded to, and it is virtually justified in the well-known report of the committee of the Royal Society appointed to investigate this affair, and which compiled the celebrated collection of papers entitled *Commercium Epistolicum*, which has always appeared to us not only of little weight, as opposed to the solemn protestations above mentioned, but as palpably illogical. We are not aware that the peculiar infirmity in the argument to which we now refer, has ever been exposed, and it may therefore justify us in bestowing a few sentences upon it. As the charge of having possibly seen something explicit on the subject, in the papers, or in the communications of Newton's friends, was but vague, Keill proceeds to say, that the two well-known letters, which had *certainly* been communicated to Leibnitz through Mr. Oldenburg, contain "indications of the system of fluxions, sufficiently intelligible to an acute mind,"* from which Leibnitz derived, or at least *might* derive, the principles of his Calculus."

The first was communicated in June, 1676, and the second in October, 1676. In the first, Newton gives an expression for the expansion in serieses of binomial powers; as also expressions for the sine in terms of the arc, for the arc in terms of the sine, &c., &c.; but the letter contains not a hint of his method of fluxions. In the second, elicited by a reply from Leibnitz, which clearly showed that the German mathematician was in the track of the same discoveries, Newton details the manner in which he first arrived at his method of Series—its application in 1665 to the quadrature of the hyperbola, and the construction of logarithms; and communicates "many other remarkable things," to use the words of Montucla. But still, results only are given; no hint is afforded of the methods by which they are attained. "The method of fluxions," says the late eminent Professor Playfair, "is not communicated in these letters; nor are the principles of it in any way suggested." "Nous remarquons ici," says Montucla—in reply to the insinuation that the second letter might have given some light—"qu'après avoir lu et relu cette lettre, nous y trouvons seulement cette méthode décrite quant à ses effets et ses avantages, mais non quant à ses principes." Those principles Newton conceals in a couple of anagrams, consisting of the transposed letters of the sentences which express them.

Now we affirm that it was in the highest degree unjust and inconsequential to say that Newton had afforded, in documents thus guarded, "indications sufficiently intelligible to an acute mind, from which Leibnitz derived, or at least might derive, the principles of his Calculus." Newton, it is evident, did not think so. His very object was, whether wisely or unwisely, to keep the matter secret; and it is clear that he thought his reserve and his ciphers would effectually secure that purpose. It is really a species of impertinence, scarcely consis-

tent with the reverence due to Newton's sagacity, to say that what *he* thought sufficiently guarded was "sufficiently intelligible to an acute mind;" and that, while *he* flattered himself that he had rendered the matter sufficiently dark, he had, in the very way in which he proposed the enigma, contrived to solve it!

We may be assured he was far more likely than Keill to judge correctly as to what regarded his secret; nor do we believe there is any one, who will calmly read the letters in question, who will maintain that this great man's sagacity was here at fault. If Leibnitz had really excogitated the differential calculus out of such materials as these letters, it would have been scarcely a less illustrious trophy of his genius than the discovery of the Calculus itself; while, if he had been able to make anything at all of the hieroglyphical ciphers, he must have had no less than the skill of that philosopher in Laputa, who, as Swift tells us, was employed in extracting sunbeams out of cucumbers. In case, however, any tyro in the mathematics should think that these ciphers may have afforded some more hopeful basis of discovery, we give them below.*

In further confirmation of the claims of Leibnitz to the honor of independent discovery, it may be remarked, that though no candid man can deny the essential identity of the two methods, the very differences of terms and notation indicate that they were arrived at by distinct trains of thought, and that the subject was regarded from different points of view. The idea of the generation of magnitudes by the motion of a point, a line, or a surface, was the conception from which Newton worked; Leibnitz, from the idea of magnitudes, as consisting of infinitely small elements, and admitting increase or diminution by infinitely small increments or decrements. "Newton and Leibnitz," says a candid and competent judge, (Professor De Morgan,) "had independently come to the consideration of quantity, and each made the new step of connecting his ideas with a specific notation."

It may seem remarkable, that two different men should have made this sublime discovery at the same time, but we must remember, that the necessities of science were simultaneously turning the attention of all the mathematical genius of the age, and even of the preceding one, in the same direction; and that Newton and Leibnitz were both preëminently gifted with powers of invention and analysis. Indeed, so far had previous mathematicians paved the way for the solution of the great problem, that we may well say with Professor De Morgan, "It has, perhaps, not been sufficiently remarked, how nearly several of their predecessors approached the same ground; and it is a question worthy of discussion, whether either Newton or Leibnitz might not have found broader hints in writings accessible to both, than the latter was ever asserted to have received from the former."†

To conclude merely from the coincidence of their discoveries, that Leibnitz must have stolen from Newton, would be as little reasonable as to

† *Elementary Illustrations of the Differential and Integral Calculus.*

* Keill even goes further—"His indicia atque his adjutum exemplis, ingenium vulgare methodum Newtonianum penitus discerneret."—*Commercium Epistolicum*, No. 84.

suppose that Laplace must have had access to some private sources of information, when, by a very difficult analysis, he proved some of the results which De Moivre had attained, but which, in accordance with the contracted spirit of the age, the latter simply announced, carrying his methods as a secret to the grave with him.

That Leibnitz was capable of making this discovery, is no such extravagant supposition as to render it necessary to resort to a charge of plagiarism. It is not, perhaps, too much to say, that his mathematical talents were equal to anything. The masterly manner in which he expounded the principles of the differential calculus, and developed its applications, even if we were to suppose its first hints borrowed from Newton; his admirable labors on the integral calculus; the success with which he entered the lists in those intellectual *jousts*, as they may be called, in which the great mathematicians of the day were wont to engage—the difficult problems he solved, and offered for solution; even his minor achievements—his calculating machine—his binary system of arithmetic—we may add, his juvenile essay *De Arte Combinatoria*—all show the highly inventive character of his genius, and the subtlety and comprehensiveness of his analytical powers.

If anything could make us doubt the claims of Leibnitz, it would be a statement of Dr. Guhrauer himself—proving, as it would, if true, that Leibnitz was capable of trifling with truth. It is well known that, in 1704, a notice appeared, in the *Acta Eruditorum*, of Newton's *Optics*. That notice contained a paragraph, which seemed to imply that Newton had been a plagiarist from Leibnitz. The obnoxious sentence given in all accounts of the controversy was as follows:—“Pro differentiis igitur Leibnitianis D. Newtonus adhibet, semperque adhibuit, fluxiones; * * * quemadmodum et honoratus Fabrius, in sua Synopsi Geometricâ motuum progressus Cavalierianæ methodo substituit.”

Newton felt highly indignant at this paragraph, as he well might—even supposing that no charge of plagiarism was intended. Leibnitz constantly affirmed in reply, that it could be interpreted into a charge of plagiarism only by a false and malicious gloss—a gloss which the compilers of the *Commercium Epistolicum* had not disdained to avail themselves of; that the very words “adhibet semperque adhibuit” were intended to imply the difference between the case of Newton and that of Fabri, to whose practice alone the word *substituit* applied.

Now, first, Dr. Guhrauer seems to have established the fact, that Leibnitz himself was the author of the obnoxious Review—a fact not much to his credit; secondly, he affirms that Leibnitz “constantly denied any knowledge of the authorship.” If this fact were true, we should hardly know what to think of Leibnitz's regard for truth. But, in reality, there nowhere appears, in as far as we have been able to discover, any proof that Leibnitz either denied knowledge of the authorship, or disclaimed the paragraph. He constantly defends the statement it contains, merely denying that it conveyed or could be intended to convey a charge of plagiarism.* To the benefit of this interpretation we would charitably admit him, since he wishes his words to be so taken; but it is impossible not to suspect that the equivocal sentence

was framed with little care as to whether it might not be misunderstood. Indeed, so natural is the interpretation of Newton, and the English mathematicians, that Dr. Guhrauer himself adopts it; declares that Leibnitz vainly strove to explain the sentence away; and that it is a proof “von Leibnitzens wahrer eigenster Meinung und Gesinnung gegen Newton.”

“Defend me from my friends,” Leibnitz might well say on this occasion; for if we adopt this interpretation as Leibnitz's true meaning, what are we to think of his shuffling exculpations?

Dr. Guhrauer is not a little indignant with Sir David Brewster, for the supposed injustice which, in his *Life of Newton*, he has done to Leibnitz, and to which he frequently refers with much bitterness. Never was a complaint more unreasonable. Our distinguished countryman does not question Leibnitz's claim to be regarded as a true inventor of the Calculus; he merely asserts the undoubted *priority* of Newton's discovery. He expressly affirms, that there is no reason to believe Leibnitz a plagiarist; but that if there were any necessity for believing either to be so, it must be Leibnitz, and not Newton, who is open to the charge. Dr. Guhrauer angrily replies, not simply by saying, (which is true,) that there is no sufficient evidence of Leibnitz's having stolen Newton's invention, but by denying the essential identity of the two methods, and by affirming that they are so different as to be considered “unlike things;”—than which nothing can, in our judgment, be more uncandid.

There is only one statement which, as respects Leibnitz, Dr. Guhrauer could fairly find any fault with, in Sir David Brewster's work; and that is, that Keill had a “right to express his opinion” that the Letters of Newton, of 1676, gave indications from which Leibnitz “derived, or might derive,” the principles of his Calculus. For reasons already assigned, we do not think that any man had a right to say this; nor that any one could say it, without being of a different opinion from Newton himself, who undoubtedly must have thought that he had not disclosed what he had designed to conceal. With no other statements of Sir David Brewster as regards Leibnitz, are we disposed to find fault. If he has shown any undue partiality in this matter at all, it is not by excessive severity towards Leibnitz, but by undeserved leniency towards Newton; for while he has expressed strong indignation at Leibnitz's atrocious charges of plagiarism against Newton, he has very gently touched the virulent reprisals into which Newton was betrayed; who even declared, at last, that Leibnitz's method was but a plagiarism from Barrow—a charge upon which only the very blindness of polemical animosity could have ventured; for it would equally show whence his own fluxions might have been derived. It exposed him at once to Leibnitz's quiet sarcasm, “that if any could have been profited by Barrow's instructions, it must have been Newton himself.” “Siquelqu'un a profité de M. Barrow, ce sera plutôt M. Newton, qui a étudié sous lui, que moi; qui, autant que je puis m'en souvenir, n'ai vu les livres de M. Barrow qu'à mon second voyage d'Angleterre.”

As both of these illustrious men could justly claim the honor of the disputed invention, so both, in the conduct of the controversy, and in the virulence of expression to which they were carried, in their reciprocal charges and accusations, exhibit

* Dutens' Edition of his Works, vol. iii., p. 461, &c.

themselves in much the same sorry light as the philosopher in *Le Bourgeois Gentilhomme*, who begins to lecture the rival masters of dancing and fencing out of Seneca, and ends by forgetting that he is a philosopher altogether. The controversy is indeed an instructive spectacle of human infirmity—showing how passion can cloud the serene intellects, and inflame the most philosophic temperaments; that its thunder-storms may be found in the highest latitudes—disturbing the frigid poles as well as the burning tropics; that there is no domain of speculation, however remote, or purely abstract, into which it cannot intrude; and that the mathematician, as well as the theologian, can exhibit all the rancor of the most vulgar controvertists. There is probably nothing parallel in history, except the controversy between the nominalists and realists, who actually began to fight for and against their shadowy universals. Yet even they first added a religious to the purely speculative element, which they at last introduced to such an extent, that they charged each the other with having committed the sin against the Holy Ghost! Newton and Leibnitz had neither the excuse nor the guilt of this superadded provocation.*

However paradoxical apparently may be the phraseology of Leibnitz, in his first expositions of the Differential Calculus, respecting his infinitesimal quantities, (as, that there are quantities infinitely less than quantities infinitely little, and that of two quantities infinitely great, one may be infinitely greater than the other,) it is plain, that he soon worked his own conceptions completely clear, and gave his abbreviated expressions their true interpretation. The explanations of Leibnitz are in fact often so perspicuous, that they ought to have satisfied every objector; and to have prevented the elegant and ingenious nonsense which Bishop Berkeley ventured upon, in regard to them, more than thirty years after, in his *Analyst*. Thus, among many other places, in an explanatory letter to M. Varignon, in 1701, Leibnitz says:—

“Je ne me souviens pas assez des expressions dont je puis m'être servi : mais mon dessein a été de marquer qu'on n'a pas besoin de faire dépendre l'analyse mathématique des controverses métaphysiques, ni d'assurer qu'il y a dans la nature des lignes infiniment petite à la rigueur, en comparaison des nôtres, ni par conséquent qu'il y a des lignes infiniment plus grandes que les nôtres. C'est pourquoi afin d'éviter ces subtilités j'ai crû que

* One other unjust statement of Dr. Guhrauer's, we cannot pass unnoticed. The unhappy controversy on the Calculus commenced, it is well known, by some slight skirmishes in the year 1699, when Fatio insinuated, that the applause which Leibnitz was receiving for his Differential Calculus, (first given to the world by him in 1684,) would be more justly bestowed on Newton—its first inventor. Dr. Guhrauer is pleased to intimate that Newton was privy to Fatio's attack, and prompted it. This is most unjust, as it is in express contradiction to Newton's assertion, that he knew nothing of Fatio's intention, and was no party to it. In several other places Dr. G. insinuates, that it is easy to see that Newton was behind the curtain in the early attacks on Leibnitz, (vol. i., p. 303,) though he did not choose to appear in the controversy himself. Whether it was wise or not in Newton to stand so long aloof—whether it was in sullen pride or real magnanimity—from confidence in his claims, or dislike of controversy—certain it is, that during all the earlier stages of the dispute he remained silent; and being so, no man has a right to charge on him, without explicit evidence, the language of his adherents, whose just pride in the reputation of their countryman is quite sufficient to account both for the rashness of their zeal, and the intemperance of their expressions.

pour rendre le raisonnement sensible à tout le monde, il suffisait d'expliquer ici l'infini par l'incomparable, c'est-à-dire, de concevoir des quantités incomparablement plus grandes ou plus petites que les nôtres; ce qui fournit autant qu'on veut de degrés d'incomparables, puisque ce qui est incomparablement plus petit, entre inutilement en ligne de compte à l'égard de celui qui est incomparablement plus grand que lui. C'est ainsi qu'une parcelle de matière magnétique, qui passe à travers du verre, n'est pas comparable avec un grain de sable, ni ce grain avec le globe de la terre, ni ce globe avec le firmament.”

Dr. Guhrauer is very severe on the “narrowness of mind” implied in Newton's concealing his fluxions under ciphers, in his correspondence with Leibnitz; and contrasts it with the frank and manly conduct of the latter, when, in his reply to Newton's second letter, he communicated the principles of his Calculus to his rival. It ought at all events to reconcile Dr. Guhrauer to Newton's procedure, that it formed in fact the safeguard of Leibnitz's claims; for had Newton disclosed his secret, it would have been impossible to establish them.

We must now conclude, though we could have wished to add a few observations on several other matters;—on Leibnitz's religious opinions,* and theological controversies—especially with Clarke, Bossuet, and Pelisson—on his political and diplomatic life, in which, with its accustomed versatility, he seems to have been as much at his ease as in literature and science—on the influence he exerted on literature as the centre of all the literary commerce of the age—an influence which Mr. Stewart has so justly appreciated, and finely illustrated in his well-known *Dissertation*. But on all these topics our space compels us to be silent, while on others we gladly content ourselves with referring to the admirable criticisms of the last

* Of Leibnitz's reputed adoption of the doctrines of Romanism, we have said nothing. It is certain that if he adopted he never avowed them, nor did he ever join the Romish communion. If the unfinished manuscript, called the *Systema Theologicum*, (not so entitled by him,) really expresses his views, it is, as Dr. Guhrauer observes, “in opposition to all his other writings, and to his whole life also.” Dr. Guhrauer's remarks on its origin and purport may be found in vol. ii., pp. 32-34. He also treats the whole question of Leibnitz's opinions on this subject very ably in vol. i., pp. 340-358. It is at the same time certain, that Leibnitz's tolerant temper, the eclecticism of his philosophy, which always disposed him to find points of reconciliation in opposing systems, whether those of Aristotle and Des Cartes, or of Rome and Luther, his reverence for antiquity, cherished by his profound historical researches—all predisposed him to regard the differences between Romanists and Protestants as far less important than they are. In the attempt to negotiate a reconciliation between them, he expended no small portion of his time and energies, and, in his controversy with Bossuet, he sometimes makes far too liberal concessions for that object.—It is not a little curious, and highly characteristic, that he always flattered himself that he was in possession of a metaphysical solution of the doctrine of transubstantiation. In this instance at least he verified a naïve assertion he was accustomed to make respecting himself—“That to him, unlike the generality of people, all difficult things were easy, and all easy things difficult.”

† Of this, a proof rendered more especially remarkable by long subsequent events, is furnished in a memorial addressed by him to Louis XIV., proposing that memorable plan for keeping some of the chief nations of Europe in check, afterwards attempted to be consummated by Bonaparte; namely, the conquest and colonization of Egypt. Of this posthumous piece, an English translation was published in London, in 1803, but which seems now entirely forgotten.

mentioned writer, and his other illustrious coadjutors, Sir James Mackintosh and Professor Playfair, in their associated Dissertations on the History of Metaphysical, Ethical, Mathematical, and Physical Science.* In each of these, Leibnitz is made, so to speak, to reënter; for while few other names appear in more than one of them, he is of sufficient importance to be subjected to a fresh examination in all. So various, indeed, are the phases of his character and genius, so numberless his accomplishments, that we may apply to him the well-known lines of Dryden, divested of the satire which was designed in their original application—

“A man so various that he seemed to be
Not one, but all mankind’s epitome.”

From Chambers’ Journal.

UNSPOKEN LANGUAGE.

It is remarkable that, while the grammar of our spoken tongue is taught in untold thousands of academies, there is no institution of any kind for instruction in that equally useful language which is neither written nor spoken. There seems to be no good reason why this kind of language should not be taught in a systematic and—so to speak—grammatical manner; for, if it may be said that it comes natural to us all, so, it may be said, does the employment of our mother tongue; and yet, as everybody knows, we cannot use that correctly without training. I would therefore humbly suggest the introduction into our principal schools and colleges of departments for the various leading branches of wordless speech, all of them under competent masters and mistresses, as the case might be.

An important department would be the various means of expressing anger, indignation, contempt, and other strong passions in the wordless manner. It ought to comprise classes for individuals of various sexes and ages. For example, there might be one composed of young ladies, to teach them the proper methods of showing how much they are offended, from a sulky look for an unreasonable papa or mamma, to a contemptuous toss of disdain for a swain who has made a non-reverential remark. It would be of particular consequence to train them to the art of cutting, for which purpose it might be necessary to set up a figure like the quintal of the tournament-ground, upon which to practise the desired art. Past this they would be paraded at a proper walking pace, and taught to look at it as if they did not see it, or know what it was. Cutting, we should think, might be taught to clever pupils in from four to six lessons.

The most expressive methods of slamming doors would form the business of a general class; for this is a form of silent, though not noiseless rhetoric, for which almost all have occasion. Doors may be slammed in a great variety of ways, each having its own peculiar signification. For instance, there is the sulky slam—a heavy dull mode, yet necessary for its own particular shade of feeling. There is also the pert, contemptuous slam—a sharp snappish sound, which seems to say, “I despise you.” Then there is the thundering slam, for towering passions only, and which generally shakes the whole tenement from garret to cellar.

On all of these, and other slams, there would of course be sub-variations for various parties. For example, a servant’s angry slam against a mistress who has been so unreasonable as point out a fault; a son’s slam against his father on being refused a horse; &c. When all the varieties of the art are considered, we could not expect that, in private tuition, slamming could be well taught in less than twelve lessons.

An important department would be that for teaching the various means of expressing derogatory opinions of friends and acquaintance independently of words. The utility of the non-verbal language is here so great, that all must be sensible of it. Particular care would be necessary in the selection of teachers, particularly those who had to train young commercial men in the methods of indicating degrees of credit-worthiness; and those, again, of the female sex who gave instructions in the best modes of denoting the state of reputations. The nicest caution and delicacy being here necessary, it would be proper to engage only first-rate talent, and to pay it extremely well. We can imagine the class-rooms for this department presenting curious scenes. Nods, winks, elevations of the eyebrows, shrugs, affectedly-concerned looks, would be seen passing between teachers and pupils in a surprising manner. A master might be seen giving lessons in the laying of a finger significantly across the lips, for half an hour at a time. A spectator unacquainted with the object would be apt to suppose the class a congregation of lunatics, when, in reality, it was engaged in preparation for some of the most important duties of social life. This allusion, by the way, reminds us of one of the things to be taught in this department; namely, the proper way of referring without words to the various degrees of sanity enjoyed by one’s friends—from that movement of shoulders and eyebrows which expresses a sense of their oddity, to the pointings to, and touchings of, the forehead, by which we indicate their being hopelessly gone in madness, or what is thought the same thing, the knowledge and goodness which soar above the common world.

One good end might be in a special manner served by the proposed institutions, and one which would, in fact, make up for the shortcomings of all other seminaries, and the obstructions to all other means of acquiring knowledge. It often happens, as every one knows, that people speak of things which none but themselves understand. What are the rest to do!—to acknowledge ignorance, and profess to be willing to learn? This were such a degradation, as none possessed of a fair share of self-respect could submit to. The alternative, of course, is to listen with that appearance of intelligence usually called a “knowing look.” But this is called for in many various forms. For example, if a friend quotes from a Latin or French author, there is required an aspect which seems to say—“Right: you have it—the thing is undeniable.” Suppose, again, you are at an exhibition of pictures, and join a pair of friends who are talking learnedly of keeping—light and shade—coloring—tone—aërial perspective—scrubbling—old woman in the red cloak to give effect to the foliage—about all of which matters you feel like a child unborn, as far as the feelings of such a member of society may be guessed at—then you will require to light up your countenance with a different kind of internal lantern. A much graver, more solemn light it must be; consisting of a decided earnestness o

* Prefixed to the Seventh Edition of the *Encyclopædia Britannica*.

eye, a primness of lips; a few firm, shrewd, side-long glances; two nods judiciously interspersed; and, finally, a toss up of the chin as you stalk away, without a single word, to the next picture, apparently determined on criticizing and judging for yourself. Looks for non-understood papers at scientific societies are not less needful; for at present many grown gentlemen hardly know how to conduct themselves on those occasions. Such looks would require to be duly graduated to the character of the various papers—from a trivial, half-attentive look for speculations in geology and other such readily-apprehensible matters, to one fixed, penetrating, and determined, when the black board was getting covered over with algebraic calculations. In this department it would be well to have private hours for the more special instruction of presidents, councillors, and other officials, as it becomes particularly absurd to see the gentlemen at the green table looking as if they had not the faintest idea of what the matter is all about.

There would be a large miscellaneous department, absorbing many odds and ends. Here one might be duly trained to the silent methods of maintaining an appearance of consequence—making people keep their distance, and so forth. A stare in reply to an over-familiar remark is a piece of art which would require a good deal of practice for most persons, as, to do human nature justice, we do not naturally feel jealous about dignity—witness the proceedings of children—and only acquire the sentiment in our intercourse with society. Connected with such lessons are those required for recognitions in streets and other public places—the cool nod for a friend who borrows, the *impressé* bow for the lady who gives nice parties, the mixture of nonchalance and perfect politeness to be conveyed to one whom you suppose to be an enemy or rival, so as to leave him nothing of which either to boast or complain. To chill down and battle off bores by mere mute dodging—to turn the cold shoulder in an unchallengeable manner to persons “not proper”—would also call for much study. All of these are utterances of a most refined nature, compared to which word-language is a piece of the grossest materiality. Decayed members of the upper classes would probably be found the only persons competent to teach such niceties. Here, also, the various feelings expressible by a turn or cast of the eyes, by a look, a smile, a pursing-up or a turning down of the mouth, and many other little gesticulations, would be subject of exercise. We would not willingly see instructions given in those mysterious applications of the thumb to the nose, which have of late years been so common, as an expression of incredulity, seeing that this practice is essentially a degradation of the human countenance divine. A polite skepticism is doubtless expressible by gestures or looks against which no such objection can be urged; and to discover and teach these, would be the business of some of the higher officials of the establishment.

Such is a general outline of the kind of seminaries proposed—liable of course to revision in point of detail, and with regard to their constitution and management. We throw it out to the world only as a hint, leaving it to others to make it a reality.

SUNLIGHT UPON THE WATERS.

SUNLIGHT upon the waters—or when, hushed,
The mirrored lake reflects it, beam for beam—
Or when it seems, on ripples radiance-flushed,
A rain of stars—how beautiful to seem!
When, with the cataract, it leaps and dashes
Down to the atoms-shattered spray below,
And, ere the dazzled eye can drink its flashes,
Melts to the semblance of the heavenly bow;
When, in that bow itself, serenely spread
O'er the storm-featured concave, it appears
A pathway for th' Invisible to tread;
A gorgeous arch, connecting holier spheres;
Then, sunlight on the waters is a theme
For poet's raptured gaze, and loftiest mystic dream.

Lo! on a lesser scale, 't is still the theme—
Spangling in dewdrops o'er the bladed grass;
Bright'ning the shallows of the pebbled stream,
Through which the naked-footed urchins pass;
When, in some reservoir, or large, or small,
It draws the basking inmates to the brim,
As, on their scales of gold and silver, fall
Th' exhilarating rays in which they swim;
Or when some well-oared boat, in swift advance,
Quickens the strokes from which the waters
glance;
Or when, to take her bath, th' imperial swan
Flutters, for glee, the surface in her track,
Stoops her arched neck, down diving, and, anon,
Showers liquid brilliants o'er her plumage-ruffled
back.

Treble, the theme!—when, viewed from some
great height,
At morn, it radiates skyward from the main;
Or when, at noon, insufferably bright,
The billows blaze along the wat'ry plain;
Or when, at even, in the purpling west,
The fleecy vapors catch chameleon-dyes,
While at their feet, in softened splendor dressed,
The undulating ocean, murmur'ing, lies;
Or when, by terraced lawn, or statued place,
Some cooling fountain jets translucent streams,
Which, from their crested summits to their base,
Freshen and revel in the pervious beams;—
And, in each phase, the poet will perceive
The beautiful on earth, in which his race believe.
Rural Sonnets.

A HOME-SONNET.

THE world is with me, and its many cares—
Its woes—its wants—the anxious hopes and fears
That wait on all terrestrial affairs—
The shades of former and of future years—
Foreboding fancies and prophetic tears,
Quelling a spirit that was once elate.
Heavens! what a wilderness the earth appears,
Where youth, and mirth, and health, are out of
date!
But no—a laugh of innocence and joy
Resounds, like music of the fairy race,
And, gladly turning from the world's annoy,
I gaze upon a little radiant face,
And bless, internally, the merry boy
Who makes a son-shine in a shady place.
Hood's Poems.

From Blackwood's Magazine.

THE LAST RECOLLECTIONS OF NAPOLEON.*

THERE are few things more striking than the analogy in civil and physical changes of the world. There have been in the history of man periods as distinctive as in the history of nations. From these periods society and nations have alike assumed new aspects, and the world has commenced a new career. The fall of the Roman empire was the demarkation between the old world and the new. It was the moral deluge, out of which a new condition of man, new laws, new forms of religion, new styles of thought, almost a totally new configuration of human society were to arise. A new settlement of the civil world took place: power absorbed by one race of mankind was to be divided among various races; and the development of principles of government and society, hitherto unknown, was to be scarcely less memorable, less unexpected, or less productive, than that voyage by which Columbus doubled the space of the habitable globe.

The Reformation was another mighty change. It introduced civil liberty into the empire of tyranny, religion into the realm of superstition, and science into the depths of national ignorance. The French Revolution was the last, and not the least powerful change within human experience. Its purpose is, like its operation, still dubious. Whether it came simply for wrath, or simply for restoration—whether, like the earthquake of Lisbon, it came only to destroy, and leave its ruins visible for a century to come; to clear the ground of incumbrances too massive for the hand of man, and open the soil for exertions nobler than the old, must be left to time to interpret. But there can be no question, that the most prominent agency, the most powerful influence, and the most dazzling lustre of a period in which all the stronger impulses of our being were in the wildest activity, centred in the character of one man, and that man—Napoleon.

It is evidently a law of Providence, that all the great changes of society shall be the work of individual minds. Yet when we recollect the difficulty of effecting any general change, embracing the infinite varieties of human interests, caprices, passions and purposes, nothing could seem more improbable. But it has always been the course of things. Without Charlemagne, the little principalities of Gothic Europe would never have been systematized into an empire;—without Luther, what could have been the progress of the Reformation!—without Napoleon, the French Revolution would have burnt itself out, vanished into air, or sunk into ashes. He alone collected its materials, combined them into a new and powerful shape, crowned this being of his own formation with the imperial robe, erected it in the centre of Europe, and called the nations to bow down before a new idol, like the gods of the Indian known only by its mysterious frown, the startling splendor of its diadem, and the swords and serpents grasped in its hands.

That the character of Napoleon was a singular compound of the highest intellectual powers with the lowest moral qualities, is evidently the true description of this extraordinary being. This combination alone accounts for the rapidity, the splendor of his career, and the sudden and terrible com-

pleteness of his fall. Nothing less than preëminent capacity could have shot him up through the clouds and tempests of the Revolution into the highest place of power. A mixture of this force of mind and desperate selfishness of heart could alone have suggested and sustained the system of the imperial wars, policy, and ambition; and the discovery of his utter faithlessness could alone have rendered all thrones hopeless of binding him by the common bonds of sovereign to sovereign, and compelled them to find their only security for the peace of Europe in consigning him to a dungeon. He was the only instance in modern history of a monarch dethroned by a universal conviction; warred against by mankind, as the sole object of the war; delivered over into captivity by the unanimous judgment of nations; and held in the same unrelaxing and judicial fetters until he died.

It is another striking feature of this catastrophe, that the whole family of Napoleon sank along with him. They neither possessed his faculties, nor were guilty of his offences. But as they had risen solely by him, they perished entirely with him. Future history will continually hover over this period of our annals, as the one which most resembles some of those fabrications of the oriental genius, in which human events are continually under the guidance of spirits of the air; in which fantastic fallacies are erected by a spell, and the treasures of the earth developed by the wave of a wand—in which the mendicant of this hour is exalted into the prince of the next; and while the wonder still glitters before the eye, another sign of the neoromancer dissolves the whole pageant into air again. Human recollection has no record of so much power, so widely distributed, and apparently so fixed above all the ordinary casualties of the world, so instantly and so irretrievably overthrown. The kings of earth are not undone at a blow; kingdoms do not change their rulers without a struggle. Great passions and great havoc have always preceded, and followed the fall of monarchies. But the four diadems of the Napoleon race fell from their wearers' brows with scarcely a touch from the hand of man. The surrender of the crown by Napoleon extinguished the crowns actually ruling over millions, and virtually influencing the whole continent. They were extinguished, too, at the moment when the imperial crown disappeared. It had no sooner been crushed at Waterloo, than they all fell into fragments, of themselves;—the whole dynasty went down with Napoleon into the dungeon, and not one of them has since returned to the world.

The name of General Count Montholon is well known to this country, as that of a brave officer, who, after acquiring distinguished rank in the French army by his sword, followed Napoleon to St. Helena; remained with him during his captivity; and upon his death was made the depositary of his papers, and his executor. But his own language, in a letter dated from the Castle of Ham in June, 1844, gives the best account of his authority and his proceedings.

“A soldier of the republic, a brigadier-general at twenty years of age, and minister-plenipotentiary in Germany in 1812 and 1813, I could, like others, have left memoirs concerning the things which I saw; but the whole is effaced from my mind in presence of a single thing, a single event, and a single man. The thing is Waterloo; the event, the fall of the empire; and the man, Napoleon.”

He then proceeds to tell us, that he shared the St. Helena captivity for six years; that for forty-

* *History of the Captivity of Napoleon at St. Helena.* By GENERAL COUNT MONTHOLON. 2 vols. London: Colburn.

two nights he watched the dying bed of the ex-monarch; and that, by Napoleon's express desire, he closed his eyes. But to those duties of private friendship were affixed official services, which looked much more like tyranny than the tribute of personal regard, and which we should think must have worn out the patience, and tried the constitution, of the most devoted follower of this extraordinary captive.

Napoleon, though apparently contemptuous of the opinions of mankind, evidently felt the strongest anxiety to make out a favorable statement for himself. And all his hours, except the few devoted to exercise on horseback and to sleep, and to his meals, were employed in completing the narrative which was to clear up his character to mankind.

During the last years passed in St. Helena, Napoleon sent for the count every night at eleven o'clock, and continued dictating to him till six in the morning, when he went into the bath, dismissing the count with—"Come, my son, go and repose, and come to me again at nine o'clock. We shall have breakfast, and resume the labors of the night." At nine, he returned, and remained with him till one, when Napoleon went to bed. Between four and five, he sent for the count again, who dined with him every day, and at nine o'clock left him, to return at eleven.

The world little knew the drudgery to which these unfortunate followers of the ex-emperor were thus exposed, and they must all have rejoiced at any termination of a toil so remorseless and so uncheering.

Napoleon was fond of the Turkish doctrine of fatality. Whether so acute a mind was capable of believing a doctrine so palpably contradicted by the common circumstances of life, and so utterly repugnant to reason, can scarcely be a question; but with him, as with the Turks, it was a capital doctrine for the mighty machine which he called an army. But the count seems to have been a true believer. He, too, pronounces, that "destiny is written," and regards himself as being under the peculiar influence of a malignant star, or, in his own words: "In fact, without having sought it, my destiny brought me into contact with the emperor in the Elysée Bourbon, conducted me, without my knowing it, to the shores of Boulogne, where honor imposed upon me the necessity of not abandoning the nephew of the emperor in presence of the dangers by which he was surrounded. Irrevocably bound to the misfortunes of a family, I am now perishing in Ham; the captivity commenced in St. Helena."

Of Count Montholon, it must be acknowledged, that he was unstained by either the vices or the violences which scandalized Europe so frequently in the leaders of the French armies. He appears to have been at all times a man of honorable habits, as he certainly is of striking intelligence. But we have no faith in his doctrine of the star, and think that he would have acted much more wisely if he had left the stars to the care of themselves, avoided the blunder of mistaking the nephew of Napoleon for a hero and a genius, and stayed quietly in London, instead of risking himself with an invasion of valets to take the diadem off the most sagacious head in Europe.

The narrative commences with the return of Napoleon to Paris after his renown, his throne, and his dynasty were alike crushed by the British charge at Waterloo. He reached Paris at six in

the morning of the 21st. It is now clear that the greatest blunder of this extraordinary man was his flight from the army. If he had remained at its head, let its shattered condition be what it might, he would have been powerful, have awed the growing hostility of the capital, and have probably been able to make peace alike for himself and his nation. But by hurrying to Paris, all was lost: he stripped himself of his strength; he threw himself on the mercy of his enemies; and palpably capitulated to the men who, but the day before, were trembling under the fear of his vengeance.

Nobleness of heart is essential to all true renown; and perhaps it is not less essential to all real security. Napoleon, with talents which it is perfectly childish to question, though the attempt has been made since the close of his brilliant career, wanted this nobleness of heart, and through its want ultimately perished. Of the bravery of him who fought the splendid campaigns of Italy, and of the political sagacity of him who raised himself from being a subaltern of artillery to a sovereign of sovereigns, there can be no doubt. But his selfishness was so excessive that it occasionally made both contemptible, and gave his conduct alike the appearance of cowardice, and the appearance of infatuation. His flight from Egypt, leaving his army to be massacred or captured, disgraced him in the face of Europe. His flight from Russia, leaving the remnant of his legions to be destroyed, was a new scandal; but hitherto no evil had been produced by this gross regard of self. The penalty, however, must be paid. His flight from the army in Belgium, leaving it without counsel or direction, to be crushed by a victorious enemy, was the third instance of that ignoble preference of his own objects which had characterized and stained his Egyptian and Russian career. But retribution was now come, and he was to be undone. The slaughter of Waterloo had been tremendous, but it was not final. The loss of the French army had been computed at forty thousand men, killed, wounded, and dispersed. He had come into the field with seventy-two thousand men, independent of Grouchy. He had thus thirty thousand remaining. Grouchy's force of thirty thousand was still untouched, and was able to make its way to Paris. In addition to these sixty thousand, strong garrisons had been left in all the fortresses, which he might without difficulty have gathered upon his retreat. The Parisian national guard would have augmented this force, probably, on the whole, to one hundred thousand men. It is true that the allied Russian and Austrian forces were on the frontier. But they had not yet moved, and could not prevent the march of those reinforcements. Thus, without reckoning the provincial militia of France, or calculating on a *levée en masse*, Napoleon within a fortnight might have been at the head of one hundred and fifty thousand men, while the pursuing army could not have mustered half the number. He would thus have had time for negotiation; and time with him was everything. Or let the event be what it might, the common sense of the allies would have led them to avoid a direct collision with so powerful a force fighting on its own ground under the walls of the capital, and knowing that the only alternatives were complete triumph or total ruin.

Count Montholon makes a remark on the facility with which courtiers make their escape from a falling throne, which has been so often exemplified in history. But it was never more strikingly exem

plified than in the double overthrow of Napoleon. "At Fontainebleau, in 1814," says the count, "when I hastened to offer to carry him off with the troops under my command, I found no one in those vast corridors, formerly too small for the crowd of courtiers, except the Duke of Bassano and two aides-de-camp." His whole court, down to his Mameluke and valet, had run off to Paris, to look for pay and place under the Bourbons. In a similar case in the next year, at the Elysée Bourbon, he found but two counts and an equerry. It was perfectly plain to all the world but Napoleon himself that his fate was decided.

There certainly seems to have been something in his conduct at this period that can scarcely be accounted for but by infatuation. His first act, the desertion of his army, was degrading to his honor, but his conduct on his arrival was not less degrading to his sagacity. Even his brother Lucien said that he was blinded with the smoke of Waterloo. He seems to have utterly lost that distinct view and fierce decision which formerly characterized all his conduct. It was no more the cannon-shot or the thunder-clap, it was the wavering of a mind suddenly perplexed by the difficulties which he would once have solved by a sentence and overwhelmed by resistance—which he would have once swept away like a swarm of flies. The leader of armies was crushed by a conspiracy of clerks, and the sovereign of the continent was sent to the dungeon by a cabal of his own slaves.

While Napoleon was thus lingering in the Elysée Bourbon, the two chambers of the legislature were busily employed between terror and intrigue. The time was delicate, for the Bourbons and the allies were approaching. But, on the other hand, the fortunes of Napoleon might change; tardiness in recognizing the Bourbons might be fatal to their hopes of place, but the precipitancy of abandoning Napoleon might bring their heads under the knife of the guillotine. All public life is experimental, and there never was a time when the experiment was of a more tremulous description.

At length they began to act; and the first precaution of the chamber of deputies was to secure their own existence. Old Lafayette moved a resolution, that the man should be regarded as a traitor to the country who made any attempt to dissolve the chamber. This was an obvious declaration against the authority of the empire. The next motion was, that General Becker should be appointed commandant of the guard ordered to protect the legislature. This was a provision against the mob of Paris. The legislature was now safe from its two prominent perils. In the mean time, Napoleon had made another capital blunder. He had held a council of the ministers, to which he proposed the question, whether he should proceed in person to the chamber of deputies, and demand supplies, or send his brothers and ministers to make the communication. Three of the ministers approved of his going in person, but the majority disapproved of it—on the plea of its being a dangerous experiment, in the excited state of the public passions. If Napoleon had declined this counsel, which arose from either pusillanimity or perfidy, it is perfectly possible that he might have silenced all opposition. The known attachment of the troops, the superstition connected with his fortunes, the presence of the man whom they all so lately worshipped, as the Indians worship the serpent for the poison of its fang, might have pro-

duced a complete revulsion. Napoleon, too, was singularly eloquent—his language had a romantic splendor which captivates the artificial taste of the nation; and with an imperial figure before them, surrounded with more powerful incidents than the drama could ever offer, and threatening a fifth act which might involve the fate of France and Europe, the day might have finished by a new burst of national enthusiasm, and the restoration of Napoleon to the throne, with all his enemies in the legislature chained to its footstool.

But he sent his brother Joseph to the chamber of peers, and received the answer to his mission next morning, in a proposal which was equivalent to a demand for his abdication.

A council of ministers was again held on this proposal. The same three who had voted for his presence in the chamber, now voted for his rejection of the proposal. The majority, however, were against them. Napoleon yielded to the majority. He had lost his opportunity—and in politics opportunity is everything. He had now nothing more to lose. He drew up an acknowledgment of his abdication; but appended to it the condition of proclaiming his son, Napoleon Second, emperor of the French. This was an artifice, but it was unworthy even of the art of Napoleon. He must have been conscious that the allies would have regarded this appointment as a trick to ensure his own restoration. His son was yet a child; a regent must have been appointed; Napoleon would have naturally been that regent; and in six months, or on the first retreat of the allies, he would as naturally have reappointed himself emperor. The trick was too shallow for his sagacity, and it was impossible to hope that it could have been suffered by the allies. Yet it passed the chamber, and Napoleon Second was acknowledged within the walls. But the acknowledgment was laughed at without them; the allies did not condescend to notice it; and the allies proceeded to their work of restoration as if he had never existed. In fact, the dynasty was at an end; a provisional government was appointed, with Fouché at its head, and the name of Napoleon was pronounced no more.

Count Montholon gives a brief but striking description of the confusion, dismay, and despair, into which Waterloo had thrown the Bonapartists. He had hurried to the Elysée a few hours after the arrival of Bonaparte from the field. He met the Duke of Vicenza coming out, with a countenance of dejection, and asked him what was going on. "All is lost," was the answer. "You arrived to-day, as you did at Fontainebleau, only to see the emperor resign his crown. The leaders of the chambers desire his abdication. They will have it; and in a week Louis XVIII. will be in Paris. At night, on the 19th, a short note in pencil was left with my Swiss, announcing the destruction of the army. The same notice was given to Carnot. The last telegraphic dispatch had brought news of victory; we both hastened to the Duke of Otranto; he assured us with all his cadaverous coldness that he knew nothing. He knew all, however, I am well assured. Events succeeded each other with the rapidity of lightning; there is no longer any possible illusion. All is lost, and the Bourbons will be here in a week."

The count remained forty-eight hours at the palace. The fallen emperor had now made up his mind to go to America, and the count promised to accompany him. A couple of regiments, formed

of the workmen of the Faubourg St. Germain, marching by the palace, now demanded that Napoleon should put himself at their head and take vengeance on his enemies. But he well knew the figure which the volunteers of the mob would make in front of the bayonets which had crushed his guard at Waterloo, and he declined the honor of this new command. A few courtiers, who adhered to him still, continued to talk of his putting himself at the head of the national force. But Waterloo had effectually cured him of the passion for soldiership, and he constantly appealed to his unwillingness to shed the blood of Frenchmen. It was at least evident that he intended to tempt the field no more, but after being the cause of shedding the blood of two millions of the people, his reserve was romantic.

The count was sent to dismiss the volunteers, and they having performed their act of heroism, and offered to challenge the whole British army, were content with the glory of the threat, and heroically marched home to their shops.

But Montholon, on returning again, addressed Napoleon on the feasibility of attacking Wellington and Blücher with the battalions of the Messrs. Calicot, upon which the ex-emperor made the following solemn speech: "To put into action the brute force of the masses, would without doubt save Paris, and ensure me the crown, without having recourse to the horrors of a civil war. But this would be also to risk the shedding of rivers of fresh blood. What is the compressive force which would be sufficiently strong to regulate the outburst of so much passion, hatred, and vengeance? No, I never can forget one thing, that I have been brought from Cannes to Paris in the midst of cries for blood, 'Down with the priests!' 'Down with the nobles!' I would rather have the regrets of France than possess its crown."

There is no country in the world, where Napoleon's own phrase, that from the sublime to the ridiculous is but a step, is more perpetually and practically realized than in France. Here was a man utterly ruined, without a soldier on the face of the earth, all but a prisoner, abandoned by every human being who could be of the slightest service to him, beaten in the field, beaten on his own ground, and now utterly separated from his remaining troops, and with a hundred thousand of the victors rushing after him, hour by hour, to Paris. Yet he talks as if he had the world still at his disposal, applauds his own magnanimity in declining the impossible combat, vaunts his own philosophy in standing still, when he could neither advance nor retreat, and gives himself credit as a philanthropist, when he was on the very point of being handed over to the enemy as a prisoner. Some unaccountable tricks of a lower description now began to be played on the goods and chattels of the Elysée Bourbon. A case containing snuff-boxes adorned with portraits set in diamonds, was laid by Bertrand on the mantel-piece. He accidentally turned to converse with General Montholon at the window. Only one person entered the room. The count does not give his name—he was evidently a person of rank. On turning to the mantel-piece again, the case was gone.

One of the ministers had brought some negotiable paper to the amount of several millions of francs into the emperor's chamber. The packet was placed under one of the cushions of the sofa. Only one person, and that one a man of rank who had served in Italy, entered the chamber. Napoleon

went to look for the money, calculated a moment, and a million and a half of francs, or about £60,000 sterling, had been taken in the interim. Those were times for thievery, and the plunderers of Europe were now on the alert, to make spoil of each other. The allies were still advancing, but they were not yet in sight; and the mob of Paris, who had been at first delighted to find that the war was at an end, having nothing else to do, and thinking that, as Wellington and Blücher had not arrived within a week, they would not arrive within a century, began to clamor *Vive l'Empereur!* Fouché and the provisional government began to feel alarm, and it was determined to keep Napoleon out of sight of the mob. Accordingly they ordered him to be taken to Malmaison; and on the 25th, towards nightfall, Napoleon submissively quitted the Elysée, and went to Malmaison. At Malmaison he remained for the greater part of the time, in evident fear of being put to death, and in fact a prisoner.—Such was the fate of the most powerful sovereign that Europe had seen since Charlemagne. Such was the humiliation of the conqueror, who, but seven years before, had summoned the continental sovereigns to bow down to his footstool at Erfurth; and who wrote to Talma the actor these words of supreme arrogance—"Come to Erfurth, and you shall play before a pit-full of kings."

From this period, day by day, a succession of measures was adopted by the government to tighten his chain. He was ordered to set out for the coast, nominally with the intention of giving him a passage to America. But we must doubt that intention. Fouché, the head of the government, had now thrown off the mask which he had worn so many years. And it was impossible for him to expect forgiveness, in case of any future return of Napoleon to power. But Napoleon, in America, would have been at all times within one-and-twenty days of Paris. And the mere probability of his return would have been enough to make many a pillow sleepless in Paris. We are to recollect also, that the English ministry must have been perfectly aware of the arrest of Napoleon; that St. Helena had been already mentioned as a place of security for his person; and that if it was essential to the safety of Europe—a matter about which Fouché probably cared but little; it was not less essential to the safety of Fouché's own neck—a matter about which he always cared very much, that the ex-emperor should never set foot in France again.

The result was, an order from the minister at war Davoust, Prince of Eckmühl, couched in the following terms. We give it as a document of history.

"General, I have the honor to transmit to you the subjoined decree, which the commission of government desires you to notify the Emperor Napoleon: at the same time informing his majesty, that the circumstances are become imperative, and that it is necessary for him immediately to decide on setting out for the Isle of Aix. This decree has been passed as much for the safety of his person as for the interest of the state, which ought always to be dear to him. Should the emperor not adopt the above mentioned resolution, on your notification of this decree, it will then be your duty to exercise the strictest surveillance, both with a view of preventing his majesty from leaving Malmaison, and of guarding against any attempt upon his life. You will station guards at all the approaches to Malmaison. I have written to the inspector-gen-

et al of the gendarmerie, and to the commandant of Paris, to place such of the gendarmerie and troops as you may require at your disposal.

"I repeat to you, general, that this decree has been adopted solely for the good of the state, and the personal safety of the emperor. Its prompt execution is indispensable, as the future fate of his majesty and his family depends on it. It is unnecessary to say to you, general, that all your measures should be taken with the greatest possible secrecy.

(Signed) "PRINCE OF ECKMUHL,
"Marshal and Minister of War."

Those documents which have now appeared, we believe, for the first time authentically, will be of importance to the historian, and of still higher importance to the moralist. Who could have once believed that the most fiery of soldiers, the most subtle of statesmen, and the proudest of sovereigns, would ever be the subject of a rescript like the following! It begins with an absolute command that "Napoleon Bonaparte" (it has already dropped the emperor) "shall remain in the roads of the Isle of Aix till the arrival of passports." It then proceeds:—"It is of importance to the well-being of the state, which should not be indifferent to him, that he should remain till his fate, and that of his family, have been definitely regulated. French honor is interested in such an issue; but in the mean time every precaution should be taken for the personal safety of Napoleon, and that he must not be allowed to leave the place of his present sojourn.

(Signed) "THE DUKE OF OTRANTO.
"THE PRINCE OF ECKMUHL."

A similar document was issued to General Beker, signed by Carnot and Caulaincourt. Count Montholon remarks, with sufficient justice, on the signature of Caulaincourt to this paper, that the emperor would have been extremely astonished to see that name subscribed to a letter in which he was called Napoleon—if anything could have astonished the former exile of Elba, and the future exile of St. Helena.

This must have been a period of the deepest anxiety to the imperial prisoner. He evidently regarded his life as unsafe; thought that he discovered in the project of his journey a determination to throw him either into the hands of assassins or of the French king, and formally announced his refusal to leave Malmaison "until informed of his fate by the Duke of Wellington." He was now reduced to the lowest ebb. He acknowledged himself powerless, hopeless, and utterly dependent on the will of his conqueror. The bitterness of heart which dictated such words must have been beyond all description. He was now abandoned by the few who had followed him from the Elvée.

But time was pressing; Wellington was advancing with rapid steps, and there was a possibility that he might capture Napoleon at Malmaison. Troops were sent to burn the neighboring bridge, and precautions were taken to prevent the catastrophe. A division of the army coming from the Vendée halted before the palace, and insisted on seeing Napoleon, and on being led by him to battle. This wasrodomontade, with the advanced troops of the whole army now within sight of Paris. But it was enough to betray him into the absurdity of proposing to try another chance for his crown. Beker was sent to Paris to try the effect of this communication. Fouché gave for

answer, the simple fact that the Prussians were advancing on Versailles. The sitting of the provisional government would have been worth the hand of a great painter. Fouché, after sharply rebuking the general for bringing in his proposal from Malmaison, made him sit down at his side, while he wrote a peremptory and decided refusal. Carnot was walking gloomily up and down the room. Caulaincourt, Baron Quinette, and General Grenier, sat silently around the table. Not a word was uttered except by the Duke of Otranto. The general received his dispatch and departed. On passing through the anterooms, he found them filled with generals and high civil officers, who all expressed but one opinion on the necessity of getting rid of Napoleon. "Let him set off, let him go," was the universal cry. "We can undertake nothing for either his personal good or Paris." There was now no alternative. Napoleon must either remain and fall into the hands of Louis XVIII., who had already proclaimed him a traitor and an outlaw, or he must try to make his escape by sea. On the 29th of June, at five o'clock in the evening, he entered the carriage which was to convey him to the coast, leaving Paris behind, to which he was never to return alive, but to which his remains have returned in a posthumous triumph, twenty-six years after, on the 15th of September, 1840.

On his arrival at Rochfort, all the talent of the French for projects was immediately in full exercise. Never was there so many castles in the air built in so short a time. Proposals were made to smuggle the prisoner to the United States in a Danish merchant vessel, in which, in case of search, he was to be barrelled in a hogshead perforated with breathing holes.

Another project was, to put him on board a kind of fishing-boat manned by midshipmen, and thus escape the English. A third project proposed, that the two French frigates anchored under the guns of the Isle of Aix should put to sea together; that one of them should run alongside Captain Maitland's ship, and attack her fiercely, with the hope of distracting her attention, even with the certainty of being destroyed, while the other frigate made her escape with Napoleon on board. This is what the French would call a *grande pensée*, and quite as heroic as anything in a melodrama of the Porte St. Martin. But the captain of the leading frigate declined the distinction, and evidently thought it not necessary that he and his crew should be blown out of the water, as they certainly would have been if they came in contact with the Bellerophon; so this third project perished.

After a few days of this busy foolery, the prisoner, startled by the new reports of the success of the allies everywhere, and too sagacious not to feel that the hands of the French king might be the most dangerous into which the murderer of the Duc D'Enghien could fall; looking with evident contempt upon the foolish projects for his escape, and conscious that his day was done, resolved to throw himself into the hands of Captain Maitland, the commander of the Bellerophon, then anchored in Basque roads. On the night of the 10th, Savery and Las Cases were sent on board the English ship, to inquire whether the captain would allow a French or neutral ship, or the frigates with Napoleon on board, to pass free? Captain Maitland simply answered, that he had received no orders except those ordinarily given in case of war; but

that he should attack the frigates if they attempted to pass; that if a neutral flag came in his way, he would order it to be searched as usual. But that, in consequence of the peculiar nature of the case, he would communicate with the admiral in command.

A circumstance occurred on this occasion, which brought M. Las Cases into no small disrepute afterwards. The captain hospitably asked Las Cases and Savary to lunch with him, and, while at table, inquired whether they understood English. He was answered that they did not; and the captain, though of course relying upon the answer, made his observations in English to his officers, while he addressed the Frenchman in his own tongue. It was afterwards ascertained that Las Cases, who had been an emigrant for some years in England, understood English perfectly. Nothing could therefore be more pitiful than his conduct in suffering the captain to believe that he was ignorant on the subject, and thus obtain a confidence to which he had no right. The circumstance, as Count Montholon says—"was afterwards made a bitter reproach against Las Cases; the English charging him with a violation of honor; because, as they affirmed, he had positively declared that he was unacquainted with their language, when the question was put to him at the commencement of the conference. This, however," says Count Montholon, "is not correct." And how does he show that it is not correct? "The question," says he, "was put collectively, that is, to both alike, and Savary alone answered in the negative." Of course the answer was understood collectively, and comprised M. Las Cases as well as M. Savary. In short, the conduct was contemptible, and the excuse not much better. Las Cases, of course, should not have allowed any other person's word to be taken, when it led to a delusion. It is possible that Savary was unacquainted with his companion's knowledge of the English—though when we recollect that Savary was minister of police, and that Las Cases was about the court of Napoleon, it is difficult to conceive his ignorance on the subject. But in all instances, there could be no apology for his fellow-Frenchman's sitting to hear conversations of which he was supposed, on the credit of Savary's word, and his own silence, to comprehend nothing.

It happily turns out, however, that all this *deceit* had only the effect of blinding the parties themselves.

"This mystification and piece of diplomatic chicanery"—we use the language of the volume—"proved in fact, rather detrimental than useful; for, no doubt, the information thus gained by surprise from Captain Maitland and his officers, contributed to induce the emperor to decide on surrendering himself to the English." The captain was too honorable a man to think of practising any chicanery on the subject; but if the two *employés* overreached themselves, so much the better.

But events now thickened. On the 12th, the Paris journals arrived, announcing the entrance of the allies into Paris, and the establishment of Louis XVIII. in the Tuileries! All was renewed confusion, consternation, and projects. On the next day Joseph Bonaparte came to the Isle of Aix, to propose the escape of his fallen brother in a merchant vessel from Bordeaux, for America, and remain in his place. This offer was generous, but it could scarcely be accepted by any human being, and it was refused. But delay was becoming

doubly hazardous. It was perfectly possible that the first measure of the new government would be an order for his seizure, and the next, for his execution. On that evening he decided to accept the offer of the *chasse-marées*, to go on board before morning, and trust to the young midshipmen and chance for his passage across the Atlantic.

We know no history more instructive than these "last days" of a fugitive emperor. That he might have escaped a week before, is certain, for the harbor was not then blockaded; that he might have made his way among the channels of that very difficult and obstructed coast, even after the blockade, is possible; that he might have found his way, by a hundred roads, out of France, or reached the remnant of his armies, is clear, for all his brothers escaped by land. But that he still hesitated—and alone hesitated; that this man—the most memorable for decision, famed for promptitude, for the discovery of the true point of danger, daring to the height of rashness, when daring was demanded—should have paused at the very instant when his fate seemed to be in his own hand, more resembles a preternatural loss of faculty than the course of nature. His whole conduct on the shore of France is to be equalled only by his conduct among the ashes of Moscow—it was infatuation.

Again the man of decision hesitated; and at four in the morning General Lallemand and Las Cases were sent on board the *Bellerophon* under the pretext of waiting for the admiral's answer, but in reality to ascertain whether the captain would express *officially* any pledge or opinion relative to Napoleon's favorable reception in England; which Las Cases had conceived him to express in his conversation with his officers, and of which this M. Las Cases was supposed not to have understood a syllable.

Captain Maitland's answer was distinct and simple. It was, "that he had yet received no information, but hourly expected it; that he was authorized to receive Napoleon on board, and convey him to England, where, according to his own opinion, he would receive all the attention and respect to which he could lay any claim." But, to prevent all presumptions on the subject, adding—"I am anxious that it should be well understood, that I am expressing only my personal opinion on this subject, and have in no respect spoken in the name of the government, having received no instructions from either the admiralty or the admiral."

It is almost painful to contemplate these scenes. What agonies must have passed through the heart of such a man, so humbled! What inevitable contrasts of the throne with the dungeon! What sense of shame in the humiliation which thus placed him at the disposal of his own few followers! What sleepless anxiety in those midnight consultations, in those exposures to public shame, in this sense of utter ruin, in this terrible despair! If some great painter shall hereafter rise to vindicate the pencil by showing its power of delineating the deepest passions of our nature, or some still greater poet shall come to revive the day of Shakespeare, and exhibit the tortures of a greater Macbeth, fallen from the highest elevation of human things into a depth of self-reproach and self-abasement to which all the powers of human language might be pale—what a subject for them were here!

The theatrical habits of the French are singu-

larly unfortunate for a nation which assumes to take an influential rank in the world. They deprive them of that capacity for coping with real things which is essential to all substantial greatness. With them the business of the world must be all melodrama, and the most common-place, or the most serious actions of life, must be connected with scene-shifting, trap-doors, and the mimic thunders of the stage. Napoleon was now in a condition the most deeply calculated to force these stern realities of life on the mind. Yet even with him all was to be dramatic; he was to throw himself on the clemency of his conqueror, like one of the heroes of Corneille. England was to stand in admiration of his magnanimous devotedness. The sovereign was to receive him with astonishment and open arms, and, after an embrace of royal enthusiasm, he was to be placed in secure splendor, cheered by the acclamations of a people hastening to do him homage. In this false and high-colored view of things, he wrote the famous and absurd note, in which he pronounced himself another Themistocles, come to sit by the hearth of the British people. A manlier, because a more rational view of things, would have told him that a war, expressly begun with a determination to overthrow his dynasty, could not be suffered to conclude by giving him the power of again disturbing the world—that his utter faithlessness prohibited the possibility of relying on his pledges—the security of the Bourbon throne absolutely demanded his being finally disabled from disturbing its authority—England owed it to her allies to prevent a repetition of the numberless calamities which his reign had inflicted upon Europe, and owed it to herself to prevent all necessity for the havoc of a new Waterloo.

The national passion for a *coup de théâtre* rendered all this knowledge of no avail, and he flung himself at the feet of the prince regent, with the flattering phraseology of claiming protection "from the most powerful, the most constant, and the most generous of his enemies."

The step was now taken. On the 15th of July, at daybreak, he left the Isle of Aix, and entered one of the boats which was to convey him on board the *Bellerophon*. He had still a parting pang to undergo. As he looked round the shore, a white flag was flying on all the ships and batteries. All the rest of this curious narrative has been already given to the world. We have no desire to repeat the details.

Count Montholon, in his fondness for excitement, here states that a privy council was held on the question, whether the terms of the congress of Vienna prevented England from giving up Napoleon to the vengeance of Louis XVIII., adding, that "the despatches of the Duke of Wellington urged them to adopt bloody and terrible determinations." This we utterly disbelieve; and, if we required additional reasons for our disbelief, it would be in the count's telling us that the energetic opposition of the Duke of Sussex alone prevented the delivery of the prisoner—there not being perhaps any prince, or any individual of England, less likely to have weight in the councils of the existing government.

Without presuming to trace the steps of Providence, it is natural and not unwise to follow them in those leading transactions which give a character to their times, or which complete events decisive of the fates of eminent men or nations. One of the most characteristic and abhorred acts of the

entire life of the French Emperor, was his imprisonment of the English who were travelling in his country at the commencement of his reign. The act was the most treacherous within human record—it was perfidy on the largest scale. Europe had been often scandalized by breaches of political faith, but the agents and the sufferers were sovereigns and nations. But in this instance the blow fell upon individuals with the most sudden treachery, the most causeless tyranny, and the most sweeping ruin. Twelve thousand individuals, travelling under the protection of the imperial laws, wholly incapable of being regarded by those laws as prisoners, and relying on the good faith of the government, were seized as felons, put under duress, separated from their families in England, suddenly deprived of their means of existence, stopt in the progress of their professions, plundered of their property, and kept under the most vigilant surveillance for eleven years.

The retribution now fell, and that retribution exactly in the form of the crime by which it was drawn down. We give a few extracts of the document by which Napoleon protested against his detention, as a most complete, though unconscious indictment against his own act eleven years before.

Protest at sea, on board the *Bellerophon*, August, 1815—"In the face of God and man, I solemnly protest against the injury which has been committed upon me, by the violation of my most sacred rights, in forcibly disposing of *my person and liberty*.

"I came freely on board the *Bellerophon*, and *am not a prisoner*—I am the *guest of England*.

"I presented myself in good faith, and came to place myself under the protection of the laws of England. As soon as I set my foot on board the *Bellerophon*, I felt myself on the soil of the British people. If the orders issued by the government to receive myself and my suite were merely intended as a snare, then they have *forfeited their bond*. If such an act were really done, it would be in vain for England in future to speak of her faith, her laws, and her liberty.

"She pretended to offer the *hand of hospitality* to an enemy, and when he had trusted to her *fidelity*, she immolated him."

If the *détenus* at Verdun, and scattered through the various fortresses of France, had drawn up a petition against the desperate act which had consigned them to captivity, they might have anticipated the language with which Napoleon went to the dungeon, that was never to send him back again amongst mankind.

There was but one preliminary to his departure now to take place. It was the execution of an order from the government to examine the baggage in the strictest manner, and to require the surrender of all money or jewels of value in the possession of Napoleon and his suite. Necessary as this act was, for the prevention of bribery, and attempts to escape from St. Helena, not for any undue seizure of private property, for a most ample allowance was already appointed by the government for the expenses of the prisoner, this duty seems to have been most imperfectly performed. As the count tells us, "the grand-marshal, gave up 4000 Napoleons, as constituting the Emperor's chest. We kept secret about 400,000 francs in gold—from three to four hundred thousand francs in valuables and diamonds, and letters of credit for more than four million of francs." Whether this immense sum was overlooked by the extraordinary

negligence of those whose duty it was to fulfil the orders of government, or whether their search was baffled, the narrative does not disclose. But there can be no question that the suite were bound to deliver up all that they possessed; and that there can be as little question that with such sums of money at his disposal, Napoleon's subsequent complaints of poverty were ridiculous, and that the subsequent sale of his plate to supply his table was merely for the purpose of exciting a clamor, and was charlatanish and contemptible.

We pass rapidly over the details of the voyage. Napoleon spent a considerable part of his time on the quarter-deck, took opportunities of conversing affably with the officers, and even with the crew. On one occasion, after some conversation with the master, he invited him to dine at the admiral's table. The master declined the invitation, as a sin against naval etiquette. "Oh! in that case," said Napoleon, "you must come and dine in my own cabin." The admiral, however, had the good sense to tell Napoleon, that any one invited by him to the honor of sitting at his table, was, by that circumstance alone, placed above all rule of etiquette, and that the master should be welcome to dinner next day. This conduct, of course, made him very popular on board; but the chief interest of these important volumes is in the conversations which he held from time to time with the officers, and especially in the long details of his military and imperial career, which he dictated at St. Helena, and which make the true novelty and value of the work. In one of those conversations which he had with them, he referred emphatically to his own efforts to make France a great naval power. "Unfortunately," said he, "I found nobody who understood me. During the expedition to Egypt, I cast my eyes on Decrès. I reckoned on him for understanding and executing my projects in regard to the navy. I was mistaken; his passion was to form a police, and to find out, by means of the smugglers, every web which your ministers, or the intriguers of Hartwell, were weaving against me. He had no enlarged ideas; always the spirit of locality and insignificant detail—paralyzing my views." He then proceeded to state the hopeless condition of the French navy when he assumed the throne. The navy of Louis XVI. was no longer in existence; the Republic possessed but four ships of the line; the taking of Toulon, the battle of the river Jenes in 1793—of Rochefort in 1794, and finally, the battle of Aboukir, had given the death-blow to the navy. "Well, notwithstanding the disaster of Trafalgar, which I owe entirely to the disobedience of Admiral Villeneuve, I left to France one hundred ships of the line, and 80,000 sailors and marines, and all this in a reign of ten years." The truth is, that the attempt to make the French navy was one of the preëminent blunders of Napoleon. France is naturally a great military power, but her people are not maritime. England is not naturally a great military power, but her people are maritime. France has an immense land frontier which can be defended only by a land force. England has no land frontier at all. The sea is her only frontier, and it, of course, can be defended only by a fleet. A fleet is not a necessary of existence to France. A fleet is a necessary of existence to England. It is therefore self-evident that France only wastes her power in dividing it between her fleet and her army; and may be a great power, without having a ship; while England is compelled

to concentrate her strength upon her fleet, and without her fleet must be undone. Thus the law of existence, which is equivalent to a law of nature, gives the naval superiority to England. There are symptoms in France, at the present day, of falling into Napoleon's blunder, and of imagining the possibility of her becoming the naval rival of England. That she may build ships is perfectly possible, and that she may crowd them with a naval conscription is equally possible. But the first collision will show her the utter folly of contending with her partial strength against the power on which England rests her defence—a struggle between a species of volunteer and adventurous aggression, and the stern and desperate defence in which the safety of a nation is supremely involved.

On crossing the Line, the triumph of Neptune was celebrated in the usual grotesque style. The Deity of the Sea requested permission to make acquaintance with Napoleon, who received him graciously, and presented him with five hundred Napoleons for himself and the crew, upon which he was rewarded with three cheers, and "Long live the Emperor Napoleon!"

On the 16th of October, 1815, the Northumberland cast anchor in the roads at St. Helena. The count remarks that the 17th, the day on which he disembarked, reminded him of a disastrous day. It was the anniversary of the last day of the battle of Leipsig. If distance from all the habitable parts of the globe were to be the merits of Napoleon's prison, nothing could have been more appropriate than the island of St. Helena. It was two thousand leagues from Europe, twelve hundred leagues from the Cape, and nine hundred from any continent. A volcanic rock in the centre of the ocean.

In the month of April, the frigate Phaeton anchored in the roads, having the new governor, Sir Hudson Lowe, with his family, on board. Sir Hudson is now where neither praise nor blame can reach him, but the choice was unfortunate in the very point for which probably he had been chosen;—he had been colonel of the Corsican regiment in our service, had served much in the Mediterranean, and had already been (as far as we remember) the object of Napoleon's bitterness in some of his Italian manifestoes. There can be no doubt that the mildest of governors would have been no favorite with the prisoner of Longwood. But in the present instance Napoleon's blood boiled at the idea of being placed under the jurisdiction of the colonel of the Corsican rangers; and he, accordingly, took every opportunity of exhibiting his indignation—a sort of feeling which, in a foreigner, and especially one of southern blood, always amounts to fury.

We pass over a multitude of minor circumstances, though all characteristic, and all invaluable to the historian of the next century; but which would retard the more interesting conversations of the extraordinary captive. On the communication of the convention signed at Paris in August, 1815, declaring him the prisoner of the four allied powers, and the announcement of the commissioners under whose charge he was to be placed, Napoleon burst out into a passionate remonstrance, which, however, he addressed only to the people around him. On those occasions he always adopted that abrupt and decisive style which in a Frenchman passes for oracular.

"The expenses of my captivity will certainly

exceed ten millions of francs a year. It has not been the will of fate that my work should finish by effecting the social reorganization of Europe." He then ran into his old boasting of his probable triumph in his great collision with the British army. "At Waterloo I ought to have been victorious—the chances were a hundred to one in my favor; but Ney, the bravest of the brave, at the head of 42,000 Frenchmen, suffered himself to be delayed a whole day by some thousands of Nassau troops. Had it not been for this inexplicable inactivity, the English army would have been taken *flagrante delicto*, and annihilated without striking a blow. Grouchy, with 40,000 men, suffered Bulow and Blücher to escape from him; and finally, a heavy fall of rain had made the ground so soft that it was impossible to commence the attack at daybreak. Had I been able to commence early, Wellington's army would have been trodden down in the defiles of the forest before the Prussians could have had time to arrive. It was lost without resource. The defeat of Wellington's army would have been peace, the repose of Europe, the recognition of the interests of the masses and of the democracy."

Napoleon was always fluent on this subject; but the only true matter of surprise is, that so clever a personage should have talked such nonsense. In the first place, he must have known that Ney with his 40,000 men had been soundly beaten by about half that number, and was thus unable to move a step beyond Quatre-Bras. In the next, that Grouchy, instead of suffering the Prussians to escape him, was gallantly fought by their rear-guard, was unable to make any impression whatever on them, and if he had not made his escape in the night, would unquestionably have been crushed to pieces the next day: and thirdly, as to the English armies being saved by the rain, the Duke of Wellington fought the French from eleven in the forenoon till seven in the evening without being driven an inch from the ground. If the French could not beat him in eight hours, they could not beat him in as many days. It was not until seven in the evening that the Prussian guns were heard coming into the field. Even then they were a mile and a half from Wellington's position. The British then charged, swept the French before them, Napoleon himself running away amongst the foremost, leaving 40,000 of his troops on the field or in the hands of the enemy. It would have been much wiser to have said not a syllable upon the battle, or much manlier to have acknowledged that he was more thoroughly beaten than he had ever seen an army beaten before; and that with 72,000 French veterans in the field, he had been routed and ruined by 25,000 British, three fourths of whom had never fired a shot before in their lives.

We have from time to time some curious acknowledgments of the political treacheries which formed the actual system of Napoleon's government, whether consular or imperial. On dictating a note relative to St. Domingo to Count Montholon, he elucidated this policy in the most unequivocal manner. It will be remembered that, on the peace of Amiens, he had sent out a powerful fleet and an army of thirty thousand men to the West Indies. It will also be remembered, that in reply to the remonstrance of the British government, who naturally looked on so formidable an armament with considerable suspicion, the First Consul disclaimed in the most solemn manner all sinister views; pronounced, with every appearance of sincerity, that

his sole object was the subjection of a French island then in revolt, and when this object was effected his whole purpose would be accomplished. But in St. Helena, where candor cost nothing, he amply acknowledged the treachery. "I had two plans," said he, "for St. Domingo. The first was that of acknowledging the power of the blacks, making Toussaint L'Ouverture governor, and, in fact, making St. Domingo a West Indian viceroyalty. This plan was my favorite, and why? The French flag would acquire a great development of power in the American waters, and a variety of expeditions might have been undertaken against Jamaica and all the Antilles, and against South America, with an army of thirty thousand blacks trained and disciplined by French officers."

We are to remember that at this time he was at peace with both England and Spain, whose territories he was thus about to dismember; for we cannot believe that the affairs of St. Domingo were suffered greatly to occupy his mind. In the busy days from Marengo to the loss of Egypt, and the conclusion of peace, he had intended to have raised a universal negro insurrection in our islands. Upon the colors of his negro army he was to have inscribed "Brave blacks, remember that France alone recognizes your liberty"—which would have been, in fact, a manifesto, calling upon all the negroes of the West Indies to revolt without delay. But the negroes of St. Domingo, having formed plans of liberty for themselves, dispatched one of their colonels with a demand of independence. The chance, therefore, of invading Jamaica through their means was extinguished at once, and France was punished by the loss of her greatest colony forever.

In a conversation with Colonel Wilks, the ex-governor, on taking his leave, he told him that India had been constantly an object of his policy—that he had constantly assailed it by negotiations, and would have reached it by arms, had he been able to come to an understanding with the Emperor of Russia on the partition of Turkey. He then talked of his constant wish for peace—a declaration which the colonel probably received with a smile; and next disclosed a transaction, which, on any other authority, would have been incredible, but which amounted to perhaps the boldest and broadest piece of bribery ever attempted with a distinguished minister.

While the French army was still on the right bank of the Elbe, the offer of the Austrian mediation was brought by Prince Metternich, demanding, as a preliminary, the abandonment of the great German fortresses which still remained in French hands.

"I said to Metternich with indignation," are the words of this singular conference—"Is it my father-in-law who entertains such a project? Is it he who sends you to me? How much has England *given you*, to induce you to play this game against me? Have I not done enough for your fortune? It is of no consequence—be *frank*—what is it *you wish*? If *twenty millions* will not satisfy you, say *what you wish*?"

He adds, that on this scandalous offer of corruption, Metternich's sudden sullenness and total silence recalled him to a sense of what he had just expressed, and that thenceforth he had found this great minister wholly impracticable. Who can wonder that he did so, or that the offer was regarded as the deepest injury by a man of honor? But Napoleon's conception of the matter, to the

last was evidently not that he had committed an act of bribery, but that he had "mistaken his man." "It was," as Fouché observed, "worse than a crime, it was a *blunder*."

One of the absurdities of the crowd who collected anecdotes of Napoleon, was a perpetual affectation of surprise that he should not have terminated his imprisonment by his own hand. He was conscious of the imputation, and it seems to have formed the occasional subject of his thoughts. But his powerful understanding soon saw through the sophistry of that species of dramatic heroism, by which a man escapes "with a bare bodkin" all the duties and responsibilities of his being.

"I have always regarded it," said he, "as a maxim, that a man exhibits more real courage by supporting calamities and resisting misfortunes, than by putting an end to his life. Self-destruction is the act of a gambler who has lost all, or that of a ruined spendthrift, and proves nothing but a want of courage."

The attempts to prove that Napoleon wanted personal intrepidity were at all times childish. His whole career in his Italian campaigns was one of personal exposure, and from the period when he rose into civil eminence, he had other responsibilities than those of the mere general. His life was no longer his own; it was the keystone of the government. Whether as consul or as emperor, his fall would have brought down along with it the whole fabric on which the fate of so many others immediately depended. It is, however, certain, that his courage was not chivalric, that no gallant fit of glory ever tempted him beyond the necessary degree of peril, and that he calculated the gain and loss of personal enterprise with too nice a view as to the balance of honor and advantage. A man of higher mind—an emperor who had not forgot that he was a general, would never have deserted his perishing army in Poland; an emperor who had not forgot that he was a soldier, would never have sent his imperial guard, shouting, to massacre, and stayed himself behind. But to expect this devotion of courage is to expect a spirit which Napoleon never exhibited; and which is singular among the military exploits of the south. Napoleon might have commanded at Plattea, but he would never have died at Thermopylae.

In days like ours, which begin to familiarize men with the chances of political convulsion, it may be well worth while to listen to the conceptions of one who better knew the nature of the French Revolution than perhaps any among the great actors of the time. Napoleon was sitting by his fireside, in St. Helena, on the 3d of September:—

"To-day," said he, "is the anniversary of a hideous remembrance, the St. Bartholomew of the French Revolution—a bloody stain, which was the act of the commune of Paris, a rival power of the legislature, which built its strength upon the *dregs of the passions of the people*. * * * We must acknowledge, that there has been no political change without a fit of popular vengeance, as soon as, for any cause whatever, the mass of the people enter into action. * * *

General rule:—*No social revolution without terror!* Every revolution is in principle a *revolt*, which time and success ennoble and render legal; but of which terror has been one of the *inevitable phases*. How, indeed, can we understand, that one could say to those who possess fortune and public situations, 'Be gone, and leave us your fortunes and your situa-

tions,' without first intimidating them, and rendering any defence impossible! The reign of terror began, in fact, on the night of the 4th of August, when privileges, nobility, tithes, the remains of the feudal system, and the fortunes of the clergy, were done away with, and *all those remains of the old monarchy* were thrown to the people. Then only did the people understand the Revolution, because they gained something and wished to keep it, even at the expense of blood."

This language is memorable. It ought to be a lesson to England. Napoleon here pronounces, that the great stimulant of political revolution is public robbery. Privileges may be the pretence, but the real object is plunder; and the progress of reason may be alleged as the instrument, but the true weapon is terror. In England, we are preparing the way for a total change. The groundwork of a revolution is laid from hour to hour; the aristocracy, the church, the landed proprietors, are made objects of popular libel, only preparatory to their being made objects of popular assault. The League has not yet taken upon it the office of the Commune of Paris, nor have the nobles, the clergy, and the bankers, been massacred in the prisons; but when once the popular passions are kindled by the hopes of national plunder, the revolution will have begun, and then farewell to the constitution. The habits of England, we willingly allow, are opposed to public cruelty; and in the worst excesses, the France of 1793 would probably leave us behind. But the principle in every nation is the same—the possessors of property will resist, the plunderers of property will fight; conflicting banners will be raised, and, after desperate struggles, the multitude will be the masters of the land.

There can be nothing more evident, than that some of the leaders in these new movements contemplate the overthrow of the monarchy. There may be mere dupes in their ranks, the spirit of money-making may be the temper of others; but there are darker minds among them which scarcely condescend to conceal their intentions. The presidentship of a British republic would be not without its charms for the demagogue; and the bloody revolution of 1641, might rapidly find its still more sanguinary counterpart in the revolution of the nineteenth century. We have the history in the annals of France, and the commentator is the "child and champion of Jacobinism"—Napoleon.

His impression that revolution always fixed its especial object in plunder, found another authority in one of the peculiar agents of public disturbance. "Barrère," said Napoleon, "affirmed, and truly, *Le peuple bat monnaie sur la place Louis XV.*" ("The people coin money in the square of Louis XV.")—alluding to the guillotine, which enriched the treasury by the death of the nobles, whose wealth became the property of the nation.

He proceeded, with equal decision and truth: "A revolution is always, whatever some may think, one of the greatest misfortunes with which the Divine anger can punish a nation. It is the scourge of the generation which brings it about; and for a long course of years, even a century, it is the misfortune of all, though it may be the advantage of individuals."

Napoleon spent the chief portion of his time in dictating the recollections of his government, and general defences of his conduct. Those dictations were sometimes written down by Montholon, and

sometimes by Las Cases. But in November, 1816, an order was issued for the arrest of Las Cases, and his dismissal from the island, in consequence of his attempting to send, without the knowledge of the governor, a letter to Prince Lucien, sowed up in the clothes of a mulatto. This arrest made a prodigious noise among the household of Napoleon, and was turned to good advantage in England, as an instance of the cruelty of his treatment. Yet it seems perfectly probable that the whole was a trick of the ex-emperor himself, and a mere contrivance for the purpose of sending to Europe Las Cases as an agent in his service.

The security of Napoleon's imprisonment was essential to the peace of Europe; and no precaution could be justly regarded as severe, which prevented an outbreak so hazardous to the quiet of the world. Among these precautions, was the strictest prohibition of carrying on any correspondence with Europe, except through the hands of the governor. The whole household were distinctly pledged to the observance of this order, and any infraction of it was to be punished by instant arrest and deportation from the island.

An order had been sent from England to reduce the number of the household by four domestics; and it seems not improbable that Napoleon's craft was suddenly awakened to the prospect of establishing a confidential intercourse with the faction whom he had left behind. But the four domestics were obviously inadequate to this object, and some person of higher condition was necessary. Las Cases some time before had attempted to send a letter to Europe by the mulatto. The fellow had been detected, and was threatened with a flogging if he repeated the experiment; yet it was to this same mulatto that Las Cases committed another letter, which the mulatto immediately carried to the governor, and Las Cases was arrested in consequence. Napoleon was instantly indignant, and vented his rage against the cruelty of the arrest, at the same time expressing his scorn at the clumsiness of Las Cases in delivering his letter to so awkward a messenger. But, whatever might be his pretended wonder at the want of dexterity in the count, it was exceeded by his indignation at the conduct of the governor. "Longwood," he writes in a long and formal protest against his detention, "is wrapped in a veil which he would fain make impenetrable, in order to hide criminal conduct. This peculiar care to conceal matters gives room to suspect the most odious intentions." This was obviously a hint that the governor's purpose was to put him secretly to death: a hint which neither Napoleon nor any other human being could have believed.

But in alluding to the arrest of the count, he touches closely on the acknowledgment of the intrigue.

"I looked through the window," he said, "and saw them taking you away. A numerous staff pranced about you. I imagined I saw some South Sea Islanders dancing round the prisoners whom they were about to devour!" After this Italian extravaganza, he returns to his object. "Your services were necessary to me. You alone could read, speak, and understand English. Nevertheless, I request you, and in case of need, command you, to require the governor to send you to the continent. He cannot refuse, because he has no power over you, except through the voluntary document which you signed. It would be great

consolation to me to know that you were on your way to more happy countries."

This letter was carried by Bertrand to the governor for Las Cases, and "the wished-for effect was produced on Sir Hudson Lowe, as soon as he saw the terms in which the emperor expressed his regret." We are fairly entitled to doubt the sincerity of the wish; for on Sir Hudson's offering to let Las Cases remain at Longwood, a new obstacle instantly arose—the count declared that "to remain was utterly impossible;" his honor was touched; he absolutely must go; or, as Count Montholon describes this happy punctilio—"Unfortunately Las Cases, influenced by extreme susceptibility of honor, thought himself bound to refuse the governor's offer. He felt himself too deeply outraged by the insult; he explained this to the grand-marshal, and we were obliged to renounce the hope of seeing him again." Then came the finale of this diplomatic farce. "It was in vain that the emperor sent Bertrand and Gourgaud to persuade him to renounce his determination; he was resolved to leave the island; and on the 20th of December, 1816, he quitted St. Helena."

We have but little doubt that the whole was a mystification. The gross folly of sending a secret dispatch by the same man of color who had been detected by the governor, and threatened with punishment for the attempt to convey a letter; the bustle made on the subject at Longwood; the refusal of Las Cases to comply with Napoleon's request to remain, which, if it had been sincere, would have been equivalent to a command; and the conduct of Las Cases immediately on his arrival in Europe, his publications and activity, amply show the object of his return. But a simple arrangement on the governor's part disconcerted the whole contrivance. Instead of transmitting Las Cases to Europe, Sir Hudson Lowe sent him to the Cape; where he was further detained, until permission was sent from England for his voyage to Europe. On his arrival Napoleon's days were already numbered, and all dexterity was in vain. We have adverted to this transaction chiefly for the credit which it reflects on the governor. It shows his vigilance to have been constantly necessary; it also shows him to have been willing to regard Napoleon's convenience when it was possible; and it further shows that he was not destitute of the sagacity which was so fully required in dealing with the *coterie* at Longwood.

Napoleon's habits of dictating his memoirs must have been formidable toil to his secretaries. He sometimes dictated for twelve or fourteen hours, with scarcely an intermission. He spoke rapidly, and it was necessary to follow him as rapidly as he spoke, and never to make him repeat the last word. His first dictation was a mere revival of his recollections, without any order. The copy of his first dictation served as notes to the second, and the copy of this second became the subject of his personal revision; but he, unfortunately for his transcribers, made his corrections almost always in pencil, as he thus avoided staining his fingers—no woman being more careful in preserving the delicacy of her hands.

Those dictations must be regarded as the studied defences of Napoleon against the heavy charges laid against his government.

We have now given a general glance at the career of the French emperor, as exhibited to us in these

Recollections. He strikingly showed, in all the details of his government, the characteristics of his own nature. Impetuous, daring, and contemptuous of the feelings of mankind, from the first hour of his public life, his government was, like himself, the model of fierceness, violence, and disregard of human laws. Whatever was to him an object of ambition, was instantly in his grasp; whatever he seized was made the instrument of a fresh seizure; and whatever he possessed he mastered in the fullest spirit of tyranny. He was to be supreme; the world was to be composed of *his* soldiery, his serfs, courtiers, and tools. The earth was to be only an incalculable population of French slaves. There was to be but one man free upon the globe, and that man Napoleon.

We find, in this romance of power, the romance of his education. It has been often said, that he was Oriental in all his habits. His plan of supremacy bore all the stamp of Orientalism—the solitary pomp, the inflexible will, the unshared power, and the inexorable revenge. The throne of the empire was as isolated as the seraglio. It was surrounded by all the strength of terror and craft, more formidable than battlements and bastions. Its interior was as mysterious as its exterior was magnificent; no man was suffered to approach it but as soldier or slave; its will was heard only by the roaring of cannon; the overthrow of a minister, the proclamation of a war, or the announcement of a dynasty crushed and a kingdom overrun, were the only notices to Europe of the doings within that central place of power.

But, with all the genius of Napoleon, he overlooked the true principles of supremacy. All power must be pyramidal to be secure. The base must not only be broad, but the gradations of the pile must be regular to the summit. With Napoleon the pyramid was inverted—it touched the earth but in one point; and the very magnitude of the mass resting upon his single fortune, exposed it to overthrow at the first change of circumstances.

Still, he was an extraordinary being. No man of Europe has played so memorable a part on the great theatre of national events for the last thousand years. The French revolution had been the palpable work of Providence, for the punishment of a long career of kingly guilt, consummated by an unparalleled act of perfidy, the partition of Poland. The passions of men had been made the means of punishing the vices of government. When the cup was full, Napoleon was sent to force it upon the startled lips of Prussia, Austria, and Russia. The three conspirators were crushed in bloody encounters—the capitals of the three were captured—the provinces of the three were plundered—and the military pride of the three was humiliated by contemptuous and bitter conditions of peace.

But, when the destined work was done, the means were required no more. When the victims were broken on the wheel, the wheel and the executioner were alike hurried from the sight of man. The empire of France was extinguished by the same sovereign law which had permitted its existence. The man who had guided the empire in its track of devastation—the soul of all its strength, of its ambition, and its evil—was swept away. And as if for the final moral of human arrogance,

France was subjected to a deeper humiliation than had been known in the annals of national reverses since the fall of Rome; and the ruler of France was plunged into a depth of defeat, a bitterness of degradation, an irreparable ruin, of which the civilized world possesses no example. His army destroyed in Russia by the hand of Him who rules the storm—the last forces of his empire massacred in Belgium—his crown struck off by the British sword—his liberty fettered by British chains—the remnant of his years worn away in a British dungeon, and his whole dynasty flung along with him into the political tomb, were only the incidents of the great judicial process of our age. The world has been suffered to return to peace; while the sepulchre of this man of boundless but brief grandeur, has been suffered to stand in the midst of that nation which most requires the great lesson—that ambition always pays for its splendor by its calamities; that the strength of a nation is in the justice of its councils; and that he “who uses the sword shall perish by the sword!”

THE RAIL-ROAD TO VENICE.—Since the Fates have decreed that the modern improvement and convenience of a railroad is to introduce the sea-born goddess to all comers for the future, it is impossible that such a design could be more worthily carried out, or that anything more magnificent, surprising, or suitable to the city could have been projected than the fine range of arches which rise out of the blue waters, and span the sea for three miles in a straight line, throwing a chain of stone from one projection of land to the other. So splendid and so singular is the effect it produces, that it strikes me as appearing quite in character with the ancient reputation of Venice, when her wealth could compel the elements to obedience, and it is a comforting reflection that this beautiful aqueduct, for such it seems and indeed will answer the purpose of such, will perhaps restore the ruined commerce of the Queen of the Lagoon, and she may once more raise her diademed head amongst the cities, lofty and commanding as of yore. Probably by the time these reminiscences have passed through the press, this wondrous railroad will be completed, and Venice be made as easy of access as any other town of the north of Italy. A continuation is projected to Milan, and, if the consent of the King of Sardinia can be gained, Turin will be joined to that: how rapid then will be the route from Paris to Lyons, and from Turin to Venice. If human ingenuity could make the road across the eternal mountains of snow less perilous, Venice and Paris could shake hands in a day. I could not help looking on the stupendous bridge of three miles, which was so rapidly advancing towards completion, with admiration, from the covered boat in which we were seated, as it bounded over the waves: we were the sole passengers to Venice, except a French gentleman who appeared connected with the works, and who was merely going to the city for letters. He had, he informed us, never seen its wonders, as he only visited it on business, and should remain as short a time as possible there, as he considered it a “triste sejour!”—*Miss Costello's Italy.*

From the Dublin University Magazine.

THE STEPSON.

FROM THE PAPERS OF G. G., SOMETIME SENIOR ASSESSOR OF THE PROVINCIAL COURT OF CIVIL AND CRIMINAL JUSTICE IN ZELL.

ABOUT half a mile from Zell, in a solitary house which is now uninhabited, lived, some twelve years ago, on his half-pay, and the interest of a reasonable amount of prize-money, a retired naval officer, named (or who shall here be named) Sturmgang. He was an austere and rugged-tempered man, despotic, it was said, in his house as he had been on the deck of his ship, and therefore instinctively averse to coming into contact with general society. In fact, he visited nobody, and the only visits he was known to receive were those of the Pastor Walding, sub-rector of the high-school in Zell, the brother of his deceased second wife, and a man whose severe character and chilling manners were the perfect counterpart of his own. Captain Sturmgang's domestic establishment consisted of two females—a youngish housekeeper and an oldish maid; in addition to whom his house possessed one other inmate, in the person of Christian Schein, the son of his second wife by a former marriage. The old officer had himself had no children by the mother of this young man; but his first wife had borne him a son, who, singular to tell, was now a shopkeeper in Zell, and supported himself, with his young wife and two children, in a struggling way, by the meagre profits of a retail business.

It was generally known that the two Sturmgangs, the elder and the younger, lived on a footing of great mutual exasperation, and the ground of this was believed to be a lawsuit in which they had been engaged some years before, and in which the son had cast his father, with costs. Since that time, they had neither seen nor communicated with each other; more than one attempt, on the part of common friends, to bring about a reconciliation, had been repulsed by both parties with a degree of violence that seemed greatly disproportioned to the supposed cause of the quarrel; and the elder Sturmgang had at length peremptorily forbid all mention of his son's name in his presence, which, of course, had precluded any further attempt of the kind.

Matters were in this state when an application was made, on the part of Captain Sturmgang, to the provincial court, praying that a commission might be appointed, to visit him at his house of Dornfeld, to take cognizance of his testamentary dispositions, as his health did not permit him to come to Zell, for the purpose. This business was placed in my hands, and I went out to Dornfeld the following day, accompanied by a junior assessor and the clerk of the court.

I found the old man (he was in his sixty-eighth year) sitting in an arm-chair, his feet and legs enveloped in flannel wrappers, sick in body, yet not in a state to give immediate apprehensions for his life. His stepson and his brother-in-law were with him.

We proceeded at once to business: the preamble of the testament was drawn up in the usual form, and I called on Captain Sturmgang to dictate his will.

"Well," said he, "write, in the first place, I disinherit my son, Ludwig Sturmgang, merchant in Zell, for reasons which I need not mention: he knows them."

"It is my duty, Captain Sturmgang," said I, "to make you acquainted with the law on this point. The father who disinherits his son, without grounds which the law recognizes as valid, is considered as of unsound mind, and his will, on application of the injured party, at once set aside. I am aware that you have had disagreements with your son, which unfortunately could not be settled without an appeal to a court of justice; but I must tell you that the law does not admit this as a sufficient ground for the proceeding you meditate."

"Humph! and what grounds *does* the law admit as sufficient for such a proceeding?"

"To enumerate them all would exhaust your patience, if not my own; but I will mention a few, and you will see how little likely is it that any among them should apply to the present case. For instance, then, when a son has accused his father of an offence against the state, has treated him in a way that compromises his—the father's—honor, has corporeally maltreated or assaulted him, has practised against his life, has—"

"Quite enough! I have legal grounds, and I disinherit him as I have said."

"But I must further inform you," proceeded I, "that the grounds of disinheritance must be expressly stated in the instrument, and must be sustainable by proof; otherwise the act is null and void."

"Does the law require that?"

"It does."

"In the devil's name, then, write—I disinherit my son Ludwig, because he has practised against my life."

I was mute for a moment with surprise and horror, and could only gaze blankly on the old man.

"And this accusation," said I at length, "is true?"

"That's my affair. Let Ludwig Sturmgang contest the truth of it, if he has the courage. The proofs will not die with me."

"The proofs? Let me remind you, Captain Sturmgang, that in a matter so improbable in itself proof should be of no common cogency."

"I have proof sufficient—proof conclusive—proof that would satisfy any jury in Europe."

"May I ask how long ago it is that your son committed this great crime?"

"Three years ago."

"I wish, Captain Sturmgang, you would reconsider this matter. In the space of time you mention, what changes may have taken place in the character of your son. Will you not try what he is *now*, before you punish him for what he was *then*? Come, my dear sir, we have all of us need of forgiveness, and I do trust you will not carry your resentment against your son into another world."

"The learned assessor," interrupted the sub-rector in his grating voice, the driest that ever fell upon mortal ear, "seems inclined to dabble in *our* craft, and to preach instead of minding his protocols."

I looked at the man with astonishment. A sneer that I could not help thinking infernal, wreathed his thin lips, and his grey eyes looked hemlock at me from under their shaggy and overhanging brows. Behind him stood his nephew, with cheeks white as paper, and drops of sweat standing visibly on his forehead.

"Sir," said I, addressing the clergyman with

looks, I believe, expressive of all the indignation I felt, "I know, if you do not, what belongs to my office. I am ignorant neither of its rights nor of its duties; and, to make you acquainted with one of the former, of which you are, perhaps, not aware—let me inform you that I am empowered to direct the removal of persons who thrust themselves, uncalled, into the business I am engaged in. Should you think proper a second time to interrupt me, I shall exercise this right, and insist on your quitting the room. You will be good enough to bear that in mind."

The sub-rector replied to this threat only by a glance, which would have made a believer in the "evil eye" go home and take to his bed. The stepson could not control his agitation; he trembled from head to foot, and seemed to grow positively sick with terror. These two persons made a singularly unpleasant impression on me, and I only wished that the uncle had indulged in another effusion of bile, to give me an excuse for getting rid of him. The old captain fidgeted in his arm-chair; his brow portended storm; however, he put constraint on himself, and said coldly,

"I beg that what I have dictated to the clerk of the court may now be written. I disinherit my son, Ludwig Sturmgang, because of his having practised against my life."

"It is written," said I with equal coldness.

He proceeded—

"I appoint my stepson, Christian Schein, here present, my sole heir, and bequeath to him all the property, real and personal, which I shall die possessed of."

The uncle and nephew exchanged a rapid glance. The young man's eyes blazed with triumph, and the blood, which had forsaken his very lips, flowed in a full tide back to his cheek and brow.

The invalid proceeded—

"To my housekeeper, Theresa Froberg, I bequeath thirty *louis d'or*, and to my maid Margareta Reuter the bed on which I shall die, with all its appurtenances."

After some other unimportant dispositions, he said he had nothing more to add. The clerk jumped up to call for a light to seal the instrument, and opened the door hastily, when a loud scream was heard from the antechamber: the Demoiselle Froberg's ear had, it seems, been *rather* near the keyhole, and the door and her head had come into somewhat ungente contact. The captain was furious at this discovery, and it required the intercessions of both his stepson and the sub-rector to withhold him from adding a postscript to his will, revoking the legacy bestowed on the fair inquisitive.

The testament was signed and sealed, the captain invited us to lunch, but we declined, and returned to Zell, in no cheerful mood. As for me, I could not get the events of the morning out of my head: I read stories by the dozen, in which one brother juggled the other out of his inheritance by diabolical machinations; I had seen plays, in which similar treason furnished the materials of the plot. Schiller's Franz Moor and this sneaking Christian Schein were blended by a curious association of ideas in my thoughts. Who knows, thought I, what devilry may be here at work! The reverend sub-rector seemed to me quite capable of playing the Mephistopheles of the drama, and the eves-dropping housekeeper—a comely person, though not in the first bloom of youth—might fill the part of one of his ministering fallen

angels. I determined to look farther into the matter.

My first step was to get information respecting the person and circumstances of Ludwig Sturmgang, and all that I heard told in his favor: he was known in the town for an upright, industrious and well-conducted man, but had, it seemed, inherited the fiery, impetuous temper of his father. He was in his twenty-seventh year, and was the father of two children—a boy of eighteen months and an infant in the cradle: his wife was described to me as a good and gentle creature, devoted to her husband and her little ones; his business was not flourishing; he was able to live by it, but in a very straitened way.

My next step was to go to him, to see what light he could or would afford me on the affair. I found him in his shop, and requested to be permitted to speak a few words with him in private. Telling his shop-boy to attend to the business, he led me into his sitting-parlor, which looked very orderly and neat. An open door gave me a momentary glimpse into the bed-room, where I discovered the young wife, her foot rocking the cradle, her fingers occupied in needle-work.

Sturmgang closed the door, and begged me to sit down.

"I don't know," said I, "whether I have to tell you who I am?"

"Oh! no, Mr. Assessor," cried he, "I know you very well. I have stood before now as a plaintiff at your green table."

"I will tell you, without preface, Mr. Sturmgang, what brings me here. I have got, without my seeking it, a peep into your family secrets."

"I know: you have been with my father about his will. Ay, ay, I have been expecting that; I was prepared for it, quite."

"You know the tenor of the will?"

"I can guess it."

"Mr. Sturmgang, I have a great desire to reconcile you with your father."

"That is impossible, Mr. Assessor; that is out of the question. After what has passed between us, I will never stretch out the hand of reconciliation, nor would he accept it if I did. When I say," added he, "I will never stretch out the hand, I mean unless——"

"Well: unless?"

"Unless he acknowledge the wrong he has done me, and ask my forgiveness."

"The father ask forgiveness of the son! And do you, then, feel yourself so free from all blame! Have you contributed nothing to the rise or the increase of this mutual hatred?"

"Who says I hate my father! God forbid I were so abandoned! But I don't love him: how could I, when he never loved me! And to humble myself before him, when I am the injured party! To own myself in the wrong, when I am not! And that for money! I would beg first—I would starve first."

"Well then, Mr. Sturmgang, do you not believe that your father would speak exactly as you do?—that he too would cry, 'What, humble myself where I have been injured—own myself wrong where I am right!' Where a quarrel is, my dear sir, there are two parties, and the cases are rare indeed in which the blame lies entirely on one side. But—suppose the present to be one of those rare cases—what does it come to? A father has offended his son; is it too much to ask the son to forgive his father?"

"I would forgive with all my heart, if—in fact,

let him take the first step, and there is no one readier for a reconciliation than I."

"If you and he were brothers, I should have no ground to urge you further, but you are the child, he the parent, and I must press it on you, my dear Sturmgang, I must indeed, to be yourself the first to make overtures of peace."

"Never! I have been too deeply offended, wounded, outraged, and without provocation—yes, I will say it—without provocation on my part. Sir, he has cursed me! Do you feel the weight of that word? I see you do. Love! reconciliation! peace!—what is the meaning of such phrases between people whom the bottomless gulf of—a curse—divides!"

The young man was silent for some moments, and then resumed with more composure—

"And you don't know my father, Mr. Assessor: he is a far more positive man than you suppose, and as violent as he is positive. Even if I could bring myself to make the first advance he would reject it, and the breach would only be widened—though wider it could hardly be."

"Well," said I, "suppose I make the attempt with him, as I have done with you, and he were to speak just as you have done—were to say, 'I will not take the first step, but I will not repulse my son if he takes it,' what would you do then?"

Sturmgang wavered—he seemed to struggle with himself; at last he said—

"I would take the step, if I had reason to believe it would not be taken in vain."

"You would go to your father?"

"I would."

"You would ask him to—forgive and forget?"

"Yes."

I shook him heartily by the hand, and declared my determination to make the attempt upon his father without delay.

The same day, in the afternoon, I went out to Dornfeld, praying on the way that I might find the old sailor alone, for I confess that I trembled at the thought that the stepson with his cattish sleekness, or the sub-rector, with his bearish roughness, might bar my access to him. Neither of these monsters, however, guarded the way, and the entrance to the enchanted castle lay free to my tread. I met nobody either in the court or the hall; the house door stood open and I was obliged to walk in unannounced.

Proceeding to the room in which I had found the captain on a former occasion, I knocked at the door, and was answered by a "come in," that made me jump. The old gentleman had certainly been dreaming of a sea-fight, and spoke as if he had had broad-sides to out-thunder. As I entered, he rose from his arm-chair, in which, no doubt, he had been enjoying an after-dinner nap, and asked in an angry growl, as he jerked off his night-cap, what I wanted, and why I had not sent up my name. Before I could reply, however, he had got better awake, recognized me, became more civil, and begged me to take a seat. Without ceremony I told him that, having been obliged to decline the lunch he had offered me a few days before, I was now come to drink a cup of coffee with him. He seemed pleased at this, went out of the room, and presently I heard an awful bellowing through the house, now in the hall, now in the garret, now in the cellar. After some time he came back in a sea passion, imprecat-

ing every mischance that can befall a ship on the housekeeper and on his stepson, neither of whom was to be found; the maid, he said, had got leave to go to church, and so he was not able to give me a cup of coffee.

I assured him that it was not of the slightest consequence, and expressed my pleasure at finding his health so much improved. In fact, he had recruited completely, and walked up and down the room with a vigorous tread. This room was recognizable at the first glance for the retreat of a seaman. The walls were hung with maps and prints of naval engagements, and a rude drawing of a man-of-war occupied a conspicuous place, flanked on one side by a sickle-shaped dirk, and on the other by the triangular gold-laced hat, diminutive and formal, that had distinguished the service in his younger days.

I asked him if that, pointing to the drawing, was the ship he had commanded—a more politic opening of a conversation was never made. It brought him on his favorite theme, and he began to tell me, with visible pleasure, of the voyages he had made in that very corvette, "the Dolphin," finishing with a grumble at having seen men leap over his head, one after another—fellows he would not have trusted with the command of a jolly-boat; that was what had made him retire from the service, and live in that lubberly place on his half-pay. I now inquired after his family, listened patiently to his somewhat prolix accounts of what I knew before, and took the opportunity to tell him that his son Ludwig bore an excellent character in the town.

He was silent.

"I am the more astonished," continued I, "when I think of your having disinherited him. I will not conceal from you that I have conceived a lively interest both for you and for him, and, in short, that the motive of my present visit is to do you both a great service."

His face darkened, but he still continued silent, pacing up and down the room with a somewhat quickened step; at last he said—

"My son has been with you?"

"No," replied I, "I went to his house yesterday."

"Humph. What for?"

"For the same purpose for which I came to you to-day—to prepare him for a reconciliation."

"Oh ho! my good sir, we are not got quite so far yet. Allow me to say, once for all, that you will do me a pleasure by speaking no more on this subject."

"I hope to do you, not perhaps a pleasure, but, as I said before, a great service, Captain Sturmgang, by not complying with your wish."

He was going to interrupt me, but I spoke on without pausing.

"I am already half and half initiated into the secrets of your family, and I beg you to hear the dispassionate word of a dispassionate man—a man whose position renders him impartial. You are old, my dear sir, and you are alone; you have a son, and yet you are alone. Why should this be? Nay, hear me, I entreat you. Nature tolerates nothing unnatural, and what can be more unnatural than enmity between parent and child? Depend upon it, nature will revenge herself—is revenging herself upon you both for this outrage upon her. You are and will be, both sufferers, more deeply than you perhaps think. Let what

will have taken place, no offence of a child can be so monstrous as to justify the parent in perpetual resentment."

"It won't do, sir; it won't do. My son and I are done with each other. A child that attempts his father's life, sir, has no forgiveness to hope for."

"Not if he reform—if he repent?"

"I would not give much for a repentance that comes only when the attempt has failed, when the tables are turned, and the assassin finds himself at the mercy of his intended victim. If he repents—which is likely enough, it is not of having meant to kill me, but of having gone about it in such a lubberly way. He repents, sir, of having left it in my power to disinherit him."

"Fie, Captain Sturmgang! These are thoughts unworthy of a father. Your son is not to have your property—well, he submits to the loss. But is that a reason that he should have your curse? It is not what you withhold from him that he complains of, but what you bequeath him; and I tell you in the name of God and humanity that you *must* revoke your curse: that horrible word must not continue to the hour of death, to ring in the ear of your son."

"My curse! bequeath him my curse! What's all that? I know of no curse."

"Have not you cursed your son? He told me you had."

"Is that possible? Cursed him—I don't believe it. When I break out in a fury, no doubt I say here and there something I don't mean. No, no, I don't curse him—God forbid."

"You make me very happy, Captain Sturmgang. May I tell your son what you say?"

"No need, sir—no need. I send him no message; I want no communication with him, and I beg I may now hear no more of him."

"Very well. It is then your determination that he shall live and die in the belief that his father's curse lies upon him."

"The devil! No, it is n't. I told you I did n't curse him."

"You told *me*. Well, then, tell *him* so."

"Him! I tell *him*! My good sir, you forget that you talk to an old officer, who would rather blow himself and the enemy up together than strike his colors."

"Ay, but you are not blowing up yourself and your son together. You are blowing him up alone. You are wilfully leaving him under the false impression that he has your curse."

"Confound it! I can't bandy words with you. I am no match for a lawyer in talk. There! tell him, then, for aught I care; and now, no more about it or him, I beg of you."

"A thousand thanks, my dear sir; but one moment more I must beg you to hear me patiently. You will not forgive your son his offence against you?"

"No."

"Never! Not even on your death-bed—not even on his?"

"Come, come, we are not on our death-beds, he or I, nor likely to be so soon, I hope."

"Did you think so a fortnight ago, when you were making your will? But I crave an answer to my question. Will you not forgive him even on your death-bed, or on his, should he be the first to die?"

"Humph! Well, perhaps I might—I think I

would. Yes, I will forgive him on my death-bed."

"Good. How long will you live?"

"How can I tell?"

"Not easily, I confess. Well, then, suppose you were to die next week—suppose you were to die to-morrow? Or, what security have you that a stroke of apoplexy may not end your life this day—this hour?"

"Stuff and nonsense!"

"Not at all. You are near your 'threescore-and-ten.' You are, perhaps, *very* near your death. Don't lose the precious moments. Do, to-day, what in a few days will no longer be in your power. Show mercy whilst you have time, lest you should find none when you need it."

"By —! I was not so hard pressed by the English frigate in the North Sea!"

"Forgive us our debts, as we forgive our debtors." I am sure, Captain Sturmgang, you make that petition every day."

He wavered visibly, grumbled something about having been all his life better at giving blow for blow than word for word, and then said aloud—

"Well, I'll talk about it with my brother-in-law."

At the name of Mephistopheles, a chill ran through all my veins.

"He will undo all my work," thought I; and the image of the smooth stepson, associating itself with his, reduced my hopes to a still lower ebb. I was opening my lips, however, for a last attempt, when the door opened, and the latter worthy made his appearance.

The old gentleman received him with a broadside of oaths, and asked where he had been so long. He answered, with great humility, that he had taken a little walk while his father enjoyed his usual afternoon's nap, not dreaming of his being exposed to intrusion. This he said with a side-glance at me.

"Where's Theresa?" demanded the captain, roughly. "Is she gone to walk, too?"

The young man, I thought, colored a little; and it was with some confusion that he replied, he had not seen the housekeeper since dinner.

"Look for her," said old Sturmgang, "and tell her to make coffee presently."

"Not for me, I hope," interrupted I, for I had lost all appetite for the stimulating beverage. "It is almost time I were on my way back to town. I must request you, sir," I added, addressing Schein, "not to give yourself the trouble."

He complied readily enough with my request, being, no doubt, glad of an excuse to stay in the room, and prevent the continuance of a *tête-à-tête* between me and his stepfather. I had now an opportunity of observing him with more leisure than at our first meeting. He was dressed in the antique style affected by our students, his hair divided in the middle, and flowing down in long locks on both sides, after the manner of the ancient Teutones, and wore a moustache and a little peaked beard. This affectation of the picturesque has always had the effect of disgusting me, and it strengthened the prejudice I had already conceived against Master Schein. The honeyed tone in which he spoke, his exaggerated attentions towards his stepfather, the insinuating smile that never disappeared from his lips, except when he shot a furtive and sinister glance towards me—all these added to the unfavorable impression he made on me, though

I strove to think I was doing him injustice. However, to continue in his neighborhood was really too much for my nerves, especially when he began to talk of filial duty, gratitude, and the pain it gave him to have even seemed for a moment to neglect his benefactor and second parent. I had, therefore, caught up my hat, and was on the point of taking leave, when Mephistopheles entered the room.

He looked at me with distended eyes, as if saying inwardly, "What in the devil's name brings you here?" A kind of inclination to defy him, which I could not resist, kept me from immediately fulfilling my intention of going; I did not like to seem driven away by him. With a brief greeting, he passed me by, went up to his brother-in-law, asked how he was, and began to talk of the weather, the roads, and some other equally interesting subjects, taking no further notice of me. I was angry, and the more so, that I felt that was what he wanted: to give him the completest triumph, I very wisely suffered his rudeness to make me rude—"Captain Sturmgang," said I, not, I fear, in the calmest tone, "I wish you a good evening;" and so I walked to the door without bestowing a look on either the sub-rector or his hopeful nephew. As I was leaving the room, the old gentleman, in a constrained manner, and, as it seemed to me, more for ceremony's sake than that he really desired it, begged I would shortly repeat my visit: hurriedly promising to do so, I withdrew.

Next day I went again to Ludwig Sturmgang's; for I was now resolved, were it but to spite Mephistopheles and his subordinate unclean spirit with the St. John's head, not to withdraw from the enterprise of reconciliation. The young man was glad to see me; he could not but guess that I had spoken with his father, and his looks expressed impatience to know the result. I began by informing him that he was not under his father's curse, and I never saw a man more thankful than he was, for the assurance. To prove his gratitude, he told me all his history, and the circumstances which had led to the state of things subsisting between himself and his father. At the age of four years he had lost his mother; a short interval had been followed by his father's second marriage, and that event, very speedily, by his stepmother's death. Captain Sturmgang had brought up his son, from the tenderest years, with the severity to which his opinions, no less than his natural temper, inclined him; and the boy had never known what it was to receive a caress from his father, never experienced an indulgence, never heard himself addressed but in the tones of harsh command, nor seen one encouraging smile relax the rigid earnestness of the features whose gloom overshadowed all his childhood. The fruit of this education was, that the young Ludwig, on his part, conceived little love for his father, and acquired a stubborn, headstrong, and daring character, cared neither for blows nor hard words, took his own way, and at an early age was come to regard no one's judgment, and consult no one's will but his own. Between his stepbrother and himself there had never been any harmony. Christian was a boy that never got into scrapes, Ludwig was never out of them; and Ludwig's scrapes were, conscientiously, and on principle, regularly reported by Christian to their father. The captain petted and praised his stepson, and held him up as a pattern to Ludwig, who showed his sense of the virtues proposed to him

for imitation, by drubbing the possessor of them soundly, whenever he could catch him in a suitable place for the operation, for which he was quite sure to be as soundly drubbed in his turn by papa.

In his sixteenth year Ludwig Sturmgang was placed by his father in a mercantile house, where, after the expiry of his apprenticeship, he continued some years in the capacity of foreman. During this period he formed an engagement with the daughter of his employer, and henceforth directed all his endeavors to the establishing himself as soon as possible in an independent business, that he might be in a position to marry. To this end he rode to Dornfeld, (he was at this time residing in a town about fifteen miles from Zell,) and requested his father to put him in possession of his mother's fortune, which by the marriage deed had been settled on her children. By the help of this sum he hoped to be able to furnish a shop in Zell. The captain, however, showed himself no ways inclined to further the views of his son, told him he should not have a penny of his inheritance till he knew how to make a better use of it, and upbraided him with great harshness for having entered into a matrimonial engagement at so early an age. The old spirit of defiance, which had long slept, now awoke in young Sturmgang, and bitter words passed between father and son. Ludwig would have left Dornfeld immediately, but he was obliged to defer his journey in consequence of a sickness of his horse. The approved remedy for this sickness was washing the part affected with a solution of arsenic in hot water, and Ludwig went to the apothecary in Zell, and procured a small portion of this poison, which he locked up in his desk. The next day Christian Schein had to drive to the town with corn, and on this account had his dinner an hour earlier than the rest of the family; scarcely five minutes after finishing his meal, he was taken ill, had repeated vomitings, complained of violent pains in the stomach, and cried out that he was poisoned. The whole house was alarmed; a carriage was immediately sent into Zell for the doctor, and in the mean time the food of which Christian Schein had partaken was examined. In the saucepan in which the soup had been made, and which was still on the fire, a white substance was found, which the old captain carefully took up, and put into a vessel. He cast looks of suspicion and rage upon his son, but spoke not a word on the subject with him. The doctor came, found Schein very much exhausted, but without further symptoms of illness; the hurtful matter seemed to have been brought away by the vomiting; the medical gentleman, therefore, merely ordered him some camomile tea, and drove back to Zell, accompanied by the captain, who after some hours returned.

The storm that now broke over Ludwig's head was terrific. Captain Sturmgang called his son a murderer, a parricide, a monster, who, in his accursed greed for money, had attempted to poison his father and his brother; nay, who had not scrupled to involve in the same destruction the lives of the innocent servants and laborers, who, as he must have known, would all have partaken of the deadly meal. "Serpent, devil, I renounce you!" shrieked the old man again and again, in accents which rage rendered almost inarticulate; and as his son stood astonished, bewildered, stupefied before him, not hearing, or not comprehending his furious commands to begone, and to leave

that house forever, he at length snatched up his pistols, and would certainly have committed an irreparable crime, had not the housekeeper and the maid thrown themselves screaming between the two, and forced the young man, confounded and incapable of resistance, out of the room. At length, out of his father's presence, he found words to ask, "What have I done?" But the only answer of the women was to entreat him to leave the house as speedily as possible. At the same time they hurried him to the stable, and Theresa, calling to an out-door servant to lead out the young master's horse without delay, hastened back to the captain, in order, as she said, to prevent him following his son, and murdering him in the yard.

Meanwhile, between Margareta and the out-door servant, the horse was got saddled, his master looking on passively, and as one stunned, till the maid, who cried bitterly all the time, with many prayers for his welfare, exhorted him to mount and begone. But he now suddenly recovered his recollection, and peremptorily declared that he would not go forth under such accusations as his father brought against him, that he would go back and know with what he was charged, and on what grounds. He would have done so, had not Christian Schein at this moment issued from the house, and, with terror in his looks, cried—

"Brother! Ludwig! for God's sake no delay! Your father has pronounced his malediction upon you, and is at this moment sending orders to the farm servants to drag you through the horse pound."

"Liar!" said Ludwig, "you shall not prevent me from going to my father."

"Believe him," cried the house-keeper, who followed the stepson out of the house; "he tells you the truth. Your father has given you his curse, and, if you stay a moment longer, you will experience ignominious treatment."

"I call everything sacred to witness," said Christian Schein, "that he was giving orders, when I left his presence, to have you dragged through the horsepond, and driven off the grounds with cart-whips."

"He was, indeed," said Theresa, wringing her hands. "Oh, for pity's sake—for your mother's sake—go at once."

Silently Ludwig Sturmgang mounted his horse, and left, without a farewell, a house endeared to him by no one recollection of happiness. From X. he wrote to his father, begging only to know what the crime was by which he had deserved a father's malediction, and such abominable outrage as had been threatened him, but the letter was returned unopened. Deeply hurt and embittered against his father, he now put the business of the inheritance into the hands of a lawyer. The law was clearly on his side, and he won his suit with costs. The little capital thus obtained enabled him to establish himself in business, and to marry. Since the circumstances above related, he had spoken neither with his father, the sub-rector, nor Christian Schein. All essays towards reconciliation had failed, and the persons just mentioned and himself had, when they casually met, met as strangers.

"What you have told me," said I, when Ludwig Sturmgang had finished his narration, "is a most curious and suspicious story, and, if some strange error be not at the bottom of the whole, it is clear that a great crime was contemplated by some

one. Appearances are certainly against you, and I wish you would answer me a few questions, which, I need not say, I do not put to you officially, but as a friend. Tell me sincerely, are you conscious of no negligence, of no thoughtlessness, of no fault in this matter?"

"Good God! Mr. Assessor, do you hold me capable of such?"

"Every one is capable of an oversight."

"In this matter, I am conscious of none."

"Do you believe that the substance in the saucepan was poison?"

"I don't know what to think."

"Did you carefully lock up the poison you had bought?"

"Carefully—and put the key in my pocket."

"Why did not you use the poison at once, for the purpose you got it for?"

"I did use about the half of it?"

"Ay! You did not tell me that before. When did you use it—and how?"

"About nine o'clock the same day that the whole disturbance happened, I boiled the solution in the kitchen, and washed my horse with it immediately after."

"Did you leave the kitchen while it was on the fire?"

"Not a moment."

"Did Christian Schein know that you had bought the poison?"

"I have no doubt he did—the whole house knew it."

"Had he gone to the town that morning, or the day before?"

"Not to my knowledge. But I begin to see that you have conceived the same suspicion that I entertain myself."

"What is that?"

"That Schein himself put the poison into the soup."

"What! You suppose that he meant to poison you, and fell into his own snare? I confess that does not seem to me very likely."

"Nay, I do not look on him as capable of such a deed, though I will not deny that I think him a bad fellow: God knows."

"Christian Schein makes no favorable impression upon me, but to practise against the lives of his stepfather and stepbrother, and even of the servants, against whom he could have no cause of enmity—to contemplate such wholesale murder is a stretch of wickedness which I will not impute to him."

"Nor I, though all that is less than the crime my own father imputes to me."

"Then, supposing he had meditated this crime, how very improbable that he should have blundered so as to eat of the poisoned food himself. But I will see you again in a few days, and I hope we shall be able to get some light on the subject. Good bye."

I proceeded from Sturmgang's to the apothecary, and demanded a sight of his poison book. It appeared that, in the month of August, 18—, by virtue of a police certificate, two ounces of arsenic had been sold to Ludwig Sturmgang. Neither Captain Sturmgang, nor Schein, nor any one else in the house, had bought poison that year, nor the year before. After a few days, I went out to Dornfeld again, requested a private conversation with the captain, told him that his son had communicated to me all the circumstances of their disagreement, so far as they were known to him,

and begged him, if he thought me worthy of his confidence, to give me his version of the occurrences. He related them pretty nearly as Ludwig had done, and at the end asked me if I now found his conduct towards his son any way unnatural or inexplicable.

"But, my dear captain," said I, "are you then convinced beyond all doubt that the substance in the pot was arsenic?"

"I know it, sir," replied he; "for I drove into town, as I have told you, with the doctor, and had the stuff examined by the apothecary, who at once pronounced it arsenic."

"But how can you tell that your son, Ludwig, threw this poison intentionally into the pot?"

"I am certain of it. Not only the maid can testify that he was the whole morning prowling about the kitchen, but Theresa—my housekeeper—saw him, from her storeroom, go to the fire and put something into the pot."

"No doubt, into the pot in which he was making the wash for his horse."

"Not at all! he was done with that by nine o'clock, and went into the stable, as he pretended, to wash his horse. It was half past ten when the housekeeper saw him at her pot."

"If that be true, I cannot deny that there are good grounds for your suspicion—at the same time suspicion is not proof."

"Not proof! By —, sir, you are proof against proof, I think! Look here! My son and I quarrel—a son, mark you, that never loved me; I don't say whose fault that is—mine, perhaps—but such is the fact; there never was love between us. Well, we quarrel, he wants his money, he can't marry without it; I refuse to give it him. The easiest way for him to get this money, and the rest of my property into the bargain, is, to put me out of the way. He was, from childhood up, quick in his determinations: he buys arsenic, for his horse he says, but my stepson is near being poisoned next day with his dinner; arsenic is found in the soup-kettle; the housekeeper has seen my son at that very soup-kettle. By —, sir, I say there's proof there to hang a man: I have knotted a man to the yard-arm myself on less proof: an English jury would send a man to the gallows on a quarter as much."

"I will not say that appearances are in your son's favor, and yet I cannot resist the conviction I have of his innocence. I acknowledge that he would have a bad chance with a jury, even *out* of England: still his frank, honest face, I think, could not but have its effect even in that suspicious nation, where, in direct contradiction to what they boast of the spirit of their law, every man is held guilty till he can prove himself innocent. To my mind, Captain Sturmang, there is that in your son's countenance and manner which totally forbids the belief of his being capable of the crime you attribute to him. And then the unblemished life he has now, for several years, led in our town—that will weigh in his favor with all reflecting men. Believe me, there is some sad mistake at the bottom of all this business—perhaps something worse."

"Aye, truly, is there something worse, and no persuasion will make me think otherwise."

"Well, suppose your suspicions just, your son has suffered for his crime—has proved himself a reformed man by his conduct ever since. Do not be implacable: if he had not sinned you would have nothing to forgive; if he has, forgive him."

"My good sir, I have thought upon that point, and made up my mind. I forgive him what he has done, but I do not and cannot forget it. You may tell him that; I forgive him, but I will not have him come into my sight. As for my fortune, a stiver of it he shall never touch, if he were to go to law with me ten times over."

"Have you spoken with the sub-rector on the subject?"

"I have; he is just such another sentimental blockhead as—I was near saying something uncivil—and would have persuaded me to a complete reconciliation."

"The sub-rector?"—cried I, in astonishment.

"Aye, aye, the sub-rector—what do you see so wonderful in that? That's just like him. But I have told him roundly that that's out of the question; to be friendly to my son is not in my power; I can't answer for myself, but I might say something disagreeable to him—it is better we keep separate, give one another as wide a berth as possible. And now, my good sir, if you do not want to make me angry, talk to me no more on this subject."

My mouth was closed by the last words. However, I had got a step further, and, although I took good care not to quit the ground I had gained, I was far from intending to stop there. I now did my best to put the old sailor in a good humor with himself and me, led the conversation to his voyages, got him into a discussion about the comparative merits of carronades and cannons, in which—Heaven forgive me! I took up (knowing nothing of the matter) the side I saw he was opposed to, merely for the purpose of letting him beat me, which I must say he did in a very effectual manner. This gave him great pleasure, and when I was going away he begged me, with real heartiness, often to come and see him, squeezed my hand, and declared that he considered me an honest man. I asked him to come see me, and said my wife would be much gratified to make his acquaintance; to which he replied that he did not like going out of his own four walls, but would call me a real good fellow if I would bring my wife with me the next time I came, though, he added, it was scarcely a place for a lady, and she would find little to repay her for the trouble of the visit.

This was exactly what I wanted: for my plan was to make an attack upon him with the help of his daughter-in-law, an unassuming and amiable young creature, whom, I thought, it was impossible he should hate, although she had been the immediate unhappy cause of the family dissension. Should he conceive a liking for her—or should she inspire him with ever so slight an interest, it might be hoped that he would at least not suffer her and her children to want, and would perhaps even find an excuse for his son, in the matter of the unfortunate law-suit, in the eagerness of the latter to possess himself of such a treasure as this lovely young woman.

I communicated this plan to my wife, and got her to go to Madam Sturmang for the purpose of inducing the latter to come into it. It was not without hesitation and fear that Madam Sturmang consented to the project; she had heard too much of the blunt manners, stern temper, and rooted prejudices of her father-in-law, not to tremble at the thought of presenting herself to him; the uncertainty of the result, and the dread of being rudely and savagely treated by the old merman, balanced the hope of rendering her husband a ser-

vice beyond price. The sense of duty, however, triumphed over that of fear, and a day was fixed for our visit to the old gentleman.

Accordingly, it might be three weeks after my last interview with Captain Sturmgang, my wife and I, with Madam Sturmgang and her eldest boy, took our places in a carriage, and drove out to Dornfeld. The young wife was to be presented to our host as a friend of my wife's, and the rest was to be left to the chapter of accidents. I believe there was not one of us whose heart did not palpitate as the carriage drove up to the door: Even the little boy had an agitated look, caught perhaps from the reflection of his mamma's. The captain, who had had notice of our visit, was on the steps to receive us. All right, but—O mercy! there stood our evil genius, the sub-rector, behind him! "I wish you were where the pepper grows," thought I, "or in a hotter place." I had reason for the wish: in the moment that we halted, received and returned the captain's greetings, and were preparing to get out of the carriage, the harsh voice of Mephistopheles cried—

"Eh! what's all this! You here, Madam Sturmgang!"

The captain started back, as if he had seen a Gorgon:—

"Where is Madam Sturmgang!" cried he.

Without speaking, the sub-rector lifted his arm, pointed with his fore-finger at the unhappy and trembling young wife, now half-choked with her tears, and stood in this position so long that he gave one the impression of a hand-post, only that he pointed the way old Sturmgang's compassion and kind feelings were *not* to go.

My wife and I, who had already stood up from our places, sank back into them with fright; this saved us a trouble, for the captain, whose astonishment had given place to indignation, called out to me with the iciest politeness—

"Mr. Assessor, you have mistaken the house. This is not the inn; you will find it about half a mile further on, in the village."

"One word, captain."

He turned on his heel, went into the house, and shut the door behind him; the ill-omened hand-post was no longer in view—it had done its work. "Home," said I to the coachman.

"*Oleum et operam peridi*," muttered I to myself, and did all in my power to tranquillize the young wife, who was near fainting, and could relieve herself only by tears. When we stopped at young Sturmgang's, I had no need to tell him how my attempt had sped; the short time we had been away, and the disconsolate air of his wife, gave him but too sure evidence of its unhappy issue. The pain his features expressed, showed that he had sincerely wished and hoped for peace with his father, and it was most reluctantly that I was compelled to add to his grief, by declaring that I could interfere no further in the matter. Half a year passed after this, without my seeing either the young merchant or old Ironskull again.

The president of the provincial court had obtained leave of absence, for the purpose of visiting the baths of P—, and the direction of affairs devolved upon me; this confined me almost the whole day to my office, which was contiguous to the sitting-room of my wife. One day the bell rang, my wife went out to see who was there, I heard eager talking in the hall, and presently after the cry of an infant in the next room. What the deuce,

thought I, does she bring such an animal here for! To my no small alarm the music came nearer, and by-and-bye my wife entered the office, with a carefully wrapped-up baby in her arms!

"Look, love!" said she, "what a darling little cherub!"

"O Lord!" cried I, "no nearer, there's a good soul! Take the darling little cherub away!"

"Yes, but I have to tell you something first," rejoined my wife; "the poor little dear has just been found in the fields."

"In the fields! Aye, aye! Who found it?"

"The people are there in the hall."

"Capital! I had too little business on my hands as it was. Well, call them in—call them in."

Four countrywomen and three children were now ushered in, and I glanced involuntarily at the three chairs which the office contained.

"If the whole village these good women belong to is coming," said I to my wife, "I must beg you to get the drawing-room in readiness, and to put all the chairs in the house into it, for we must have places for Assessor R— and the clerk of the court, whom I will thank you to send for immediately."

The examination was begun, and the story told by young and old was this. The three children had gone into the fields to glean, heard a faint cry, and found on a crossway, near a farm house, the child lying. They ran into the house, into the village, spread the news, the four women came about the same time to the spot where the deserted creature lay, and forthwith commenced a procession to town, and to my office. I asked if any of them had given the child drink. Not one—the compassionate souls had been afraid, one and all, to take it into their houses, lest they should have to keep it. They were all agreed that no girl out of their village could be the mother of the child, as there were not the slightest grounds for supposing that a secret *accouchement* had taken place there. As soon as I had dismissed them, I called in my wife, whom I asked if she had any baby-linen by her. She blushed to the eyes at this question in the presence of the assessor and the clerk, for it was visible enough that she would very soon want baby-linen herself; however, this was quite *à propos*, and I said—

"There's no help for it; you must act as child's maid; strip the little thing to the last thread, and dress it in whatever you have got, for we must take the clothes it has on *ad acta*—but for Heaven's sake, get it something first to stop its roaring."

The little one's clothes were of rather finer materials than ordinary; but there was no mark to be discovered, which might serve as a clue to the mother. The child was given to a woman to take care of, and the tip-staff was sent the same evening to all the shopkeepers in the town, to show them its little coat, and to ask them if they remembered having sold any of that description of calico, and to whom: two shopkeepers had had this calico, and named different maid-servants in Zell who had bought some of it; but the inquiries set on foot gave no grounds of suspicion against any of these. The next day the tipstaff was sent with the cloth to the neighboring villages, to show it to as many women as possible, in the hope of obtaining in this way a clue to the delinquent. This measure succeeded: before midday he came back with intelligence that several women of a village

near Dornfeld declared they had seen Captain Sturmgang's housekeeper, Theresa Froberg, wear a gown of this stuff three years before, which they remembered by this token, that they had censured her at the time among themselves, for wearing garments above her degree, and prophesied there would no good come of it. The tipstaff, before returning to X., had asked an outdoor servant of Captain Sturmgang's how were all at Dornfeld, and received for answer that all there were well, except Madame Theresa, who was ill in bed.

My next step was to send the district physician to visit this woman, and from his report I learned that she had been delivered of a child within a few days, but was now in a state which admitted of her being judicially interrogated. I repaired accordingly to Dornfeld without delay, and had no difficulty in obtaining from her, in her first alarm, the confession that she had, three days before, given birth to a child, the father of which was Christian Schein, her master's stepson; that she had concealed her condition, had delivered herself in secret, and, according to previous concert, given the babe to Schein, who left it in the neighborhood of human habitations, that it might be the sooner found, and not perish. She acknowledged that this was the second child she had borne to Christian Schein, but the former was still-born, and had been buried by its father in the garden.

To arrest Schein was now the most pressing concern, but, on taking steps for that purpose, we discovered that that bird was flown, having first broken open the captain's desk, and taken out of the same three hundred dollars in gold. The housekeeper, however, I had removed to Zell, (on the doctor's certifying that this might be done without danger,) and placed in the prison infirmary, under the charge of a careful nurse.

The next morning the sub-rector entered my office, with a face rigid as that of the statue in Don Juan.

"Mr. Assessor," said he, in a hollow voice, "I come to you on a distressing occasion."

I requested—in no very sympathizing manner, I am afraid—to know how I could serve him.

"You are conducting the investigation of this affair of my brother's housekeeper?"

I bowed.

"And my nephew is implicated?"

"Sir," answered I, "you should be aware that a magistrate engaged in a criminal investigation does not take every casual inquirer into his confidence."

"As you please: I know, however, that he is implicated."

"Then, sir, as a magistrate, I must ask you *how* you know it?"

"From common report, and from my brother-in-law."

"Humph!"

"I come to make a request of you. My unfortunate nephew has absconded, and the tribunal will of course do its utmost to trace and arrest him. But it would be a bitter disgrace for me to see the name of my sister, of my nephew, in the hue and cry. Can you, and will you, not do something to prevent this scandal?"

"You will excuse me, Mr. Sub-rector, if I say that I have no very urgent motive to interfere with the cause of justice, for the sake of sparing you a mortification."

"I see you are prejudiced against me—misunderstandings!"

"Ah!—misunderstandings."

"I am convinced, Mr. Assessor, that you are judging me unjustly. It is true that I have suffered myself to be imposed on by that unhappy young man—that I have had a better opinion of him than he deserved. He has deceived me, brought shame and grief upon his family, made our honest name a town-talk. I confess I expected, for all this, rather compassion than insult from you."

"Mr. Sub-rector; I should be sorry to insult misfortune; but I will acknowledge that I do not feel very strongly moved to compassion for you, because I have seen how little you showed for that poor young fellow, Ludwig Sturmgang, who nevertheless had nearer claims on you than you have on me."

"Did he deserve compassion! God pity my poor brother-in-law, betrayed by those who are nearest to him! The hand of a stranger will close his eyes, for one son after another shows himself unworthy to do it!"

"That is not so certain. I believe young Sturmgang fully worthy to perform that pious office, and should be sorry, Mr. Sub-rector, to be the wall of partition that separates father and son."

"There is no one but my brother-in-law himself that can remove the wall of partition, as you call it. I have often enough tried to bring them together, to move my brother-in-law to forgiveness. But Ludwig is to the full as impracticable as his father, and after he had so contumaciously rejected my mediation, I don't see how I should have gone on pressing it on him. No, I look on that young man as doubly unworthy, without sense of filial love or of common gratitude."

"And have you, Mr. Sub-rector—have *you* endeavored to mediate in this unhappy quarrel?"

"To be sure I have: who should, if I did not?"

"Who, indeed! And may I entreat you to tell me in what manner the young man, as you have expressed it, contumaciously rejected your mediation?"

"My nephew Christian, who wished as much as I do to see the good understanding between his father and his brother restored, went several times to Ludwig, to induce him, if possible, to abandon the law suit. On these occasions, Ludwig expressed himself, regarding me, in a way that made me highly indignant—asserted that I belied him with his father with a view to get a share in his inheritance myself. Such aspersions, I confess, had the effect of greatly embittering my feeling towards him, and I felt in no way called upon to make him a personal visit—which otherwise I should have done. However, about two years ago, I had got my brother-in-law a good deal softened, sent my nephew to Ludwig, and bid him use the moment, as I was convinced that if he would now beg his father's pardon, a complete reconciliation would be brought about. How was my good will requited! Ludwig answered my nephew, 'Tell your uncle, he may tan the hides of his scholars as much as he pleases, but that I am a little too old to have the fifth commandment flogged into me.'"

"Your nephew brought you that message from Ludwig?"

"He did—and a still more impertinent message than that: 'And tell him, moreover,' added this graceless young man, 'that he may bless his stars that he has *not* me for a scholar, for I would get up a revolution in the school-room, and by—I need not repeat his oaths—we'd flog the flogger.'"

"Very disrespectful, indeed."

"That was not the worst. 'And as for my father,' he went on, 'you may tell him from me that the state showed its judgment in not promoting him, and that it was a fortunate day for the navy when he left it. And tell him he did well when he planted me behind a counter instead of taking me to sea, for by—more oaths—I'd have had the crew in a mutiny in three days, and we'd have hung the old tiger at the yard arm.' I should like to know, Mr. Assessor, what you think of that?"

"And your nephew delivered that message to Captain Sturmgang?"

"He did, with fear and trembling."

"Well, Mr. Sub-rector, I begin to think we have all of us fallen into some errors of judgment. But no more on the subject at present—leave the rest to me. I have now to attend the court, and must pray you to excuse me."

When a culprit has once made a confession of his main offence, it is generally not very difficult to bring him to acknowledge his minor ones. This reflection induced me to examine the housekeeper with respect to the poisoning affair. To my surprise and vexation she stuck to her old story, that she had, from the store-room, seen Ludwig Sturmgang spill something out of a paper bag into the soup-kettle, and at every subsequent examination she repeated this without variation. I had the young man summoned, and asked him (though not on his oath, as it was possible that he might, in the course of the inquiry, have to appear before the tribunal as an accused person) when he had last spoken with Christian Schein. He answered, on the day he left his father's house. I admonished him that it was probable this question might be put to him on his oath within a few days. He replied that he could give no other answer to it than he had now done. In reply to further questions he distinctly denied that he had ever had a conversation with his stepbrother respecting the sub-rector or a reconciliation. I asked him (without mentioning the assertion of the housekeeper) had he gone at all to the soup-kettle on the day of the alleged attempt to poison. He answered most decidedly in the negative; there was nothing to take him to the soup-kettle on that or any other day. The whole business seemed to me a tangled yarn, and I dismissed Ludwig Sturmgang without coming to any conclusion.

"After all," thought I, "he may be guilty, and that a jury would pronounce him so is almost certain. Theresa Frohberg's intrigue with Schein, to be sure, throws suspicion on her testimony; and yet her persisting in it now, after the flight of her lover, and when she can have no conceivable interest in blackening young Sturmgang, is, to say the least, very embarrassing. In my heart I'm convinced of his innocence—but, thank Heaven, I'm not on his jury."

An event occurred the next day which solved the riddle. A letter addressed to the housekeeper, and bearing the Bremen post-mark, was handed to the court; it was from her seducer, and ran thus:—

"DEAREST THERESA:

"Before I leave my country forever, I cannot resist the impulse which bids me send you a last—an eternal farewell. I am, you will be glad to hear, safely arrived in Bremen, and sail an hour hence for New Orleans. Ere you receive this, the shores of Europe will have disappeared from my view. We shall meet no more. Forget me, Theresa; but be assured that you will never be forgotten by

"Your sincerely broken-hearted

"CHRISTIAN SCHEIN."

On reading this letter, the unfortunate creature broke into bitter tears, and cursed the author of her misery. She now confessed that she had been the tool of this miscreant in her inculpation of Ludwig Sturmgang. Schein had promised her marriage, but there were two hindrances to the fulfilment of the promise—the life of Captain Sturmgang, and Ludwig's claims as his heir. The captain was old, and breaking down; they could reckon on his being soon out of the way, but the heir was a more serious obstacle. Schein, however, had long profited by the absence of the younger Sturmgang, to ingratiate himself with the old man, and insure himself, at least, a legacy; nor had he neglected his many opportunities to blacken Ludwig in his father's eyes. Ludwig's betrothal, and the pecuniary disagreement between him and his father, enlivened the hopes of the abandoned pair to make their harvest at his expense, and the accidental circumstance that his horse fell sick at Dornfeld, and that he got arsenic to wash it, inspired them with the hellish plan, which was as hastily carried out, as it was conceived, of making the old man believe that his son intended to poison him. By the prospect of being now shortly able to marry, Schein induced the housekeeper to aid him in this work. She went in the evening into the town, and bought a sufficient quantity of tartar emetic; this she gave to Schein, who placed in her hands the arsenic, which he had got, by means of a false key, out of his brother's desk. Theresa put the poison into the soup, after she had served her lover with his own portion, and this, having mixed the emetic in it, he immediately took. It was not long down before he was seized with vomiting; he cried out that he was poisoned; the housekeeper pretended to recollect having seen the captain's son put something into the pot; it was examined, and the arsenic was found. This plan succeeded: the father and son were irreconcilably disunited; the latter hardly knowing why, for Theresa's testimony against him had never come to his ears, and he was not aware of his father's grounds either for believing that the matter found in the pot *was* arsenic, or for concluding that he had put it in.

To exasperate both parties the more against each other, and to render any danger of a reconciliation more unlikely, Christian Schein had fabricated the malediction and threat of ignominious treatment, which he announced to Ludwig on the part of his father, and had afterwards brought to the captain and the sub-rector accounts equally mendacious, of his having visited young Sturmgang on errands of peace, and of the insulting messages, to both the old gentlemen, by which the rebellious son had met these overtures.

Theresa Frohberg had been the faithful ally of Schein in all these measures; and, even when their intrigue came to light, and the seducer absconded, she continued to keep the secret of their

alliance, believing that Schein, once beyond the reach of pursuit, would not fail to provide her with the means of rejoining him, or would even, perhaps, return, when the scandal was blown over, and sit as fast as ever in his stepfather's favor; for she had not been informed of the act of the theft which had preceded his flight. Now, however, he had cast her off, and all motive for concealment of the truth was at an end. The two rogues had fallen out, and honest men, according to the proverb, came by their own.

No sooner had I received the above confession, than I despatched the tip-staff to summon the captain and the sub-rector to give evidence before the court. After asking them some questions about Christian Schein's amour with the housekeeper, I said to the captain—

"Sir, the tribunal has been compelled to intrude into your domestic secrets, because, as I need not tell you, it is instituted to the end of discovering and punishing criminals. It is known to you that arsenic was brought into your house for a certain alleged purpose, and was there used as the means of an intended crime."

"It is but too well known to me."

"You yourself have named your housekeeper to me as a witness; it has become necessary that you should hear her testimony before the court."

"Pray, spare me the humiliation of hearing the crime of my son deposed to before a public tribunal."

"I am sorry to say it cannot be."

I rang, and directed that Theresa Froberg should be brought in. She appeared pale and dejected. I bid her repeat her deposition of yesterday.

It was done. The two old men stood as if turned into stone, as the story of the prisoner removed the scales from their eyes.

"Now, gentlemen," said I, "be so good as to walk into the waiting-room till these depositions are signed and sealed. I will be with you in a few minutes."

They did so, and I shortly followed them.

"Now," said I, "I must request you to accompany me a short distance."

I said this with so official a look, and in so civilly peremptory a tone of voice, that they thought I had authority to take them wherever I pleased, and followed me without a word. Both looked like men suddenly awakened, and not knowing rightly whether they were in the body or out of the body. Need I tell the reader that I led them to Ludwig Sturmgang's?

As we were at the door, and I was going in, the captain grasped my arm, and asked—

"Sir, what does this mean?—where are you bringing me?"

"Go with him," said the sub-rector, soothingly. "Let the assessor have his way, he means your good."

With these words, he pressed my hand.

We went in. The shop-boy was behind the counter; the young wife sat in the parlor, rocking the cradle, and sewing. At the sight of the old captain, she sprang up with a cry of terror, and darted out of the room.

"What's the matter?" said Ludwig, coming in; but, as he saw his father and his uncle, his arms fell as if paralyzed at his sides. Father and son stood at the two opposite doors of the room.

It was an even chance whether they were to advance towards each other or to draw back.

"Sturmgang," said I to the young man, "it was I that brought your father and your uncle hither; they did not know my purpose, though I dare say they guessed it. The moment is come—the quarrel is at an end—all is explained. Sturmgang, throw yourself into your father's arms."

Sturmgang stood as if his shoes were part of the floor.

"Captain, then, embrace your son."

He stood like his son's counterpart.

"Mr. Sub-rector," appealed I—but he was crying.

"Good folks," said I, "do you mean to put me in a passion? Ludwig Sturmgang, will you be friends with your father?"

"I will," answered he, quickly.

"Captain, has your enmity no end?"

"It is past," was his equally quick reply.

"Well, then, when two people that have fallen out mean to be good friends again, why, either one of them *must* take the first step, or both must step out together. Come—together be it."

"No," said Ludwig Sturmgang, stepping forward, "I am the son—the first step belongs to me. Father, there is my hand—forgive me!"

"Stop!" shouted the old man, "stand back! Mine must be the first step: it is I that have to say 'forgive!' I alone am guilty of all this misery. My poor, poor Ludwig, I have done thee bitter, ay, bitter and crying wrong. God forgive me!"

"Hurra!" cried I, and with a spring was in the kitchen. "In with you, Madame Sturmgang," said I to the trembling young wife; "you'll find none but friends in the parlor."

The following Sunday my wife and I, in compliance with a formal invitation, sent two days before, dined at Dornfeld. The company was not large; there were only ourselves, the Sturmgangs, and the sub-rector. After dinner, the captain presented us pipes, and bid Margareta bring a light, which she did, sobbing violently, as she had done, to the great peril of the captain's equanimity, all dinner time.

"I have got no matches," said the old gentleman; "but here is some paper. Good Mr. Assessor, will you tear it neatly into strips: we can light our pipes with it very well."

The *will* was in a very few minutes torn up, and helped to light the "calumet of peace."

"I want a purchaser for Dornfeld," said the captain to me. "I am going to live with the children in town. It's so dull out here."

I puffed.

By and by, the sub-rector drew me to a window.

"When is your office open?" asked he.

"Day after to-morrow." Puff, puff.

"I wish to make my will," said he.

"I can guess." Puff, puff, puff.

"What? Who my heir is to be?"

Puff, puff, puff.

He pressed my hand.

"Are you still angry with me?"

"Ye watchful stars," thought I, "and I have called this man *Manhistopheles*! 'Wise judges are we of each other!' " Puff, puff, puff-f-f-f-f.

THE BEAR-CHASE.

[From the French.]

ONE evening, a short time after the battle of Fontenoy, (1745,) a group of the king's body-guard was congregated near the Latona basin, at Versailles, listening to two of their number discussing a subject which at that period was rarely a matter of controversy in military circles.

"Refuse a duel after a public affront!" exclaimed the tallest of the speakers, whose bronzed features were rendered almost ferocious by a thick red mustache: "it is a stain that all the waters of the deluge would not wash away."

"I repeat, Monsieur de Malatour," replied the other in a calm, polite tone, "that there is more true courage in refusing than in accepting a duel. What is more common than to yield to passion, envy, or vengeance; and what more rare than to resist them! Therefore it is a virtue when exhibited at the price of public opinion; for what costs nothing, is esteemed as worth nothing."

"A marvel! Monsieur d'Argentré, I would advise, if ever the king gives you the command of a company, to have engraven on the sabres of the soldiers the commandment—'*Thou shalt do no murder.*'"

"And wherefore not? His majesty would have better servants, and the country fewer plunderers, if we had in our regiments more soldiers and fewer bullies. Take, as an example, him with whom you seem so much incensed: has he not nobly avenged what you call an affront by taking, with his own hands, an enemy's colors, while your knaves most likely formed a prudent reserve behind the baggage?"

"Cowards themselves have their moments of courage."

"And the brave also their moments of fear."

"The expression is not that of a gentleman."

"It is that of Monsieur de Turenne, whose family equalled either of ours, and who avowed that he was not exempt from such moments. Everybody has heard of his conduct to a braggadocio, who boasted in his presence that he had never known fear. He suddenly passed a lighted candle under the speaker's nose, who instantly drew back his head, to the great amusement of the bystanders, who laughed heartily at this singular mode of testing the other's assertion."

"None but a marshal of France had dared to try such a pleasantry. To our subject, sir. I maintain that your friend is a coward, and you—"

"And I——" repeated D'Argentré, his eyes flashing, and his lips firmly compressed.

"Holla, gentlemen!" exclaimed a third party, who, owing to the warmth of the argument, had joined the group unperceived. "This is my affair," said he to Monsieur d'Argentré, holding his arm; then turning to his adversary, added—"Monsieur de Malatour, I am at your orders."

"In that case, after you, if necessary," said D'Argentré, with his usual calmness.

"By my honor you charm me, gentlemen! Let us go."

"One moment," replied the new comer, who, young as he was, wore the cross of St. Louis.

"No remarks. Gentlemen, hasten."

"Too great haste in such cases evidences less a contempt for death than an anxiety to get rid of his phantom."

"I listen, sir!"

"Monsieur d'Argentré just now stated that the bravest have their moments of fear. Without taking as serious his anecdote of Monsieur de Turenne, I shall add that, with the exception of the difference that exists between muscles and nerves, the courage of the duellist is more an affair of habit than of principle; for it is the natural state of man to love peace, if not for the sake of other, at least for himself. Do you wish me to prove it?"

"Enough, sir: we are not here to listen to a sermon."

"Yet a moment. Here is my proposition: we are all assembled this evening previous to our leave of absence: I invite you, then, as also these gentlemen present, to a bear-hunt on my estate, or rather amongst the precipices of Clat, in the Eastern Pyrenees. You are very expert, Monsieur de Malatour—you can snuff a candle with a pistol at twenty paces, and you have no equal at the small-sword. Well, I shall place you before a bear, and if you succeed—I do not even say in lodging a ball in his head, but merely in firing upon him—I shall submit immediately after to meet you face to face with any weapons you choose to name, since it is only at that price I am to gain your good opinion."

"Are you playing a comedy, sir?"

"Quite the contrary. And I even repeat that this extreme haste shows more the courage of the nerves, than of the true courage arising from principle."

"What guarantee have I, should I accept your proposition, that you will not again endeavor to evade me?"

"My word, sir; which I take all my comrades to witness, and place under the safeguard of their honor."

There ran through his auditory such a buzz of approbation, that De Malatour, though with a bad grace, was obliged to accede to the arrangement. It was then agreed that, on the 1st of September, all present should assemble at the Chateau du Clat.

Whilst the young lord of the manor is making the necessary preparations for their reception, we shall explain the accusation of which he was the object, yet which had not branded him with any mark of disgrace among a class of men so punctilious on the point of honor.

The young Baron de Villette, in entering amongst the gentlemen who formed the household guard of the king of France, carried with him principles which remained uncorrupted amidst all the frivolities of one of the most licentious courts in Europe. Such, however, is the charm of virtue, even in the midst of vice, that his exemplary conduct had not only gained him the esteem of his officers, and the friendship of his companions, but had attracted the attention of the king himself. One alone among his comrades, Monsieur de Malatour, took umbrage at this general favor, and, on the occasion of some trifling expression or gesture, publicly insulted him. Villette refused to challenge him, as being contrary to his principles, but determined that this seeming cowardice, in not fighting a well-known duellist, should be redeemed by some action of *éclat* during the campaign just commenced. That moment had arrived; and for his noble conduct in taking the English colors at the battle of Fontenoy, he received the cross of

St. Louis from the king's own hand on the field, the eulogium of Marshal Saxe, and a redoubled enmity on the part of De Malatour.

The first care of the young baron on arriving at his estate was to call his major-domo, an old and faithful servant.

"I have business of thee, my master," said he cordially shaking him by the hand.

"Speak, monseigneur," replied the pareur, who was deeply attached to his young lord: "you know the old hunter is yours to his last drop of blood."

"I never doubted it, my old friend. Did you receive my letter from Paris?"

"Yes, sir; and those gentlemen, your comrades, will have some work before them."

"Are there bears already on the heights then?" asked Villetreton, extending his hand in the direction of one of the lofty peaks, whose summit, covered with snow, glittered in the morning sun.

"Five in all—a complete *ménage*—father, mother, and children; besides an old bachelor, whom the Spaniards had driven to this side."

"In less than a week we shall go in pursuit of them. Do you know, pareur, some of my comrades are rather rough sportsmen: there is one of them who is able to snuff a candle with a pistol at twenty paces."

"Easier, perhaps, than to snuff a bear at four," replied the old man laughing.

"That is what I said also. But as I should wish to judge for myself of his prowess, you must place us together at the same post—at the bridge of Maure, for instance."

"Hum!" said the pareur, scratching his ear; "it would better please me to have you elsewhere."

"Why?"

"Because, to guard this post, a man ought to be in a state of grace, for he will be between two deaths—the bears and the precipice."

"I know the one, and do not fear the other; thanks to your lessons."

"I am sure of that. But, with your leave, I should like to guard the bridge myself."

"You are sure, then, that the bears will pass that way?"

"Sure—yes; but quite sure—no. Recollect that they are sullen and prudent beasts, which never confide their plan of route to any one."

"It is agreed on. I shall guard the bridge with my comrade. Now, go and have the trackers ready."

"Very well, very well," murmured the pareur as he retired; "I shall have my eye on him."

Eight days afterwards, all those invited, not excepting Monsieur de Malatour—who, despite the delicate attentions of the host, preserved a cold reserve—were assembled at the chateau. The magnificent grandeur of the Pyrenees, their shining summits relieved against the blue sky of Spain, was an unlooked-for pleasure to the greater number of the guests, who for the most part belonged to the rich and fertile plains of the interior.

The morning following their arrival, a body of trackers and scouts, provided with all manner of discordant instruments—trumpets, saucapans, drums, &c., &c.—were assembled under the walls of the chateau, with the pareur at their head; while by his side stood the mandrin, who proudly

guarded a dozen large mastiffs, held in leash by his vigorous helpers. The young baron and his friends, armed with carabines and hunting-knives, had scarcely appeared, when, by a sign from the pareur, the whole troop moved silently forward. The dogs themselves seemed to understand the importance of this movement; and nothing was heard but the confused tramp of feet, blending with the noise of the distant torrent, or, at intervals, the cry of some belated night-bird flying heavily homeward in the doubtful glimmer of the yet unopened day.

As the party reached the crest of the mountain which immediately overhung the chateau, the first rays of the sun breaking from the east glanced on the summit of the Pyrenees, and suddenly illuminating the landscape, discovered beneath them a deep valley, covered with majestic pine-trees, which murmured in the fresh breeze of the morning.

Opposite to them, the foaming waters of a cascade fell for some hundreds of feet through a cleft which divided the mountain from the summit to the base. By one of those caprices of nature which testify the primitive convulsions of our globe, the chasm was surmounted by a natural bridge—the piles of granite at each side being joined by one immense flat rock, almost seeming to verify the fable of the Titans; for it appeared impossible that these enormous blocks of stone could have ever been raised to such an elevation by human agency. Sinister legends were attached to the place; and the mountaineers recounted with terror that no hunter, with the exception of the pareur, had ever been posted at the bridge of Maure without becoming the prey of either the bears or the precipice. But the pareur was too good a Christian to partake of this ridiculous prejudice: he attributed the fatality to its real cause—the dizziness arising from the sight of the bears and the precipice combined, by destroying the hunter's presence of mind, made his aim unsteady, and his death the inevitable consequence. He could not, however, altogether divest himself of fears for his young master, who obstinately persevered in his intention of occupying the bridge with his antagonist.

After placing the baron's companions at posts which he considered the most advantageous, the pareur rejoined his men, and disposing them so as to encompass the valley facing the cascade, commanded the utmost silence to be preserved until they should hear the first bark of his dog. At that signal the mastiffs were to be unleashed, the instruments sounded, and all to move slowly forward, contracting the circle as they approached the cascade. These arrangements being made, the pareur and his dog, followed by the mandrin alone, disappeared in the depths of the wood.

For some minutes the silence had remained unbroken, when suddenly a furious barking commenced, accompanied by low growling. Each prepared his arms; the instruments sounded; and the mastiffs being let loose, precipitated themselves pell-mell in the direction of the struggle. Their furious barking was soon confounded with the cries of the hunters and the din of the instruments, mingled with the formidable growling of the bears, making altogether a hideous concert, which, rolling along the sides of the valley, was repeated by the distant echoes. At this moment the young baron regarded his companion, whose countenance, though pale, remained calm and scornful.

"Attention, sir," said he in a low voice. "The bears are not far from us: let your aim be true, or else——"

"Keep your counsels for yourself, sir!"

"Attention!" repeated Villetteyron, without seeming to notice the surly response—"he approaches!"

Those who were placed in front of the cascade, seeing the animals directing their course to the bridge, cried from all parts, "Look out, look out, Villetteyron!" But the breaking of branches, followed by the rolling of loosened stones down the precipice, had already given warning of the animal's near approach. Malatour became deadly pale; he, however, held his carbine firmly, in the attitude of a resolute hunter.

A bear at length appeared, with foaming mouth and glaring eyes, at times turning as if he would fain struggle with his pursuers; but when he saw the bridge, his only way of escape, occupied, he uttered a fearful growl, and raising himself on his hind legs, was rushing on our two hunters, when a ball struck him in the forehead, and he fell dead at their feet.

Malatour convulsively grasped his gun—he had become completely powerless. Suddenly new cries, louder and more pressing, were heard.

"Fire! fire! he is on you!" cried the pareur, who appeared unexpectedly, pale and agitated, his gun to his shoulder, but afraid to fire, lest he should hit his master.

The latter, perceiving his agitation, turned round: it was indeed time. On the other side of the bridge, a bear, much larger than the first, was in the act of making the final rush. Springing backward, he seized the carbine of his petrified companion, and lodged its contents in the animal's breast ere he could reach them. He rolled, in the death-struggle, to where they stood. All this was the work of an instant. The knees of the hardy

old pareur shook with emotion at the escape of his young master; as for Malatour, his livid paleness, and the convulsive shuddering of his limbs, testified the state of his mind.

"Take your arms," said the young baron, quickly replacing in his hands the carbine; "here are our comrades—they must not see you unarmed; and, pareur, not a word of all this."

"Look!" said he to his companions as they gathered around, pointing to the monstrous beasts—"one to each. Now, Monsieur de Malatour, I wait your orders, and am ready to give the satisfaction you require."

The latter made no reply, but reached out his hand, which Villetteyron cordially shook.

That evening a banquet was given to celebrate the double victory. Towards the end of the repast a toast to "the vanquishers" was proposed, and immediately accepted. Monsieur d'Argentré, glass in hand, rose to pledge it, when Malatour, also rising, held his arm, exclaiming—"To the sole vanquisher of the day!—to our noble host! It was he alone who killed the two bears; and if, through his generosity, I have allowed the illusion to last so long, it was simply for this reason: the affront which I gave him was a public one—the reparation ought to be public likewise. I now declare that Monsieur de Villetteyron is the bravest of the brave, and that I shall maintain it towards all and against all."

"This time, at least, I shall not take up your gauntlet," said Monsieur d'Argentré.

"There's a brave young man!" cried the pareur, whom his master had admitted to his table, and who endeavored to conceal a furtive tear. "Nothing could better prove to me, sir, that, with a little experience, you will be as calm in the presence of bears, as you are, I am sure, in the face of an enemy."

DIAMOND DUST.—The demand for diamond dust within a few years has increased very materially, on account of the increased demand for all articles that are wrought by it, such as cameos, intaglios, &c. Recently there has been a discovery made of the peculiar power of diamond dust upon steel: it gives the finest edge to all kinds of cutlery, and threatens to displace the hone of Hungary. It is well known that in cutting a diamond (the hardest substance in nature) the dust is placed on the teeth of the saw—to which it adheres, and thus permits the instrument to make its way through the gem. To this dust, too, is to be attributed solely the power of man to make brilliants from rough diamonds; from the dust is obtained the perfection of the geometrical symmetry which is one of the chief beauties of the mineral, and also that adamantine polish which nothing can injure or affect, save a substance of its own nature. The power of the diamond upon steel is remarkable: it is known to paralyze the magnet in some instances—and may there not be some peculiar operation upon steel with which philosophers have not yet taught us to be familiar! How is it that a diamond cast into a crucible of melted iron converts the latter into steel? Whatever may be said, it is evident that the diamond dust for sharpening razors, knives, and cutlery, is a novelty which is likely to command the attention of the public, whether or not it is agreed that there is anything beyond the superior

hardness of the dust over the steel to give that keenness of edge that has surprised all who have used it.—*Church and State Gazette.*

SIR ROBERT PEEL has, it is said, recommended Mr. McCulloch to the queen for a pension of £200, in recognition of the services which he has rendered to political economy:—and we may mention, too, while speaking of the rewards conferred on such merit as comes within the purview of the *Athenæum*, by the retiring minister, that we find the name of Sir Moses Montefiore in the batch of baronets just gazetted—the well-earned reward of his labors in the cause of humanity; not the least conspicuous (and we trust effectual) of which has been his late generous expedition to the foot of the Russian autocrat's very throne, in behalf of his oppressed coreligionists.—*Athenæum.*

At a late meeting of the Paris Academy of Sciences, an extraordinary communication was made by a Greek physiologist, M. Eseltja—who asserts that, by the assistance of electric light, he has been enabled to see through the human body, and thus to detect the existence of deep-seated visceral disease. He has followed the operations of digestion and of circulation—and has seen the nerves in motion. M. Eseltja has given the name of "Anthroposcope" to his remarkable discovery.—*Athenæum.*

From the Athenæum.

Theoretical and Practical Treatise on the Printing of Tissues.—[*Traité Pratique et Théorique, &c.*]
By J. PERSOZ. 4 vols. Paris.

THIS work we consider to be one of the most remarkable that has issued from the Parisian press during the present year. Some time since, the French "Society for the encouragement of National Industry," established in 1802, offered a prize for the best essay on bleaching and printing calicoes. None of the papers sent in were deemed worthy of the prize; but, in the mean time, the author of the above work, who is Professor in the School of Pharmacy at Strasburg, though unable to complete his work by the specified day, persevered—and finally laid before the Society the result of his labors. That body fully appreciated the great value of M. Persoz's MS.; and published it, under their patronage—at the same time, presenting the author with a medal, of the value of 3,000 francs. M. Persoz was born and brought up in a calico printing manufactory; and spent a considerable portion of his life at Alsace, in the midst of print works—where he taught chemistry.

The first two volumes of the work are devoted to the description of the various coloring matters, and the means employed in printing—embracing the different kinds of machinery used in manufactories. The latter volumes contain the receipts for the colors actually used in printing on cotton and woollen cloths. To each receipt is annexed a pattern of the cloth so printed; by which means the reader is put in possession of the effect produced. The illustrations to the work amount to not less than 105 designs and 429 patterns—printed in with the text—besides a quarto atlas, of twenty plates. The patterns have been contributed by the principal calico printers in Alsace, Switzerland, Normandy, Paris, England, and Scotland; and it is pleasant to find the author alluding gratefully to the liberality evinced by the different manufacturers—who, rising above all petty national jealousies, were happy to have an opportunity of advancing chemical science, by placing the products of their manufactories at the disposal of M. Persoz.

Some of the patterns are of great beauty—displaying a brilliancy of color which we have never seen excelled; and, altogether, the work gives abundant evidence that the art of calico-printing has attained to extraordinary perfection. It is worthy of mention, that the English legislature enacted, in 1720, an absurd sumptuary law, prohibiting the wearing of all printed calicoes whatsoever, either of foreign or domestic origin. This act remained in force during a period of ten years; and then, was repealed by an only half-enlightened body of senators—who permitted what were called British calicoes, if made of linen warp, with weft of cotton only, to be printed and worn, upon payment of a duty of sixpence on the square yard. These acts had the effect of nearly extinguishing, amongst us, the rising industry in this ingenious department of the arts: and it was only after 1774, when that part of the act of 1730 which required the warp to be made of linen yarn was repealed, that calico-printing engaged the serious attention of English manufacturers.

The dread of encouraging the importation of cotton, and throwing flax (a native product) out of cultivation, had a similar effect in France;—although that country had the good sense to perceive its error at an earlier period than Great Britain. It is well known that the principles of calico-printing are now profoundly studied by the

French manufacturers; who generally keep a chemist constantly at work, making experiments upon colors in a well-mounted laboratory.

The work of M. Persoz—to which we earnestly invite the attention of our Lancashire manufacturing friends—shows the pains-taking manner in which one of our most important and pleasing arts is studied. We observe that the Society under whose patronage these volumes are published, announces its intention to give copies of the work, as prizes, to overseers and foremen who may produce new inventions in design or printing.

CAUSE OF DOUBLE FLOWERS.

THE cause of double flowers has lately been explained in the *Revue Horticole*, on a rather curious and interesting principle. It is impossible for any inquiring mind not to attempt an explanation of the fact, that many plants which, in a state of nature, never present more than a single row of petals, begin to assume several rows under continued cultivation. The effects of a richer soil, and other genial circumstances, or the mere accident of double petals in one plant transmitted with improvement through its progeny, are the common explanations; and these are generally received as satisfactory, without reflecting that what we call accident is itself a result of some cause, and that change of condition must attack some physiological principle before it can have any effect in modifying the character of a plant. Nothing is now so common as double flowers; and "to explain the phenomenon," says the *Revue*, "we must make practice agree with theory. Every gardener who sows seed wishes to obtain plants with double flowers, so as to have blossoms which produce the greatest effect. Every double plant is a monstrous vegetable. To produce this anomaly, we must attack the principle of its creation; that is to say, the seed. This being granted, let us examine in what way these seeds ought to be treated. If, after having gathered the seeds of ten weeks' stock, for example, we sow them immediately, the greater number of the seedlings will produce single flowers; whilst, on the contrary, if we preserve these same seeds for three or four years, and sow them, we shall find double flowers upon nearly all the plants. To explain this phenomenon, we say that, in keeping a seed for several years, we fatigue and weaken it so, that the energy which would otherwise have been expended in producing stamens, produces petals. Then, when we place it in a suitable soil, we change its natural state, and from a wild plant make it a cultivated one. What proves our position is, that plants in their wild state, shedding their seeds naturally, and sowing them as soon as they fall to the ground, yet in a long succession of time scarcely ever produce plants with double flowers. We think, then, after what we have said, that whenever a gardener wishes to obtain double flowers, he ought not to sow the seeds till after having kept them for as long a time as possible. These principles are equally applicable to melons, and all plants of that family. We admit, like many other observers, that melon plants obtained from seeds the preceding year ought to produce, and do produce, really very vigorous shoots, with much foliage; but very few fruitful flowers appear on such plants; whilst, on the other hand, when we sow old seeds, we obtain an abundance of very large fruit. In fact, in all varieties of the melon, the seeds should always be kept from three to eight years before being sown, if we would obtain fine fruit, and plenty of it."

NEW BOOKS AND RE-PRINTS.

The Bible, The Koran and the Talmud; or Biblical Legends of the Mussulmans. Compiled from Arabic sources, and compared with Jewish Traditions. By Dr. G. Weil. Translated from the German. Vol. 15 of Harpers' New Miscellany.

The Modern British Plutarch; or Lives of Men distinguished in the recent history of England for their Talents, Virtues, or Achievements. By W. C. Taylor, LL. D. Vol. 17 of Harpers' New Miscellany.

The Expedition to Borneo of H. M. S. Dido, for the Suppression of Piracy: with Extracts from the Journal of James Brooke, Esq., of Sarawak (now agent for the British government in Borneo.) By Captain the Hon. Henry Keppel, R. N. Vol. 18 of Harpers' New Miscellany.

Temper and Temperament; or Varieties of Character. By Mrs. Ellis. Published by Harper & Brothers.

The Wandering Jew is now completed.—Copland's Dictionary of Practical Medicine has reached the letter O in Part 16.—Harpers' Illuminated and Illustrated Shakespeare has reached No. 100.

Pictorial History of England. This book it is pleasant to look at: so well is it printed, and so good is it for the family.

Statesmen of the Commonwealth of England; with a Treatise on the Popular Progress in English History. By John Forster. Edited by J. O. Chowles. Sir John Eliot, the Earl of Strafford, and John Pym, are the lives in Nos. 1 and 2. To be completed in five numbers.

WILEY & PUTNAM have issued several good books:

Ecclesiastical Reminiscences of the United States. By the Rev. Edward Waylen, late Rector of Christ Church, Rockville, Maryland. Eleven years resident in America.

[Whether it arise from the longer residence here, or a better temper, or a clearer head than many other English travellers have had—it is pleasant to see an Englishman writing of us without arrogance or pertness. And when we recollect the high praise we received from Mr. Lyell, who differs so much from Mr. Waylen in his religious opinions, we may perhaps, diffident as we are, be convinced that there is really some good among us. We copy a few passages from his preface, dated Queen Square, Westminster.]

"That he has spoken favorably of the Americans as a people, arises from his long and intimate acquaintance with them; during which he has associated with almost every class in that community. He cannot lend himself to a falsehood to make his book sell; though it has to be proved whether defamation or grotesque caricature, applied to the people of a country, whose glory and greatness are our own, furnish the only staple commodities in this department of authorship. The Americans, as a race of people, inherit most of the good, and are free from many of the bad qualities which distinguish the nation from whence they have sprung; nor has the free intermixture of continental blood effected any deterioration in their mental or physical qualities. The defects of character (arising solely from education) which

distinguish a portion of them before the world, and the exhibitions of popular license which the country occasionally presents, originate in a combination of religious and political influences, in which the former has decidedly the largest share; as in the following pages is attempted to be shown.

"The author's own experience has satisfactorily proved to him, that even amongst the demagogue political capitalists, the arrogance and conceit which is erroneously charged upon the whole nation is, in fact, only a 'defensive' weapon, resulting from the contempt which it was fashionable for English writers and public speakers to express for America and her institutions long after the war which made her independent of the mother country.

"The people of the United States—the author's experience and intimate knowledge of them enable him to affirm it—those who form the mind of the nation, and who, it is hoped, will yet recover their legitimate control over the action of the country—are ready and desirous to join with us in securing a lasting alliance, and in all the schemes for more enlarged benevolence to which such alliance must naturally lead."

[Mr. Waylen is of the Episcopal church, and it may require a "catholic spirit" on the part of readers of other denominations to enjoy the book. We have not had time to read it, but look for much pleasure therefrom.]

The Life and Correspondence of John Foster: edited by J. E. Ryland. [Mr. Foster is so well known as the Author of the Essay on Decision of Character, that American readers will take up these volumes with much interest.]

Responses on the Use of Tobacco. By the Rev. Benjamin Ingersoll Lane, Author of the *Mysteries of Tobacco*. [This book consists principally of letters to the author from twenty-five well-known persons who carry on the war against tobacco with much zeal. We remember to have heard a man of many bad qualities, among which a want of politeness was evident, say to an old lady who offered him a pinch of snuff—"I never snuff, smoke, chew, swear, or drink rum." She threatened to throw her snuff-box into his eyes, for his classification, and perhaps that mode of disposing of it would have been useful to him, as it certainly would have been to her. We do not use tobacco, except for the purpose of disgusting the moth, but nevertheless are candid enough to see that there must be something *strong* in it, for else the many high-spirited young men about town would not submit to the labor of decocting it; and there must be something *good* in it, or its use would not be indulged in by so many clergymen and other wise men. Many distinguished "temperance" men, appear to find help in it. There must be great good, to make up in the minds of such men as we have spoken of, for the offences to delicacy and cleanliness which are inseparable from the use of this "great medicine."]

GREELEY & McELRATH have added to their stock of good books, Incentives to the Cultivation of the Science of Geology. Designed for the use of the Young. By S. S. Randall, Deputy Superintendent of Common Schools of the State of New York, Editor of Common School Journal, &c.

From the Foreign Quarterly Review.

De la Démocratie chez les Prédicateurs de la Ligue.
Par M. Ch. LABITTE. 8vo. Paris: 1841.

FROM about the year 1576 to 1594, a period not far short of twenty years, the fair realm of France, bound down with the iron fetters of that cruel, turbulent, implacable "Ligue" which has obtained a place in history not less conspicuous than the "Directorat" or the "Consulat" of later times, was prostrated at the feet of its clergy. Perhaps no period of history has ever presented a state of things so extraordinary in all its relations, or so replete with warning for future ages. None has been so generally misunderstood and misrepresented by modern historians, who, judging only from a superficial and partial view of the outward face of events, have tried to give it a variety of physiognomies at their own pleasure, and have left it at last a sort of incomprehensible mystery.

It is the duty of the historian to dive beneath the surface of the stream of events; he should seek out the cause which moves the waters; it is not enough to watch merely the apparent actions of those who, perhaps, in spite of their outward importance to the view, are in reality only the arms which execute, while a moving principle far less splendid and less imposing sets them to work.

Such was the case in an especial degree with this redoubtable "Ligue." Writer after writer has traced the intrigues of the princes, has admired the persevering constancy and bravery of the King of Navarre, has spoken reproachfully of the political pretensions of the pope, and of the selfish designs of the Spaniard; but few or none have withdrawn their eyes from these more dazzling spectacles, to trace the progress of a band of preachers who kept these actors in motion, who used religion as a means of gratifying their ambition or their appetite, and who raised a storm which, as we have just remarked, it took nearly twenty years to allay. These formed the true body and soul of the "Ligue," and they furnish a political lesson which it would be well to remember. A French writer of good promise, who was recently cut off in the prime of his life, attempted, in the volume of which we give the title above, to compile their history from a class of documents too seldom consulted—the political sermons and satirical tracts, which, under circumstances like these, never fail to issue from the press in profusion. A few pages will not be thrown away in laying before our readers some portion of the result of his researches, which are very little known in this country. We take his volume as a collection of materials; for in some of his general views we entirely disagree. In many things M. Labitte appears to us to partake too much of the character of a historian, who flatters himself that he is viewing history from a neutral and impartial position, because he treats the principles of both parties with equal contempt; and, in so doing, he further runs into a fault too common in French writers of this class—that of generalizing facts which are simply accidental, and of giving as general principles what are merely the evident result of sudden political excitement.

Let us, before we proceed, glance for a moment at the events that preceded those which more especially belong to our subject. It is not our intention to dwell upon those sanguinary persecutions of the Protestants which disgraced the reign of Charles IX., and seemed to have turned this part of Europe into one wide unchanging field of murder, rape, and pillage. The monks and Catholic preachers acted a prominent part in these fearful scenes; they waded literally through blood to the pulpit, from which there seemed to issue but one continuous cry of, "Slay! slay! rob! rob!" a cry which had, indeed, been heard long before it was put in execution. As early as the year 1554, ten years before the execution of Anne Dubourg, and eighteen before the fatal St. Barthélemy, the dean of St. Germaine l'Auxerrois at Paris, father Le Picart, had the effrontery to preach from his pulpit, when speaking of the Protestants, that, "the king ought for a time to counterfeit the Lutheran amongst them, so that thus alluring them into his power, they might fall upon them all, and purge the kingdom of them at once." As the support of the clergy became more and more necessary to the ambitious designs of the Guises, their influence increased to such a point that even the royal will was no longer a bridle to it, and they undisguisedly and unequivocally urged on the populace to rise and destroy the Huguenots. There was soon a general insurrection of the clergy against the moderate and peaceful policy of the king, whose weakness only increased their audacity. For several years priests and monks were everywhere busily engaged in preaching to the people that they should take up arms; they hesitated not to point out to the assassin men of wealth and influence who favored the reformers; they even went so far as to proclaim in their sermons that, "if the king showed too much reluctance to massacre the Calvinists, he ought to be dethroned, and shut up in a convent;" and, at the beginning of the memorable year 1572, a bishop, Arnaud Sorbin of Nevers, *faisait rage* (to use the expression of contemporary historians) against the king for not killing them, and publicly excited the Duke of Anjou to do the work himself, "not without giving him some hope of the primogeniture, as Jacob had received that of his brother Esau." The pulpit became a power superior to the laws; the king was no longer able to resist, and the result was the catastrophe of the 24th of August, 1572, which is still remembered with horror as the massacre of St. Barthélemy. From this moment the French clergy, in the persons of its preachers, a number of turbulent, seditious, unruly men, took the field undisguisedly, and continued to overawe the crown by constantly stirring up the passions of the mob. These preachers soon became the masters of the kingdom.

Such was the state of France when, in 1574, Henri III. ascended the throne. A powerful insurrection against the crown already existed, which was excited by men who above all others had the entry to every hearth and access to every ear, and who made no scruple of enlisting to their purposes every wild passion and revolutionary feeling under the specious pretence of the safety of the church.

All they wanted was organization, and a banner under which to fight. The latter was furnished by the popularity of the Guises, whom, for more than one generation, the Catholic preachers had been pointing out to the devotion of their hearers by the most extravagant eulogies of which they were capable; scarcely a distinguished member of the family had died within memory who had not been held forth from the pulpit as a saint or a martyr.* On all these occasions, the preachers hardly concealed their wish to set up the House of Lorraine in opposition to the reigning family; and they constantly dwelt on the theme, that a king who shows favor to heretics ought to be torn from his throne by his subjects, and one more orthodox substituted in his place. The organization, which the earlier opposition to the crown had wanted, was found in the "Ligue."

This Ligue, of which the first serious symptoms showed themselves in 1576, was only the realization on a large scale of what had already been attempted partially by the Cardinal de Lorraine. When once formed, the association increased rapidly, and as it became stronger, its aim was directed proportionably higher. One of the articles of its programme was "The Defence of the King;" but as that was only a secondary object, it was soon forgotten. In fact, it was covenanted from the first, that those of the "Holy Union," as it was termed, had a right to sustain their cause by force of arms against whoever it might be. The remissness which they thought Henri III. showed in persecuting heretics, and the defection of the heir-presumptive (the Duke of Alençon) to the united party of the Huguenots and discontented Catholics, irritated the violent Catholics to that degree, that it was resolved to overthrow the house of Valois. A messenger sent to the court of Rome represented, that the benedictions bestowed by the Holy See on the race of Charlemagne had not passed to the family of Hugh Capet, and a genealogy was drawn up by which the Guises were made to be the descendants of the Carolingians. The first volume of the "*Mémoires de la Ligue*" contains a note of the secret council held at Rome for the destruction of the house of Valois, and the transmission of the crown to that of Guise, in which the preachers were to act a very important part. They are brought forward even in the first article, which directs, "that in the pulpit and at the confessional the clergy shall exert themselves against the privileges granted to the sectarians, and excite the populace to hinder them from enjoying them."†

* The unscrupulous political violence of the Catholic preachers was as remarkable in their eulogies as in their personal attacks, and many really amusing examples might be given. M. Labitte takes the following anecdote from De Thou. Pierre du Chartel, in his funeral sermon on François I., proclaimed to his hearers that the soul of the great monarch was already in heaven. The faculty of theology was singularly scandalized by this assertion, which they considered as a denial of purgatory. A deputation of theologians was sent to the new king, Henri II., to expostulate; but Jean de Mendoza, who was to introduce them, said to them, "Je sais pourquoi vous venez ici; je connaissais notre bon maître mieux que vous, et s'il a été en purgatoire il n'aura fait qu'y goûter le vin; il n'était pas homme à rester longtemps en place." The Sorbonne appears to have been satisfied with this explanation.

† "Qu'en chaire et au confessional ceux du clergé s'élevaient contre les privilèges accordés aux sectaires et excitent le peuple à empêcher qu'ils n'en jouissent." We have seen a similar political use made of the confessional in France in our own days; so certain is it that the bad principles of the Romish church are inherent to the system, and that they remain unchanged.

The curés were enjoined to act the part of men in condition to bear arms, and it was resolved that the king should be deposed and shut up in a monastery. This was an attempt to force society back to the barbarism of the first ages of the monarchy.

When Henri convoked the first states at Blois, he hoped that moderate men would have been elected; but the preachers had caused so much excitement among the Catholics, that the Protestants did not dare to offer themselves, and the deputies present were all liguers. The king felt the difficulty of his position, and attempted to recover his influence by suddenly placing himself at the head of the Ligue; but his weakness of character hindered him from profiting by this step. The projects of the Guises were for a moment only disconcerted; and the edict of Poitiers strengthened their party, which now openly encouraged and invoked the democratic passions of the mob as a weapon against the throne. The violent attacks upon the king from the pulpit, and the eulogies of the Guises, increased daily. Every vice and even every weakness of Henri III. was raked up and dwelt upon with malicious acrimony; his very acts of devotion, which in another monarch would have been lauded to the skies, were turned into crimes; and when he founded a monastic order of penitents, one of the most distinguished and active preachers of the day, the benedictine Maurice Poncet applied to them in his sermon the title of "*la confrérie des hypocrites et athéistes*." In fact, the Catholics would not allow the king to save his soul even in an orthodox manner.

Under these circumstances, the principles of the Ligue rapidly spread themselves through every part of the kingdom. "In the north, as in the south, the Union found its adepts as well amongst the turbulent as among the moderate. At Nîmes, it was established by massacres and rapes; at Laon, it was adopted in the name of reason and legality. In the pulpits of the provinces, the same principles and the same invectives resounded as in the pulpits of Paris; at Lyons, there was the Jacobin monk Bolo, and more especially the Jesuit Claude Mathias, *the courier of the Ligue*, as he was called, an indefatigable traveller who, under the least pretext, ran from one end of Europe to the other for the interests of his party; at Soissons, there was Launay, who in the sequel became one of the chiefs; at Rouen, the cordelier Gilles Blouin; at Orleans, the learned but violent theologian Burlat; and above all, there was at Toul the archdeacon of the cathedral, François de Rosières, who declaimed against his king amid the applauding shouts of the mob, "*con plausibile e popolare eloquenza*," as Davila says. This François de Rosières had in 1581 published a book in favor of the title of the house of Lorraine, for which he was thrown into the Bastille; the credit of the Guises procured his release; but Rosières showed no gratitude to Henri III. for his clemency, or rather for his incredible apathy. At Châtillon, the sermons of the preachers appear to have been thought insufficient; to excite more effectually the populace, the clergy caused to be represented, in a mystery or theatrical exhibition, the combat of David against the giant Goliath. David, as might easily be guessed, was the symbol of Henri de Guise." The result of this extraordinary activity of the Catholics was, that Henri III. was universally abandoned. The state of things became still more alarming, when the death of the Duke of Alençon made Henri de Navarre, the Huguenot leader, heir-apparent to the throne. His claims

were at once set aside by a bull of excommunication, and the court of Rome openly put forward the titles of Henri de Guise, the eager adviser and promoter of the massacre of the Saint Barthélemy, to the crown of France, which the preachers were directed to set forth zealously in their sermons.

At first the higher clergy had shown some degree of reluctance to take part in these gross and indecent attacks upon royalty. It was the religious orders, the curés, the *maîtres des arts crottés*, (as they were termed in derision by the other party,) the doctors of the Sorbonne, fed with Spanish money, publicly encouraged by the Guises, paid and excited, and even prompted by the Duchess of Montpensier, to whom the king was an object of furious hatred; in fact it was the whole body of the secondary clergy, who, assisted by the intrigues of the Jesuits, the support of the pope's nuncio, and the discontent of two or three ambitious and turbulent prelates, threw themselves into the foremost ranks of the disaffected, and acted upon the masses by the unbridled brutality of their declamations. An example or two will show the unscrupulous manner in which they propagated misrepresentation and falsehood. In August, 1587, Jean Boucher, (one of the most violent of the curés of Paris,) preaching in the church of St. Barthélemy, told his auditors with the greatest assurance, that the king intended to hinder all the preachers from speaking the truth, and that he had already put to death Burlat, the incendiary preacher of Orleans. Henri III., informed of this calumny, sent for several of the rebellious doctors of the Sorbonne, and in their presence asked Boucher why he had accused him of murdering Burlat? Boucher said that it had been told him for truth. The king reproached him for believing what was evil rather than what was good, and then caused Burlat to be introduced, alive and well, to Boucher's no small confusion, who, however, escaped without punishment. It is even said that Burlat had been all the time living in intercourse with Boucher and the other preachers. In the same year, when the German Reiters were entirely defeated at the battle of Auneau, at which the king was present, the preachers could scarcely give him a small share in the victory, a few of them only condescending to compare him with Saul, who had slain his thousand, while David, *i. e.*, Henri de Guise, had killed his ten thousand; but every pulpit rang with the marvellous valors of this "new Gideon sent for the salvation of France." The king is said to have been extremely offended at these demonstrations of partiality; but he was still more alarmed in the December following, when in the Sorbonne the faculty of theology decided that it was lawful to take the government out of the hands of princes, who did not fully perform the duties expected from them.

We are now arrived at the eventful year 1588. In spite of the successful efforts of the preachers, in spite of the approbation and encouragement of the pope, and the active support of Philip II., of Spain, the Guises seem to have shown some reluctance to put themselves openly at the head of the insurrection, till the uncontrollable zeal of a self-formed committee, behind which they concealed themselves, obliged them to throw off the mask. This committee consisted chiefly of the more intemperate of the preachers, with two or three *bourgeois*, equally distinguished by their violence,

who on entering were made to swear to sacrifice their lives, if necessary, to the cause, and who met for some time in the chamber of Boucher, in the Sorbonne. They were especially supported by the Duke of Mayenne, and were directly countenanced by the pope. It was, indeed, with them, that the latter communicated most confidentially. They began by demanding of the king the establishment of an inquisition, like that of Spain, in every town in France, which was of course refused; and then they sent agents into every part of the kingdom, to agitate the populace. At Paris, the seditious acrimony of the sermons increased to such a degree, that the king was obliged to send for one of the preachers, who, at the beginning of May, had held forth against him with more than ordinary intemperance in the pulpit of St. Séverin. A report was instantly set abroad by the clergy, that the king designed to seize all the preachers; whereupon the curé of St. Séverin raised his parishioners, and refused to deliver the offender. Boucher simultaneously sounded the tocsin in his parish of St. Benoit; their confederate, Bussy-le-Clerc, one of the most violent of the lay members of the committee, came with his company in arms, and established himself in the immediate neighborhood of the church; and the king's archers, who came to seek the preacher, were driven away. The die was irrecoverably thrown by this open act of rebellion; and only a few days after, on the 12th of May, 1588, the "barricades" compelled Henri III. to make a hasty retreat from his capital by one of its most private entrances, followed by the musket-shots of his own subjects. This event had been long in preparation by the revolutionary council of the preachers, who, in the moment of action, showed themselves in the foremost ranks. They marched at the head of an army of 400 monks, and 800 scholars of the university, shouting out "That they must go and seize 'brother' Henry de Valois, in his Louvre." After the king's escape, they established a kind of municipal government in the capital.

Influenced by this success, for the king by his flight had given them an undoubted advantage, the clergy of Paris seemed to be worked up to a sort of madness, and the king, in his retreat, was exposed daily to new insults and humiliations. Many of the vacant curés of the churches of the capital were given to violent liguers, to the injury of those who were legitimately entitled to them; and two priests, who afterwards made themselves peculiarly conspicuous, Guincestre and Pigenat, were thus forced into the churches of St. Nicolas des Champs, and St. Gervais. The latter preacher was especially popular with the Parisian mob, and he carried his zeal so far as to march in their fanatical processions stark naked, with nothing but a little apron of white linen before him. Henri III., driven to desperation, had the weakness to attempt to deliver himself by a crime; he ordered the murder of the two Guises, Henri and his brother, the cardinal, which was executed on the 23d of December, 1588.

The preachers of Paris were struck dumb with astonishment at the first intelligence of this unlooked-for tragedy, and for two or three days their violence seemed to have ceased. But it was only the silence which often precedes a great explosion. Guincestre was the first to break it; on the 29th of December he mounted the pulpit of the church of St. Barthélemy, and pronounced a violent philippic against the king, whom he called a *villain*

Herodes (the anagram of Henri de Valois,) and after applying to him every kind of opprobrious epithet, declared to his audience that they owed him no further obedience. The latter, after the sermon, rushed to the door, where they tore down the king's arms, and trampled them under foot. On the 1st of January, the same Guincestre called out to his audience to hold up their hands and swear that they would revenge the deaths of the princes with the last farthing in their purses, and with the last drop of their blood. The president, De Harlay, a man distinguished for his moderation, was sitting in face of the pulpit; and the preacher addressed him more pointedly than the rest—"Raise your hand, Monsieur le President, raise it very high, in order that everybody may see you." Had the president dared to disobey, he would probably have fallen a sacrifice to the mob. Not many weeks afterwards, he was thrown into prison by the liguers. Pigenat preached the apotheosis of the Guises at Nôtre Dame; and, in the midst of a torrent of eulogistic eloquence, he stopped suddenly to ask his auditors if there was not a man among them zealous enough to avenge the martyrs "in the blood of the tyrant who had ordered their death." This was a direct incitement to regicide. In Paris, the clergy got up a procession of 100,000 persons carrying tapers in their hands, and shouting, "God, extinguish the race of the Valois!" Some of the priests placed on their altars wax images of Henri III., and during the service of the mass stabbed them several times to the heart.

The murder of the princes forms a marked epoch in the history of the Ligue. Mendoza, the Spanish ambassador, left the king and repaired to Paris, where he gave the Ligue, by his presence, the authority of the name of Philip II. The Duke of Mayenne, the brother of the Guises, had also thrown himself into Paris; and under his presidency was constituted the "council of forty," afterwards increased to the number of fifty-four, which included seven of the most intemperate preachers, Rose, Boucher, Prévost, Aubry, Pelletier, Pigenat, and Launay. The members of this council, which had virtually seized upon the government of the country, received each a salary of a hundred écus every month. The object of the Essay of M. Labitte, which we are following in our narrative, is to show the democratic tendency of the sermons of these preachers; and it is evident throughout, that they encouraged republican principles, with the object of securing to themselves the exercise of power unchecked by a superior hand. They were never unmindful of their own interests, for they took care to appropriate to themselves a large portion of the plunder of the houses of suspected royalists, and some of them were known to be living in shameful profligacy. A writer of the time tells us that men who a few years before stood amongst the lowest of the clergy, and possessed little more than what was necessary for their existence, were now grasping, one at a rich benefice, another at an abbey, another at a bishopric, and were hardly satisfied even with these.

The hundred écus a month had certainly a powerful effect in stimulating the zeal of those who received them, who were, if possible, less scrupulous than ever in their calumnious statements. They began, as M. Labitte observes, to deal in the marvellous. Boucher, speaking of the king, in a sermon, on the 15th of February, 1589, said,

"This scurvy-pate (*ce teigneur*) always wears a turban like a Turk, which he has never been seen to take off, even at the sacrament. And when this wretched hypocrite pretended to go against the Reiters he wore a furred German coat with silver hooks, which signified the good intelligence and agreement which were between him and *ces diables noirs empistolés*." These were all gratuitous falsehoods. Guincestre, though not a member of the council, went still further. On Ash-Wednesday he announced that that Lent he would not preach the gospel, because it was "too common and everybody knew it," but that he would relate to his congregation, "The life, actions, and abominable deeds of that perfidious tyrant Henri de Valois," in the course of which he deliberately accused him of offering worship to devils; and drawing out of his pocket an ornamental candlestick, supported by figures of satyrs, which he pretended had belonged to the king—"Lo!" said he, "these are the king's demons; these are the gods whom he adores, and whose enchantments he uses!" Guincestre and Feuardent, a preacher as violent as himself, with the influence of others of the fraternity, now obtained from the faculty of theology a decree, which declared that Henri III. was dethroned, and authorized his subjects to take arms against him. The personalities employed in the sermons became daily more frequent; the moderate inhabitants of Paris were obliged to attend the preachings, and join in acts of intemperate zeal, or they ran the risk of being pointed out from the pulpit to the vengeance of the mob. Women were not spared. On one occasion, a preacher having pointed out two ladies of quality, named Barthélemy and Feudeau, as being somewhat remiss in their zeal, it was not without the greatest difficulty that their persons were saved from outrage, and their houses from pillage. Murder, when committed upon a partisan of the king, was a subject of public exultation. One day a liguier slew a royalist, in a frivolous duel; his valor was in an instant the subject of a sermon in every church. "The young David," it was said, "has slain the Philistine Goliath!"

A new tragedy was now preparing, which was to lead to a further complication of events. The king had strengthened himself by joining with the King of Navarre, who came to his assistance with a Protestant army, and they advanced upon Paris. The populace began to be discouraged; an exhibition of strength might still revive the latent respect for the crown, and in that case the influence of the preachers was at an end. The latter, aware of this, were indefatigable in their exertions, both at Paris and in the provinces, to keep up people's zeal; they said that the capital was strong enough and rich enough to set at defiance four kings; that France was sick, and could only be relieved by a "potion of blood;" and they announced officially that they knew it was intended that, in every town which surrendered to the king, the preachers were to be massacred, the magistrates hung, and the women abandoned to the brutality of the soldiers. The not over-scrupulous writers of the time refuse to report the gross indecency of the terms in which the king was spoken of in the pulpit. The end of July was approaching, and Paris was suffering so much from the siege, that people already began to speak of surrendering. The preachers begged them to wait patiently seven or eight days, and assured them that they would see before the end of the week "some great thing," (*quelque grande chose*), which would effect their deliverance. We

are told that the same announcement was made by the preachers at Rouen, Orleans, Amiens, and other great towns. Within the time specified, on the 1st of August, 1589, Henri III. was assassinated by the Jacobin monk, Jacques Clement, who had been urged to this crime by the exhortations of the preachers, by the favors (as it was said) of the Duchess of Montpensier, and by the promises of the chiefs of the Ligue. One only of the clergy of France, the superior of a Cistercian convent, distinguished by his virtues, ventured to celebrate in public the funeral service for the unfortunate monarch; his monks rebelled against him, he was driven from his office, and was long afterwards an object of persecution in the church.

As we stated at the beginning of our article, France now lay absolutely at the mercy of its preachers. M. Labitte has given brief notices of some of the most prominently seditious. Jean Boucher, the most remarkable of them all for the part he acted, and for the number and violence of his writings, was a native of Paris, born in 1551, distinguished for his learning and eloquence, but ambitious in the extreme, and possessed of a ferocity of character which the historians of the time describe as amounting almost to madness. Next to him comes Guillaume Rose, a fit companion for him, equally learned, and even more eloquent, but characterized by Bayle as *le plus enragé ligueur qui fût en France*: he was two or three years older than Boucher, had received innumerable benefits from the king whom he deserted, and had been made Bishop of Senlis in 1584. He was believed by some to be liable to temporary attacks of insanity. Mathieu de Launay was a native of Sens, had been a convert from Calvinism, and was subsequently a canon of Soissons, where he was the grand supporter of the cause of the Ligue, until he was called by his brethren to Paris; he was accused of irregularity of morals, and there were those who did not hesitate to characterize him by the appellation of *un scélérat*. Génébrard, a Benedictine, born at Riom, in 1537, was also distinguished by his learning, and by his fanatical violence—Lestoile compares his eloquence to that of a fish-woman in a passion. The cordelier, François Feuardent, born at Coutances, in 1539, was also considered as one of the pillars of the Ligue; his name appears to have been characteristic of his temper. A contemporary writer, speaking of his eloquence, tells us that *verbum sicut facula ardebat*. Such were the men who in a manner wielded the destinies of their country. After these in importance come the names of Pigenat, Pelletier, Prévoist, and Guincestre, the latter a Gascon, whose name would seem to show that he was descended from an English family. Jean Hamilton, the curé of St. Cosme, was a Scot, who had left his native country in his youth, on account of his religion. These were imitated in their zeal in a greater or less degree by the numerous muster of names, most of them obscure, which formed the army of this extraordinary church militant. There were but three churches in all Paris which were not occupied by violent liguers; all the others had become veritable nests of sedition, and there was not a place of worship in which a sermon for the success of the "Holy Union" was not preached twice every day.

The murder of the king threw everything into momentary confusion. The preachers were far from wishing to avoid the odium of the deed. A circular was sent round to the clergy of Paris,

containing three points which they were to sustain in their next sermons—to justify the act of the Jacobin by comparing him to Judith—to prove that "the Béarnois" (Henri de Navarre, who had at once assumed the title of Henry IV.) could not succeed to Henry de Valois, and to show that all those who ventured to support his claims ought to be excommunicated. Guincestre celebrated first the apotheosis of Jacques Clement, who was proclaimed in every pulpit as "the blessed child of St. Dominic," "the holy martyr of Christ." Those who dared to apply the title of regicide to the hero who had delivered his country "from that dog Henri de Valois," were marked by the preachers for popular vengeance, under the coarsely expressive but untranslatable epithet of *garnements*. Tapers burnt in the churches around the statue of Jacques Clement, whose mother came to Paris to receive the reward of his act. The people were invited in special sermons to go and reverence "the blessed mother of the martyr," who, on her return, was accompanied to the distance of a league from the capital by a cortège of forty monks. The pope in his joy, on receiving intelligence of the murder, exclaimed that the deed was as useful to the church as the incarnation of the Saviour, and compared the heroism of the assassin to the actions of Judith and Eleazar.

The siege of Paris had been relinquished after the murder of Henri III., and the liguers, whose hopes were suddenly raised to the highest pitch, proclaimed the Cardinal de Bourbon (then a prisoner) his successor, under the title of Charles X., a mere shadow of a king, as M. Labitte observes, which adjourned the settlement of the question among the real pretenders, and allowed them to unite for the destruction of the rightful monarch, Henri IV. The latter appeared to have no resource left but his own tried genius and courage. The Duke of Mayenne had pursued him to the neighborhood of Dieppe, in the confidence of there putting an end to the war, and the windows of the houses in Paris were already let to those who wished to see the Huguenot king led a captive through the streets, when the victory of Arques, in the month of October, completely changed the face of events. The preachers were thunderstruck at the news of this disaster; but they had recourse to their old tricks, and kept people in ignorance as long as they could, by reading from the pulpit pretended letters of their general, announcing triumph after triumph. A sudden and vigorous attack on the faubourgs of the capital revealed the truth to the astonished Parisians.* Another circumstance alarmed the preachers: Pope Sixtus V. had hitherto given the Ligue his entire support, but, perhaps seeing more advantage to be derived from the expected conversion of Henri IV. than from the success of his rebellious subjects, he began to show a certain degree of irresolution, which irritated them so much that they actually began to

*A circumstance told by Lestoile on this occasion shows the tyranny exercised by the preachers and lower bourgeoisie at this time, and their jealousy of the civil magistracy. "Le Lundy sixième de Novembre quelques zélés ayant remarqué que pendant que le roi estoit maître des faubourgs, le président Blancmenin, président au parlement, avoit son visage plus riant que de coutume, le prirent prisonnier, et commencerent de lui faire son procès, comme homme suspect et attaché au Béarnois. Cependant il n'en mourut pas par les soins de son frère, seigneur de Gevre et Secrétaire d'Estat." People were daily murdered in the streets or drowned in the river for offences of no greater magnitude.

speak openly against the head of the church, and the news of his death, which happened soon afterwards, was received with expressions of joy.—“God,” said Aubry, in announcing this event from the pulpit, “has delivered us from a wicked and ‘politic’ pope. If he had lived longer, people would have been surprised to hear the pope preached against in Paris, but it would have been necessary to do it.” The Duke of Mayenne and other great leaders of the Ligue began also to nourish more moderate feelings, for they were tired of the intemperate violence of the churchmen. But the latter were supported by the gold of Philip II., who had his own private views; and they endeavored to keep up the political agitation by a multitude of libellous and seditious pamphlets, among the writers of which Jean Boucher stood preëminent. A party, however, had risen, known under the title given them by the preachers, of “the politics,” advocates of moderate measures, and willing to give the crown to Henri of Navarre, on his conversion to the Catholic faith, who were increasing daily, though in secret, and who exerted a considerable influence on events in the sequel. For the present, the preachers had obtained entire command over the minds of the people, as well in the provinces as in the capital. “Fanaticism,” as M. Labitte observes, “reasons not, and, until the exasperation subsided of itself, the efforts of the royalists to plead their cause were vain. They, therefore, returned to the means of conquest, while the liguers redoubled new methods of exciting the populations. Decrees of the Sorbonne, protestations of the pope’s legate, (who, by the way, paid little attention to the directions of his master, when contrary to the party in which he had joined heart and soul,) processions, threats of damnation, promises of felicity in heaven, sermons more frequent than ever, everything was employed with a new eagerness, all means were accumulated, so to say, to render the insurrection general.” Every town in the north of France, and several cities of the south, especially in Provence, were by such means as these secured under the domination of these turbulent monks.

In March, 1590, the Ligue received a still more serious check in the battle of Ivry. The council of government alone knew this fatal intelligence, which had been brought by a prisoner released on parole; and they knew not how to communicate it to the people. After a long deliberation, the monk Christin was charged with this difficult mission. On the 16th of March, the second day after the battle, he mounted the pulpit, and in the course of his sermon introduced, as if by chance, the words of the Scripture: “Quos ego amo, arguo et castigo.” This offered a theme upon which he dwelt at some length, and in the course of his argument he went on to say that God, without doubt, would not fail thus to try the devotion of his Parisians. He pretended to have done with this part of the subject, and was proceeding to another division of his sermon as a courier hastily entered the church, and placed a letter in his hand. Christin looked at it, and then raising himself suddenly in the pulpit with the letter in his hand, he cried out with an affected air of consternation, that doubtless Heaven had inspired him, and had made him that day a prophet rather than a preacher. He then related to them the disaster they had experienced at Ivry, and with all the force of his eloquence, burst into such pathetic exhortations, that the crowd, which at first had listened in silence and

sadness, passed from terror to enthusiasm, and showed a disposition to suffer anything for the holy cause of the Union. Another siege of Paris was imminent, and the wiser heads began to talk of conciliation; but the violent councils of Boucher, Pelletier, Aubry, Hamilton, &c., carried the day. Henri IV. established the blockade of Paris on the 8th of May, 1590, and nearly at the same time the death of the so-called Charles X. left the liguers without even the shadow of a king.

At the beginning of the siege, the ecclesiastics of Paris made a grand procession, which took place on the 3d of June. About 1300 monks, priests, and scholars, all dressed in the habits of their order, and bearing arms of different descriptions, with their robes tucked up, marched in grotesque military order through the streets of Paris, with the Pope’s legate, the bishop of Asti, (Panigerolle,) Bellarmine, (not yet a cardinal,) and Bishop Rose at their head. Even buffoonery like this was not thrown away on the excitable minds of the Parisians; and it helped to encourage them in sustaining the miseries of the siege, which were increasing daily in the total absence of supplies from without. The violence of the preachers had created a sort of terror; the man who dared to speak of peace or of surrender was pointed out as a “politic,” and instantly sacrificed; people were everywhere dying of hunger, yet they were satisfied with popish indulgences and promises of Paradise. However, as a historian of the time informs us, “the chiefs took care that the convents and presbyteries were well stored with victuals, for fear that if they felt hunger themselves, the clergy might not show so much inclination to preach patience to others.” From day to day the preachers promised relief before the end of the week; yet weeks passed, one after another, and the capital was gradually reduced to the last extremity. A few herbs boiled in water were an enviable repast—every kind of animal was eaten with avidity—then even scraps of leather boiled were sold as a dainty—a dead dog was devoured in the street without waiting to be cooked—and lastly it was proposed to make bread of dead men’s bones, taken from the church-yards, and ground to powder; and a mother ate her own infant. In the course of three months 30,000 persons died of hunger. Yet still the preachers ceased not to urge people to patience and endurance. Whole quarters of the city were deserted, and even venomous reptiles were seen in some of the unfrequented streets. The bishop of Asti said that “this was the effect of magic, and an illusion of the devil to discourage the good Catholics.” Things had proceeded to that point, that even the preachers were likely to be no longer listened to, when the Duke of Parma, who had entered France with an army of Italians, formed a junction with the Duke of Mayenne, and very opportunely raised the siege, forcing the king to remain comparatively inactive, with the exception of taking two or three provincial towns, for some months. The clamorous exultations of the preachers knew no bounds; it was a miracle from heaven, sent as a reward for their persevering constancy in the good cause, that had delivered the Parisians; and the populace in their joy forgot their past sufferings, and put more confidence than ever in their clerical leaders.

In the moment of success dissension began to show itself among the all-powerful curés of the parishes of the capital. Some leaned towards

Spain, others towards the Duke of Mayenne, and others towards the young Duke of Guise, who had escaped from his prison at Tours. The greater number wanted a popular government of their own fashion, to be composed of a certain number of theologians and bourgeois, who, to use the words of our author, "would in the first place have established their authority by proscriptions, and then strengthened it by a new Barthélemy of the moderate party." Many of them changed, according to circumstances, from one side to another, and they all joined when their own power was to be exercised or defended. During the earlier months of the year 1591, the sermons of the clergy were entirely devoted to two objects, to abuse the person of Henri IV., and to call down the vengeance of the people upon the detested "politics." The king laid siege to Chartres, the second city of the Ligue, which enjoyed the special sympathy of the Parisians, and every church in Paris immediately resounded with vows and prayers. These were interspersed with announcements of fictitious intelligence, invented for the purpose of buoying up the hopes of the faint-hearted, and conveyed in coarse terms calculated to arrest the attention of the mob. One day Commolet, preaching from the pulpit, stated (though he knew it to be false) that succors had been thrown into the besieged city; and he cried out, amid extraordinary gesticulations for which he was famous: "Va te pendre, va te pendre, va te pendre, te dy-je encore un coup, Politique! Ton Béarnois est bien peneu; il est entré du secours, malgré sa moustache et ses dents!" When the necessity of surrender could no longer be concealed, the preachers declared that the city had been sold by the "politics," (as they constantly termed the advocates of moderation,) and that the only hope remaining was that the true Catholics of Chartres might "rise up against their 'politic' fellow-citizens, and bury their daggers in their bodies." The declamations against the "politics," who were increasing in number, and consisted chiefly of the more respectable part of the community, now became perfectly fearful. Boucher, preaching Lent at St. Germain l'Auxerrois, said: "Qu'il fallait tout tuer," and that "it was quite time to put the hand to the sickle and exterminate those of the parliament and others." The Duke of Mayenne, terrified and unable to resist the blind fury of the clergy, sent letters of *cachet* to several of the magistrates, ordering them to quit Paris as a measure of precaution. The preachers, supposing it was a measure of vengeance, openly praised the duke, but at the same time they excited the populace to continue these insufficient proscriptions. After the surrender of Chartres, Bishop Rose declared from the pulpit that *une saignée de Saint Barthélemy* was necessary, and that they must cut the throat of the disease. Commolet declared that "the death of the 'politics' was the life of the Catholics." Aubry proclaimed, equally from the pulpit, that he was ready to march first to the slaughter. Cueilly said he wished they would lay violent hands on every one they saw laugh. And Guincestre expressed the wish that they would throw into the river all who inquired after news. These atrocities showed that the moderate party was gaining strength; but, although many were disgusted with such excesses, they were more than ever obliged to attend at the sermons, for their absence was taken as a proof of their being "politics," and

they were in danger of being marked out for murder and pillage.

The magistracy of Paris became next the object of attack, because they presented a powerful impediment to the sanguinary designs of the preachers. Boucher, Rose, and Aubry, were the most intemperate in their abuse of this body. The court of parliament acquitted a gentleman named Brigard, who held the office of *procureur du roi de l'Hôtel de Ville*, unjustly accused of treason. The preachers set up a universal cry from their pulpits that the whole court ought to be thrown into prison. Aubry went so far as to point out one of them named Tardif, who dwelt in his parish, as a traitor, and said that under pretence of playing at bowls, he held in his garden secret meetings for the subversion of their cause. Pelletier exclaimed from the pulpit, that as they could not have justice from the court, it was time to make use of their knives. The preachers and others of the council of the Union met, and chose a secret council of ten, which, after several preliminary consultations, met in the night of the 14th of November, at the house of Pelletier, who, as we have just seen, had spoken of knives, and was curé of St. Jacques-la-Boucherie, and it was there resolved that the president Brisson, though a zealous liguier, with the counsellors Tardif and Larcher, should be put to death. At seven o'clock in the morning, the preachers and their satellites were up in arms, and Brisson and Larcher were seized at once, carried to the Châtelet, and there slaughtered without any form of judgment. Hamilton, the curé of St. Comme, with a party of priests, went to the house of Tardif, and finding him ill they dragged him from his bed of sickness, carried him to the place where the others had just been killed, and hanged him without even the intervention of the ordinary executioner. The preachers then proceeded to seize upon the governing power, expelled all they disliked from their offices, and made out a list of forty-four persons to compose a *chambre ardente*, or court of inquisition, a sort of revolutionary tribunal which was to have power of life and death over the persons of the Parisians. Next, preparations were made for a general proscription; and each in his own quarter drew up lists, which they called *papiers rouges*, containing the names of all the "politics," marked with the letters C, D, or P, which signified the fate to which each was destined, *chassé*, *dagué*, or *pendu*. This horrible design was only adjourned because the Spanish and Italian troops, which formed the garrison of Paris, refused to lend their hands to it, and it was entirely quashed by the vigorous and timely interference of the Duke of Mayenne, who, hearing that the preachers were determined to brave his authority, hastened to Paris with his army, where he dissolved the council of the union, gave the municipal offices to "politics," and condemned to death nine of the council which had procured the death of Brisson. Four only were executed, and even this might have served as a salutary check upon the sanguinary disposition of the clergy, had not Mayenne relapsed almost immediately into his ordinary weakness of character. Boucher was the leader of the seditious attacks which were now made upon Mayenne from the pulpit, and by his extraordinary violence earned for himself the popular title of the King of the Ligue. The four victims of Mayenne's just anger were cried up as martyrs, and during the whole of

the year 1592, the pulpits groaned with maledictions against every authority which offered any impediment to the designs of those who had possession of them.

The preachers, mortified at the ill success of their attempt to establish a sacerdotal democracy in the place of a king, turned more and more towards the king of Spain, who coveted the throne of France for one of his own family, and who paid them liberally for their support. The period which intervened between this and the calling together of the States for the election of a king, in 1593, offers only a sickening repetition of the same scenes which we have already described. The preachers feared more and more the "politics," as the expectations of the conversion of Henri IV. to the Catholic faith became more substantial, and they were proportionately intemperate in their declamations. They had now long acted the part of masters, and they were furious at the slightest prospect of losing ground which they could only retain during the absence of a power to control them; and they had compromised themselves far too much to hope for indulgence, unless from a king who should owe his crown entirely to their efforts. In fact, they feared more from the king as a Catholic, than they did while he remained a Huguenot. Pelletier publicly excommunicated all his parishioners who should speak of peace, or of "receiving the Béarnois returning to mass;" and he declared that he would refuse Christian burial to any one who should hold the least communication, even in trade, with the "politics" "whose blood," he said, "ought to stain the pavement." Feuardent told his congregation that he was sure that Henri IV. would be struck with thunder from heaven, and that they need not be uneasy about him. Boucher said that the king's successes had been procured through magic, and when Henri was slightly wounded in the battle or skirmish of Aumale, he had the assurance to tell his hearers that "his flesh, or rather his carrion, had been entered, but not deeply, on account of the charms which had been discovered upon his person." The absurdity of accusations like these, after they had been repeated so often, gradually weakened the influence of the oratorical dictature they had so long exercised, and their sermons began evidently to have less effect. This was seen on many occasions. One day, Commelet, seeing three persons leave the church while he was preaching, cried out to the people to go after those "politics" and see who they were; a few months before, this would have been the signal for a massacre, whereas now the auditors laughed and remained in their places. Aubry declared that all the "politics" were irrevocably damned, yet he avowed with sorrow that he believed if any one would rip open many in his parish, they would find a great Béarnois in their bellies." The same preacher, in his sermon on the ninth of August, 1592, declared that he abandoned the houses of all the "politics" in his parish to the mob for pillage; but the mob not only did not pillage them, but satirical answers to his threats were placarded on the walls. In the same manner, when he pointed to them the master of requests, Tronson and his family, then present at his sermon, as worthy to be all thrown into the river, they remained quietly in their places, and no one touched them. But it was impossible to say how long such forbearance might last; and personalities like these, which were now more common

than ever, obliged people from fear to make an outward show of zeal by being regular attendants at the sermons. The time was not yet arrived when it would be safe to offer the preachers any open resistance.

As the time fixed for the meeting of the States approached, this event, which was never very palatable to the preachers, but looked upon only as a thing which could not be avoided, added new fuel to the flame. Several of them, hitherto distinguished by their violence, began to think it safest to moderate their language; but others, as their apprehensions increased, only became the more intemperate. The doctrine of royalty set up at this time and under these circumstances, by the clergy of France, is expressed in the following words of a treatise of Pigenat: "The power of reigning, in spite of all claim of succession, comes from God, who, by the clamors of the people, declares the person who it is his will shall command as king. *Vox populi, vox Dei.*" The "clamors of the people" were at this time regulated by the voice of the preachers, who now attempted to influence the deputies by their menacing language, in the same manner that a short time before they had overawed the magistrates. Commelet, discoursing on the words of the gospel, "the boat agitated by the tempest," quoted St. Ambrose as an authority for stating that Judas was in that boat, which led him to observe, that among the deputies there was not one Judas, but twenty, nay, thirty—"you will know them by their votes!" he cried, "and now, my friends, rush boldly upon them, strangle them for me, for they are all bad." The declamations against Henri IV. continued unabated. Commelet and others celebrated anew the praises of Jacques Clement the regicide, and called aloud for some one to follow his "blessed" example, declaring that it was indifferent whether it should be a monk or a layman, for even one of the very scum of the people would in such a case be sure of Paradise. Not long after this, Pierre Barrière attempted to assassinate the king. Before he started on this mission, he went to consult the curé Aubry, who received him in the most friendly manner, embraced him, gave him to drink, and then, speaking to a Jesuit who was present with him, he said, "It would be a good deed, and without doubt he would gain a great glory in Paradise."

The venality of the preachers became more apparent as the end of their reign approached. All their chiefs received pensions from Spain, and some of them had even the effrontery to boast of it in the pulpit; but they often turned and varied, as the chances of success leaned towards this pretender or the other. M. Labitte justly observes, that "the language of the preachers responded to the vehemence and violence of ambitions. The abrupt turnings about of parties, opinions relinquished and then suddenly taken up again, the inextricable complications of intrigues, translate themselves in the pulpit. How are we to explain the useless violence of many of these paid orators? To understand the diversity of their words, would require to know the diversity of their little interests of every day. We might imagine ourselves in the clubs of 1793; we find here already the same grossness of language. When one party gains the chances, when its influence increases, it is absolved. Glory to the faction which can triumph, shame to it if it is vanquished. It is a melancholy page in the history of the French clergy,

a melancholy spectacle in the history of human morality." At the very time the States were aiming at peace, the more violent preachers still continued to urge the people to take up arms. Aubry shouted vehemently from his pulpit, "La paix ! hé ! pauvre peuple, pensez-y ; ne l'endurons point, mes amis ! plutôt mourir. Prenons les armes ce sont armes de Dieu. * * * Un bon Ligueur (et je vous déclare que je le suis et que je y marcherai le premier) vainera toujours trois et quatre politiques. * * * Qui frappe le premier a l'avantage." Such fanatical exhortations as this still kept the populace in the interests of the clergy. On the 12th of May, 1593, the anniversary of the Barricades, when Henri III. was driven out of Paris, Boucher, preaching on the occasion, praised that day's work as *La plus belle qui fut jamais au monde*, and speaking of Henri IV. he said, "ce n'est pas à tel boueux, bon à jeter au tombereau, que le trône appartient, quoi qu'en puissent dire les larrons, paillards, et boulgres." These expressions were aimed at the deputies of the States—at the whole body of the hated and feared "politics." Aubry, on another occasion, said in his sermon, "if our princes agree to a peace, let them take care of themselves. They are but men. There are still some good friars in Paris who will fight against it, and all the good Catholics would die rather than endure it. I would let them drag me to the river and throw me in a sack into the water before I would ever consent to it. If they come to that, there will be plenty of blood shed ;" he added, "we must poignard the 'politics' * * * if I had as much force as I have courage, I would kill them myself * * * I offer myself to be your standard-bearer * * * The pope's legate has promised to die with us." Such was the language of the preachers amid the deliberations of the States, and the intrigues of the parties who hoped to influence them.

The sudden and unaccountable falling off of Bishop Rose from the interests of the King of Spain did much towards ruining the projects of that monarch, and joined with the other differences of opinion which arose in the assembly, caused it to be dissolved without coming to an election. Several of the preachers, among whom was the too celebrated Guincestre, deserted their party, and went over to Henri IV. The public announcement of Henri's conversion to the Catholic faith gave the final blow to the Ligue. But the preachers held out to the last ; and the pulpits of Paris became more than ever the arena of political strife. Boucher preached a series of sermons on the *simulée conversion* of the king, which were afterwards printed and spread abroad, and were admirably well calculated to sustain the drooping hopes of his party. They consist chiefly of a mass of calumnious declamations against the king and his friends, and their aim is to prove not only his unworthiness of the throne, but the nullity of his conversion. Another intemperate priest, named Porthaise, preached against the *simulée conversion* in the church of Poitiers, and he imitated Boucher in committing his sermon to print. In other parts of the country, as at Amiens, at Lyons, at Dijon, similar doctrines were preached, and with equal violence. At the latter place, on the 20th of March, 1594, a Jesuit named Christophe having wearied his audience with his "atrocious" calumnies against the king, a peasant called out to him, that he would be better employed in preaching the gospel. This interruption was the signal

for a violent uproar, the congregation thrust the preacher out of the church, and he was only saved from worse treatment by the promise of one of the magistrates to commit him to prison. It was clear that a reaction in favor of the royalists was beginning to show itself.

As they saw the chances that Henri of Navarre would succeed to the crown become greater, the preachers began anew to talk of murder and slaughter, as the only means by which the Holy Union could be effectively supported, and as things perfectly justifiable when approved by the church. Their notions of justice were indeed sufficiently pliable, when questions arose between them and those who were not of their party. A cutler, named Gaillardin, a fanatical ligueur, struck a poor cobbler with his dagger, and wounded him severely, because he had uttered some words which savored of royalism. The Jesuit Commelet, as well as the curé Garin, preached in favor of the assailant, and declared that the only thing to be regretted was, that his victim had escaped alive. When the assassin received encouragement like this, the injured man, as a matter of course, received no kind of satisfaction. The Duke of Mayenne, who was fat and somewhat indolent, disgusted with the conduct of the clergy, had complained to the pope's legate of the unbearable license of the preachers ; so far from their being effectually checked, Commelin in his next sermon marked him out as an object for the knife, exclaiming, "There wants an Aod for the pig, for the effeminate man with the great belly (you understand whom I mean !)" The doctrine of canonical murder had truly made strange progress. Aubry sustained that the king's conversion was of no avail, for the pope himself could not absolve him. Cueilley declared that the pope had sworn he would never receive into the church "that goat of a Béarnois," and he asserted that there was an army of 30,000 men ready to come to the assistance of the Union. The prior of the Carmelites, Simon Fillieul, assured his audience that if the Béarnois, "had drunk all the blessed water of our lady" (!) there would still be room to doubt the sincerity of his conversion : he compared him to Judas betraying his Lord with a kiss ; and said it was to be hoped that some *good lady Judith* would shortly save France by a *coup du ciel*. This was the expression which had before been applied by the preachers to the murder of Henri III. by Jacques Clement ; the allusion, on the present occasion, was to attempts made by some of the more unscrupulous of their party to persuade Henri's mistress, Gabrielle d'Estrées, to murder her lover. At the end of August, 1598, a Jesuit in one of the pulpits of Paris, exclaimed, "It is a blasphemy to think that the pope will absolve the Béarnois ; if an angel should descend from heaven and say to me, receive him, I should look upon the message with suspicion." Five months after, a monk proclaimed "that people should sharpen their poignards, for there was need of a circumcision." Indeed, they all began to be convinced that a murder only could keep Henri IV. from the throne ; and in the chance that some one, excited by their clamors, would commit this murder, they placed their last hopes.

The monk Garin was now the most violent and the most indefatigable of the preachers. He was the boldest apologist of the tyrannical anarchy of the old council, which had governed in the more flourishing days of the Ligue, and in his fury

against the Duke of Mayenne, for suppressing that body, and overthrowing Boucher's project of a *chambre ardente* and its attendant proscriptions, he vomited against the general of the Ligue every description of abuse and imprecation, going so far as to say that "A spindle would be more suitable to this fat pig than a sword." Garin attacked with equal license of language the parliament and the magistrates; and there was no power now in Paris to restrain or punish him. Once, addressing the judges, he said, "He who would give you your due, would cause you all to be hanged; there is not one among you who does not well deserve it. * * * * You shall have the rope one of these days, and shall all be dragged to Montfaucon." When people first talked of the king's conversion, Garin made his congregation recite a prayer to God begging that he would not permit the pope to give absolution to the Béarnois. When this conversion was made public, he cried out from his pulpit, "We must not be down-hearted * * * * perhaps there will soon be found some honest man to kill the Béarnois. We have already been delivered once by the hand of *un pauvre petit innocent*." The sermons of Garin sometimes lasted three hours and a half. Few, comparatively, of his auditors were present at them by free choice, but they were intimidated by his tone and language, and did not yet dare to keep away.

It was evident now that Paris could not long remain in its present condition. The better classes of society, throughout the kingdom, were becoming royalists, and the clergy and the mob were left to support one another. The Duke of Nemours, governor of the city, left his post and retired into the Lyonnais, where he fell into the power of the royalists. Mayenne himself hurried to Soissons, to join the Spanish army, which was to assemble there; but before his departure, perceiving well that no legitimate and reasonable authority could at present be sustained in the capital, and that a revolutionary organization alone could there hold up the cause of the Ligue, he restored the old council of clergy and bourgeois, and Brissac, the willing slave of the preachers in all their deeds of violence, was appointed commander of the garrison of Paris. This was, in fact, leaving the preachers to take care of themselves; and when Mayenne quitted the city, on the 6th of March, 1594, they again assumed their old characters, and, finding themselves masters, appointed Boucher president of their council, who at once declared that the pope had not the power to absolve the Béarnois, and revived the courage and appetite of his brethren, by his extensive dreams of proscriptions. In Paris, the church was now literally militant. The curés Hamilton and Pelletier, not only carried large quantities of arms and munitions into their own houses, but they also placed large stores in the convent of the Cordeliers. Hamilton never went out of his house without being accompanied by a troop of rabble, who brandished their pikes and arquebusses as they went along the streets; he performed the service of the mass armed in a cuirass, and he even baptized a child in full congregation, without troubling himself to take off his armor. Garin also armed his convent, and he boasted to the populace, that he had 2000 monks under his orders. On the 10th of March, he recommended from the pulpit, that the gates of the city should be closed, and that the populace should run to their arms and slay all the "politics." The effect of this avowed project of a new St. Barthélemy was

to put the royalists on their guard. The Governor Brissac, who had ever figured among the most intemperate of his party, had many sins to pardon, and he was consulting his own interests, and providing for his own safety, by treating secretly with the king for the delivery of Paris. The preachers had some intimation or suspicion of what was going on, and they denounced him from the pulpit; which rendered it still more necessary for his safety, that he should lose no time in completing his treason. Garin again encouraged his friends to hope that some one might be induced to deliver them by a murder. On the 13th of March, he declared in a sermon, that they ought to ennoble the family of Jacques Clement, and, in alluding to the king, he made one last despairing exclamation that "they must make away with this man also; it would be a very holy, heroic, and praiseworthy deed, which would assure Paradise to the perpetrator, and would merit for him the place nearest to the person of God." Bishop Rose also acted his part to the last. On the 20th of March, he announced from the pulpit of the Church of St. André-des-Arcs, that he was going to preach a whole week "to complete the process of the Béarnois." On the morrow, the 21st of March, he began this series of sermons, in presence of the Cardinal of Plaisance, and promised to prove, in his sermon the next day, "that the Prince of Navarre was a bastard, and unworthy to succeed to the crown of France." This sermon was not preached, for in the morning (the 22d of March, 1594) Henri IV. was in possession of Paris.

It is hardly necessary for us to follow M. Labitte, in tracing the subsequent history of the various preachers who cut so melancholy a figure in the extraordinary events we have been very briefly narrating. When the king entered Paris, the inhabitants showed clearly by their joy, that latterly their submission to their masters had been only the effect of fear, and that the popularity of the turbulent clergy was at an end. The preachers were in general terror-struck; but some of the more fanatical retired in arms to the *quartier Latin*, the district of the university, and there joining with the captain of the parish of St. Jacques, an obstinate liguier, resolved to hold out to the last. Hamilton, with a perruque in his hand, went to assist them, but it was too late. Forty of the more violent curés, among whom was Boucher, saved themselves by accompanying the soldiers of the Spanish garrison in their retreat. Garin also attempted to make his escape with the garrison, in the disguise of a Spaniard, but not succeeding, he was found a day or two afterwards concealed in the garret of a house in the Rue St. Denis; he threw himself at the feet of the men who discovered him, begged them in the most suppliant manner not to kill him, and swore, that if need were, he was ready to preach the eulogy of the king. Henri IV. had pity on his cowardice, and merely banished him from Paris, and his name does not appear again in history. Aubry and Cueilley showed more courage, and had the audacity to preach against the king a day or two after he was master of his capital; yet the royal clemency was extended even to them, and they, with Hamilton, Rose, Pelletier, the prior of the Carmelites—Simon Fillicul, and a considerable number of others, were banished from Paris. Of most of them we hear no more—they appear to have passed their days in obscurity, perhaps in poverty. A few devoted the remainder of their lives to literary pursuits. Fil-

lieul, after a short absence, received his pardon, and returned to Paris. Pelletier showed his gratitude for the leniency he had experienced, by a farewell sermon to his parishioners, in which he praised with warmth the clemency and generosity of their king. Boucher, and some of those who escaped with the Spaniards, retired to Flanders, and there continued to publish incendiary writings against Henri IV. Boucher was subsequently made Canon of Tournay; besides a host of other pamphlets, he published, in 1595, a treatise in justification of the new attempt at regicide by Jean Châtel; he declaimed bitterly against the edict of Nantes; and continued to publish opinions long after Henri of Navarre had quitted the scene, for he died at a very advanced age, so late as 1646, fifty-five years after the entry of Henri into Paris. Rose fled from Paris to the abbey of Val de Beaumont sur Oise; but, although the king extended his generosity to him so far as to allow him to retain his bishopric of Senlis, he was perpetually involved in one seditious practice or another, and remained all his life an object of suspicion to the government. The general agitation, however, gradually subsided, and the sermons of the clergy lost their political character. But Henri never secured the attachment of the church; his moderation was not agreeable to the taste of the Catholics of that age, whose vengeance was persevering and implacable; after escaping from the murderous arm of Jean Châtel, and being exposed to several other attempts, the king fell at last, in 1611, by that of the Jesuit Ravallac. The fanaticism of the Ligue lived only after the Ligue itself was extinct.

Such is the melancholy picture of a country conquered by its clergy; and it is no more than may at any time happen with a priesthood which lays claim to infallibility and political superiority over the laity, like that of the church of Rome. It is a history worthy of serious contemplation even in our own times. But let us not forget, above all, that our forefathers were watching with painful anxiety every phase of this, to them, fearfully tragic story. Their faith and peace were equally at stake. Spanish money was as actively employed against Elizabeth, as against Henri III. or Henri IV. The knife of the assassin had doubtless been more than once prepared for her. Hundreds of cunning Jesuits and wily preachers, educated expressly for the purpose, were sent into this country in disguise, and were busily engaged in sowing, in private, the same seditious principles. A Ligue was prepared for England, if it had succeeded in France. Let us not, then, judge too rashly the statesmen, who, in condemning Mary of Scotland, thought that the death of an ambitious woman, a Guise by her mother's blood, a ready instrument in the hands of her family, was necessary for the safety of their country. The designs in which she partook were those of the Spaniard, the pope, and the house of Lorraine; and when she manifested her zeal for the establishment of the Catholic church and the overthrow of heretics, it was to be done by means such as those employed on the continent by Spain, and the pope, and the Guises.* It is thus that, at

* It is somewhat singular that the Ambassador of Scotland—without doubt, Mary's old ambassador, the Bishop of Glasgow—appears as an active liguier. We learn from Lestoile that at the beginning of the siege, in 1590, he was in Paris, and he is mentioned among the *seigneurs* of the Ligue. "Le Mercredi douzieme de May, les seigneurs se rendirent chez M. le Duc de Nemours, sça-

certain periods, to understand our own history, it is necessary that we should have something more than a superficial knowledge of that of the surrounding nations.

THE FREE CHURCH OF SCOTLAND AND THE THREE THOUSAND PIECES.

AN intense commotion has been excited among the Scottish community, by the publicity given to the fact that the Deputation from the Free Church, which went over to America to promote the cause of the voluntaries and their secession, has not scrupled to solicit and receive contributions in aid of its funds from the slave-holders of America. Virtuous men of plain common sense insist that the reception of offerings from such a source was, in the first instance, thoughtless and barely pardonable—but, with a vehemence which will never abate, till the polluted tribute be disgorged, they insist, that the retention of it, after expostulation, and opportunity to weigh well the principles and consequences involved in such a procedure, is *an unmitigated abomination*. They are right—the 30 pieces of Judas Iscariot were not more polluted in their origin than the 3,000*l.* of the slave-holders—and buyers—and sellers—and scourgers—and executioners—of America. Just let Drs. Candlish and Cunningham read the account of the appalling murder, done upon the slave *Pauline*, for the crime of *ill-treating—only ill-treating—her mistress!*—or, of the *ripping open* (further south) of the victims in the Brazilian mines, to ascertain if they had swallowed any of the diamonds, and then let them, if they can, persist in their detestable casuistry and special pleadings, with which they are fain to defend the retention of the 3,000 pieces of money, coined from the blood and groans of the miserable slave—their brother and fellow man!—(*From Hood's Magazine, July, 1846.*)

VIEWS AND REVIEWS IN AMERICAN LITERATURE, HISTORY AND FICTION. By the author of "The Yemassee."—A collection of miscellanies contributed to the American reviews and magazines, by a popular author. Though repelled from time to time, by a certain aridity of style, there is a fairness of tone in the better critical literature of America which we have always recognized as excellent;—and it characterizes these papers. A large portion of them, too, attracts us by its nationality. Mr. Simms seeks to make his countrymen American in their literature—not copyists at second-hand of the fashions of England, the follies of France, the philosophies of Germany, or the enthusiasms of Italy. In his page, they appear a grave, self-respecting people; who own a past, and a picturesque, and a poetry of their own; and have around them a life rich in character and adventure. In these days, when reverence and revival are unnaturally confounded, and imitation assumes the honors of invention—efforts like those made by Mr. Simms are too healthy, too manly, too sensible, and too poetical, (in the largest sense of the word,) not to merit praise—even though the execution fall short of the intention.—*Athenæum*.

voir, le Legat, l'Ambassadeur d'Espagne, celui d'Ecosse, le Cardinal de Gondy, l'Archevêque de Lyon, et plusieurs du corps du Parlement, déliberèrent de donner volontairement de l'argent pour payer les soldats et autres."

From the Foreign Quarterly Review.

THE CADET OF COLOBRIÈRES.

IN the five successive numbers of the "Revue des Deux Mondes," beginning on the 15th of November last, there appeared, under the title of "Le Cadet de Colobrières," the first of a promised series of tales about the old convents of Paris, from the pen of Madame Charles Reybaud. Though we are diligent, and generally prompt readers of our clever Parisian contemporary, yet it was not until a considerable time after all the five *livraisons*, containing this story, had been in our possession, that we sat down unwillingly and despondently to its perusal. Much unpleasant experience had taught us, in fact, to look with aversion on all French fictions published bit by bit in periodicals—a prejudice which those who are best acquainted with *feuilleton* literature will perhaps excuse, as one to which they would themselves have been apt to yield on a like occasion. If any of our readers have done so with regard to "Le Cadet de Colobrières," and passed unheeded that beautiful creation of a woman's genius, we entreat them to correct their mistake without delay; for an egregious mistake it certainly is to put Madame Reybaud in the same category with the very best of the *feuilletonists*. Judging her from the work before us, she is as much superior to the cleverest of them all, Dumas, as Miss Austin's novels are to Mrs. Gore's, or in other words, as the truth and simplicity of genius are to the most ingenious artifices of mere talent. Of all modern French writers Mérimée appears to us the one with whom Madame Reybaud may be best compared. Both of them are distinguished for admirable skill in the choice and coördination of their materials, and for that consummate graphic art which produces the most distinct and life-like effects within the narrowest canvass;—we rest with complete satisfaction on their delineations; we feel that they are adequate and true, free from all false glare and distortion, and that there is in them not one superfluous line, not one touch but is fitly subservient to the general effect of the picture. In the use of dialogue, Madame Reybaud is scarcely equal to Mérimée, who, indeed, surpasses most writers of the age in the dramatic exposition of character, besides which his style in general is recognized by French critics as a model of purity and grace. Madame Reybaud, on the other hand, has an immense advantage over him in the depth and tenderness of her womanly feelings. The brilliant author of "Colomba," "Charles IX.," and "Carmen," seems to us to put forth his keen powers of observation simply for the pleasure of the exercise. His critical dissection of human impulses is exquisitely subtle and exact, yet there is something in the coolness of the operator, with which in secret we are not quite content. Such masterly knowledge of his subject, combined with so much apparent indifference to it, except as a matter of curiosity, affects us with a disagreeable sense of irony; and while we admire, our hearts do not warm towards the shrewd, cold observer of the passions, frailties, follies, and sufferings of his fellow-men. An impression directly the reverse of this results from the perusal of the "Cadet of Colobrières," a work which in every line bears token that it is the offspring of a spirit as quick and genial in its sympathies, as in judgment it is calm, large, and discerning.

Instead of laying before our readers the mere

dry bones of the story, in the way of an epitome, we think it better to give them a specimen of its general tone in one long unbroken extract. Fortunately we find one exactly suited to our purpose in the very beginning of the tale, which contains not only the germ of all the rest, but likewise an episode complete within itself, and of singular beauty:—

"A short league from the French frontier, on the high-road to Italy, and near the point where the Var divides Provence from the county of Nice, are seen the ruins of an old castle, surrounded by a landscape of stern and rugged aspect. The façade is yet standing, and seems as if backed against the deep blue sky that shines through its large windows. A massive tower, of more ancient architecture than the rest of the building, rises above the other remains; and from its embattled summit, which time has but slightly breached, protrudes a blackish point, not unlike an ordinary lightning conductor; this is the iron socket of the flag-staff that formerly sustained the seignorial banner. The hill, crowned by these ruins, is scantily clad with an aromatic vegetation that would gladden the heart of a botanist; for the rare species of plants, whose drowsy odors the wind often spreads over the whole country-side and for many leagues out to sea, thrive well on the rocky soil that would not nurture a grain of wheat.

"It is now some three quarters of a century since this castle and the lands around it belonged to a worthy nobleman, the Baron de Colobrières, descended on the female side from an old Italian house that reckoned in its genealogy twenty cardinals and one pope. His paternal ancestry was not less illustrious, and went back to what might be called the fabulous ages of Provençal aristocracy. Notwithstanding this high descent, Baron Mathieu de Colobrières was anything but an opulent lord. His armorial bearings were a thistle, vert, springing from a tower, fenestrate and masoned, sables—a truly expressive cognizance, for the sterility of the baronial lands was proverbial, and it was a common saying in the country, 'Colobrières' husbandry, sheaves of thistles and fields of stones.' The baron's ancestors having, by little and little, bartered away all their seignorial rights, there remained to their descendant nothing but the manor and the adjacent lands, which yielded an exceedingly slender revenue. There was not one among the clowns, who doffed their hats as they passed the lordly escutcheon carved above the castle-gate, who would have consented to farm the barony.

"The poor lord of Colobrières had espoused a young lady as noble, and still poorer than himself, who brought him for her whole fortune some hundred crowns' worth of jewels and trinkets. Heaven superabundantly blessed their union. Fourteen children issued from it, and waxed in stature and comeliness almost by the bounty of the sky alone, like the wild plants of their rocky domain. The revenues of the fief of Colobrières barely provided the family's daily bread; for everything else they had to make up by dint of industry and frugality. The baroness had never had any newer gown than her bridal robe, but dressed herself and her children in garments made out of the antique bed-furniture of the castle. The hereditary tapestries were converted to the young gentlemen's use; and the young ladies wore, in the shape of petticoats and bodices, the curtains embroidered by ancestral hands.

"The castle of Colobrières was like a hive that every year threw off the swarms it could no longer feed or shelter. As the elder children grew up, they departed successively to seek their sustenance elsewhere. The baron was too thoroughly penetrated with a sense of what was due to his rank, to suffer any of his children to derogate from their birth. Notwithstanding the penury to which they were reduced, not one of them forgot what be-seemed his blood: seven sons became monks, or entered the king's service, and five daughters put on the robe of the order of Notre Dame de la Misericorde, into which young ladies of quality were received without dowery. Of so numerous a progeny there at last remained in the castle only the two youngest, a son and a daughter, whom the baron used to call with a sigh the props of his age.

"Gaston de Colobrières, or, as he was called by the people of the country, the cadet of Colobrières, was a handsome young man of five-and-twenty, an intrepid sportsman, high-spirited, but shy withal, so that he would look another way if he chanced to meet a country-girl on his path. This rustic Hippolytus was continually roaming, with his gun on his shoulder, over the lands of the barony, which were fertile only in game. In this way he turned the estate to the best account, for were it not for the game he brought home every day, the inhabitants of the castle would have been reduced almost to dry bread for their four meals.

"The baron's youngest daughter, Mademoiselle Anastasie, was a handsome brunette, with a pale and pensive cast of countenance. She had magnificent black hair, and eyes whose dark pupils shone with a changeful light through their long fringes. Her hands were small and delicate; and teeth of pearly lustre were seen with the least smile that parted her rosy lips. And yet it had never entered the head of any one in her little world to think her pretty. On Sunday, when she went to hear mass in a neighboring village, the bumpkins used to look at her as she passed without the least admiration. Her father, indeed, admitted that she had about her a certain air that betokened the young lady of quality; but her mother remarked with sorrow the pale gipsy complexion that tarnished her, as it were, and would rather have seen her cheeks glowing with red and white. She herself had no suspicion of her own beauty, and had never been instigated by her mirror to harbor the least thought of pride or coquetry.

"The life led in the castle of Colobrières was one of the narrowest and most monotonous routine. The gentry of the neighborhood did not seek the society of the baron, who, for his part, had no wish that they should be witnesses of his proud poverty; and the only intercourse kept up by the family consisted in the weekly visits of a good priest, who had been for thirty years curé of a village not far from Colobrières. Of yore the lords of Colobrières had had pages and squires, and there was even among the apartments in the castle one which was still called the hall of the guards; but in the period of its decay, of which we are here speaking, the whole retinue consisted of an old laquais, who entirely neglected the duties of the pantry and the ante-chamber to devote himself to the culture of the kitchen-garden, and of a servant-girl, named Madeleine Panozon, and surnamed La Roussee, whose business would have been light enough, if

it embraced only the cooking department in the mansion of M. le Baron; but, besides this, the stout girl did all the work of the household, and assisted Madame la Baronne to spin the thread for the family linen.

"The architecture of the château de Colobrières belonged to various periods. The large tower that formed, as it were, the nucleus of the whole, was in the Roman style, massive, square, and with circularly arched openings; the buildings round it dated from the *renaissance*. A Colobrières, captain of a company of adventurers, having served with success in the great Italian wars, and been present at the sack of Rome, returned home from his campaigns with a large booty. He renovated his ancestral manor, held high court in it with a number of boon companions, and died, bequeathing to his heirs nothing but the handsome mansion he had erected, and its valuable pictures and furniture. At the period of our story, the modern structures round the old keep were already greatly dilapidated; the furniture was sadly worn, and had, in a great measure, disappeared in passing through the hands of five or six generations; and there actually remained of the antique splendor of the Colobrières only a few waifs and strays, now looked on as relics, such as a trunk inlaid with ivory and mother-of-pearl, in which the baron kept his archives, a clock with musical bells, and six silver spoons and forks engraved with the Colobrières arms. No repairs had been made for some fifty years in the roof or in the outer wood-work; so that the windows were for the most part unglazed and without shutters, and the rain had rotted the floors. The rooms on the first floor were no longer inhabitable, and the family resided in the arched rooms of the ground-floor, the temperature of which was nearly that of a cellar, warm in winter, and cool in the height of summer.

"The chapel was in a state of utter dilapidation, and for many a year the Colobrières family had gone to a neighboring village to hear mass. This was a great mortification to the baroness, who had never indulged more than one ambitious dream in her life, viz., that of possessing some fifty crowns with which she might repair the chapel, and have mass celebrated in it on Sundays and holidays by some Minorite friar, whom she would afterwards invite to dinner; but there was no likelihood that the baron's finances could ever suffice for such an outlay, and the good lady submitted with as much resignation as she could to this hard privation. Every Sunday, whether it rained or shone, the family set out on foot in a certain costume that varied little with the change of seasons. The baron wore an old reddish-brown coat, still decent, but bearing proofs of its long service in the equivocal lustre of the seams. His stockings of rockspun silk, drawn without a wrinkle over a leg that must once have been shapely enough, descended into large shoes with buckles, and his napless three-cornered hat greatly needed to be handled with extreme caution. Madame de Colobrières accompanied him in a skirt of gros-de-Tour, somewhat faded, with a taffety mantle that dated from her marriage. Their children had no other adornment than their good looks. The young man wore a serge-coat, and a coarse felt hat like the peasants; the young lady had a brown cotton frock, a kerchief of sprigged muslin, and a little hat set on the crown of her head, and under which her hair was

gathered back from her face. The only change made at long intervals in this costume was, that the hat had sometimes a new riband. Hard as it must have been to feel the constant pinching of such narrow means—a hundred times more difficult to endure than naked and avowed poverty—still a sort of permanent serenity prevailed in the Colobrières family, and their mutual concord was never disturbed. The young people especially led a life unruffled by vain longings and anxious forethought, contenting themselves with the little they had, and never repining over the decay of their fortune and their house.

"One Whitmonday, after mass, whilst the baroness and her children were returning to the castle, the baron loitered awhile in the village market-place, where some itinerant merchants had set up their booths. It was the grand holiday time of that part of the country, and the merchants were doing a brisk business with their latten rings, pinchbeck crosses, and glass chaplets. The baron bought an ell of riband for his daughter, cheapened a *chifarcani* gown, sighed, and did not buy it. After dinner that day he did not leave the table immediately, as was his custom, to take his siesta, but remained in his chair, leaning back with his eyes fixed in deep reflection. Gaston and his sister had stolen out noiselessly, thinking that their parents were dozing on either side of the table.

"Instead of sleeping the baron was half-whistling between his teeth, which in him was a token of deep cogitation, and tapping alternately his plate and his empty glass. The baroness soon yielded to the influence of this music; her eyes closed, and she fell asleep in the effort to guess what it could be that her husband was thinking of so intensely. After half an hour's silence the baron heaved an explosive sigh, looked up at the ceiling, and said,

"I heard news to-day of Agathe de Colobrières."

"Eh—what—I beg your pardon: did you speak?" ejaculated the baroness jumping up in her chair, and staring at her husband in bewildered surprise.

"I say," replied the baron, coldly, "that a pedlar in the fair told me news of Agathe de Colobrières."

"Holy Virgin! and what did he tell you?"

"Things I was far from expecting, certainly. Agathe has had more good luck than she deserved. In the first place that man, her husband, that Maragnon is dead."

"The old lady crossed herself."

"Next," continued the baron, "he has left a very large fortune."

"Are there children?" inquired the baroness, trembling with emotion.

"There have been several; but of all that hopeful lineage of the Maragnons there remains but one girl."

"And the merchant that told you this saw Agathe, perhaps?"

"He did; and she told him that if she dared she would send her compliments to me."

"Poor woman!" murmured Madame de Colobrières.

"Send me her compliments, indeed; I would not have received them!" cried the baron, striking the table with his fist. "Wretch that she is! she dares still to utter the name of Colobrières! She! Madame Maragnon!"

"She thinks of us! She loves us still," murmured the baroness.

"What does that matter to you, madam?" replied the baron, indignantly. "What is there in common at present between us and that woman? I am really vexed with myself that I mentioned the subject to you."

"With these words he rose and hurried from the room as if to cut short the conversation. The baroness remained alone in deep thought. For thirty years the name of Agathe de Colobrières had not been breathed in her presence. It was forbidden to speak of her in that castle where she was born, and neither Gaston nor his young sister was aware even of her existence. And yet she was near akin to them; she was the Baron de Colobrières' own sister—his only sister.

"Thirty years before, Mademoiselle de Colobrières was residing in the paternal mansion, which she had never quitted. She was approaching the mature age of maidenhood. She was no longer a delicate bud sheltering timidly beneath the foliage, but a splendid, full-blown rose, whose fragrant petals would be scattered by the first breath of wind. This beautiful girl belonged to a house too poor, too noble, and too proud to make it feasible, even in thought, to find a husband for her. It was decided that she should enter a convent; but as she had no vocation for the monastic life, she temporized and remained in the castle even after the death of her parents and her brother's marriage.

"Still it was a settled thing that she was to be a nun, and she never conceived the thought of saying no, perhaps because she could see no chance of escaping her lot; only she would fall at times into fits of deep dejection, and weep in the baroness' presence without ever divulging the cause of her tears. The family was augmenting every year. The castellan of Colobrières had already six children, and poor Agathe felt plainly she must depart and make room for those little ones. Neither the baron nor his wife pressed her to fulfil her resolution; but her entrance into the convent was considered as near at hand, and was talked of every day.

"While things were in this state, it happened that some itinerant merchants presented themselves one evening at the gate of the castle. The weather was frightful; the rain, which had fallen in torrents, had broken up the roads, and the poor travellers could not reach the village, where they would have found shelter and a place to lie down. The baron generously opened his door to them, which was really all the kindness he was able to bestow upon them. They took up their quarters in an empty hall not far from the stable, where they sheltered their baggage mules, and made their arrangements for passing the night there. The baroness had seen their arrival from her window, and said soon after to her sister-in-law:

"I should like to lay out five or six francs with these merchants. The children's things are made up for the season; but you and I—it is mortifying to be obliged to go to mass with our plain hats and our *fichus de lisard*. You in particular, my dear, are sadly in want of a new kerchief."

"What would be the good of it, sister?" replied Mademoiselle de Colobrières with a sigh, "I should not have long to wear it; I shall soon have no more need of such things."

"Never mind," said the baroness; and casting

a stealthy glance at her husband, who was dozing at the table with his nose on an old book of noble families of which he every evening read a few lines, she added in a lower tone, 'I have saved a few fifteen sous pieces, and will put them into your hands; but be sure your brother does not know anything of the matter. By and by, when we are gone to our bed-room, do you go to these merchants and buy what you think best.'

"So saying she went to the cupboard in which she kept her most valuable hoards, fetched from it a rather limp-looking little purse of leather, and gave it to Mademoiselle de Colobrières.

"There are six livres fifteen sous in it,' she said. 'Mind you go cleverly to work with these people. Besides your kerchief and our ribands try to get two ells of Italian gauze, to make us *capelines*, and some green taffety to cover our *parasols*. You will very likely have to do with Jews, so be on your guard. In short, I rely on you to lay out the money discreetly.'

"Make your mind easy, sister,' said Agathe, taking the purse with a faint smile. 'Look, there's my brother opening his eyes and turning over a page of his book; take him away if you wish me to go quickly and make your purchases.'

"The baron and his wife soon retired to their large chamber, the broken windows of which let in a sharp little breeze that put out the lights. Mademoiselle de Colobrières likewise withdrew to her little bedroom. It lay at the extremity of a suite of very large rooms, and had formerly been the oratory of the ladies of the castle. The ceiling was adorned with cherubims' heads encompassed with garlands, and with their outspread wings meeting one another, and the shield, with the thistle, vert, springing from a tower, masoned, sable, figured proudly in every direction. A cross of exquisite workmanship, but with its delicate inlaying much impaired, was fixed over a worm-eaten prayer-desk, from the angles of which protruded broken-nosed visages of saints. The scanty bed, laid on tressels, and covered with a huge counterpane of faded silk, stood opposite a table, the only drawer of which contained all the worldly possessions of Agathe de Colobrières, that is to say, her slender ward-robe, some devotional books, and a little enamelled gold cross that had been her mother's. The poor young lady had hardly ever in her life handled coined metal, and she could not have added a farthing to the store amassed by the baroness. As she entered the room she threw the purse on the table, sat down pensively, and thought of all things that money procures, and of the omnipotence of that vile and precious form of matter. For her, money was the realization of all her longings and her chimeras; it was happiness, liberty! She took up the purse and shook it, whispering to herself with a long-drawn sigh, 'If I had twenty or thirty thousand of these little pieces how happy should all be here! I would have the castle repaired; we should all have new dresses every season. The store-rooms should be well stocked—there should never be any uneasy thought for the morrow; there would be something to give to the poor, and I should not enter the convent. But I have nothing—nothing—and I cannot work to earn my bread. I must go where the good God in his mercy will provide me with food and raiment.'

"She opened the purse and turned out its contents on her palm; then after looking on them for a moment she closed her hand upon the coin, and

said bitterly, 'What is this in comparison with the wants of this house! It is a drop of water on a burnt soil. If this money were mine I would not spend it, but cast it to the first poor creature that stopped at the castle gate.' The clock struck nine at this moment, Agathe thought it was time to discharge her commission. Too proud and well bred to think even for a moment of going down alone to the itinerant merchants, she went into the children's room, and gently awakened the eldest girl, who was her god-daughter and her favorite. The little girl was soon ready; her aunt took her by the hand, and both went away together with noiseless steps.

"The hall in which the merchants were quartered was a very large room, that still retained some traces of its original state. Many a gay and splendid banquet it had doubtless witnessed of yore; here and there on the panels was still to be seen a cornucopiæ entwined with garlands of roses; and heads of satyrs, laughing from ear to ear, projected from each corner of the tall chimney-piece, the casing of which was adorned with a figure of Bacchus, sculptured in high relief, and surrounded by all the attributes of the jolly god. But all trace of furniture had vanished from this banquet hall, where no revels had been held for more than a century; the carpets had given place to the green moss, that invested the marble slabs of the floor, and spiders had woven filmy curtains before the half-broken windows. The temporary occupants of this dismantled hall had arranged themselves in it with the peculiar adroitness of men accustomed to long travelling and scant accommodation. They had contrived to make an extemporaneous suite of furniture out of their goods; two chests, placed together and covered with a green cloth, served for a table: some bales did service for chairs, and a tolerable light was afforded by one of those large canvass lanterns which wagoners hang by night from the pole of the wagon.

"Agathe de Colobrières tapped at the door, and entered, holding her niece with one hand, whilst the other was plunged into the depths of the pocket in which she carried the baroness' savings. Had she been about to present herself thus far before persons of her own quality, she would have experienced an insurmountable embarrassment, and would have been very awkward and confused; but she felt no difficulty in accosting these low people; and slightly bending her head she said merely, 'Good evening. May I trouble you to let me see your goods?'

"The itinerant merchant rose from his seat in some surprise at the appearance of the handsome young lady, who had paused in the middle of the room, and stood waiting with an air of quiet self-possession and modest dignity until he should display his stock. Though dressed in a shabby drug-get gown she had the bearing of a princess, and the pride of her race was legible on her broad open front. The merchant bowed respectfully, and said, as he pushed forward one of the bales that served instead of chairs, 'Be pleased to take a seat, madame. Had you sent for me I should have obeyed your orders. I will instantly unpack the laces and silks, the best things in my assortment.' —'Show me your kerchiefs and ribands,' said Agathe, seating herself and taking the child on her lap, who was beginning to gaze curiously around her. Mademoiselle de Colobrières herself, too, began to observe with some surprise the various

objects in the room. The bales of merchandise were regularly piled up at one end, and behind the screen made by them, lay the sleeping figure of a man rolled up in his travelling cloak. His silver spurs shone in the faint light, and his gun rested against the wall within reach of his hand. This measure of precaution was probably occasioned by the bad state of the locks and the fastenings in the castle, and by the important amount of specie and negotiable paper in a valise that stood on the table. The merchant had, apparently, been arranging his accounts at the moment that Agathe entered. A morocco leather portfolio, the pages of which were full of figures, lay open beside the valise, and from the latter there had escaped handfuls of six-livre pieces mingled with louis d'or. The owner of this wealth was a man still young and of pleasing appearance; he did not appear superior to his condition in language and manners, but there was a certain intelligence and decision in his countenance that stood him instead of high breeding. With an indifferent air he thrust back into the valise all that fine coin, the sight of which astonished Agathe, and began to unfold his handkerchiefs and ribands. Never had Mademoiselle Colobrières seen such magnificent fabrics; there were Smyrna crapes, and Indian satins brocaded with flowers, butterflies and birds, and ribands of all colors interwoven with gold and silver. The little girl cried out in ecstasy at the sight of all these fine things; while Agathe looked on them in silence with a bewildered eye, and was rather embarrassed how to declare that they were all too handsome for her. The merchant apparently did not guess the cause of her hesitation, for he said, pushing aside the boxes he had opened, "I think I can show you something still better."

"Pray do not trouble yourself to search further," said Agathe, with a sigh, as she took out her little purse; "I only want a very plain handkerchief; something simple and cheap. All these things are too elegant."

"Pardon me, madame la baronne, nothing can be elegant enough for you," replied the merchant politely.

"I am not Madame Colobrières," said Agathe, blushing, "I am her sister-in-law. It would not be becoming for a young lady to wear such sumptuous things."

"Oh, do, do, aunt, dress yourself out fine for once!" exclaimed the child; "you have never done so, nor we either."

"People who live all the year round in the country have no need of so much dress," interposed Mademoiselle de Colobrières, hastily, in hopes to put a stop to the child's prattle; but the little creature was too much excited by the splendid things the merchant continued to place before her, and she went on with unchecked volubility:

"But indeed, indeed we ought to buy all these things, and then Nanon, the exciseman's daughter, would not give herself such airs at mass when she struts before our bench with her gingham frock and her *coiffe à papillon*. We should have new clothes like her, instead of being obliged to mend our Sunday clothes every Saturday."

Agathe colored deeply, and with much confusion of manner rebuked the little girl's loquacity; but almost instantly overcoming the natural weakness of her pride, she put aside the glistening silks with one hand, and with the other she laid her light purse on the table, saying in a tone of

melancholy dignity: "We are not rich; here is all I can lay out with you at present."

"Never mind, mademoiselle," was the merchant's eager reply; "do me the honor to choose whatever you may please to require; you will pay me another time."

Agathe shook her head; but the merchant persisted: "You can discharge this little debt in a year, if convenient to you, mademoiselle: I shall be here again by that time."

"When that time comes I shall not be here," said Mademoiselle de Colobrières, sadly. "No finery is needed where I am going, but a black woollen gown to be worn all the year, and a veil that is never changed."

"You are going into a convent, mademoiselle?" said the merchant with a guarded expression of surprise and interest.

"Yes, ere long; and really," she continued in the same sad and resigned tone, "I have no need of such things as you have shown me. Oblige me by letting me see the plainest goods you have."

The merchant went to a bale at the end of the room to comply with her wishes, and while he was unpacking it, Agathe amused herself with looking over the goods strewed before her. Among them lay a portfolio of tolerably good engravings, which she began to examine with some curiosity. Most of them represented polite pastoral scenes, in which plump cupids and enamored deities sported with dainty shepherdesses and innocent swains bedizened with pink ribands; but among these idyllic compositions there was one that made a deep impression on Mademoiselle de Colobrières. The artist, seized with a tragic inspiration, had depicted a scene of monastic life in all its horrors. In a damp vault, scarcely lighted by an expiring lamp, a nun lay stretched on her bed of straw. She was dying immured in the *in pace*, and her wasted hands and dim eyes were raised to heaven with an indescribable expression. Like the prophet king she seemed crying out from those depths in a hopeless appeal to the divine mercy.

Agathe gazed in dismay on this dismal image. All the latent repugnance of her soul for the monastic life, all her loathing for the vows she was about to pronounce, were suddenly and violently aroused; she let the engraving fall on her lap and burst into tears. Just at that moment the merchant came back from the other end of the room. A glance at the engraving explained to him the cause of this outbreak of grief, and he said with evident emotion, "You are going into a convent, mademoiselle? It is a terrible step, if you are not led to it by a strong vocation. Pardon me if I venture to offer an opinion on what concerns you, but I cannot help thinking you will commit a crime against yourself in thus entering the grave alive. The time will come, perhaps, when you will bitterly regret such a step."

"Regret it! I do so already!" cried Mademoiselle de Colobrières, whose long pent feelings now broke forth uncontrollably; "I loathe a convent life, and look forward with dread to the future; but I must submit to my fate."

"You have a father or a mother who insists on this sacrifice?"

"No, my parents are dead."

"Indeed! Then who constrains you?"

"Necessity," replied Agathe bitterly. "A nunnery is the only asylum on earth for a poor maiden of noble blood, and in such an asylum most of the females of our family have been immured in

the prime of life. It has long been the custom of the Colobrières to sacrifice us thus, since their fortune has ceased to be adequate to the maintenance of their rank. Oh, why does not God, to whom we are devoted in spite of ourselves, why does he not take us from the cradle, when our innocent hearts are as yet bound by no ties to this world?"

"Whilst Agathe spoke thus, looking up to heaven with her beautiful eyes filled with tears, the merchant gazed on her with a singular expression of countenance. The man was really superior to his vulgar condition; his was one of those prompt and decisive natures, which by dint of resolute will and daring shrewdness, carry themselves triumphantly through the most difficult circumstances. Such were the qualities to which Pierre Maragnon already owed a fortune acquired in hazardous speculations. As he gazed on the beautiful and high-born lady who now bent her tearful eyes to the ground, and seemed abashed at having suffered a stranger to be the witness of her unguarded emotion and the confidant of her secret sorrows, Pierre Maragnon felt the moment might be decisive of the future destiny of them both. A thought, extravagant almost to wildness, flashed upon his mind. With the same quick tact that he exercised in all his dealings, he calculated the chances of the matter before him; they appeared favorable, and he dared to conceive a hope, a project; viz., that he would carry off Mademoiselle de Colobrières, and marry her, he Pierre Maragnon! To any one who could have seen into the mind of Agathe at that moment, such an idea would have seemed the height of presumption and folly. The poor young lady did not even take any notice of him who was gazing with such deep scrutiny upon her beautiful downcast countenance. In the eyes of the indigent daughter of the barons of Colobrières, a merchant, a *roturier*, was not a man; and the good will with which she deigned to regard Pierre Maragnon was of a kind, perhaps, more mortifying to its object than would have been mere indifference. The first necessary step was to bring down that instinctive pride of hers, and annihilate her inveterate prejudice by a direct and undisguised attack; and this Pierre Maragnon resolved to do, at the risk of incurring the displeasure of Agathe upon the first word he uttered.

"You will think me very forward, mademoiselle," he said, in a grave, respectful tone; "but as I have spoken my mind as to your situation, I think it my duty also to give you this advice. Make up your mind to endure anything rather than enter a convent. You cannot remain with your family; they are too poor to keep you; well, then, leave them and go live elsewhere. Work, if it be necessary; it is neither a disgrace, nor even a misfortune. Is not constant toil, with freedom, better than a life of sloth, cloistered within four walls, whence you can never come out, alive or dead?"

"That is true," replied Mademoiselle de Colobrières, surprised, but not offended at such language. "If I could only renounce my nobility and my name, my course would be taken to-morrow—at once. I would go and live no matter where, by the labor of my hands, rather than become a nun!"

"And what prevents you, mademoiselle?" said Pierre Maragnon, boldly. "It needs only a slight effort of courage, and you may descend from that rank which imposes so terrible a sacrifice upon

you, and become a *petite bourgeoisie*. You have no other refuge than the convent, because you are too poor to marry a man of your own quality; but a *roturier* would think himself fortunate to wed you without a dower."

"A man of no birth would never dare to ask me in marriage," replied Agathe, naïvely.

"The situation in which you are placed may prompt some one to make so bold," said the merchant in a tone of peculiar meaning, and looking her steadily in the face.

"She understood him. The blood rushed into her cheeks: her eyes flashed with pride, perhaps with indignation; but this involuntary movement of the blood subsided immediately; she made no answer, and remained thoughtful. Pierre Maragnon deemed his triumph certain when he saw her ponder thus. Concealing his joy, and the very strong feeling that was already taking possession of his soul, he began again to descant on the fate of those who become nuns without any special vocation. Though his youth and his good looks might have inspired him with a certain degree of confidence, he had the good sense not to make trial of any vulgar means of seduction; he said not a word of what was passing in his heart, but keeping within due control the admiration, mingled with respect and tenderness, with which the beauty of Agathe had at once impressed him, he applied himself to discussing the possibility of a marriage between a wealthy *roturier* and the descendant of an illustrious and utterly ruined family. He set forth his own position in precise terms; it was prosperous. An orphan from his childhood, he owed to his own active exertions a fortune ten times the fee-simple value of the castle and estates of Colobrières. Agathe hearkened, confused, and tempted, not by her heart, but by her reason, which told her that after all it would be better to become the wife of a merchant, than to be shut up for the rest of her days in a nunnery.

"The little girl had fallen asleep on the lap of her young aunt. All was hushed in the old manor. The castellan of Colobrières, far from suspecting the affront with which he was threatened, was fast asleep beside his wife, and dreamed of finding under the head of his bed a fine bag of crowns, with which he had the castle repaired, and bought himself a new coat. Mademoiselle de Colobrières and Pierre Maragnon had full leisure to confer together, and when the clock struck midnight, their interview was not yet ended. Agathe nevertheless had not made up her mind. The longer she reflected, the more she felt the importance of the consent or refusal she was about to pronounce. Pale, oppressed, and trembling, she kept silence, or replied only in monosyllables mingled with sighs, to the pressing arguments with which Pierre Maragnon strove to fix her wavering purpose. But in the course of this long conference he had made immense progress. Mademoiselle de Colobrières was insensibly coming to treat him as an equal, and more than once she called him monsieur. At last, unable as yet to decide, she said:

"In the perturbation into which all this has thrown me, monsieur, I cannot come to any decision. I want to be alone, to collect my thoughts, and pray to God before I give you an answer. It is now late in the night, and you go away in the morning: well then, as soon as the first streak of dawn appears yonder, behind the hills, my resolu-

tion will have been taken. If I do not return to meet you, quit this castle immediately, for I shall have resigned myself to my lot."

"She rose, and Pierre Maragnon replied submissively, but with deep feeling, 'Your weal or woe are in your own hands, mademoiselle; may Heaven inspire you, and bring you hither again to-morrow morning.'

"Agathe took the sleeping child in her arms and slowly left the room. She had to traverse part of the castle to reach her chamber. The silence of night, and the pale moonbeams falling on the disjointed floors, imparted to those vast and long uninhabited halls a sad and desolate aspect that sank with a chill weight on her spirits. She gazed long around her, as if to confirm to herself the total ruin of her house, and passed onwards, pondering on the haughty penury of her family, and the painful contrast between such pinching indigence and the high nobility of descent, which was her sole and woful dower. On entering her little chamber, she laid the child on the bed, and sat down pensively before the prayer-desk. Her lamp, which she had left burning, shed but a flickering light on the blackened wood carvings that projected from the sombre face of the walls. The ticking of the invisible death-watch was heard loudly amid the deep stillness, as the creature pursued its slow work of destruction on the elaborately sculptured oak and walnut. Other slight sounds occasionally interrupted the noise made by the insect, as the hungry mice, running about behind the wainscot, brought down the damp crumbling mortar of the old walls. It was near the end of October; the approach of winter already made itself felt, and as the night advanced, a chiller air entered through the dilapidated windows, and made Agathe shiver. The poor girl had sunk on her knees and wished to pray; but whilst her heart sought to lift itself up towards God, her mind was lost in an endless maze of thought. Like all persons who are hurried along by no passion or intense feeling, she vacillated in fear and doubt between the two alternatives before her, and dreaded that whatever her choice might be she should repent of it on the morrow. Had she found more sympathy and tenderness in those around her, family affection would have prevailed in that hour of crisis, and she would have be-thought her of the affliction and shame which a *mésalliance* would cast on her house. But the baron took no great interest in her fate, all his stock of affectionate feelings being engrossed by the little prattlers whose numbers grew with every year. When all his pretty brood was gainbolting about him, he used to fall into a reverie, like the woolman in the tale of Little Poucet, and calculate how much more easily he should rear his bantlings when he should have got rid of poor Agathe. The baroness was a good soul, but her distressed condition rendered her selfish, and forced her upon a system of ways and means, which, in any one of a less kindly nature, would have degenerated into sordid scheming. Mademoiselle de Colobrières plainly felt all this, and it was this humiliating and painful certainty, that made her contemplate without dread the rage and indignation of her kindred, when they should have received the astounding intelligence of her marriage. Still, however, she wavered; and as often happens in the most important circumstances of life, it was a trifling incident that fixed her decision. Whilst she was immersed in her distracting thoughts, and was observing with alarm the faint twilight that already began to steal

upon the horizon, the child moved uneasily on the bed and sighed in some unpleasant dream. Agathe went to her, raised her gently on the pillow, and kissed her soft cheeks, bathing them with tears. This woke the child, who instinctively put her arm round her aunt's neck, muttering, 'Show me all you bought last night of the merchant, aunt.'

"'I did not buy anything,' said Agathe. 'Come, my dear, go to sleep. Or shall I take you back to the other room, to your brothers and sisters?'

"'No, I will stay where I am,' said the child, looking round her; 'mamma promised me this room should be mine, because I am the eldest.'

"'Ha! and she told you you should have it soon?'

"'Immediately, when you are gone to the nunnery,' said the child, with the naïf selfishness which children carry into all their little schemes.

"'To the nunnery!—I will not go!—and I leave you my chamber, Euphémie,' said Mademoiselle de Colobrières, starting up.

"The child sank back on the pillow and was asleep again in a moment. Agathe took from the drawer, that contained her all, her little enamelled cross and her prayer book, opened her door softly, traversed the castle with firm and rapid steps, and went down into the courtyard. Pierre Maragnon had been waiting since the first glimpse of daybreak with his eyes bent on the great door. Doubtless he had trembled in his soul at the thought that it would not open again, for his pale and haggard looks told of an anxious night. At the sight of Mademoiselle de Colobrières he grew still paler, and then the blood rushed from his heart to his head with a revulsion of pride and joy; but instantly overcoming his violent emotion he advanced and said quietly with as much respect as though he were addressing a queen, 'Mademoiselle, we are just about to start if you please; in four hours you will be in Antibes, and you will then let me know your further commands.'

"'I am ready, monsieur,' said Agathe, in a low voice, modestly but firmly; 'but instead of going direct to Antibes, we must pass through the village of St. Peyre, and stop there an hour.'

"The mules were already laden, and the two men who had charge of them had drawn them up in line outside the castle yard. A tall young man, the same whom Agathe had seen asleep, with his gun in reach of his hand, on the preceding evening, was in the saddle keeping discreetly out of earshot; his likeness to Pierre Maragnon told plainly that they were of the same blood and bore the same name. At a sign from the merchant the little caravan began to march. Agathe was still in the hall, looking at a heap of silks, laces, and other goods, neatly arranged on the sill in the deep recess of a window. Over all these fine things, and placed in a manner to strike the eye at once, was a paper, on which was written: From Mademoiselle de Colobrières. The little purse containing the six livres fifteen sous, the baroness' savings, lay under the paper. 'It is your wedding present, mademoiselle; I have taken the liberty of making it in your name,' said the merchant.

"'The poor children will have new clothes for once in their lives!' murmured Agathe, thanking Pierre Maragnon with a look. Then she said, hurriedly, 'Let us begone.'

"The merchant led up his saddle horse, a powerful animal, fit to carry the four sons of Aymon,

placed Mademoiselle Colobrières on the croupe, mounted, and set off at a round trot. The caravan was already out of sight beyond a turn of the road, but the tramp of the mules and the tinkling of their bells were audible.

"When they reached the foot of the hill, and before they entered the tortuous road leading away from Colobrières, Agathe turned back and looked her last on the castle of her fathers. It was a look full of sorrow and fondness that poignantly bespoke all the feelings of her soul. 'Farewell!' she mentally ejaculated, 'farewell, noble abode, whence poverty expels me! Had I been allowed to pass my cheerless existence within the shelter of those ruined walls—had I been left a little place by my father's hearth, and a right to sit at the scanty table where I should not, perhaps, have always found my daily bread, I would not have forsaken my family and renounced my name.'

"Her tears flowed silently as she thought thus; she wiped them away with one hand, whilst the other instinctively clung to Pierre Maragnon's arm, with a close and timorous grasp. The merchant, proud as a monarch, rode with head erect and a glad heart, thinking of the happiness and the honor that awaited him. Once out of sight of the castle of Colobrières he put his horse to a walk, and took the liberty to ask Agathe if she had any particular purpose in going to St. Peyre.

"The purpose of being married to you this very day,' was her reply.

"The heart of Pierre Maragnon thrilled at the words. In his ecstasy he was near raising to his lips the small hand that grasped his green ratteen sleeve; but checking himself, he only replied in the most respectful tone: 'I durst not have taken it upon me to press you on this subject, mademoiselle; and yet I felt that the most proper course you could take was not to postpone the honor you intend to do me; your determination delights me. If you please, we will allow my people to proceed slowly, and we will ride on before them.'

"Yes,' said Agathe, 'that is well thought of; we should be at St. Peyre before the hour of mass.'

"The merchant set spurs to his horse, and turning off from the road, rode across the fields, by which means he had soon outstripped the caravan, which was proceeding steadily in a sunken way, so deep that ill-disposed persons might have lain there in ambush. Agathe, frightened a little by the brisk pace of the horse, drew up her small feet under her petticoat, and clung with both arms to her companion, who at that moment looked not unlike Pierre of Provence carrying off the fair Maguelone.

"It was about seven in the morning when the young couple arrived in front of the church of St. Peyre. The sacristan had already rung the first matin bell, but the village population were in the fields, and there were only two or three old men about the church, basking in the sun. The merchant fastened his horse to the palings of the priest's little garden, and accompanied Mademoiselle de Colobrières into the church, where both knelt down at the entrance of the lonely nave. Agathe then making a sign to Pierre Maragnon to wait for her, went into the sacristy, where she found the curé putting on his robes, assisted by the lad who was to aid in the performance of the mass. He was a young priest, tolerably well-read; a man of tolerant piety and great virtue. Occasionally, in visiting his parishioners, he had called at the

castle of Colobrières, and Agathe was well known to him.

"The blessing of Heaven be on you, mademoiselle,' he exclaimed, as Agathe advanced to him pale and trembling. 'Has anything untoward happened at Colobrières!'

"No, Monsieur le Curé,' she replied, 'it is myself the matter concerns, and I am come to beg you will hear my confession immediately.'

"The curé, much astonished, motioned to his little clerk to retire, and sat down, after having closed the door of the sacristy. Mademoiselle de Colobrières then knelt down, and after relating what had occurred on the preceding night, she told him the resolution she had taken, and the purpose for which she was come. The case was novel and embarrassing. Mademoiselle de Colobrières was an orphan, and had attained her majority, so that she could dispose of her own hand; nevertheless, her family was legally empowered to resist such a *mésalliance* as she was about to make. Besides this, it was necessary to fulfil the previous formalities required by the ecclesiastical laws in all but extraordinary cases. The good priest refused at first, hoping, perhaps, that Agathe would abandon her intention, and allow him to convey her back quietly and without scandal to Colobrières. But upon the first word he uttered to that effect, she rose and said, resolutely, 'No, Monsieur le Curé, I did not take this step with the intention of afterwards receding. I will go with Pierre Maragnon wherever he chooses to take me, and he will marry me when it shall so please him; but it is for you matter of conscience to let me depart thus. Since I am resolved to go with him, were it not better he should take me away as his wife and not as his mistress? Alas! if we both commit such a fault, it will be sorely against our will.'

"This way of putting the case alarmed the curé. He was a truly religious man, of a timorous conscience, but of an upright and decided character. 'Mademoiselle,' he said, after some reflection; 'I consent to marry you; God in his mercy grant that you may live afterwards without regret and remorse! After the ceremony, I will go and see M. le Baron de Colobrières. No doubt they are searching for you at this moment, and any surmise will have been adopted by your family rather than a suspicion of what is actually occurring. I will intercede for you, but I fear it will be without avail. For the last time, I intreat you to reflect: are you fully resolved thus to forever separate from your family, who will never think of you, perhaps, without anger and shame?'

"My greatest desire is that they may forgive me,' replied Agathe, with mournful determination; 'but I do not hope they will, Monsieur le Curé; and when I left Colobrières, I knew well that it was forever.'

"The curé motioned to her to kneel down again, and after praying with her and duly accomplishing all that should precede the religious ceremony, he told her to go and wait for him in the church, and meanwhile to send Pierre Maragnon to him. The little clerk went by the priest's desire and fetched two of the old men who were sitting in the porch, to act as witnesses; and a quarter of an hour afterwards Pierre Maragnon and Agathe de Colobrières were married. On coming out of church they met the whole caravan which had just arrived, and Pierre, going up to the young man we have seen before, said to him, with a face beaming with

proud joy as he pointed to Agathe, 'Take her hand, Jacques; she is your sister.'

"That same afternoon, whilst the new married couple were on their road for Marseilles, the curé proceeded to Colobrières. The baron and his wife were still busy with conjectures: they had found Agathe's wedding presents on the window-ledge, but could not tell what to make of them, and their wits were perplexed with a host of conjectures, none of which approached the truth. When the curé had given a plain statement of the facts, the baron burst in paroxysms of rage and indignation, and the baroness shed tears. In spite of her natural gentleness and indulgent disposition, the good lady was also incensed against her sister-in-law, and cried out in a comical transport of anger and distress: 'Mademoiselle de Colobrières the wife of Pierre Maragnon! That she should have been guilty of the weakness of loving him is what I might, perhaps, conceive; but marry him—never!'

"The Baron de Colobrières renounced his sister Agathe, cursed her, and expressly forbade that her name should ever be uttered in his presence. After this solemn declaration he had a bonfire made of

brushwood in the great court, and when it was well lighted, he sternly flung Agathe's presents into the blaze. The baroness sighed piteously when she saw the brave tissues vanishing in the flames, and mentally computed the number of new dresses that might have been made out of what was soon but a handful of ashes. But she knew her husband too well to venture on the least remonstrance; she knew that the worthy man would rather have seen his children clad in lambskins, like the pictures of little St. John, than decked in garments made of Pierre Maragnon's wedding presents. With a heavy heart she locked up the six livres fifteen sous which had been found untouched in the purse; and considering that all this disaster had come of the unlucky wish to spend her savings, she made a vow that she would be wiser in future. Agathe's example, moreover, was a warning to her respecting her daughters. None of the first five saw their eighteenth year under the paternal roof, but were shut up in a nunnery, and had made the last vows long before the age when their aunt had chosen to marry a roturier rather than take the veil."

FLOGGING AT HOUNSLOW.

A JURY was impanelled on Wednesday evening at the George the Fourth Inn, Hounslow-heath, before Mr. Wakley, to inquire into the death of Frederick White, aged twenty-six, late a private in the 7th Hussars, who died subsequent to, and it was alleged in consequence of, having received severe corporal punishment. After the jury had viewed the body the inquiry was adjourned for a week, to allow an examination of the deceased by a surgeon not connected with the army, and for the summoning of several material witnesses. The coroner also ordered that the deceased man's family should be requested to attend. The following statement has appeared in a morning paper, but it must be regarded as altogether *ex parte*. It will probably be satisfactory to all parties that the investigation could not be in better hands than Mr. Wakley's for the discovery of the whole truth:—"The deceased has been in the regiment seven years and a half, and had never before been subjected to corporal punishment; but, being given to drink, he had been subjected to extra drills, &c., as a punishment. While laboring under the effects of liquor, an altercation took place between him and Sergeant Daly, when he struck the latter on the breast with a poker. For his conduct on that occasion two charges were preferred against him, one for assaulting a non-commissioned officer, and the other for using abusive language towards him. Under a warrant issued by the commander-in-chief, a court-martial assembled at Hampton Court barracks, consisting of seven officers, the president being Captain Arthur Shirley, of the 7th Hussars, who found the deceased guilty of both charges, and sentenced him to receive 150 lashes. That sentence was confirmed at head-quarters, and carried out on the 15th ult., at Hounslow barracks, in the presence of the regiment, of Colonel White, the commanding officer, and of Dr. Warren, the head surgeon. The triangles were not used on the occasion, but 'the jadder,' and the whole number of lashes was given. The deceased walked into the hospital himself, after the flogging, and subsequently kept his bed for fourteen days. His wounds were first treated with fomentations, and afterwards with dressings.

Some days after, the skin of his back being healed, he would have left the hospital had he not complained of his left side. The pain subsequently shifted to his bowels, and on Saturday last, about three o'clock, he became insensible, and died in the evening of the same day. He was seen on that day by Mr. Hall, one of the staff surgeons, by request of Dr. Warren. On Monday last that gentleman assisted Dr. Reid, also a military surgeon from town, in making the *post mortem* examination. Deceased, who was a healthy man, was visited while in the hospital by some of the officers, and never made any complaint, but while there was not visited by any of his relatives, neither were they made acquainted with either his punishment or illness. It is said that at the infliction of the punishment ten of the privates present fainted. The deceased was a tall, fine grown, intelligent young man, bore the infliction with stoical indifference, uttering not a word beyond requesting that the lash might not fall so frequently upon his neck. There is a young man named Mathewson, now in the hospital, suffering under the effects of a flogging. He had not joined the regiment more than seven or eight weeks before he was punished. He was one day standing in his room stooping with his head to the ground, when he heard his name suddenly called. He answered, 'Heigho;' and on looking up found he had been called by one of the sergeants. The latter demanded why he made such an answer! to which the former replied that he did not know it was the sergeant who called him. The sergeant still pursued the subject, until at length Mathewson exclaimed, 'Do you want me to go down on my knees to you?' for which expression the sergeant put him under arrest. Mathewson was subsequently taken before the commanding officer, who, after severely reprimanding him, was asked by Mathewson to tell him how he ought to have answered the sergeant, which was construed into disrespectful conduct towards his commanding officer, for which the young soldier was tried by court-martial, found guilty, and sentenced to receive one hundred lashes, from the effects of which he is now in the hospital."

From the Foreign Quarterly Review.

History of the Indian Tribes of North America, with Biographical Sketches and Anecdotes of the Principal Chiefs, embellished with One hundred and twenty carefully colored Portraits, etc. etc. By T. L. MCKENNEY, Esq., and JAMES HALL, Esq. Philadelphia: Rice and Clarke. London: C. Gilpin.

IN turning over the leaves of the magnificent picture-book before us, we rejoice at the opportunity it affords us for departing from the tone of censure in which we have too often felt compelled to speak of the works and deeds of our kinsmen across the Atlantic. For once, at least, they cannot accuse us of scornful disrespect, or of insular prejudice, when, according to our best ability, we recommend nationality in art, as the one thing beautiful, desirable, and needful for its permanent existence. Towards this point we would have our American friends strain every nerve. They have already proved themselves steady and enthusiastic pilgrims along the world's highways. We may mention the names of West, Washington Allston, Leslie, Sully, in proof that they can take rank among the most admirable Europeans, when they deign to paint in the European fashion; nor can the Londoners or the Florentines forget, that in his "Greek Slave," W. Hiram Powers has put in a very strong claim for the championship of modern sculpture, one to which the Rauchs, and the Gibsons, and the Schwanthalers, and the Baily's would find it hard to offer a rejoinder. In all revivals and adaptations, however—in all workings after this antique, or the other tradition, there is an unsoundness, and a want of satisfaction, the end of which can be but mediocrity. It needs but to walk the rounds of the churches, galleries, and studios of Munich, to ascertain the limits of modern, when imitating ancient art. There has been no want of earnest study, no want of unselfish devotion to a purpose, no want of sympathy and patronage: and here and there industry, ingenuity, and sincerity have "tossed and turned" themselves, have accumulated and wrought, till the result is all but a creation—all but a work of genius. Yet the impression, on ourselves at least, of these vaunted works is saddening. It is painful to see that sympathy will not keep pace with effort; painful to be compelled to admit, (as one is compelled to do, a score of times every hour, by some flash of recollection of the glories of the ancients,) that we are only looking at an elaborate mistake; painful to anticipate a not very distant period, when Glyptothek and Basilica, *Fest-bau*, and *Aller Heiligen Kapelle* will be reviewed by the connoisseurs, as so many monuments of respectable pedantry, and school exercise; more praiseworthy for intent, but little more so in fact of artistic merit, than the follies of Louis Quinze, or than the library built after the fashion of a chest of drawers with which the great Frederick of Prussia chose to diversify the main street of his show capital!

We have dwelt upon Munich because the name of this city is in every one's mouth; but it is only an illustration of the spirit of the times; not a solitary instance. The worthy personages, who imagine they are advancing the cause of devotion and authority, by attempting to bring back church music to the barbarianism of the Gregorian chant, offer another. Why are these things? Does that old superstitious fear yet linger on the earth, which mistrusted creation and discovery as irrever-

ent? Is Orthodoxy maintained by not a few, because it saves the trouble and cost of original thought? These questions sound almost monstrous: yet, much of the artistic criticism, and the motives held out for artistic effort in the present day, when stripped of the verbiage in which canters of all classes love to involve them, have no wiser principles for kernel. Yet, digressing for a moment, let us thankfully remark how—in spite of all this laziness and pedantry, this appeal to a spurious devotional spirit, which overlooks the glorification of God in the present, no less than in the past—genius is vindicating itself: how the necessities, the materials, and the social arrangements of the world are unconsciously calling forth and shaping productions, which posterity may admire as models. Those whose connoisseurship and enthusiasm, being merely an affair of precedents and synods, can see nothing of the poetry which belongs to every effort of human ambition, of the beauty which bears company with every step of civilization, will deride us as utilitarian, or denounce us as at once visionary and materialist, if, by way of illustration, we venture to assert, that in the magnificent structures which steam conveyance has originated, we have more chance of a new order of architecture, than in all the porings and prying of the Pugin school of artists, who sanction every anachronism and inconsistency of past, half-instructed ages, on the score of a mystical sanctity, and demands the sacrifice of criticism at the altar of faith. Let all memorials of the past be reverently preserved, but preserved as memorials, not models. It should be our task, as it is our privilege, to go forward.

Viewed under their two-fold aspect, especially, seeing that anything entirely new stands, for the present, at so heavy a disadvantage, whatsoever the enchantment of distance may do for posterity—all collections with regard to the aboriginal inhabitants of America have a value, which every year will only increase. Perhaps never has savage life worn a form so inviting and poetical, as in the annals of the Indian tribes. Though hardly disposed, with the *prospectus* of Messrs. McKenney and Hall's work, to admit the Red-jackets and Mohongos as "Ciceros and Cæsars, Hectors and Helens;" though human conservatism, or human simplicity, could never, in their most stiff or sickly vagaries, dream of a revival of wigwags, of an extension of the picturesque birch-bark and quill manufactures; of encouraging, after the fashion of "Young England," the dances and the ball-plays, with all their distinctive forms of full-dress and un-dress, (the latter, as a lady tourist has told us on some festive occasions, a mere simple osprey's wing)—though it would exceed the boldness of any Benedict to speak even leniently of *squaw-dom*, as an "honorable condition," in days like these, when The Schoolmistress is abroad arousing and inspiring the "womenkind,"—there is still, under every point of view, for the studious or for the sympathetic, for the antiquarian or for the artist, for the wild sportsman or the closet philosopher, a dignity, a charm, and a poetry about the Red Man, to which, not the whole library of trumpery of which he has been made the subject can render us indifferent. The Americans, then, are justified in calling attention to this, as a great national work. Few rate more highly than ourselves the magnificence of Audubon's collections; the artistic power, which he has thrown into his drawings, giving his ornithological sub-

jects the attractiveness of some professed picture by Snyders or Landseer, (distancing, let us add, Hondeköeter, the court painter of poultry, by many a rifle's length)—few have enjoyed more heartily the admirable pages which detail his wanderings, and describe his specimens; entertaining (to quote Johnson's anticipation of Goldsmith's *Natural History*) "as a Persian tale," and poetical as one of Christopher North's most eloquent rhapsodies when "*Ebony*" was young; yet, in right of subject, we must give the handsome volumes on our table a yet more distinguished place. Nor can we attempt to glance at their contents, without a word or two on a less important point, in which the Americans may legitimately take pride. Their manner of production and publication is most praiseworthy. Mr. Wittingham of Chiswick, it is true, might suggest that the type was too heavy for the paper; and it would strike Mr. Hullmandel's experienced eye, we doubt not, that in some half-dozen specimens, among the lithographs, the grain of the chalk is too coarse and woolly to pass muster in these perfected days of the art. But the above objections are trifling:—hinted, peradventure, merely to keep up our character as just critics, whose habit it has been, from time immemorial, to indulge their spleen by declaring "that the picture would have been better painted, if the painter would have taken more trouble."

It seems an Irish beginning to open the third volume first; but the reason is ready in the "History of the Indian Tribes" contained therein, and our visit is merely a passing one. For if the physiologists, philologists, and other "cunning men" of science, have failed to ascertain, past contest, whether the American Indians were or were not of the Tartar stock—if the signification of the great coincidence between the word "*ha, ha,*" as a definition of an English park ditch, and the same appellation given by the Sioux to the falls of St. Anthony, is still far from being duly appreciated:—if antiquarians are not precisely agreed how far the hieroglyphical paintings of the Mexicans, and the uncouth symbols and effigies which emboss the Yucatan temples, "coincide" with the patterns rather than drawings on the buffalo-skins of the Western Indians—if, to quote the author of the Introductory Essay before us, nothing can be more uncertain, and more unworthy, we will not say of credit, but of consideration, than their earlier traditions, and probably there is not a single fact, in all their history, supported by satisfactory evidence, which occurred half a century previously to the establishment of the Europeans:—wherefore should we vex our readers with splitting theories, and spinning disquisitions? Again, to touch the modern history of the Indians—were it ever so sketchily—would lead us into a review of Mr. Schoolcraft's interesting collections, and Mr. Stone's spirited and elaborate histories and biographies:—into glancing over such memoirs of the war-time as the Mrs. Grants and Mrs. Bleekers contributed (since woman's testimony has always its special value, as embracing points which her lordly master disdains to observe.) We should have to *crystallize* into the smallest solid space the amount of facts and features to be got out of the writings of Fenimore Cooper, the Irvings, and Bird. A more romantic library still remains to be ransacked, that of missionary enterprise, somewhat sentimentally opened, some fourteen years since, by Mr. Carne; but containing, we apprehend, abundance

of matter, for the thinker, or the painter, or the philanthropist. Enough, on the present occasion, then to say, that the variety of materials seems in some degree to have puzzled the writers of the Prefatory Essay, as well as ourselves. The days of laborious concentration are gone, and perhaps it were too extreme to expect that they should be revived for this occasion only, when the task to be done was merely to make up a handsome introduction to a picture-book. If, as we believe Sir Harris Nicholas would tell us, our lodges have sometimes "forced their facts," in writing the biographies of our illustrious personages—if Corneys poke their heads out of remote corners to prove that our D'Israelis are somewhat given to the Japanese fashion of *mermaid-making*, when busy over their "Curiosities of Literature"—far be it from us, on peaceful thoughts intent, to do more than hint, that here or there is a flimsiness or an inaccuracy, or a want of that grasp of the whole subject, for which the memory of a ripe scholar, and the hand of a finished artist, are alike demanded. Better than picking of notes, than complaining of facts carelessly collected, or of style left in the unweeded state of nature, will it be to offer the reader a sample of the introductory matter to the volume. The following, however, is not so much a part of the history, as one among the *pièces justificatives* upon which it has been founded. We have rarely met with a more touching and complete illustration of the strength and weakness of savage life:—

"Certain murders were committed at Prairie du Chien on the Upper Mississippi, in 1827, by a party of Indians, headed by the famous Winnebago chief, Red Bird. Measures were taken to capture the offenders, and secure the peace of the frontier. * * * Information of these movements was given to the Indians, at a council then holding at the Butte des Morts, on Fox River, and of the determination of the United States government to punish those who had shed the blood of our people at Prairie du Chien. The Indians were faithfully warned of the impending danger, and told, that if the murderers were not surrendered, war would be carried in among them, and a way cut through their country, not with axes, but guns. They were advised to procure a surrender of the guilty persons, and, by so doing, save the innocent from suffering. Runners were dispatched, bearing the intelligence of this information among their bands. Our troops were put in motion. The Indians saw, in the movement of these troops, the storm that was hanging over them. On arriving at the portage, distant about one hundred and forty miles from the Butte des Morts, we found ourselves within nine miles of a village, at which, we were informed, were two of the murderers, Red Bird, the principal, and We-kaw, together with a large party of warriors. The Indians, apprehending an attack, sent a messenger to our encampment. He arrived, and seated himself at our tent door. On inquiring what he wanted, he answered, '*Do not strike. When the sun gets up there*' (pointing to a certain part of the heavens) '*they will come in.*' To the question '*who will come in?*' he answered, '*Red Bird and We-kaw.*' Having thus delivered his message, he rose, wrapped his blanket about him, and returned. This was about noon. At three o'clock another Indian came, seated himself in the same place, and being questioned, gave the same answer. At sun-down, another came, and repeated what the others had said."

We must proceed with this romance of savage life, as told by Mr. McKenney, in a private letter to Mr. Barbour, the then secretary of war. The wildness of the incident acquires an additional local color from the prosy and florid style of American narration, which we would not destroy or lessen. The reader, then, must excuse something of prolixity, for the sake of character.

"You are already informed of our arrival at this place on the 31st ultimo, and that no movement was made to capture the two murderers, who were reported to us to be at the village nine miles above, on account of an order received by Major Whistler from General Atkinson, directing him to wait his arrival, and meantime to make no movement of any kind. We were, therefore, after the necessary arrangements for defence, and security, &c., idly, but anxiously, waiting his arrival, when, at about one o'clock to-day, we descried, coming in the direction of the encampment, and across the portage, a body of Indians, some mounted, and some on foot. They were first, when discovered, on a mound, and descending it, and by the aid of a glass we could discern three flags, two appeared to be American, and one white; * * * and in half an hour they were near the river, and at the crossing-place, when we heard singing; it was announced by those who knew the notes, to be a *death-song*, when presently the river being only about a hundred yards across, and the Indians approaching it, those who knew him said, 'It is the *Red Bird* singing his *death-song*.' On the moment of their arriving at the landing, two *scalp-yells* were given, and these were also by the *Red Bird*. The Menominites who had accompanied us were lying, in Indian fashion, in different directions all over the hill, eying, with a careless indifference, this scene; but the moment the yells were given, they bounded from the ground, as if they had been shot out of it, and running in every direction, each to his gun, seized it, and throwing back the pan, picked the touch-hole, and rallied. They knew well that the yells were *scalp-yells*, but they did not know whether they indicated two to be taken, or two to be given, but inferred the first. Barges were sent across where they came over, the *Red Bird* carrying the white flag, and *We-kaw* by his side. While they were embarking, I passed a few yards from my tent, when a rattle-snake ran across the path: he was struck by Captain Dickeson with his sword, which in part disabled him, when I ran mine, it being of the sabre form, several times through the body, and finally through his head, and holding it up, it was cut off by a Menominitie Indian with his knife. The body of the snake falling, was caught up by an Indian, whilst I went towards one of the fires to burn the head, that its fangs might be innoxious, when another Indian came running, and begged me for it; I gave it to him. The object of both was to make *medicine of the reptile*. This was interpreted to be a good omen, as had a previous killing of one a few mornings before on Fox River, and of a bear. * * *

"By this time the murderers were landed, accompanied by one hundred and fourteen of their principal men. They were preceded and represented by *Caraminie*, a chief, who earnestly begged that the prisoners might receive good treatment, and under no circumstances be put in irons. He appeared to dread the military, and wished to surrender them to the sub-agent, Mr. Marsh. His address being made to me, I told him it was

proper he should go to the great chief (Major Whistler,) and that so far as Mr. Marsh's presence might be agreeable to them, they should have it there. He appeared content, and moved on, followed by the men of his bands: the *Red Bird* being in the centre, with his white flag; whilst two other flags, American, were borne by two chiefs, in the front and rear of the line. The military had previously been drawn out in line. The Menominitie and Wabanocky Indians squatting about in groups (looking curious enough) on the left flank, the band of music on the right, a little in advance of the line. The murderers were marched up in front of the centre of the line, some ten or fifteen paces from which seats were arranged, and in front of which, at about ten paces, the *Red Bird* was halted, with his miserable looking companion *We-kaw*, by his side, while his band formed a semicircle to their right and left. All eyes were fixed upon the *Red Bird*, and well they might be; for, of all the Indians I ever saw, he is decidedly the most perfect in form, in face, and in motion. In height he is about six feet, and in proportion, exact and perfect. * * * His head too—nothing was ever so well formed. There was no ornamenting of the hair after the Indian fashion: no clubbing it up in blocks and rollers of lead or silver; no loose or straggling parts, but it was cut after the best fashion of the most refined civilized taste. His face was painted, one side red, the other a little intermixed with green and white. Around his neck he wore a collar of blue wampum, beautifully mixed with white, sewn on a piece of cloth, and covering it, of about two inches width, whilst the claws of the panther, or large wild cat, were fastened to the upper rim, and about a quarter of an inch from each other, their points downward and inward, and resting upon the lower rim of the collar; and around his neck, in strands of various lengths, enlarging as they descended, he wears a profusion of the same kind of wampum as had been worked so tastefully into his collar. He is clothed in a *Yankton dress*, new, rich, and beautiful. It is of beautifully dressed elk or deer skin; pure in its color, almost to a clear white, and consists of a jacket, (with nothing beneath it,) the sleeves of which are sewn so neatly, as to fit his finely turned arms, leaving two or three inches of the skin outside of the sewing, and then again three or four inches more, which is cut into strips, as we cut paper to wrap round and ornament a candle. All this made a deep and rich fringe, whilst the same kind of ornament or trimming continued down the seams of his leggings. These were of the same material, and were additionally set off with blue beads. On his feet he wore moccasins. A piece of scarlet cloth, about a quarter of a yard wide, and half a yard long, by means of a strip cut through its middle, so as to admit the passage through of his head, rested, one half upon his breast, and the other on his back. On one shoulder, and near his breast, was a large and beautifully-ornamented feather, nearly white: and on the other, and opposite, was one nearly black, with two pieces of wood in the form of compasses when a little open, each about six inches long, richly wrapped round with porcupine quills, dyed yellow, red and blue, and on the tip of one shoulder was a tuft of red dyed horse-hair, curled in part, and mixed up with other ornaments. Across his breast, in a diagonal position, and bound tight to it, was his war-pipe, at least three feet long, richly ornamented with

feathers and horse hair, dyed red, and the bills of birds, &c., whilst in one hand he held the white flag, and in the other the pipe of peace."

We hope our readers have catholicity enough to excuse this Grandisonian minuteness, marvellous in a people so given to *going a-head* as the Americans. But if such is the taste of their Congress orations, how shall their national literature escape? The sentimental touches in the passage which follows (little needed, let us observe, by a scene intrinsically poetic and pathetic) are as oddly characteristic of the most utilitarian nation under the sun, as the above anxious enumeration of the poor Red Bird's toilette trumperies.

"There he stood. He moved not a muscle, nor once changed the expression of his face. They were told to sit down. He sat down with a grace not less *captivating than he walked and stood* (!!) At this moment the band on our right struck up Pleyel's hymn * * * when the hymn was played, he took up his pouch, and taking from it some *kinnakanie* or tobacco, cut the latter after the Indian fashion, then rubbed the two together, filled the bowl of his beautiful peace pipe, struck fire with his steel and flint into a bit of spunk, and lighted it and smoked. * * *

"I could not but speculate a little on his dress. His white jacket, with one piece of red upon it, appeared to indicate the purity of his past life, stained with but a single crime; for all agree that the Red Bird had never before soiled his fingers with the blood of the white man, or committed a bad action. His war-pipe, bound close to his heart, appeared to indicate his love of war, which was now no longer to be gratified. Perhaps the red or scarlet cloth may have been indicative of his name, the *Red Bird*."

The above receives a last touch of whimsicality little meditated, as being subscribed by one who "writes in haste."

"All sat, except the speakers, whose addresses I took down. * * They were in substance that they had been required to bring in the murderers. They had no power over any except two, and these had voluntarily agreed to come and give themselves up. As their friends they had come with them. They hoped their white brothers would agree to receive the horses, (they had with them twenty, perhaps,) meaning, that if accepted, it should be in commutation for the lives of their two friends. They asked kind treatment for them, earnestly begged that they might not be put in irons; that they should all have something to eat, and tobacco to smoke. We advised them to warn their people against killing ours, and endeavoring also to impress them with a proper conception of the extent of our power, and of their weakness, &c."

"Having heard this, the Red Bird stood up; the commanding officer, Major Whistler, a few paces in advance of the centre of his line, facing him. After a pause of a minute, and a rapid survey of the troops, and a firm composed observation of his people, the Red Bird said, looking at Major Whistler, '*I am ready*.' Then, advancing a step or two, he paused and added, 'I do not wish to be put in irons, let me be free. I have given my life, it is gone,' (stooping down and taking some dust between his finger and thumb, and blowing it away,) like this * * * I would not have it back. It is gone.' He threw his hands behind him, to indicate that he was braving all things behind him, and marched up to Major Whistler, breast to breast. A platoon was wheeled back-

ward from the centre of the line, when Major Whistler stepping aside, the Red Bird and We-kaw marched through the line, in charge of a file of men, to a tent that had been provided in the rear, over which a guard was set. The comrades of the two captives then left the ground by the way they had come, taking with them our advice, and a supply of meat and flour. (!!!)

"* * * The Red Bird does not appear to be thirty, yet he is said to be over forty * * *"
—Vol. iii., pp. 36 to 39.

The Red Bird died in prison. We-kaw, as generally happens to the confidant, *alias* the shabbier fellow, and greater rascal of the two, was let off: and comes in, moreover, for a reputation. There are desperate difficulties, we know, inherent in the subject. The uniform of "Major Whistler and his men" are sad stumbling-blocks in any painter's way, as Horace Vernet could tell us; and it would require consummate tact to rescue the heroic Red Bird and the sneaking degraded We-kaw if drawn out in all their bravery as described, from certain May-day and masquerade associations, which no sane artist would care to conjure up. Still we hold that an Allston would have been more honorably and profitably employed, as concerns Art, in trying to harmonize such objects as these, and thus to add to the world's stores of beauty—than in measuring himself against the ancients by once again painting "Jacob's Dream," or entering the lists against the beauty-painters, who, like "most women, have no character at all," by devoting time, pains—aye, and poetical thought, too—to his "Rosalie listening to Music," or to the thousandth presentiment of "Lorenzo and Jessica," the best how infinitely below Shakespeare!

Let us now turn to the portraits, and the anecdote which accompanies them. The first is properly enough that of "Red Jacket," as the white men chose to call the "Keeper Awake" of the Senecas. Is there not "an acted bull" in this portrait—an inconsistency which ought not to have escaped the projectors of a national work? "Red Jacket" was a professed hater of the white men—a contemner, we are expressly told, of their institutions—the point of "disdaining to use any language save his own." Yet here is this stickler for his nationality handed down to posterity, in the blue coat and Washington medal of those he abominated! It is true that all over the world we could find other portraits of the uncompromising, in like apparel, were we to seek! "Kishkalwa," the second subject in the gallery—nominally and legally head of the Shawanoe nation, is a far more genuine-looking personage, at least in a picture:—his nose garnished with a crescent-shaped ring; his ears with cruel-looking appendages; his head with a comb or top-knot of scarlet feathers (with a few civilized "odds and ends" of riband,) as bristling with defiance as Chanticleer Bantam's own! This fiery personage seems to have understood a joke* as little as the editor of "My Grand-

*The "Book of Offences" (a work which, by the way, we beg to commend to some comic moralist in search of a subject) would receive some of its most curious pages from the history of *savage* life. It is intelligible enough that the loss of a virile garment should be a sore subject among people particularly touchy in point of valor; but while the crotchet passes through our brains, we cannot resist a far less serious anecdote of Indian offence, which has always struck us as alike whimsical and inexplicable. When the Ojibbeway party was in London, a party was made (after the fashion of Mrs. Leo Hunter's) for

mother's Review," in the days of Byron. Being jeered on the laying aside of his one garment during certain warlike operations, as though he had been a coward who had dropped his "ineffables" while running away, he undertook a foray or *razzia*, to wipe away this stain on his character:—and it was one of the express conditions of the peace which followed his victorious arms, sealed by the present of a beautiful young lady, that Kishkalwa's "vestment" (to quote the precise noun which transatlantic scrupulosity enjoins) should, indeed, be henceforth remembered among the "unmentionables." "Shingaba W'Ossin; or, Image Stone," a Chippewa Indian, has, also, a fine unsophisticated head; though, unlike "Red Jacket," he was so far in advance of his tribe, as to encourage investigation with regard to a *Manitou* or object sanctified by superstition—the huge mass of virgin copper, known to all mineralogists and American tourists as existing on the Outanogon River, Lake Superior. A famous subject, too, for the painter, though in a transition state between the "osprey wing" style of dress and the adoption of the militia uniform, is Tenskautawaw—"The Open Door." Though described as a person of slender intellects, weak, cruel, and sensual; despite, too, the loss of an eye, this personage had a bland and agreeable presence. Brother to the well known Chief Tecumthe, "The Open Door" enjoys an almost equal renown as a prophet. When we read in these Indian annals of a hit so lucky as his fixing the precise day for an earthquake, and recollect how on no stronger grounds our gentry believed in Murphy, (not to recall the more humiliating trust of their tenantry in the Canterbury fanatic,) we must not appropriate "The Open Door's" success as a trait of savage life, so much as of universal credulous humanity. We only protest against the "slenderness" allotted to his wits. The biographers, however, attribute the contrivance of the juggle to Tecumthe, who, among his other schemes of assisting Indian rights and regenerating Indian morals, including even a temperance movement, perceived that supernatural influences would make an important figure. Even a puppet, however, must be in some degree stoutly and symmetrically framed to answer to the jerk of the master's hand. And we can hardly reconcile such an assertion as that the prophet was pronounced by General Harrison to have been the most graceful and accomplished orator he had seen amongst the Indians, with the following paragraph, in which we are told that "he seems to have exhibited neither honesty nor dignity of character in any relation of life." The tale of Tecumthe, however, is one of the best in the collection—full of subject.

The portrait of Waapashaw, chief the Dacotah nation, a sagacious looking man, in an European

dress, like the prophet *minus* an eye, gives his biographers occasion to relieve his tribe from the stigma which has been laid upon it, of a vice no less loathsome than cannibalism. The name of the Keoxa tribe, to which he belongs, meaning "relationship overlooked," implies marriages forbidden in the last leaf of the prayer-book; and one admitted practice of questionable reputation (for even among savages it is curious to observe how constantly the dawns of moral perception touch the same points) may have led to false accusations of another. The Twighees and the Kickapoos (*vide* vol. iii., p. 26) will hardly come out from under the accusation so easily. We are assured that they had a society expressly ordained for the maintenance of the practice: possibly—who knows!—their Hieroglyphic Human Cookery Book! Nathless, let us charitably point out, that exact information on subjects like these—where credulous horror and cunning ignorance meet, the one as willing to be mystified as the other is anxious to mystify—comprehends precisely that branch of testimony which is to be least relied upon. Ferocity or revenge may drive untutored people into exceptional crimes; and the extreme reluctance to admit the fact, which all savages have ever shown, would argue a sort of instinctive averseness, which warrants our generally receiving tales of the systematized practice *cum grano*.

As we advance in the volume, we get deeper and deeper into the wilderness, as it were—among wilder people. Some of the heads are very fierce, initiating us into the mysteries of Indian paint. Wash Cubb, "The Sweet,"—whose son was seized with the vagary of fancying himself a woman, and devoting himself to the degradation of feminine employments—has a most becoming crescent of green spots upon his cheeks:—Caatou-see, or "Creeping out of the Water," a square patch of yet brighter verdigris, in which one cruel eye is set as cleanly as a bead in a patch of enamel. Peah-Mus-Ka, a Fox chief (whose *barbette à la Pischek* makes a whimsical disturbance of our visions of prairies, portages, and other features of wild life in the West,) has his black handkerchief cap *tied on*, as it were, by a streak of vermilion under the chin, by which also his ear is dyed. While we are on the subject of aboriginal "paint and patches," commend us to No-way-ke-sug-ga, the Otoc chief, whose portrait is to be found early in volume the third, and whose citron green chin, with a Vandyke pattern of the same piquant *nuance* across his forehead, "composes" with the superb cherry-colored plume of horse-hair or feathers upon his head, so as to form an arrangement of color of which a Parisian designer of fancies might be proud. There is somewhat of caprice, we are told, in these decorations—a caprice, it seems, constant in the avoidance of "the stars and stripes," though not seldom awkwardly emulating the lines of "the Union Jack;"—but we take it for granted, something of symbolism also. And in these days, when reds and blues are mere matters of faith and orthodoxy, when the cut of an aureole, or the frilling and flouncing of an initial letter, becomes subjects concerning which homilies are preached, and libraries written—we must not be thought absurd in recommending to American *savans*, "the nature and significance of Indian paint," as a mystery worth looking into, for the use of historians and artists yet unborn. Out of accidents little less freakish, we take it, did the whole school of what is by some called Christian

"Tobacco," the "Driving Cloud," and the rest of the company: not forgetting the ladies. Their behavior was pronounced to be most discreet and easy; it seemed, too, that they enjoyed themselves. But in an evil hour arrived Mr. —, the piano forte player, and by way of ascertaining what amount of musical ear the distinguished strangers possessed, he was requested to perform a fantasia. He complied; the Indians sat, all attention, to the very end. But, then, rising up very gravely and with some ceremony, they left the room; went down stairs to the parlor on the ground floor, resisting all entreaties; and there seating themselves on the floor, waited in dignity the appointed hour of departure. They had been affronted:—nothing further, we believe, was ever explained.

art, originally construct itself. At all events, there is now some possibility of obtaining information on these important matters—though at the risk of depriving controversialists in embryo of their life-breath; to wit, matter for controversy. To speak, meanwhile, of a matter of detail, in its order, important—we are surprised that in a work like this, so carefully and expensively produced, greater descriptive minuteness was not thought necessary. There are many accessories and objects introduced into these portraits, which we neither know how to describe or to name. This ought not to have been.

The portrait of a Rant-che-wai-me, "Female flying Pigeon," also called "the beautiful female eagle who flies in the air," reminds us that we have been somewhat remiss in paying our dues to the gentle sex. But this is true forest fashion. The lady before us is mild and gracious looking. We were told she was free-handed to an excess: as her widowed husband phrased it, "when the poor came, it was like a strainer full of holes, letting all she had pass through." She was extreme, moreover, in her tenderness of her conscience, "often feared that her acts were displeasing to the Great Spirit, when she would blacken her face and retire to some lone place, and fast and pray." But we take it that so far as any grace which free-will gives can go, "the Female flying Pigeon" was rather an exceptional than an average woman. It is true that, in her charming "Winter Studies and Summer Rambles," Mrs. Jameson, whose honorable desire to improve the condition of her sex, sometimes leads her into odd puzzles and paradoxes, does her best for the squaw; trying to prove her condition in some essential points far better than that of the *conventionalized* white woman, (as the jargon of the day runs.) And we suppose that social philosophers on the other side of the argument—the power-theorists to wit—would declare that man's ministering angel was in her right place, when hewing wood and drawing water, drudging in the fields, and dragging burdens, leaving "her master" undisturbed in the nobler occupations of fighting and foraging. But we confess that we are a trifle hard to convince as to the supreme felicity of the Indian woman's lot. The utmost her race has done has been to produce, not a Boadicea, but a Pocahontas. Of this last, "the heroine of the tribes," we have somewhat too niggardly a notice. There is a portrait of her, however, in her civilized condition, which an appendical series of documents assure us is authentic; the features wearing an expression of grave and womanly sweetness, befitting one whose name was somewhat prophetically "a rivulet of peace between two nations."

But this is not the time or place for us to argue out the great question of the lady and the lord, to determine how far (as *Cherub* says) nature never meant that a Griseldis should be put to the test by her Sir Perceval, or *vice versâ*. Ample opportunities to hear new wisdom against old prejudices are sure to present themselves! The mention of "authentication" and its accompanying assertion that all these portraits are warrantable, recalls to us yet another of the curious peculiarities of savage life: namely, great solicitude and touchiness in the delicate matter of resemblances painted. Queen Elizabeth herself, with her royal command of "garden lights," and similar devices which excluded shadows, and other such unpleasing accidents—*Lady Pentwistle*, when big with the pur-

pose of "calling up a look," which should take mankind by storm—were gentle and easily-contented customers compared with the braves and the medicine men, whom the founders of the school of American art have been called upon to immortalize. Mr. Catlin, in his "Letters and Notes," gave us some whimsical and touching details of the "relations" which the court painter of the Indians has to hold with his sitters. Who has forgotten the anecdote of the chief who came to the artist's tent, with an offer of six horses, and as much treasure besides as the magician chose to exact, so he might bear away the portrait of his dead daughter! The portraying of a Sioux chief, Mah-to-cheeja, "the Little Bear"—in profile, led to yet more serious results. Mr. Catlin had to pack up his brushes and run to save his scalp; since Shonka, "the Dog," found out that the "Little Bear," thus presented, was "only half a man!" The Red Men, as we have seen, do not love jests. The Dog's taunt bred an affray which cost the Little Bear his life. The volumes before us afford us an addition to the above store of anecdotes: which, ere we part from them, we shall extract:—though conscious that it makes against us, and for those who consider the squaw a less suffering woman than the Mrs. Caudles, Mrs. Grundys, and Mrs. Partingtons of our streets and squares, and village-greens.

"It happened," says the memorialist of Young Mahaskah, the son of the Female flying Pigeon, "when Mahaskah was at Washington, that the agent of this work was there also. * * * As he turned over the leaves bearing the likenesses of many of those Indians of the Far West, who were known to the party, Mahaskah would pronounce their names with the same promptitude as if the originals were alive and before him. Among these was the likeness of his father. He looked at it with a composure bordering on indifference. On being asked if he did not know his father, he answered, pointing to the portrait, 'That is my father.' He was asked if he was not glad to see him. He replied, 'It was enough for me to know that my father was a brave man, and had a big heart, and died an honorable death in doing the will of my Great Father.'"

* * * * The portrait of the Eagle of Delight, wife of Shaumonekussee, the Ottoo chief, was then shown to him. 'That,' he said, 'is my mother.' The agent assured him he was mistaken. He became indignant, and seemed mortified that his mother, as he believed her to be, should be arranged in the work as the wife of another, and especially of a chief over whom his father had held and exercised authority. The colloquy became interesting, until, at last, some excitement, on the part of Mahaskah, grew out of it. On hearing it repeated by the agent that he must be mistaken, Mahaskah turned and looked him in the face, saying, 'Did you ever know the child that loved its mother, and had seen her, that forgot the board on which he was strapped, and the back on which he had been carried, or the knee on which he had been nursed, or the breast which had given him life?' So firmly convinced was he that this was the picture of his mother, and so resolved that she should not remain by the side of Shaumonekussee, that he said, 'I will not leave this room, until my mother's name, Rantchewaime, is marked over the name of 'Eagle of Delight.' The agent of the work complied with this demand, when his agitation, which had become great, sub-

aided, and he appeared contented. Looking once more at the painting, he turned from it, saying, 'If it had not been for Waucondamony (the name he gave to the agent of the work, which means *walking god*, so called, because he attributed the taking of these likenesses to him,) I would have kissed her, but Waucondamony made me ashamed.'

"Soon after this interview, the party went to King's Gallery, where are copies of many of these likenesses, and among them are both the 'Eagle of Delight' and the Female flying Pigeon. The moment Mahaskah's eye caught the portrait of the 'Flying Pigeon,' he exclaimed, 'That is my mother, that is her face, I know her now, I am ashamed again.' He immediately asked to have a copy of it, as also of the 'Eagle of Delight,' wife of Shaumonekuse, saying of the last, 'The Ottoo chief will be so glad to see his squaw, that he will give me one hundred horses for it.'"

There are others, more competent judges of art than simple Mahaskah, will occur to every reader with whom (no offence to their connoisseurships) "the fan" makes the likeness.

It will be easily gathered, from the above hasty notes and illustrations, that to comment upon the entire contents of these volumes would lead the critic beyond all reasonable limits. Having given a fair sample, we must here pause. A parting word is, perhaps, required to assure certain excellent persons, that because we have treated this work crotchety-wise, rather than in the cut and dry "Encyclopedia" fashion; no disrespect to it has been meant. On the contrary, there are certain subjects more vividly brought home to us by familiar treatment and comparison, than by dissertations *ex cathedra*: and this is among them. The book is a most interesting collection of raw materials, out of which a school of imaginative art might be constructed; but to lecture upon them, appealing the while to "the principle of the pyramid," would be to impugn our own common sense, and not to assist either teachers or people. We regard it as a valuable addition to the American's library:—and as full of suggestion to all persons who love to look around and forward as well as to linger with fond reverence among the traditions of the past.

THE POETRY OF STEAM.

"MR. PUNCH,

"SIR,—Being a stoker, it is natural I should feel enthusiastic on the subject of steam. It appears to me, sir, that Mr. Wordsworth makes a great mistake when he talks of steamers and railways as—

Motions and means on land and sea, at war
With old poetic feeling.'

For my own part, I think there's a deal more poetry in steam-engines than in anything else, except men and women. I have tried my hand at a description of the Seven Ages of Steam, after Shakespeare, and venture to send it to you to show the world and my brother stokers that there is some poetry about us.

"Yours respectfully, JOHN COKE."

"The world's ruled by steam,
And all the men and women are its subjects:
It guides their movements and their whereabouts;

And this steam, in its time, plays many parts,
Its acts being Seven Ages. At first, the kettle,
Hissing and sputtering on a kitchen hob,
And then Newcomen's engine, to its piston,
By atmospheric pressure, giving force
Imperfectly to pump: Then Watt's condenser,
More economic, with its stuffing-box
And double-acting movement: Then a steam-boat,
Full of strange smells, and crammed like Noah's ark,

(It, on high pressure, sudden and quick to explode,)

Raising up Fulton's reputation

In everybody's mouth: Then the steam-horse,
By Stephenson devised, on Wall's End fed,
With boiler grimed and—wheels of clumsy cut,
Spurning brass knobs and copper ornaments—
And so he plays his part: The Sixth Age shifts
Into the war of broad and narrow gauge;
Brunel on one, Hudson on t'other side—

Their several lines stretching a world too wide
For the Committee's and Steam's manly voice
That in the kettle's childish treble piped,
Now whistles o'er the world: Last scene of all,
That ends this strange eventful history,
Is general brotherhood, and mere oblivion
Of troops, of wars, of blood, and all such things."

Punch.

THE AGGRIEVED PROFESSORS.

To the Universities of Oxford and Cambridge, to the Colleges of Physicians and Surgeons, and to the learned Corporations and Societies of England at large,

The Humble Petition of us, the undersigned respectable Scientific Men and Philosophers Natural and Moral;

SHEWETH. That your Petitioners belong to a class of persons from whom, at Colleges and Institutions for the advancement of Science and Literature, Lecturers and other Teachers are selected:

That such individuals, in their official capacity, are commonly styled Professors:

That certain other individuals, in divers advertisements, and in sundry bills, placards, and posters, have of late assumed and added to their names the title or appellation of Professor; and that by the said appellation or title of Professor they have procured themselves to be commonly called and known:

That of these individuals, some are teachers of dancing, others fiddlers, and others posture-masters, not to say mountebanks; that others of them, again, are Professors of pills and ointment, and that one of them hath lately announced himself to the world as Professor of a ventilating peruke:

That, from thus serving to denote dancing-masters, and fiddlers, and players of monkeys' tricks, and quack-salvers, and barbers, the name of Professor hath acquired a significance which rendereth it anything but a creditable one.

Your Petitioners, therefore, have humbly to request that you will find some other title for your Lecturers and Teachers than this same denomination of Professor; which your said Petitioners do object to share with the kind of persons above mentioned.

And your Petitioners, as in duty bound, &c.

(Here follow the signatures.)

Punch.

THE LIFE AND ADVENTURES OF MISS ROBINSON CRUSOE.

CHAPTER IV.

WALKING ON, I raised my eyes, and what was my astonishment, my delight, to behold the ship—the *Ramo Samee*—reclining as upon a sofa, on a bank of sand about two miles distant! My heart fluttered. After all, I might not be alone upon a desolate island. The captain might be spared; if not the captain, at least the boatswain. Again, when I looked upon the vessel, soft thoughts stole into my bosom; hope stirred within me, and all about my plum-colored silk and my crimson velvet—and the band-boxes, every one with a love of a bonnet, and the night-caps, (I was always particular in my night-caps,) with their beautiful lace borders, chosen with an eye to the hopeful future. These thoughts forced tears from my eyes; and I resolved to save my wardrobe; or, as I once heard a gentleman in blue silk and spangles exclaim, “perish in the attempt.”

I satiated my hunger with raw periwinkles—for I found they strewed the lower part of the beach—which I was enabled to do, having several pins in my dress. I had never thought of it before; but how beautifully has Nature or Fashion, or whatever it may be, ordained that woman should never be without pins! Even as Nature benevolently guards the rose with thorns, so does she endow woman with pins; a sharp truth not all unknown to the giddy and frolicsome.

Though dreading to approach my boxes, lest I should discover that the salt water had spoilt all my things, I nevertheless determined to visit the ship, and preserve what I could of my beautiful outfit. A pang shot through my heart when I thought of a certain white satin, made up—for I had provided against being married unawares in case of the officer coming off in the yam-boat. Allowing it to be preserved from the wrathful billows, of what avail would it be in such a place! Of what avail, indeed, any of my clothes, for who could see them! And when I thought of this, my tears flowed anew.

As I proceeded, my eyes beheld what, at the distance, they believed to be a monstrous eel. It is a fish I am prodigiously fond of; and I will own it, for the moment I forgot the horrors of my situation in the thought of my gratified palate. I ran to seize the prize, when, to my passing disappointment I discovered that what I thought to be an eel was nothing more than an india-rubber life-preserver, that had floated from the vessel. My better feelings were aroused, and I will not repeat what thanks I uttered for the accident.

Taking off my gown—for the flounces were very full, and therefore would hold much water, I put on the life-preserver, and made for the ship. It is true I was a good swimmer, and could have gained the vessel without any foreign aid; but I husbanded my strength, for I knew not what trials awaited me. Now and then I shivered as a flying-fish rose before me; for where flying-fishes were found, there, I had heard, were sharks; and my feet were wholly unprotected, the Adelaide boot being at that time wholly unknown. How strangely doth fear magnify circumstances! More than once I screamed at what I believed I felt to be an alligator—at the very greatest, perhaps, it was a shrimp. I

swam round and round the ship, looking for an easy place to get up. At length, I saw a bit of rope hanging out of the captain's window, and—always being a good climber—I was speedily in his cabin. The silence—the solitude appalled me. His pipe—relinquished when the breeze began to freshen—still lay upon the table. There was something about that pipe that—I know not why—affected me.

I crept from cabin to cabin: all was still. I sat down upon a bench, and was buried in reflection. Now my thoughts dwelt upon my sad condition, and now they wandered to the wardrobe and jewels of the female passengers: poor things! all removed from the toil and trouble of such vanities. Whilst thus occupied, I felt something rub against my knee. The thought electrically shot through me—“I am not alone, then. Is it the captain: is it the boatswain?” This, I say, was the thought of a second, and ere I could look about me. Then, casting my eyes downwards, I beheld a cat—the ship cat. Now, cats I had always treated with very distinguished contempt; believing them, in my maidenly superstition, the inevitable companions of single wretchedness. And as the animal continued to rub against me, and stare at me with—as somebody somewhere says of melancholy—its “green and yellow eyes,” and mew and mew, that its voice thrilled my heart-strings, I thought the creature cried, “Welcome, Miss Robinson, to old-maidhood; welcome forever to celibacy.” The idea was too much for me. I rose, and running and stumbling, reached my own cabin. There I found some water, and a bottle of *eau-de-cologne*. Equally mixing the liquids in a horn, I drank the beverage, and was revived considerably. Another and another libation put new heart into me, and I continued my search from place to place. My own boxes were safe, and—shall I ever forget the emotion that swelled my heart—dry. A canary-colored satin slip was, however, utterly ruined by the salt-water; though I thought that probably the surrounding country might furnish me with materials to dye it for common.

It was with some natural feelings of curiosity that I rummaged all the boxes of my late female companions. Could I choose my readers, I would not hesitate to name the many artifices of millinery that I discovered; the many falsehoods made of buckram, and wool, and wadding—and—but no; far be it from me to put a weapon in the hands of the male malignant. In every box I found a large supply of French slippers and shoes; but, of course, they were all much too big for me.

By dint of great exertion I got all these boxes upon deck. Had their weight been of anything else than beautiful dresses, I do not think I could have lifted it. But I know not what it was that put a mysterious power within me. I carried up trunk upon trunk as though it had been no more than a Tunbridge Wells work-box. “How happy,” thought I, “could I be with such a wardrobe, if anybody could see me wear it!”

In the steward's cabin there were all sorts of pickles and preserves, guava jelly, and preserved ginger. All these, and fifty other kinds of pleasant eatables, with—what could have prompted me to take it, I know not—one bottle of gin, I brought and set down upon the deck. My next thought was—and for a long time it puzzled me—how to get them ashore. But this I managed, as the reader shall learn.

CHAPTER V.

By rummaging with all the earnestness and intelligence of my sex—and who, when she likes, can rummage like a woman?—I discovered, in the steward's store cabin, a crate full of life-preservers; a sufficient number to have saved the lives of the crew of what I think on the voyage I once heard called a three-decker. How they came to be forgotten in the hour of our peril, is only to be accounted for by the frequent truth, that we can rarely put our hands upon anything when we are in a hurry for it. (The reader who has ever mislaid her scissors, or any particular ball of cotton, will at once understand me.) Now, the life-preservers were exactly of the same sort as the one I found upon the beach. It immediately occurred to me, that by filling some fifty or more of them with air, and tying them together with tight string, I might make what is called a raft, upon which I might safely deposit the trunks, the band-boxes, and other valuables. With this thought I set to work; beginning with all my power to blow up every single article. Exhausted as I had been by the terrors of the previous night, this was no easy task. But perseverance was always my motto—as it should be that of every young woman setting out in life for a husband—and though I had had but a poor breakfast, I succeeded in perfectly well blowing up every one of the articles, and then flung every one of them overboard. Recruiting myself with another horn of *eau-de-cologne* and water, and some potted anchovies, found in the captain's cupboard, I again set to work to finish my task. I descended the ship's side, and with my preserver still about my waist, with some tight string bound every piece of buoyant India-rubber close together. Returning to the ship I threw overboard a patent water-bed, which subsequently I laid upon the life-preservers, and very snug and comfortable it looked. I then moved trunk by trunk and box by box from the ship upon the raft: and who can know, who can understand, my delight, when I perceived that every box, though trusted to uncertain Neptune, remained as dry as a bone! For the sea was like glass; there was not spray enough to straighten the curls of a mermaid.

Whilst thus employed, securing my own boxes, and the boxes of the other lady passengers, I cast my eyes towards the shore. The tide, I perceived, had risen, and was carrying away my gown, with all its flounces. I felt a momentary pang; but, looking at the boxes on the raft, permitted myself to be comforted. Having first secured all the articles of wearing apparel, my next thought was to provide myself with a sufficient store of food. A few sides of bacon—stowed away in the steward's cabin—half-a-dozen hams, and all the pickles and preserves, with twenty packages of Embden Groats (for how, I thought, could I bear existence without, now and then, my gruel!) were, with much pain and labor, discovered, and safely placed upon the raft. A very beautiful mahogany case of surgical instruments—the *Ramo Samee* had advertised to carry a surgeon—providentially attracted my notice. This I also secured; and happy was it that I did so.

My next thought was to secure some weapons to protect me against the bears and lions that might already be in the island, or the savages that might visit it. The captain's pistols were in his cabin; and as nobody saw me, I took them down,

without even attempting to scream—which, I have no doubt, I should have done had anybody been present. A canister of powder, and a bag of shot about as big as pins' heads, next rewarded my scrutinizing vigilance. I will not stay to number all the things secured, (many of them will immediately arise to the recollection of every housewife,) but state, that as I thought my raft pretty well furnished, I had nothing more to do than—as I have heard the sailors observe—shove off.

I again descended from the vessel, and was about to cut the string that secured the raft to the ship's side, when—the thought flashed upon me, and as I may say, with its brightness illuminated the very depths of my being—when I remembered that I had no looking-glass!

A woman, nursed in the lap, and dandled upon the knees of luxury, without a looking-glass! Imagine it—dwell upon it—is it possible for fate, in its worst malignity, more cruelly to punish her! When at home, with every blessing about me, I thought nothing of the chief delight, the happiness of sitting two or three hours before my mirror, trying here a patch and there a patch. Now limiting the furtive wanderings of an eyebrow—and now making pretty experiments with my hair, for all the world as they practise in Woolwich marshes—for more certain killing. I had heard something about “painting the rose, and giving a perfume to the violet,” and every morning, for two hours at least, determined to try if it could not be done. I shall not, at this lapse of time, be accused of vanity when I declare that very often, as I then believed, I succeeded to a miracle.

To think of the looking-glass, and again to be on the ship's deck was, I may say, the same thing! As the poet says, “Like the darting swallow” I fled into the ladies' cabin, for there, I recollected, was a large gilt-framed mirror, nailed to the wall, with lions' claws (doves, not lions, ought to support looking-glasses; for what, in her innocence, knows woman of claws!) standing upon nothing. How to detach it, for it seemed to have been nailed up by a giant! Rummaging about, I found a chisel, with which—I know not how long—I labored, I shall never forget the various expression of my features in that looking-glass, as I worked and toiled. I looked red, and black, and angry, and savage; and still, in the very height and depth of my despair, I could not help pausing and asking if it could be possible that it was the same Miss Robinson reflected in the crystal, the very same that had so often “painted the rose, and perfumed the violet.” Again and again I thought I must leave the glass to the mermaids. And then the thought of breaking the glass, and at least rescuing the fragments, rose within me. And then I shuddered.

Nerved by a thimble full of *eau-de-cologne*, I resumed my task. How shall I describe my emotions, when I felt the first nail yield to the chisel! My face—I caught a look of myself—seemed to go off as it were in one tremendous smile, (often as I have since practised for the same look, I never could touch it.) Nail followed nail; and, not to weary the reader—for such person may be of the male sex—I folded the liberated mirror to my breast, as I released it from the wall. Had it not been a mirror I should have considered its weight quite insupportable; as it was, I felt it light—light, as somebody says who knew nothing about it—as vanity.

My next care was to place the glass upon the

raft. Very thick, and very violent, were the beatings of my woman's heart as I brought the mirror over the ship's side. No words, though bright as rainbows, can paint my feelings when I saw the glass safely lowered among my other goods. I sank upon the deck, and grateful tears ran, like rain-drops on cottage casements, down my cheeks. Finally recruiting myself for my great effort—to land my goods—I descended upon the raft—it bore me beautifully; and it was not without some pride that I gazed upon my valuables, so safely stowed, my looking-glass included.

Taking an oar in my hand—I had once, in an hour of childish hilarity, rowed a boat upon a lake, somewhere near Hornsey, so was not altogether unskilful in the management of skulls—I paddled, as some one once said to me (oh, memory! and oh, fate!) “like a little duck as I was.”

I steered towards a slit—a creek, I think it's called—in the shore: to avoid the billows that,

big as feather beds, were rolling over the rocks. Then I trembled for my raft; felt cold and hot, and hot and cold for my mirror. However, all went smoothly enough for a mile; and the more I paddled, the greater confidence I felt in my powers. Keeping—pardon the unfeminine expression—a sharp look out, I steered and paddled on; but knowing nothing of flats and shoals, my raft suddenly run aground on the edge of a rock or something. I merely shifted my oar; and, summoning all the energies of my soul, endeavored to shove off. And I did so. But judge of my despair—think of my horror! The raft violently moved, gave a sort of lurch: it communicated motion to one article—then to the next—then to the next—until, striking against my mirror, it sent it headlong (if I may use the word) headlong into the sea! After this loss, consider if you can, what were my reflections!

From Punch.

ON WHIPPING.

NOTHING can be more disgusting or atrocious than the exhibition of incendiary ignorance, malevolent conceit, and cowardly ill-will, which has been exhibited by the Pekins of the public press, and a great body of civilian snobs in the country, towards the most beloved of our institutions; that institution, the health of which is always drank after the church at public dinners—the British army. I myself, when I wrote a slight dissertation upon military snobs—called upon to do so by a strict line of duty—treated them with a tenderness and elegant politeness which I am given to understand was admired and appreciated in the war-like clubs, in messes, and other soldatesque societies: but to suppose that criticism should go so far as it has done during the last ten days; that every uneducated cockney should presume to have a judgment; that civilians at taverns and clubs should cry shame; that patriots in the grocery or linen-drapery line should venture to object; that even ignorant women and mothers of families, instead of superintending the tea and butter at breakfast, should read the newspapers, forsooth, and utter their shrill cries of horror at the account of the floggings at Hounslow—to suppose, I say, that society should make such a hubbub as it has done for the last fortnight, and that perhaps at every table in England there should be a cry of indignation—this is too much—the audacity of civilian snobs is too great, and must be put an end to at once. I take part against the Pekins, and am authorized to say, after a conversation with *Mr. Punch*, that that gentleman shares in my opinion that *the army must be protected*.

The answer which is always to be made to the civilian snob when he raises objections against military punishments, promotions, purchases, or what not, is invariable.—He knows nothing about it.—How the deuce can *you* speculate about the army Pekin, who don't know the difference between a firelock and a fusée?

This point I have seen urged, with great effect, in the military papers, and most cordially agree that it is an admirable and unanswerable argument. A particular genius, a profound study, an education specially military, are requisite, before a man can judge upon so complicated a matter as the army; and these, it is manifest, few civilians can have enjoyed. But any man who has had the supreme satisfaction of making the acquaintance of En-

sign and Lieutenant Grigg, of the Guards, Captain Famish, of the Hottentot Buffs, or hundreds of young gentlemen of their calling, must acknowledge that the army is safe under the supervision of men like these. Their education is brilliant, their time is passed in laborious military studies; the conversation of mess-rooms is generally known to be philosophical, and the pursuits of officers to be severely scientific. So ardent in the acquisition of knowledge in youth, what must be their wisdom in old age? By the time Grigg is a colonel (and, to be sure knowledge grows much more rapidly in the guard regiments, and a young veteran may be a colonel at five-and-twenty,) and Famish has reached the same rank—these are the men who are more fitted than ever for the conduct of the army; and how can any civilian know as much about it as they? These are the men whose opinions the civilians dare to impugn; and I can conceive nothing more dangerous, insolent—snobish, in a word—than such an opposition.

When men such as these, and the very highest authorities in the army, are of opinion that flogging is requisite for the British soldier, it is manifestly absurd of the civilian to interfere. Do you know as much about the army and the wants of the soldier, as Field-Marshal the Duke of Wellington? If the great captain of the age considers flogging is one of the wants of the army, what business have *you* to object? *You're* not flogged. You are a Pekin. To lash fellow-creatures like hounds, may be contrary to your ideas of decency, morals, and justice; to submit Christian men to punishments brutal, savage, degrading, ineffectual, may be revolting to you; but to suppose that such an eminent philanthropist as the great captain of the age would allow such penalties to be inflicted on the troops if they could be done away with, is absurd. A word from the chiefs of the army, and the cat might have taken its place as an historical weapon in the tower, along with the boots and the thumb-screws of the Spanish Armada. But, say you, very likely the great captain of *his* age, the Duke of Alva, might have considered thumb-screws and boots just as necessary for discipline as the cat is supposed to be now. Pekin! Don't meddle with subjects quite beyond the sphere of your knowledge. Respect the articles of war, and remember that the majority of officers of the British army, from his grace down to Ensign Grigg, are of opinion that flogging can't be done away with.

You can't suppose that they are inhumane.

When that wretched poor fellow was lashed to the ladder at Hounslow, and as the farriers whirled the cat over him, not only men, but officers, it is stated, turned sick and fainted at the horrible spectacle. At every military punishment, I am told that men so drop down. Nature itself gives way, making, as it were, a dying protest against that disgusting scene of torture. Nature: yes! But the army is not a natural profession. It is out of common life altogether. Drilling—red coats, all of the same pattern, with the same number of buttons—flogging—marching with the same leg foremost—are not natural: put a bayonet into a man's hand, he would not naturally thrust it into the belly of a Frenchman: very few men, of their own natural choice, would wear, by way of hat, such a cap as Colonel Whyte and his regiment wear every day—a muff, with a red worsted bag dangling down behind it, and a shaving-brush stuck by way of ornament in front: the whole system is something egregious—artificial. The civilian, who lives out of it, can't understand it. It is not like the other professions, which require intelligence. A man one degree removed from idiocy, with brains just sufficient to direct his powers of mischief or endurance, may make a distinguished soldier. A boy may be set over a veteran: we see it every day. A lad with a few thousand pounds may purchase a right to command which the most skilful and scientific soldier may never gain. Look at the way Ensign Grigg, just come from school, touches his cap to the enormous old private who salutes him—the gladiator of five-and-twenty campaigns.

And if the condition of the officer is wonderful and anomalous, think of that of the men! There is as much social difference between Ensign Grigg and the big gladiator, as there is between a gang of convicts working in the hulks and the keepers in charge of them. Hundreds of thousands of men eat, march, sleep, and are driven hither and thither in gangs all over the world—Grigg and his clan riding by and superintending; they get the word of command to advance or fall back, and they do it: they are told to strip, and they do it: or to flog, and they do it: to murder or be murdered, and they obey—for their food and clothing, and two-pence a day for beer and tobacco. For nothing more:—no hope—no ambition—nor chance for old days, but Chelsea Hospital. How many of these men, in time of war, when their labor is most needed and best paid, escape out of their slavery! Between the soldier and the officer there is such a gulf fixed, that to cross it is next to a miracle. There was one Mameluke escaped when Mehemet Ali ordered the destruction of the whole troop of them; so certainly a stray officer or two may have come from the ranks, but he is a wonder. No: such an institution as this is a mystery, which all civilians, I suppose, had best look at in silent wonder, and of which we must leave the management to its professional chiefs. Their care for their subordinates is no doubt amiable, and the gratitude of these to their superiors must be proportionably great. When the tipsy young lieutenant of the 4th dragoons cut at his adjutant with a sabre, he was reprimanded and returned back to his duty, and does it, no doubt, very well: when the tipsy private struck his corporal, he was flogged, and died after the flogging. There must be a line drawn, look you, otherwise the poor private might have been forgiven too, by the great captain of the age, who pardoned the gentleman offender. There

must be distinctions and differences, and mysteries which are beyond the comprehension of the civilian, and this paper is written as a warning to all such not to meddle with affairs that are quite out of their sphere.

But then there is a word, *Mr. Punch* declares, to be said to other great commanders, and field-marshal besides the historic conqueror of Assaye, Vittoria, and Waterloo. We have among us, thank Heaven! a field-marshal whose baton has been waved over fields of triumph the least sanguinary that ever the world has known. We have an august family field-marshal, so to speak, and to him we desire humbly to speak:—

"Your royal highness," we say, "your royal highness, (who has the ear of the head of the army,) pour into that gracious ear the supplications of a nation. Say that as a nation we entreat and implore that no English Christian man should any longer suffer the infernal torture of the cat. Say, that we had rather lose a battle than flog a soldier; and that the courage of the Englishman will not suffer by the loss. And if your royal highness, Prince Albert, will deign to listen to this petition, we venture to say, that you will be the most beloved of field-marshals, and that you will have rendered a greater service to the British people and the British army, than ever was rendered by any field-marshal since the days of Malbrook."

A CASE FOR FEMALE SYMPATHY.

REALLY the ladies should get up an agitation in favor of the Queen of Spain. She has about twenty lovers, and is not allowed to marry one. France offers a husband whom she must not have for fear of displeasing Narvaez. Narvaez introduces a young Prince whom England does not like. England sends a member of that fine matrimonial country, Coburg, where princes are taught at school to sit upon thrones, and wield sceptres; but Louis Philippe says "No: the queen can't have a Bourbon, and she shan't have a Coburg." Portugal even recommends its candidate, whilst Carlos, Miguel, and Queen Christina have each a miserable *protégé*, who are continually proposing to Isabella, and being married regularly once a week—in the newspapers. But amidst all this confusion of opposition husbands, the poor queen is likely to die an old maid. She is not allowed to marry any one she likes, and every state is wishing her to marry some one she does not like. We propose, therefore, in order to end these differences, that there should be a royal election. Let all the princes go to the poll, and he who gets the greatest number of votes be returned husband of the Queen of Spain. We think, in a matter of this delicate nature, the ladies only should vote. What an animated scene it would be! We can imagine all the placards! "Keine Bourbon." "A bas le Cobourg." "Vote for Prince Widdicomb, and a real moustache." "Don Henrique and Spanish Liquorice." "Le Duc de Montpensier, et beaucoup de Champagne." "Le Prince des Asturies. Tous ses châteaux sont en Espagne."

Seriously, we hope some scheme will yet be devised to put an end to these petty squabbles about choosing a husband. One would really think that the queen had no voice in the matter. Considering she is the party the most interested, she ought to be allowed to do as she likes! Ladies, rally round the Queen of Spain and assert your rights!

Punch.

THE HYDE PARK CORNER CLOCK.

To the nocturnal pilgrim passing out of the Great Metropolis, the clock over the Curds and Whey House used to be a sort of shrine—a species of minor Mecca, produced by mechanism. It was consoling to see the hour, and companionable to see the face of a friend, especially when that friend was continually extending both his hands in amiable amity. Lately, however, for some reason or other, which is of course no reason at all, the clock has not

“Smiled as it was wont to smile,”

for it has been impossible to see its face, or recognize its figure. The clock, which, under the influence of enlightenment, may be said to have

“Lisped in numbers, for the numbers came,”

has latterly been exceedingly dingy after dark, and it is impossible to ascertain its meaning. For the sake, therefore, of the travellers to the “far west,” we earnestly call upon the gasman to light that clock, in the same spirit as the woodman was requested to spare that tree:—

Gasman, light that clock,
The time I cannot see;
It can't be more than twelve,
And yet it looks like three!
Its hands are all confused,
Its numbers none can trace:
Say, is that humble clock
Ashamed to show its face?

It can't be very late:
True—I've been out to sup;
But, ho! what says the clock?
Come, gasman, light it up.
Say, can the mist be caused
By fumes of generous wine?
Is it three quarters past eleven,
Or is it only nine?

Is it half-after twelve,
Or six, or eight, or two?
That dismal rushlight kept inside
No good on earth can do.
When I go home to bed
I'm quite afraid to knock
If I've no notion of the hour—
So, gasman, light that clock.

THIS dismal dial continues in the same state of hopeless want of enlightenment. If the clock is incapable of managing the works with which it is entrusted, let extra hands be put on immediately. It is, however, only at night that the clock shows symptoms of indisposition, for then an eruption breaks out all over the face, which exhibits such confusion that even Lavater would be puzzled to read its expression. Who may be the illumer of this illuminated clock we do not know, but it is enough to excite our ill-humor to see the dingy condition of this once bright and happy-looking dial. It has, however, lost the smile that once shed brilliance over its countenance.

Such were our reflections as we passed by Hyde Park Corner a night or two ago, when our feelings naturally took the form of the following ballad:—

Oh! smile as thou wert wont to smile
Before the London air
Had black'd thy face, and for a while
Left only darkness there.

Some gas, perchance, 't were best to add—
One little extra jet;
With which—should some one wash your face—
You may be useful yet.

Oh! do not name departed clocks,
That were as bad as you:
Though the Horse-Guard's the public mocks,
With pale and sickly hue.
Perchance, by sitting up all night,
Weary and dull you get;
But, with a little stronger light,
You may be useful yet.

A NEW ROMAN ROAD.

Ancient Romans, ancient Romans—
Cato, Scipio Africanus,
Ye whose fame's eclipsed by no man's,
Publius Æmilianus,
Sylla, Marius, Pompey, Cæsar,
Fabius, dilatory teaser,
Coriolanus, and ye Gracchi,
Who gave so many a foe a black-eye,
Antony, Lepidus, and Crassus;
And you, ye votaries of Parnassus,
Virgil, and Horace, and Tibullus,
Terence and Juvenal, Catullus,
Martial, and all ye wits beside,
On Pegasus expert to ride;
Numa, good king, surnamed Pompilius,
And Tullus, eke 'yclept Hostilius—
Kings, consuls, imperators, lictors,
Prætors, the whole world's former victors,
Who sleep by yellow Tiber's brink;
Ye mighty manes—what d' ye think?
The pope has sanctioned railway bills!
And so the lofty Aventine,
And your six other famous hills
Will soon look down upon a “line.”
Oh! if so be that hills could turn
Their noses up, with gesture antic,
Thus would the seven deride and spurn
A Roman work so unromantic:—
“Was this the ancient Roman way,
With tickets taken, fares to pay,
Stokers and engineers, perhaps—
Nothing more likely—English chaps
Bawling away, ‘Go on!’ for *Ito*,
And ‘Cut along!’ instead of *Citò*;
The engine letting off its steam,
With puff and whistle, snort and scream;
A smell, meanwhile, like burning clothes,
Flouting the angry Roman nose!
Is it not, conscript fathers, shocking?
Does it not seem your memory mocking?
The Roman and the railway station—
What an incongruous combination!
How odd, with no one to adore him,
A Terminus—and in the Forum!”

SOCIETY FOR THE PREVENTION OF CRUELTY TO SOLDIERS.—Meetings are held, and petitions presented, from time to time, against flogging in the army; in the mean while, soldiers are whipped to death. The costermonger is limited in the application of the lash; surely the commanding officer might be restrained a little. The donkey is a brute not so very much nobler than the private. Now if a costermonger were to take his donkey, tie it to a ladder nailed to a wall, and deliberately whip the skin off the creature's back, the miscreant

would be fined, or sent to the treadmill, amid the execrations of the mob. Yet thus may a court-martial treat a fellow-creature. But the one man is a costermonger and a blackguard; the others are officers and gentlemen. Still even officers, and gentlemen to boot, should not be allowed to behave exactly like fiends incarnate.

The law should not suffer them to torture poor soldiers to death. There really is required a Martin's act for the military. It is with the view of procuring some such an enactment that we recommend the formation of a Society for the Prevention of Cruelty to Soldiers. The Animals' Friend Society protects even the cat from man, but we want a society for protecting man from the cat.

SLAVES IN SMOCK FROCKS.

"MEASTER PUNCH:

"Plaze zur, I zee my likeness, or zomebody else's, the imidge o' me, draad 'tother day in your peeaper, a poundun zummut in a doctor's pessul and martur. I be glad to vind you teaks zum account o' we poor country fellers, and if you 'll only goo on draaun true picturs on us, I 'll warrand you 'll do 's good. In the mane time, zur, I 'll meak so bold as to ax 'ees for a word of advice; hopun you wun't be 'fended at the liberty I be a takun of. I be a varmer's laborer. My wagis is in generl zevn shilluns a wake; zumtims I med git aight or nine; but precious seldum. I 've got a wife—moor fool I—and a kit o' children, wuss luck! What we lives upon is mostly taters and zalt. We han't had a taste o' bhaacon for I dwoount know how long, nor a drap o' beer since last harvust whooam. We bides in a crazy ramshackle consarn of a cottidge, nare a mossle better than a cowus—nit so good. How much longer we can keep out o' the Union is moor than I can tell; it must come to that, I spose, in the end. This here 's a dull look out Measter Punch, baint it! Now, I 've heerd a good deal o' late 'bout nigger slavery; what a sin and a sheam 't is, and how the poor slaves be to be pitied. Here 's a lot o' fellers, wi' Lard Brougham at the head on 'em, as wun't buy their sugar cheap, nor, what's wuss, let me buy mine cheap neither; all 'cause they should n't encurridge the slave trade.

"What there is in a nigger to meak 'em take sitch a fancy to 'un, I dwoount know. I only wishes as how I was one; 'cause then praps they 'd take a fancy to me. Thof I be white, baint I a man and a brother too! What I wants your opinyun about, zur, is this here. Dwoant'ee think, now, if I was to black my veace and goo hollern and bawlung my greevunces about street, I should stand moor chance o' beeun 'tended to! Or d'ye think I 'd better bide as I be, and git zum o' they good gennulmen as calls theyselves Poor Man's Friends to make a stir agin white slavery. I wish, Measter Punch, you 'd spake to zum on 'em vor me; your favourat, Ben Disrally, for instance. Could n't 'ee persuaid un to spoort a broadbrimm'd hat, and a quoot wi' a square taail, to gie un the cut o' the jib of a sart o' pantiler like, so as to git the Exeter Hall folks to listen to un! Thof 't would make un look a bit of a Gy, that are ood be just the trim for un to spake a good word in, for

"Your obajunt Zarvunt,
"MATHER WAY."

CCXI. LIVING AGE. VOL. X. 30

THE BALM OF SPEECH.

THE hum of insects, as they throng
The summer sunbeam's glorious way;
The soaring sky-lark's early song;
The nightingale's mellifluous lay;—

The murmur of the peaceful wave;
The valley-breezes gently sighing;
The wind's wild voice in mountain cave;
And Echo from her cell replying;—

The soft Æolian lyre, whose notes
Upon the lonely musier rise;
The church-bells' hallowed tone, that floats
Like music from the distant skies;—

Could never make my spirit feel
So rapt above this lower sphere,
As when affection's accents steal,
All musical, upon mine ear.

The harmonies of mortal art,
And e'en of nature's varied strain,
Ne'er touch, as when another's heart
Reveals in words our own again.

Oh! may the melody of speech
Sing to me, while on earth I rove;
And may the last faint tones that reach
My dying ear be those of love!

Poetical Remains of a Clergyman's Wife.

NIGHT.

MYSTERIOUS Night! when our first parent knew
Thee, from report divine, and heard thy name,
Did he not tremble for this lovely frame,
This glorious canopy of light and blue?
Yet, 'neath a curtain of translucent dew,
Bathed in the rays of the great setting flame,
Hesperus with the host of heaven came:
And, lo! creation widened in man's view.
Who could have thought such darkness lay concealed

Within thy beams, O Sun! or who could find
Whilst fly, and leaf, and insect, stood revealed,
That to such countless orbs thou mad'st us blind?
Why do we, then, shun death with anxious strife?
If light can thus deceive, wherefore not life?

Blanco White.

'Tis but degree
That marks the storm from the propitious gale—
The torrent, from the fertilizing stream—
This justice overurg'd grows tyranny.

Now, they stand
Like frightened cattle that, beneath an oak,
Had sought protection from the threatening storm,
And find the forked lightning's earliest flash
Strike even there where they had made their shelter.

There is a sadness of no kin to sorrow,
And such, alone, is mine. Is it not sad,
And yet how sweet, to sit in some close nook
And hear the big rain patter on the trees?
Or, listlessly, in some cool dell's recess,
To mark the babbling of the tiny brook?
Or, from the casement, watch the fading day
Tinge, with its changeeful pencil, the gray clouds?
When, if we chance to sigh, 'tis but to ease
The heart o'erburthened with its sweet sensations.

Lovell's Provost of Bruges.

CHAPTER XXX.

THE country girl, alone in the Brown Bear, had some slight twitchings of remorse. She felt it; she had very much slandered London and the Londoners. She had been taught—she had heard the story in fields and at fire-sides, seated in the shade of haystacks, and in winter chimney-corners—that London was a fiery furnace; that all its inhabitants, especially the males, were the pet pupils of the Evil One, and did his work with wonderful docility. And now, how much ignorance had departed from her! In an hour or two, how large her stock of experience! She was alone—alone in a London tavern; and yet she felt as comfortable, as secure of herself as though perched upon a Kent haycock. She had seen thousands of people; she had walked among a swarm of men and women, and nobody had even so much as attempted to pick her pocket; nobody had even snatched a kiss from her. With the generosity of a kind nature, she felt doubly trustful that she had unjustly doubted. She was in a London hotel (poor hawthorn innocence!) and felt not a bit afraid; on the contrary, she rather liked it. She looked about the room: carefully, up and down its walls. No; there was not an inch of looking-glass to be seen. Otherwise she thought she might have liked to take a peep at herself; for she knew she must be a fright; and the young man would be back soon; and though she cared not a pin about him—how could she!—still, still she should have liked one look.

"What, my little girl, all alone?" asked a newcomer—as the young woman thought, a very rude, and ugly, and somewhat old man. "Got nobody with you, eh? Where's your parents?"

"I'm not alone, and that's enough," said the girl, and she fervently clutched her little bundle.

"Very well, my dear; would n't offend you, my lass; would n't?"

"I'm not your dear; and I don't want at all to be talked to by you." Saying this, the girl continued to grasp her property, and looked with very determined eyes in the harsh, ugly face of the old intruder. The fact is, the girl felt that the time was come to test her energy and caution. She had too soon thought too well of the doings of London. The place swarmed with wicked people, there was no doubt of it; and the man before her was one of them. He looked particularly like a thief as he looked at her bundle.

"That's right; quite right, my little wench. This is a place in which you can't be too particular," and saying this, Bright Jem—for it was the uncommon honesty of that good fellow's face that had alarmed the spinster—Bright Jem, with his mild, benevolent look, nodded, and passing to the further end of the room, seated himself in one of the boxes. And the girl felt more assured of his wickedness; and anxiously wished the return of that very nice young footman—that honest, sweet-spoken young man—so long engaged in converse with his aunt. Would he never come back? It was odd, but every moment of his absence endowed him, in the girl's mind, with a new charm. Bright Jem was all unconsciously despoiled of every good quality, that his graceless relative, Ralph Gum, might be invested with the foreign excellence.

Hark! a footstep. No; it is not the footman: he still tarries with his aunt. It is Jerry Whistle, the Bow-street officer, with his daily flower between his lips; his happy face streaked like an

apple; and his cold, keen, twinkling eye that seemed continually employed as a search-warrant, looking clean through the bosoms of all men. He paused before the girl, taking an inventory of her qualities. And she, to repel the boldness of the fellow, tried to arm herself with one of those thunderbolt looks that woman in her dignity will sometimes cast about her, striking giants off their legs and laying them in the dust forever. Poor thing! it was indignation all in vain. She might as well have frowned at Newgate stones, expecting to see them tumble, as think to move one nerve of Jerry Whistle. Medusa, staring at that officer, would have had the worst of it, and bashfully, hopelessly let drop her eyelids. And so it was with the country maiden. Jerry still stared: leaving the girl nothing to do but to wonder at his impudence. At length, however, Mr. Gum enters the room; and Jerry, glancing at him, and, as the girl thought, very much awed by his presence, instantly moves away.

"Well, I'm so glad you're come!" cried the girl, and her eyes sparkled, not unnoticed by the footman.

"Sorry, my daffydil, to keep you waiting; but aunt is such a 'oman for tongue. A good cretur though; what I call a reg'lar custard of a 'oman; made o' nothing but milk and spice and sugar."

"What! and no eggs! Pretty custards they'd be" cried the girl, with a smile of pity for the detected ignorance.

"That's like you women," said Mr. Gum, playfully twitching the girl's bonnet-string; "you can't allow for a bit of fancy: always taking a man up, and tying him to particulars. Well, you are a rose-bud, though!"

"Never mind: I know that: let us go to Mary Axe, and the girl vigorously retied her bonnet-strings, and stood bolt up.

"In a minute. Just half-a-mouthful of brandy and water between us; just no more than would fill the eye of a little needle. You can't think what a lot of morals my aunt always talks: and you can't think how dry they always make me. Now, don't shake your dear little head as if it was of no use to you: I tell you, we must have a little drop, and here it is." (And Mr. Gum spoke the truth.) "I ordered it as I came in."

"Not a blessed drop—I won't, that I won't, as I'm a sinner," cried the girl with feminine emphasis.

"A sinner! There never was a cherub on a tombstone like you. I should like to hear anybody call you a sinner—it would be a bad day's work for 'em, I can tell you. Now, just a drop. Well, if you won't drink, put your lips to the edge of the glass, just to sugar it."

"Well, what a cretur you are!" said the girl; and with cheeks a little flushed, she took a bird's one sip of the liquor.

"Ha! now it's worth drinking," cried Ralph; and he backed his opinion by taking a long draught. "And now," said he, staring full in the girl's face, and taking her hand, "and now, as a particular favor, I want you to tell me one thing. Just one private question I have to put. Look in my eyes, and tell me what you think of love."

"Go along with your rubbish!" exclaimed the girl; at once cutting the difficulty of a definition. Love! Rubbish! She knew it not; but the wench spoke with the tongue of old philosophy. She gave a homely expression to the thoughts of sages, anchorites and nuns. The shirt of hair; the iron

girdle; the flagellating thong, all declare the worthlessness of love. "Love is rubbish" chants the shaven monk: and the like treason breathes the white-lipped sister, and sometimes thinks it truth. The words are writ on monastery, convent walls, though dull and dim-eyed folks without do not believe them; and—perverse is man!—turn from the silver music of the syllables for jangling marriage-bells

"Ain't you atead the roof will tumble on you! Love rubbish! Why, it's what I call the gold band about natur's hat"—for liquor made the footman metaphorical. "Love, my slip of lavender, love is"—

"I don't want to know nothing about it, and I won't stay a minute longer from Mary Axe." And again the girl stood up, and began to push her way from the box, Mr. Ralph Gum refusing to give place, at the same time lifting the teaspoon from the glass, and vainly menacing her with it in the very prettiest manner.

"Well, my peppermint, you shall go; to be sure you shall. There now!"—And with determined swallow, Mr. Gum emptied the glass to prove his devotedness to her will. "We'll pay at the bar, my poppy. Don't forget your bundle. Got your best things in it, eh? Don't forget it, then."

A smile, with something of contempt in it, played about the maiden's lip. Forget it!—as if any woman ever forgot a bundle, the more especially when it contained any of those vestments that, looked upon with thoughtful, melancholy eyes, are only flowing, shining proofs of a fallen state, though the perverse ingenuity of the sex contrives to give a prettiness to the livery of sin, to the badges of our lapsed condition. When we remember that both sorts of millinery, male and female, are the consequences of original wickedness, ought not the manly heart to shrink, and feel a frog-like coldness at an embroidered waistcoat? Ought not woman, smitten with the recollection of the treason of her great mother, to scream even at the rustling of a pompadour, as at the moving scales of a gliding snake? She ought; but we fear she seldom does. Nay, sometimes she actually loves—determinedly loves—fine clothes, as though she had first waked in Paradise, like a queen from a siesta, in velvet and brocade, with jewels in her hair, and court plaster stars upon her cheek. With heart-breaking perverseness, she refuses to admit the naked truth to her soul, that the milliner came into the world with death. Otherwise, could philosophy with its diamond point engrave this truth upon the crystal heart of woman, it would very much serve to lessen pin-money. We have heard it said—of course we immediately wrapt our countenance in our cloak, and ran from the slanderer—that woman fell for no other purpose than to wear fine clothes. In the prescience which she shared with man she saw the looms of the future world at work, and lost herself for a shot sarsenet. It is just as possible, too, that some of her daughters may have tripped at the window of a mercer.

We cannot at this moment put our finger upon the passage, but surely it is somewhere written in the Talmud, that Eve, on leaving Eden, already took with her a choice and very various wardrobe. We have entirely forgotten the name of the writer who gives a very precise account of the moving. Nevertheless, many of the details are engraved—as with pen of iron upon rock—on our heart. First

came a score of elephants; they, marching with slow pace, carried our first mother's gowns bestowed in wicker-work. To a hundred and fifty camels were consigned the caps and kerchiefs. And our author, we remember, compassionately dwells upon a poor dromedary—one of two hundred—that, overladen with bonnet-boxes, refused to get upon his legs until the load was lightened by half, and another hunchbacked beast appointed to share the burden. Whole droves of ponies, that have since made their way to Wales and Shetland, carried shoes and silk stockings, (with the zodiac gold-worked for clocks,) and ruffs and wimples, and farthingales and hoods, and all the various artillery that, down to our day, from masked batteries aim at the heart of heedless, unsuspecting, ingenuous man—weapons that, all unseen, do sometimes overthrow him! And in this way, according to the Talmudist, did Eve move her wardrobe into the plain country; and in so very short a time—so active is woman, with her heart like a silkworm, working for fine clothes—did our first mother get about her, what she, with natural meekness called, only a few things, but which Adam—and at only the nine thousandth package, with an impatient sulkiness that we fear has descended to some of his sons—denominated a pack of trumpery. If women, then, are sensitive in the matter of bundles, they inherit their tenderness from their first rosy mother. And our country wench, though we think she had never read the Talmud, had an instinctive love for the fine clothes she carried with her.—An instinct given her by the same beneficent law that teaches parrots and cockatoos to preen their feathers.

Whilst, with profane fingers—like an allowed shopman—we have twiddled with the legendary silks and muslins, and other webs the property of Eve; whilst we have counted the robe-laden elephants, and felt our heart melt a little at the crying, eloquent pathos of the bonnet-crushed dromedary, Mr. Ralph Gum has paid for his liquor, and, his heart generous with alcohol, has stepped into Bow-street. Glowing with brandy and benevolence, he heroically observed—"Never mind the bundle. I don't care if any of our folks do see me. So, my heart's honeysuckle, take my arm." And, with little hesitation—for now they could not be very far from St. Mary Axe—the girl linked herself to that meek footman. "Don't know what place this is, of course? Covent-garden market, my bluebell. This is where we give ten guineas a pint for green peas, and"—

"Don't they choke you?" cried the wench, astounded at what she thought a sinfulness of stomach.

"Go down all the sweeter," answered the epicurean vassal. "When they get to ten shillings a peck, they're out of our square altogether; only fit for pigs. Noble place, isn't it? Will you have a nosegay? Not but what you're all a nosegay yourself; nevertheless, you shall have something to sweeten you; for that Mary Axe—well, I wouldn't set you against it—but for you to live there; you, a sweet little cretur that smells of nothing but cow's breath and new-mown hay;—why, it's just murder in a slow manner. So do have a nosegay;" and Mr. Gum insisted upon disbursing threepence for a bunch of wallflowers, which, against his wish and intention—she herself placed in her bosom. Then he said: "I do pity you, going to Mary Axe."

"But I'm not a going to stay there," said the

girl: "no—I'm only going to see master, and he's to take me into the country, to live with such a sweet young lady."

"Well, there'll be a couple of you," said Ralph, "I'm blessed if there wont. And whereabouts?"

"That's telling," replied the girl; as though she stored up a profound secret in her heart, that it would take at least five minutes for Ralph's pick-lock tongue to come at. This Ralph felt, so said no more about it.

"And here, in this place, we make our members for Westminster—things for parliament, you know."

"How droll! What should they bring 'em like turnips to market for?" inquired the wench, wondering.

"Don't you know! Because they may be all the nearer the bad 'tatoes and the cabbage stumps. That 's what our porter tells me is one of the rights of the constitution; to pelt everybody as puts himself up to go into parliament. Well, I've been done out of a nice chance, I have," said the footman, with sudden melancholy.

"What do you mean? Not lost anything?" and the girl looked sweetly anxious.

"Ain't I, though? You see, his lordship, my young master, went and stood in the country; and I could n't go down with him. Now, if he'd only put up for Westminster, I'd just have come here in plain clothes, and dressing myself as if I was a blackguard, should n't he have known what bad 'tatoes was?"

"Why, you wicked cretur! you would n't have thrown 'em at him!"

"Oh, would n't I though!" cried Mr. Gum, and he passed his tongue round his lips, enjoyingly.

"What for? Is he sich a wicked master—sich a very bad man?" inquired the girl.

"Don't know that he is. Only you can't think what a pleasure it is to get the upper hand of high folks for a little while; and 'tatoes and cabbage stumps do it. It's a satisfaction, that's all," said the footman.

"I won't walk with you—not another step," and the wench angrily withdrew her arm.

"There you go, now; there you go. Just like all you women; if a man makes a harmless joke—and that's all I meant—you scream as if it was a flash of lightning. Bless you! I'd go to the world's end for my master, even if I never was to see him again. That I would, my sprig of parsley."

"Is this the way to Mary Axe? If I'm not there directly, I'll ask somebody else."

"Just round this turning, and it's no way at all." And Mr. Gum went through the market, and through street after street, and threaded two or three courts, the girl looking now impatient, now distrustful. At length Ralph paused. "My dear, if I have n't left something at my aunt's! In that house, there; just step in a minute, while I call for it."

"No, I shan't," answered the wench, with a determination that somewhat startled Mr. Gum. "I shan't go into any house at all, afore I come to Mary Axe. And if you don't show me the way directly, I'll scream."

"Why, what a little sweet-briar you are! Don't I tell you, my aunt lives there? A nice, good old soul, as would be glad to see you—glad to see anybody I brought to her. I tell you what, now,

if I must say the truth, I told her what a nice girl you was; and how you was waiting for me; and the good old 'oman began to scold me; and asked me why I did n't bring you here. I shan't stop a minute—not a minute."

The girl looked up in Ralph's face; looked up so trustingly, and again so innocently placed her arm in his, that that great-hearted footman must have felt subdued and honored by the confidence of his companion. And so he was about to hand her across his aunt's threshold—he was about to bring her face to face with that venerable, experienced, yet most mild woman—when, suddenly, he felt his right ear seized as by a pair of iron pincers, and the next moment he felt himself spinning round and round; and the very next moment he lay tumbled in a heap upon the pavement. His heart bursting with indignation, he looked up, and—somehow, again he felt another tumble, for he saw in his assailant Bright Jem, his mother's brother-in-law; the meddlesome, low fellow, that had always taken it upon himself to talk to him. A few paces distant, too, was Mr. Whistle, Bow-street officer, serenely turning his flower between his lips; and with both his hands in his pockets, looking down upon the footman as though he was of no more account than a toadstool. Of course, the girl screamed as the assault was committed; of course, for a few moments her rage against the ruffian—the ugly man who had, and so like his impudence, spoken to her at the Brown Bear—was deep and womanly. But suddenly the face of Mr. Gum grew even a little darker; and the wench, though no scholar, read treason in every black line. Hence, with growing calmness she beheld Mr. Gum elaborately rub himself, as he slowly rose from the pavement.

"Who spoke to you? What did you do that for?" Such was the poor platitude that the smitten footman uttered: for guilt was at his heart; detection weighed upon him, and he could not crow.

"Does n't his aunt live here?" cried the girl. "He said it was his aunt that wanted to see me?"

"The only aunt he ever had," said Bright Jem, "is in heaven; and—I know it—she's a blushing for him this very minute. I say, Whistle, could n't we help him to a little Bridewell for all this?"

Mr. Whistle, shifting his flower to the corner of his mouth, was about to say something; but it was clear that Mr. Gum had not at the moment either taste or leisure to attend to legal opinions. He therefore took to his heels; and he never ran so fast, because, perhaps, he never felt so little as he ran.

"Now, was n't I right, Whistle? And did n't I say that there was mischief in him? And was n't it lucky we followed him from the Bear? Well, he has a nice crop of early wickedness, has n't he?" Thus spoke Bright Jem, with a face of wonder. Mr. Whistle, however, was in no way disconcerted or astonished. He was one of those unfortunate people—though he himself considered his happy superiority to arise from the circumstance—who had seen so much wickedness, that any amount or eccentricity of evil failed to surprise him. He therefore twirled the flower in his mouth, and remarked a little plaintively—"Why was you so quick? If you'd only had patience, we might have sent him to Bridewell; and now, you've spoilt it all—spoilt it all." With these

words, and a brief shadow of disappointment on his brow, the officer departed.

"Poor little soul!" cried Jem, taking the girl's hand, and looking paternally in her face—"where did you come from—and where are you going to? Come, you'll answer me, now, wont you?"

"I come from Kent, and I'm going to Mary Axe. That young man, I thought, was taking me the way!"

"Poor little lamb! You would n't think he was old enough for so big a villain; but somehow, he's been reared in a hot-bed, and has spindled up 'astonishingly. He's my wife's sister's child, and I will say this for his father; he was as good and as honest a nigger as ever a Christian white man stole to turn a penny with. But we can't send goodness down from father to son; it can't be willed away, like the family spoons. 'Virtue,' as Mr. Capstick says, 'like vice, does n't always descend in a right line; but often goes in a zig-zag.'"

The girl was an attentive listener; but we fear did not very perfectly understand the uttered philosophy. She, however, felt that she had been snatched from peril by the interference of the odd and ugly-looking man before her, and gratitude and confidence stirred in her woman's heart. "Bless you, sir; I was very uncivil, but I thought that is—I'm in such a tremble—can you take me to Mary Axe? I'm going to a place. Perhaps you know the gentleman—Mr. Snipeton? I mean Mrs. Snipeton, his beautiful young wife!"

Jem stared, and marvelled at the strangeness of the accident. He, however, owned to no acquaintance with the fortunate owner of the lady. "Take my arm," he said, "and I'll leave you at the very door." With this Jem proceeded onward, and at length turned into Long Acre. Passing the door of Capstick—for we believe we have already informed the reader that the member for Liquorish had taken humble lodgings in that district—the door opened, and the senator himself, with no less a person than Mr. Tangle, attorney-at-law, advanced to the threshold.

"Eh, Jem! What's this? A thing from the buttercups! Where did you pick it up?" cried Capstick. Now the wench was no grammarian, yet she seemed to have a born knowledge that "it" applied to one of the female gender was alike a violation of grammar and good-breeding. Therefore she echoed "it" between her teeth, with of course a significant tossing of the head.

Jem observed the working of the feminine mind, and immediately whispered to the girl—"He's my master and a member of parliament; but the best cretur in the world." Jem then in a bold voice informed the senator that "the young 'oman was come up from the country to go to service at Mr. Snipeton's."

"Bless me! what a very strange accident! Come to Mr. Snipeton's, eh? How very odd!" cried Tangle, feeling that he ought to speak.

In the mean time Bright Jem, with commendable brevity, whispered to Capstick the history of his meeting with the gentle wayfarer. "Well, and she looks an innocent thing," said Capstick, his face scarlet with indignation at Jem's story. "She looks innocent; but after all, she's a woman, Jem; and women can look whatever they like. They've a wonderful way of passing pocket-

pieces for virgin gold. I don't believe any of 'em; nevertheless, Jem, run for a coach; and as Mr. Tangle and myself are going to Snipeton's, we can all go together. I dare say, young woman, you're tired of walking! You look so; if, as I say, looks are anything! Jem, run for the coach. Come up stairs." And with this invitation, Capstick gently clasped the arm of the maiden—a little awe-struck that she felt the pressure of that mysterious, solemn creature, a live member of parliament—and led her, ascending, to his room. Mr. Tangle followed, much scandalized at the familiarity of the legislator; and fortifying himself with the determination, not, without a vehement remonstrance, to ride in the same hackney-coach with a maid-of-all-work.

Mr. Capstick had, he was accustomed to declare, furnished his room with a vigilant eye to his duties as a member of parliament. Over his mantel-piece was *Magna Charta*, framed and glazed. "A fine historic fiction," he would say; "a beautiful legend; a nice sing-song to send men to sleep, like the true and tragical history of Cock Robin chanted to children." He was wont to chuckle mightily at the passage—a fine stretch of fancy he would call it—about "selling or deferring justice," and vow it ought to be written in blood-red letters in the court of chancery. "There is fine, grave comedy, in this sheet, sir; an irony that strengthens the nerves like a steel draught. They ought to hang it up on board the *Tower Tender*; 't would make pretty reading for the free-born Englishman, kidnapped from wife and children to fight, and to be cut into a hero to vomit songs about, by the grace of the cat." And in this irreverent, rebellious fashion would the member for Liquorish talk of *Magna Charta*. He called it a great national romance; and never failed to allude to it as evidence of the value of fine fiction upon a people. "Because it ought to be true," he would say, "they think it is."

And the misanthrope member had odd nickname toys; and all, as he said, to continually remind him of his duties as a senator and a citizen. He had a model of George the Third's new drop in mahogany. "One of the institutions of my country," he would say, "improved under the reign of my gracious sovereign. Some folks hang up the royal portrait. Now I prefer the works of a man to his looks. Every ordinary morning I bow once to that engine as a type of the wisdom and philanthropy of a Christian land; once on common occasions, and three times on hanging-days." Besides this, he had a toy pillory; with a dead mouse fixed, and twirling in it. "And when I want an unbending of the immortal mind within me—by the way," Capstick once said to Tangle, "what a bow we do sometimes make of the immortal mind, the better to shoot at one another with—when I want to unbend a little, I place the pillory before me, and pelt the mouse with cherry-stones and crumbs. And you would n't believe it, but it does me quite as much good—quite as much—as if the dead mouse was a living man, and the stones and crumbs were mud and eggs."

There were other fantastic movables which, for the present, we must pass. Mr. Capstick, to the astonishment of Tangle, approached a corner cupboard, taking therefrom a decanter of wine and a glass. "You are tired, young woman; and sometimes a little of this—just a little—is medicine to the weary." He then poured out the wine; which the wench obediently swallowed. Had it

been the most nauseous drug, there was such a mixture of kindness and authority in the manner of the member of parliament—the physis must have gone down.

“Mr. Capstick, one word,” said Tangle, and he drew the senator to a corner of the room. “Doubtless, I made a mistake. But you know we have important business to transact: and no, you never intend to go to Mr. Snipeton’s in the same coach with that gentleman’s maid-of-all-work?”

“She won’t bite, will she?” asked Capstick.

“Bite!” echoed Tangle.

“Coach is at the door, sir,” said Bright Jem, entering the room.

“Go you first,” said Capstick to Tangle in a tone not to be mistaken; “I’ll bring the young woman.” And if Tangle had been really a four-footed dog, he would, as he went down stairs, have felt a great depression of the caudal member, whilst the senatorial muffin-maker tript after him with the ignominious maid-of-all-work.

CHAPTER XXXI.

For some days Snipeton had half resolved to surprise his wife with a present; a dear and touching gift—the miniature of her father. Again and again he had determined upon the graceful act; and as often put the expensive thought aside—trod the weakness down as an extravagant folly. And then it would occur to his benevolence, that he might make a bargain with himself, and at the same time impart a pleasure to his spouse. The miniature was enriched with diamonds; first-water gems, he knew, for he had lent gold upon them; though his wife—at the time of the loan she was yet unmanacled—was unconscious of the ready money kindness. Her father had withered, died, in the clutch of the usurer; who still cherished the portrait of the dead man—it was so very dear to him. The picture had been a bridal present to Clarissa’s mother; it had lain warm in her wedded bosom; though Snipeton, when he grasped the precious security, knew nothing of its history. Well, he would certainly delight Clarissa with this sweet remembrance of her father. She knew not of its existence, and would bless and love her husband for his sudden goodness. He would give the wife the miniature; it was settled: he would do it. “What! with the diamonds?” cried Snipeton’s careful genius, twitching his heartstrings, to pull him up in his headlong course. “With the diamonds, Ebenezer Snipeton! Are you grown lunatic—doting? Diamonds, eternal diamonds—diamonds everlasting as the sun—the spiritualized essence of Plutus—diamonds for one flickering look; for one sick smile from withering lips! Have you forgotten the worth of wealth? Lost man! are you suddenly dead to arithmetic? Give diamonds to your wife? Pooh! pooh! As women love anything that glitters—and as moreover they love Jack-o’-lanthorns just as well as heaven’s own stars—don’t throw away the real treasure; but mock it; sham it; pass off a jeweller’s lie, and let the picture blaze with the best and brightest paste. He’s a fool who throws pearls to pigs, and thinks the pork will eat the richer for the treasure. He’s no less a fool who showers diamonds upon his wife when, knowing no better, paste will make her just as grateful.” And Snipeton gave all his ears to this scoundrel genius, that lived in his heart like a maggot in a nut, consuming and rotting it. There were times,

though, when the genius slept; and then Snipeton—ignorant, unadvised man—was determined to be honest, generous. He would not countenance the fraud of false setting. No; his bird of Paradise; his lamb; his darling Clarissa; the queen flower in his life’s garden—for she was this and all of these—should have the diamonds. Besides, if given to her, they were still his own; for according to the sweet rights of a husband, property so bestowed—with no parchment to bind it—might at any time be reclaimed by the lawful lord. After all, it was but lending his wife the diamonds; though—gentle simpleton!—she might still be tickled with the thought that they were wholly hers.

It was the morning after the visit of Crossbone; and Snipeton, seated betimes at his cottage window—his eye first wandering among some flowers—his wife’s only children as he once bitterly called them—and at length fixed upon the labors of a bee that toiled among the blossoms, taking sweet percentage for its honey bank: it was at such a time that Snipeton again pondered on the diamonds. Again he revolved the special pleading of his thrifty genius; again attended to the counter-reasoning of his affections; allowing that he had them, and again allowing that affections do reason. He watched the bee—conscientious porter!—load itself to its utmost strength, and then buzz heavily through the casement. The insect had taken all it could carry. Wise, frugal, man-teaching insect. No: Snipeton would not give the diamonds. He would keep all he could: in his own grasp. All. And the determination, like a cordial, mightily comforted him.

At this moment Clarissa entered the room from her chamber. Snipeton suddenly rose as to an angelic visitor. His wife looked so beautiful—so very beautiful. With such new sweetness in her face; such beaming mildness in her eyes; there was such grace in her motion, that love and vanity swelled in the old man’s heart; and his hand strangely trembled as it greeted her. His prudent genius was on a sudden paralyzed and dumb. Clarissa looked at her husband, as he thought, never before so lovingly—and for the moment, the miser glowed with the prodigal.

“Why, you are better, love; much better. Even Crossbone’s talk has revived you. Ha! and we’ll have this horse, and straightway: and—the rose of my life will bloom again. Look here, my love.” It was done: even at the last one spasm of the heart it cost, but it was over. The miniature—that diamond-circled piece of ivory and paint—was in Clarissa’s hand. Astonished, happy, she said no word, but kissed the sudden gift; again and again kissed it, and her tears flowed. “I have often thought—indeed, have long determined to give it you,” cried Snipeton.

“Thank—thank you, dear sir. Indeed, you have made me very happy,” answered his wife.

His wife! Did she answer like his wife! Was it the voice of his twin soul—did the flesh of his flesh move with her lips! Was it his other incorporate self that spoke! Did he listen to the echoes of his own heart; or to the voice of an alien! When the devil jealousy begins to question, how rapid his interrogations!

“I tell you,” said Snipeton, “I repeat—I have all along determined that you should have it; in good season, have it. Your father’s picture, who with so great a right to it! He told me ‘twas once your mother’s. She wore it, till her death.

Poor thing! He must have loved her very dearly. When he spoke of her, and never willingly, he would tremble as with the ague." Clarissa bowed her head; was silent; and again kissed the picture. "This fondness—these tears, Clarissa, must—if spirits know such matters—be precious to your father, now once more joined with your mother in heaven. Why, what's the matter? So pale—so lily white; what is it, love?"

"Nothing, sir; nothing but the surprise—the joy at this gift," faintly answered Clarissa.

"Well, I see it has delighted you. I hoped so. Much delighted you: very much. You have kissed the picture fifty times, Clarissa. Is it not fifty—or have I falsely counted? Tell me. Fifty—is it not?"

"I cannot tell, sir"—replied the wife, timidly. "Can they—ought they to be counted?"

"Why—but then, I am a cold arithmetician—I can count them; at least, all that fall to my lips. Can you not tell the number vouchsafed to the gift? Strange! I can count, aye, every one, bestowed upon the giver." Mournfully, and with some bitterness did Snipeton speak. His wife, with a slight tremor—suppressed by strong, sudden will—approached him. Pale, shuddering victim! with mixed emotions fighting in her face, she bowed her head, and placing her cold arms about the old man's neck, she closed her eyes, and kissed his lips.

"Indeed, sir, I thank you. Pardon me; indeed I thank you for this and all your goodness." She felt relieved: she had paid the demanded debt.

And Snipeton—poor old man!—was he made happy by that caress! How much real love was in it! How much truth! How much hypocrisy? Or at the best, enforced obedience? It came not from the heart: no; it wanted blood and soul. It was not the fiery eloquence of love, telling a life's devotion with a touch. It was not that sweet communing of common thoughts, and common affections; that deep, that earnest, and yet placid interchange of wedded soul with soul. In his heart, as in a crucible, the old man sought to test that kiss. Was it truth or falsehood? And as he pondered—how mysteriously are we fashioned!—a thing of forty years ago rose freshly to his mind. What brought it there?—yet, there it was. The figure, the face of one who with proved perjury at his lips kissed the book, swearing the oath was true.

Clarissa saw her husband suddenly dash with gloomy thoughts. They reproached her; and, instinctively, she returned to the old man's side, and laying her hand upon his brow—had the hand been a sunbeam, it had not lighted the face more suddenly, brightly—she spoke to him very tenderly: "Are you not well, sir?"

"Quite well; always well, Clarissa, with you at my side—with you as even now." And she looked so cheerful, yes, so affectionate—he had wronged her. He was a fool—an exacting fool—with no allowance for the natural reserve, the unconquerable timidity, of so gentle a creature. "And, as I was saying, you are better; much better; and we'll have this horse; and—but, Clary, love, we have forgotten breakfast." Resolved upon a full meal, Snipeton moved to the table; and whilst he strove to eat, he talked quite carelessly, and, by the way, of a matter that a little disturbed him. "And how do you find Mrs. Wilton, eh, dearest?"

Clarissa, with troubled looks, answered—"Find her, sir? Is she not all we could wish?"

"Oh, honest, quiet, and an excellent housekeeper, no doubt. Do you know her story?"

"Story, sir?" and Clarissa trembled as she spoke. "What story?"

"Her story! Has she not one? Everybody, it's my opinion, has; but here's the rub: everybody won't tell it, can't tell it, musn't tell it. Is it not so?"

"It is never my thought, sir; my wish to question your experience. You know the world, you say. For my part, I never wish to know it. My hope is, to die in my ignorance."

"True; you are right; I would have it so. For it is a knowledge that—but no matter. My learning shall serve for both. Well, she never told you her story?" With this, Snipeton looked piercingly at his wife, who at first answered not. At length she asked, "Do you know it, sir?"

"No: but it is plain she has a story. I am firm in the faith."

"Some grief—some sacred sorrow, perhaps," said Clarissa. "We should respect it: should we not?"

"Why, grief and sorrow are convenient words, and often do duty for sin and shame," cried Snipeton.

"Sin and shame are grief and sorrow, or should be so," replied Clarissa, mournfully.

"Humph! Well, perhaps they are. However, Mrs. Wilton's story is no affair of ours," said Snipeton.

"Assuredly not," cried Clarissa, quickly.

"But her melancholy is. 'Tis catching; and infects you. Her bad spirits, her gloom, seem to touch all about her with mildew. A bad conscience—or a great grief—'t is no matter which, throws a black shadow about it; and to come at once to my meaning, Clarissa, I think Mrs. Wilton had better quit."

"Oh, sir!" exclaimed Clarissa. "'T would break her heart—it would, indeed, sir."

"It's wonderful how long people live, aye, and enjoy themselves, too, with broken hearts, Clarissa. I've often thought broken hearts were like broken china: to be put nicely together again, and—but for the look of the thing—to be quite as useful for all house-work as before. Now Mrs. Wilton's heart—"

"Do not speak of it. If—if you have any love for me, sir"—cried Clarissa.

"If I have love! Well, what think you? Have I not—even a few minutes since—given good proof?" It was somewhat distasteful to the old man, that after the gift of such diamonds, his love could be doubted. He had better have listened to his good, his wise, his profitable genius, and presented paste. How many wives—however badly used and industriously neglected—would still bestow their love! Now he, even with diamonds, could not buy it. For his wife to doubt his love, was to refuse her own. This his philosophy made certain. And this, after the diamonds!

"Nay, I am sure of your love, sir; certain; most confident," said Clarissa, very calm in such assurance. "And therefore you will refuse me nothing. Eh, dear sir?"

Again Snipeton's heartstrings relaxed again, listening to the music of the enchantress, his darker thoughts began to pass away, and his soul enjoyed new sunlight. "Nothing—nothing," he said, "that is healthful."

"Then promise me that Mrs. Wilton shall remain. Indeed, you know not how much I have—"

learned of her; how much she loves me; how much she respects you."

"Respect is a cold virtue, I know, *Clariassa*; very cold. Now, with her 'tis freezing. I sometimes think she looks at me, as though—but I'll say no more. She blights your spirits; darkens your thoughts with her sorrow or her sin, or whatever it may be; and in a word, she shall stay no longer. I am resolved."

"Blights me! Darkens my thoughts! Oh, sir, I would you heard her talk. I would you knew the pains she takes to make me happy; to make me cheerful; to place all things in the happiest light, shedding, as she does, the beauty of her spirit over all. Doubtless, she has suffered, but"—

"But—but she goes. I am resolved, *Clariassa*; she goes. Resolved, I say."

And *Ebenezer Snipeton* struck the table with his fist; and threw himself back in his chair, as, he believed, a statue of humanity, hardened by resolution into flint. And very proud he felt of the petrefaction. Nor lightnings, nor thunderbolts should melt nor move him.

Clariassa—her suit was for a mother—rose from her chair, and stood beside her husband's. She threw her arms about his neck. Flint as he was, he felt they were not so lumpish, clay-like as when last they lay there. "Dear sir; you'll not refuse me this! You'll not refuse me!" And *Clariassa* for once looked full in the eyes of her husband.

"Resolved," said *Snipeton*, thickly; and something rose in his throat. "Resolved."

"No; no. You must promise me—you shall not leave me without," and the arms pressed closer; and the flint they embraced became soft as any whetstone. "You will not deprive me of her solicitude—her affection!" *Snipeton* answered not; when *Clariassa*—in such a cause, what cared she for the sacrifice!—stooping, kissed her husband with a deep and fervent affection for her mother. And the statue was suddenly turned to thrilling flesh; had the old man's heart been stuck with thorns, his wife's lips would have drawn them all away, and made it beat with burning blood. The man was kissed for an old woman; but he set the rapture to his own account, and was directly rich with imaginary wealth. Need we say the man consented? What otherwise could strong resolution do?

A new man, with a newer, brighter world beaming about him, *Snipeton* that day departed from his rustic home to *St. Mary Axe*. His wife seemed to travel with him, he was so haunted by her looks of new-born love. And now he hummed some ancient, thoughtless song; and now he smacked his lips, as with freshened recollection of the touch that had enriched them. The mist and cloud of doubt that had hung about his life had passed away, and he saw peacefulness and beauty clearly to the end. And these thoughts went with him to his dark and dismal city nook, and imparted deeper pleasures even to the bliss of money-making.

This once, at least, *St. Giles* was in luck. A few minutes only after *Snipeton's* arrival, with his new happiness fresh upon him, the young man presented himself with a letter from *Crossbone*. "He looks an honest fellow; a very honest fellow," thought *Snipeton*, eyeing him. "'Tis a bad world; a wicked world; yet, when all's said, there are some honest people; yes, there must be some." And this charitable thought enhanced for

the nonce *St. Giles*. He could not have come in happier season. "Hamp! and you have known *Mr. Crossbone* some time? To be sure, he told me, from a child. And your father was killed, trying to do good! That's hard; plaguy hard; for people arn't often killed in that humor. And you've been kind—very kind to your mother! Well, that's something; I think I may trust you. Yes: you may consider yourself engaged. When can you come?"

"Directly, sir," said *St. Giles*; who had been duly impressed by *Crossbone* with the necessity of obtaining *Snipeton's* patronage; it was so very essential to the happiness of his lordship. "Be vigilant, be careful,"—thus had run the apothecary's counsel, "and his lordship will make a man of you!" What a golden prospect for one who, with the hopes and worthy desires of a man, knew himself to be a social wolf in the human fold; a thing to be destroyed, hung up; a wholesome example to runaway vagabonds. To be made a man of, what a load must he lay down! What a joy, a blessing, to stand erect in the world—and be allowed to meet the eyes of men with confiding looks. Now, he crept and crawled; and felt that his soul went upon all-fours. Now, he at times shrunk from a sudden gaze, as from a drawn knife. And his lordship would make a man of him! Glorious labor, this; divine handiwork! And there is plenty of such labor, too, in this broad world, if we had but the earnest-hearted workers to grapple with it. How many thousand thousands of human animals; creatures of outward humanity; beings on two legs, are yet to be made men of! Again, what is a man? You, reader, may possibly have a pretty correct notion of what he is, or ought to be: now, *Mr. Crossbone's* ideal of a perfect man was but of a perfect rascal. He would make a man as he would have made a gin, a trap; the more perfect the snare, the nobler the humanity. And in this sense was *St. Giles* to be elevated into a man for the direct advantage of the young lord, and the supplementary benefit of the apothecary. And *St. Giles* himself—it must not be forgotten—had some misgivings of the model-excellence after which he was to be fashioned. It just passed through his brain that the man he was to be made, might be a man, if not nearer to the gallows than himself, at least a man more deserving (if any deserved it) the elevation. There seemed to him new peril to be made a man of. Yet, what could he do? Nothing. He must wait; watch; and take the chances as they fell.

Snipeton read the letter. Nothing could have fallen out so luckily. A friend of *Crossbone's*—a man of honor though he dealt in horseflesh—had a beautiful thing to sell; a thing of lamb-like gentleness and beauty. The very thing for *Mrs. Snipeton*. A mare that might be reined with a thread of silk. Moreover, *Mr. Snipeton* might have the beast at his own price; and that, of course, would be next to no price at all.

"Do you understand horses, my man?" asked *Snipeton*, as he finished the letter.

"Why, yes, sir," answered *St. Giles*; and he must have answered yes, had the question been unicorns.

"Well, then"—but at this moment, *Snipeton's* man brought in the names of *Capstick* and *Tangle*. To the great relief of *St. Giles*, he was ordered into an adjoining room, there to wait. He withdrew as the new visitors entered.

"Mr. Snipeton, this—this"—why did Capstick pause!—"this gentleman is Mr. Tangle, attorney"—

"Solicitor," was Mr. Tangle's meek correction. "It's of no consequence, but—solicitor."

"Pooh, pooh! It is n't my way, sir. I always say 'attorney,' and then we know the worst," said Capstick.

"I have heard of Mr. Tangle. We never met before—but his reputation has reached me," sneered Snipeton.

"Reputation, sir," observed Capstick, "is sometimes like a polecat; dead or alive, its odor will spread."

"Very true; it is; it has," was the corroboration of Snipeton; and Tangle, though he tried to smile, fidgetted uneasily.

"You are, perhaps, not aware, Mr. Snipeton, that a petition is to be presented to the house of commons—my house—for the purpose of turning out its present patriotic member for Liquorish," said Capstick.

"Indeed! Upon what ground?" inquired Snipeton.

"Bribery. Would you imagine it! Could you think it! Charge me with bribery!" said the member.

"Pardon me. Not you; oh, by no means! We never do that. We're not so ill-bred. No, sir, the crime—that is, the statutable crime—for morals and statutes, sir, are sometimes very different things—the crime of bribery is laid at the door of Mr. Capstick's agents. His agents, sir," said Tangle.

"I had none: none whatever. It is my pride—if, indeed, a man should be proud of anything in this dirty, iniquitous world—a world of flip-flaps and sumersets—my pride, that I was returned purely upon my own merits; if, indeed, I have merits; a matter I am sometimes inclined to doubt, when I wake up from my first sleep. I go into parliament upon bribery! I should think myself one big blotch—a human boil. No; I can lay my hand upon my breast—just where I carry my pocket-book—and answer it, before the world—except the price of the hackney coach that carried me to the house, my seat did n't cost me sixpence."

"Ha, Mr. Capstick!" cried Tangle, half closing his eyes; "you don't know what friends you had."

"Yes, sir, I do; for I've been intimate with them all my life. Integrity, honor, out-speaking"—Capstick paused; and the next moment blushed, as though detected in some gross fault. The truth is, he was ashamed of himself for the vain-boasting. Integrity and honor! Supposing that he had them—what then? Was it a matter to make a noise about? Capstick blushed; then hurriedly said—"I beg your pardon. Go on with the bribery."

"And so they want to turn you out, eh?" cried Snipeton. "The house of St. James can't swal-

low the muffin-maker. Ha! ha! I can only wish you had been a chimney-sweeper. 'T would have been a sweeter triumph."

"I am quite contented, Mr. Snipeton," said Capstick, majestically, "as it is. Not that, as one of the social arts, I despise chimney-sweeping. By no means. For there may be cases in which it would not be such dirty work to clean folk's chimneys, as to sweep their pockets."

"True; very true," said Snipeton, who never selfishly took a sarcasm to himself, when, as he thought, so many of his fellow-creatures equally well deserved it. "And so to the bribery. We must meet this petition."

"I thought so; and therefore waited upon Mr. Capstick to offer my professional services. You see, sir, I have peculiar advantages—very peculiar. For although, by that unfortunate and most mysterious robbery of the gold, the bribery—on the part of his lordship—was limited, rather limited; nevertheless, I have here, sir—here"—and Tangle tapped at his breast—"such facts, that!"

"I see," said Snipeton; "and you'll turn yourself inside out to oblige us!"

"I am a free agent; quite free. Being no longer his lordship's legal adviser—you wouldn't think that that paltry box of gold could have parted us; but so it is—there is no gratitude in the great;—being, as I say, free, sir; and in the possession of secrets!"

"If you want a cheap pennyworth of dirt, you can buy it, you can buy it," said Capstick.

"Mr. Capstick!" exclaimed Tangle with a darkly solemn face, "Mr. Capstick"—but the attorney thought it not profitable to be indignant; therefore he suffered a smile to overflow his cheek, as he said—"Mr. Capstick, you're a wag." But Tangle had in this a secret consolation: for in his legal opinion he had as good as called the muffin-maker "thief and housebreaker." Tangle then proceeded. "What I shall do, I shall do for justice. And public justice, with her scales!"

"Bless my soul! I'd quite forgot the girl. Mr. Snipeton, your maid-of-all-work from Kent is below. A droll business. Quite an escape, poor thing! But she'll tell your wife all about it," said Capstick.

"Your pardon. Just one minute;" whereupon Snipeton repaired to St. Giles. "You know my house! Mind, I don't want all the world to know it. Well, make the best of your way there, and—stop. Come down stairs." And Snipeton left the room, St. Giles following him. St. Giles—so Snipeton determined—should at once escort the wench to Hampstead. Another minute, and to the joy and ill-concealed astonishment of the pair, the girl saw in St. Giles the wanderer and vagrant to whom she had given the shelter of a barn—and he beheld in his new fellow-servant, Becky, the soft-hearted maiden of the Lamb and Star.

From the Spectator.

MR. LANE'S LIFE AT THE WATER CURE.

MR. LANE, the eminent lithographic artist, was bled within an ace of his life, at the age of nineteen, by some "active practitioner;" and his habits ever since appear to have been ill-adapted to the acquirement of robust health. As an invalid, he was often under the doctor's hands; and besides the perpetual physic of a valetudinarian, he had several attacks of acute disease. As an artist in request and loving his profession, he sacrificed too much to it. He rose early—often at five, and worked till nine, on some chocolate and toast. After breakfast he continued his labors without intermission till three or four. He then rapidly fulfilled his engagements by making calls "upon the run;" and returned home excited and exhausted, "generally too late for the late dinner." After dinner he again worked, and frequently passed the evenings "in heated rooms or theatres." In addition to these physical ills, he suffered mentally from family affliction and bereavement. By the time he had reached forty or thereabout, both mind and body exhibited signs of severe derangement. His sight began to fail; he was troubled with severe neuralgic pains; a slow intermittent fever wasted him; there were symptoms which threatened palsy; and his powers of attention and exertion broke down. Change of air and scene had often been prescribed without any permanent benefit; drugs ceased to relieve him; and in fine, he was persuaded to try the cold-water cure at Dr. Wilson's. He went to Malvern, and on the very first day felt that exhilaration which we have all experienced when the mind has cast its cares behind it and the worn spirit is taking a holiday. The treatment was gradual, no doubt judicious, and it agreed with Mr. Lane. This first stimulus was supported by change of scene, good air, and the agreeable company he found at the establishment, as well as the hope which his improvement by these aids excited—though we do not mean to deny the benefit to be derived from a judicious use of water. The upshot was, that after a month Mr. Lane returned home a new man with a new lease; not indeed quite cured, but, by the advice of Dr. Wilson, his own ingenuity and skill in fitting up a cold-water apparatus in his house, and above all by resolutely persisting in morning exercise in all weathers, he is now a perfect cure. His neuralgic and all other pains have left him; his appetite is capital; he has discarded under-clothing and top-coats; he rarely has occasion to use glasses at his work; and he seems confident that he shall contradict the prophecy of the last medico he consulted, and "make old bones."

Life at the Water Cure consists of Mr. Lane's experience, observations, and outpourings during his month at Malvern, mingled with sketches of the company and doings of the place. He tells how he felt on waking in the morning, and what sensations he experienced under the different water processes from the "shallow bath" to the douche. His walks, his water-drinkings, his rides, the aspects of nature, and the incidents of the road, are all chronicled, along with the sayings and doings of his fellow-patients at Malvern; the persons, excepting Sir Edward Bulwer Lytton, being concealed under fictitious names. These topics Mr. Lane varies by reminiscences and remarks connected with different subjects in literature and art.

What he calls the sequel, or the story of his case till the time of publication, contains a similar freedom in the choice of topics, but with less range, as he has not in the Regent's Park the variety of Malvern's walks or patients.

With many, perhaps with most men, such a book would have been insufferably tedious, or offensive from its flimsiness, levity, pertness, or artifice. None of these failings are felt in Mr. Lane's *Life at the Water Cure*; everything is so obviously natural, and full of good feeling and animal spirits. Mr. Lane must have been the very kind of patient that any medical man would have chosen for an experiment, where it was sought by change of air and the stimulus of novelties to tone a relaxed system, renovate shattered nerves, and give a fillip to the constitutional springs, whatever and wherever they may be. With his cheerfulness, his bonhomie, his disposition to be pleased with everything and everybody, his eye for natural beauties, his facility in depicting to the eye the various operations of the Cold Water House, and such incidents or effects as struck him during the morning-walks, he must have been as great an acquisition to the patients as to the physician. Even the distant reader cannot altogether resist the heartiness which imparts a freshness and charm to the manner of the book; its matter, as may be inferred, is not of a very solid kind; and the style is somewhat diffuse.

The sketches of life at Malvern are best read as a whole, when we are gradually introduced to the persons, and feel an interest in their characters and discourse. Some of their doings admit of separate presentation; and we will take one of the most important, for those who may contemplate a trip thither. The supplies are not so much amiss for patients "given over by the faculty," and who are under regimen.

BREAKFAST AND DINNER AT THE COLD WATER CURE.

"Another glass of this exquisite water, and home to breakfast at nine. Several sorts of bread, all in perfection, and excellent butter; bottles of the brightest water and tumblers, duly arranged on the table; jugs of milk for those who like it, and to whom it is allowed. One jug *smokes*, and the well-known fragrant flavor soon suggests to the nose tea! Surely this is irregular, or why the disguise! Why not a teapot!"

"At the head of the table, where the Doctor presides, was the leg of mutton, which, I believe, is every day's head dish. I forget what Mrs. Wilson dispensed, but it was something savory, of fish. I saw veal cutlets—with bacon, and a companion dish, maccaroni—with gravy (a very delicate concoction;) potatoes, plain boiled, or mashed and browned; spinach, and other green vegetables. Then followed rice-pudding, tapioca, or some other farinaceous ditto, rhubarb tarts, &c. So much for what I have heard of the miserable diet of water patients. The cooking of all is perfection, and something beyond, in Neddy's [his son's] opinion, for he eats fat!"

"After dinner the ladies did not immediately retire, but made up groups for conversation, both in the dining and withdrawing room. A most happy arrangement this, which admits the refreshing influence of the society of ladies in such a house."

There is something sadly pleasing in the fatal termination of the following case, and the good feeling which attended it.

"A sad page in my diary—a *death* has occurred in the house.

"Mr. ——— arrived ten days ago, without notice, having journeyed from Norfolk to London to consult the first physicians. He had cancerous tumors, pronounced by all *incurable*. As a last resort, he performed with difficulty the journey to Malvern, and arrived at the house in a state which rendered it dangerous to move him to lodgings. The doctor instantly pronounced his state beyond the reach of human aid, except in *palliating* suffering, and soothing his few remaining days. He told Mrs. B—— that he could not survive ten days. After four days, Mr. B—— came to the drawing-room, and cordially shaking hands with all his fellow-patients, thanked God that he was *safe*, and getting well—he was 'sure of it.' His appetite good—he slept well, and was free from all pain. The doctor was obliged to tell his afflicted wife that this happy change showed no amelioration of the actual disease, which was surely proceeding to its fatal termination. When, some days after this, it was deemed right to tell the patient of his state, he was with difficulty made to believe it. He had been buoyant with high spirits, and perfectly at ease. His relatives then came around him; and about the tenth day, (or, as I believe, on the very day predicted,) he has died. The brothers proposed to remove the remains, but the considerate patients would not hear of it. They asked if he would have the funeral at early morning; Dr. W. would not allow secrecy, and it is to take place in the afternoon."

For the writer's main end, a proof of the efficacy of the cold-water cure, Mr. Lane's book is of slender value. His own case, we must be permitted to think, proves little or nothing. The main evil was evidently on the nervous system or "the spirits." The best proof of this is, that as soon as his trifling anxiety about the cold-water process was over, Mr. Lane felt comparatively well in himself; a result which could not have followed and been maintained in the case of organic derangement—unless upon the principle of Goldsmith's quack, whose patients felt an improvement even while the pills were going down the throat. From his obvious unacquaintance with medicine, Mr. Lane's other instances prove nothing; he uses terms so generally that they convey no precise meaning; so that his conclusions are not warranted by his premises. He speaks of some old man of eighty, with "disease of the heart," who was greatly improved. Before such a case is worth a rush, we must know in what way the "heart" of the old gentleman was affected, and how its disorder was inferred; even then, the case, considering the age and the uncertainty of medical inference in obscure diseases, is too near a modern miracle for implicit credit.

THE ANTI-SLAVERY THAT MIGHT SUCCEED.

FREE trade in sugar must at first act as an encouragement of the slave-trade—there is no doubt of it. The opening of so important a market as that of Great Britain will enhance the value of slave-grown sugar; the higher value of the article will enhance the value of the producers; and that will enhance the profits of the slave-trade. Our armed efforts at suppressing the trade, therefore, will be rendered more ridiculous than ever, by the crowning inconsistency, that we shall do our best

to intercept the slave on his way from Africa to America, and to disappoint his owner, but as soon as he has crossed, we shall not only leave his owner in peace but give him our custom for the commerce in which he uses the slave.

But the bad results would not rest there. Continued enforcement of the armed suppression would tend still further to aggravate the horrors of the middle passage. The increased profits of the trade would of course multiply the vessels engaged in it; the traders would also be more than ever stimulated to brave the risk of detection in hope of profit, while the higher profit would allow a wider margin for loss by capture; vessels, therefore, would be more readily and more often captured. But the incentives to evade detection would be stronger than ever; swiftness and secrecy would be still more sought, and the miserable freight still more cruelly sacrificed to a water-cutting shape of the vessel and to concealment. It will be impossible to continue the armed suppression much longer, in the teeth of growing opinion and augmenting proof of its inefficacy—its mischievous self-defeat. It will be abandoned.

Must the slave-trade, then, be left to its criminal career—to people America with a race in bondage? We think not. We believe that the ceasing of the armed intervention will be the first step towards an effectual but peaceful war with agrarian slavery and the slave-trade. How may this come about?

The immediate result of the cessation will be, that England will no longer be regarded with distrust by foreign countries whom she coerces to obey her notion of moral necessity. England has a conscience against trading in slaves, and she not only abstains, but forces other nations to abstain. Some do not, but merely affect to do so; and while they pretend to obey, they own an increasing grudge against the country that compels them to so humiliating, inconvenient, and costly a sacrifice. They do not understand her motives to be purely philanthropic, because they are not conscious of such motives in themselves; they believe her to be actuated by an invidious dog-in-the-manger wish to hinder their prosperity, and at all events hate her pragmatismal tyranny. Ill-will to England is the great substantial product of her armed intervention; a feeling shared by America, Brazil, Spain, and other great nations. The feeling will die away when the coercion ceases.

The slave-employing countries may resort to Africa to fulfil all the demands upon their labor-markets. It is not likely that the Southern States of the great American Union would do so, since social and political reasons make the citizens of the Union view the increase of slaves with alarm; but Cuba, and possibly Brazil, might take a larger draft of slave-immigrants. The traffic, however, would be free; the slaves would be more valuable; and the trader would have no motive to treat them worse than cattle would be treated; their health, therefore, would be an object of care, and the horrors of the middle passage would cease with our intervention.

But if we abstained from restricting the slave-migration, there would be no reason for restricting the migration of free blacks. To British subjects we might forbid slave-trading; by proper regulations in the West Indies, we might prevent any British slave-trading by defeating its object, the individual profit of the trader. But the free migration would bring to the West Indies, their most useful population, the Negro. With a free labor

market, where wages have superseded the lash as an incentive to industry, it is most imperatively necessary to have an abundance of laborers: that abundance the West Indies would soon have, and they would *then* be able to compete with slave-owning countries in the growth of sugar.

But to people the West Indies is the one great essential to any probable scheme for civilizing the Negro. The West Indies will for the first time be able to set a complete practical example of free black labor; of which we have preached the merit, though we have shrunk from exemplifying it. The white civilizer cannot penetrate the pestilential continent of Africa, to civilize the denizens of the soil; but in the West Indies he has the African entirely under his own eye, and in the best possible circumstances for the process of civilization. The Negro is at once introduced to a fully-civilized society, but one blessed by the too rare concomitant that industry prospers in it. He is easily kept in the state of discipline, legal and moral, the most conducive to his own welfare. But he is in all respects a free man, and is at once introduced to the practice of free institutions; even attaining the franchise, municipal and political, without hinderance. And experience has proved that in the West Indies the Negro actually does become a civilized man, with extraordinary facility and rapidity.

Show, for the first time completely, that in the West Indies emancipation really succeeds in a worldly sense—that it is politically safe, and commercially profitable—and you teach the best possible lesson to slave-owning countries; one far more persuasive than coercion. You show them that they may abandon slavery itself, and that therefore they do not need the trade in slaves. Some have already shown a disposition to profit by such a lesson, were it humanely and perseveringly read to them. Brazil has several public men willing and able to read it; Cuba has had its Governor Valdez; and even the Southern States of the Union might consent to benefit by an experimental attempt at solving the great problem that darkens their future.

But Africa—how would such a change affect her? Most momentously. Were the eastern shore of America fully peopled with a free black race—were even the West Indies alone so peopled—commercial relations must necessarily increase with the opposite coast of western Africa. It must inevitably follow, that free blacks would be much and increasingly employed in any commercial relations with Western Africa; for which their race alone is suited by physical constitution. The number of free civilized blacks in Africa would multiply. To state this modest fact alone, is to imply a social revolution in Africa; monarchs in that benighted country could not long remain in a condition lower than menials in the free settlements. If the monarchs did not begin to advance in civilization, the menials would soon speculate in the trade of being monarchs. But free settlements would multiply, and would be normal schools for the neighboring races. Civilization—a true European civilization—once established on the continent of Africa, would soon spread by a beneficent contagion. It is to be remembered that there are no such settlements in Western Africa: there are some trading stations; Sierra Leone is a station for liberated Africans, ill managed, unprosperous; Liberia is a settlement of transported slaves; but there are no proper colonies.

There have been no such settlements, because there have been no materials for them—a surplus free black population to be spared from the American side of the Atlantic. There has, however, already been shown the disposition to such a reémigration: the black emigrants from our principal West Indian colonies have willingly returned as “delegates;” gentlemen of the black race have even consented to go, in order to promote an intercourse so beneficial to their kind; and an official agent at Sierra Leone belonged to the race. These are solitary instances, but they serve to show that the desired motive and capacity both exist in the African; both have been exhibited under the influence of a free black emigration to the West Indies, limited as that was. Were the West Indies fully peopled, our stations on the coast of Western Africa would become really colonies; although the climate excludes the Anglo-Saxon race, Anglo-Saxon influences would take root, would fructify, and would spread towards the interior.

Such is the way in which Africa might be civilized through the West Indies; such is the Anti-Slavery enterprise that *might* succeed.—*Spectator*, 25th July.

From the Spectator.

SLAVERY AND TIME.

A GREAT question of time is involved in the project of the anti-slavery philanthropists, which they seem entirely to overlook. They induced England to abolish first the slave-trade and then slavery, in her own dominions; but they did so by convincing her. They have continued their importunity, and extended it to the request that England should force other countries to abolish the slave-trade, and also slavery, without waiting for conviction. Their wish has been indulged to a surprising extent, but up to this time with no very flattering results; for the compulsory style of policy manifestly defeats itself, hindering what might be accomplished were it sought by wiser means.

There is such a thing as national consistency. It needs not be confounded with obstinate adherence to one opinion, for it does not refer to different periods. A country, like an individual, may fairly hold different sentiments at different periods; the change being brought about by the legitimate process of conviction. Thus, England has more than once changed her opinion on the subject of West Indian slavery, and each change has been a real advance towards a wiser and more moral view. The consistency of which we speak refers to the different acts of the same country at any one period. England violates it at this present time, by tolerating slavery in the southern states of the great American Union, and not in Brazil; for we make fiscal distinctions between the two, where there is not a trace of moral distinction. In like manner, we tolerate in Russia what we denounce in Cuba. It is the same with the slave-trade: we forbid on the Niger and in the West Indian archipelago what we suffer at Mozambique and in the Bosphorus.

How can a nation speak to the world while the practical expression of its views is thus full of confusion and contradiction! Countries are not, like human individuals, endowed with one single, audible, and unmistakeable voice; Britannia is not a real person, and cannot rise to her feet and address

the nations in a voice of oneness. Nations must speak by their actions; and, to make the discourse intelligible, must make their actions have one obvious and consistent drift. By an opposite system England baffles her own utterance; one part of her policy is an answer to the other, and to refute herself her own actions may be cited. How can she pretend that slavery is an intolerable offence, when she makes no single abatement in her amity, commercial or political, with the slave-owning, slave-trading states of the Union? Brazil may well believe that we lie when we say that we will not trade with her on account of her slave-dealing, since she is far more humane even on that score than nations from whom we withhold no friendly relation. Brazil must guess that we have some other motive. If we wish to make her believe what we say, we must shape our utterance to a consistent unity; and if we *cannot*, by force of treaties, or of irresistible circumstances in our commercial and social state, be consistent in our compulsory course against the slave-trade, we must adopt some other course in which we *can* be consistent. As long as we hesitate to do so, we achieve nothing but defeat.

Now, can we suppress either slavery or the slave-trade by compulsion? Certainly we cannot, *proprio motu*. We cannot decree the cessation of slavery in Brazil, in the United States, in Asia, or even in Africa; we cannot suppress the slave-trade under other flags, by our own edict. To effect either result, we must obtain the assent of the nation whose institutions we would modify. Can we do that by compulsion? Obviously not. We cannot even attempt it. Where we have extorted a reluctant assent from foreign governments to use compulsion over their subjects, we have uniformly failed; and we have certainly provoked abundant odium, exasperation, vindictive desire rather to encourage than abandon the traffic we denounce.

But while we engage in this fruitless crusade, what a waste is there of precious time! The slavery that we cannot abolish is increasing in its numbers and its geographical limits; the slave-trade by sea has become more horrible in its details; and slave-trading for the market of North America has turned into a domestic traffic, quite shut up from our interference. The institution, therefore, is growing, and its overthrow is becoming more difficult every day; not merely because our hostile advances have grievously hindered our proselytism, but because the mere increase in numbers and extent renders the practical removal or emancipation of an ignorant slave population more and more difficult through the lapse of time. Certainly, slavery makes greater progress than the doctrine of abolition does, and there is no sign yet that the relative pace of advance has really begun to alter.

The most hopeful prospect of success lies in a process of conversion by example. But we cannot speak that example emphatically while we complicate it with other processes that are not example: it must be unavailing while we harden the hearts of the nations against us by a hostile compulsion. In order, then, to endow with vigor that course which is hopeful, let us abandon that which is hopeless—call off the hostile band of compulsion, and apply our attention, energies, and resources, solely to the example.

One immediate result would be a great saving in money. The precise amount cannot be ascertained. The machinery for the armed suppression

of the slave-trade costs about half a million yearly. The tax on sugar for protecting the West Indies is estimated at not less than a million and a half. The loss by refusal to trade freely with Brazil, Cuba, and other countries, augmented by their retaliatory tariffs, must be represented by a still larger but an unknown amount. The gross loss, therefore, is to be counted by millions sterling; which we should save.

But the fund thus accruing, or even a portion of it, might be devoted in a variety of ways to encourage the conversion of slave-owning countries to a humaner and wiser policy—devoted to the anti-slavery agitation by force of example. Sir Robert Peel has suggested improvements on the ministerial plan for altering the sugar-duties, and among them attention to immigration of labor into the British sugar colonies: that may best be done by extending the sources to other than the present "British possessions" on the western coast of Africa; and to do so, with the official aid and supervision that would be desirable, would occasion expense. Ingenuity would devise other modes in which England could apply the fable of the North Wind and the Sun. Meanwhile, not only would the nations be seduced into a more favorable mood, but the example would be relieved of its contradicting and frustrating contingencies, and would be furnished forth to shine in the most conspicuous manner. In that way England might make free labor succeed; might so display the fact before the world as to make the knowledge of it unequivocal and inevitable; and at the same time might conciliate the stranger to accept conviction, instead of exasperating him obstinately to resist it.

LORD JOHN RUSSELL has manfully grappled with the moral part of the sugar question. In rejoinder to the reply that the wrong of admitting slave-grown sugar is not to be justified by the other wrongs of admitting slave-grown coffee, cotton, and tobacco, he denies that these are wrongs, and contends that it is not for us in our tariffs to be pronouncing judgment on the institutions and customs of other nations. Commerce is the great instrument for securing the peace of the world, and that instrument is impaired by any restrictions, especially of such an offensive and irritating nature as those founded on hostility to particular usages. How incensed would the people of England be, if the United States were to forbid commercial intercourse with us on the score of our alleged injustice to Ireland; how exasperated Russia would be with us, if we were to refuse to take her tallow and hides because they were the produce of serf labor. The peace of the world could not consist with this international prying and meddling, and spying out immoralities. We have not advanced a jot by it towards the only object for which it has been put in practice, the great object of ridding the world of slavery. It remains to be seen whether that end may not be better promoted by what improves the harmonies and good understanding between nations. As yet, we have adopted but a sorry mode of recommending free labor, guarding it with fences implying its inferiority to slave labor. We begin to give fair play to the example when we brave competition, and our efforts to induce other nations to copy us will not be weakened by the withdrawal of offensive prohibitions, and the establishment of the closer amity and improved influences which result from the ties of commercial interests.—*Examiner*, 1 Aug.

From the Christian Observer.

PEACE SOCIETIES; AND ELIHU BURRITT, THE
LEARNED AMERICAN BLACKSMITH.

AND so Elihu Burritt is coming across the Atlantic to make a philanthropic tour in England. And who is Elihu Burritt? To ask the question "argues oneself unknown;" for who that receives many letters, and is supposed to have any influence, has not been showered upon with olive-branches and other anti-war papers, in which the name of Elihu Burritt is as conspicuous as the Duke of Wellington's statue is like to be upon the triumphal arch. We are hearty peace men, though not Peace-Society men; we abominate and deprecate war, though we believe that national defence is lawful; just as we should with a good conscience knock down, tongs-wise or poker-wise, an assassin who should burst in upon our wife and children; or as the Quaker on the deck of a vessel boarded by an enemy, though he would not use lead or steel to repel the invaders, yet thought it his duty to thrust as many of them as he could overboard into the ocean, with "Friend, thou hast no business here." We are far from undervaluing, as many persons do, the benevolent intentions of good men on either side of the Atlantic, who are laboring to promote the principles of universal peace and good will. We honor their motives, though they sometimes injure the cause they plead by the manner in which they urge it, and by not allowing that defensive warfare, when it cannot be avoided without submitting to aggressive ruffianism, is justifiable;—that it is a duty imperative upon men, patriots, and Christians.

Elihu Burritt is without question a remarkable, and highly estimable, man. His zealous exertions to suppress slavery, to promote temperance, and to blunt the appetite of nations for war, have been honorable to his character as a philanthropist and a Christian; and his labors have produced a considerable effect in his own country, and have elicited many friendly memorials from ours. The "Peace-Advocate" asks:—"Who can estimate the influence of Elihu Burritt in calming down the fiery spirits of America to their present temperature? For surely the writer, who, through the late tempestuous period, has been pouring his arguments for peace into a million of minds every week, [probably two millions,] as it is estimated he has done through his Olive Leaves for the American press, may well be supposed to have exercised an important influence in the amelioration which has taken place."

We fear that the "cooling down" has not yet extended in some quarters much below fever point; and the addition of the word Mexico, to those of Texas and Oregon, upon the American popular war-banner, has not evinced that the mind of his countrymen is wholly pacific. But this is not his fault. We doubt whether all his classical learning will dissuade his ardent compatriots from their cherished notion that Texas, in its political etymology, assuredly means something which behaved to be *woven* with the Union, for which purpose they might quote Terence and Virgil—"Telam texere," "Texamus robore naves;"—or that the Oregon claim is not good Greek for coveting, and stretching out their hands and reaching after, whatever they may think it politically or commercially expedient to possess. Our Athenian blacksmith, however, spares them not; he is impartial in his censures; he excepts neither gentle nor simple,

private nor commander, nation nor legislature, in his denunciations of war, under all its forms and for every purpose. If he maintains that it is a game, "which, were subjects wise, kings would not play at," we doubt not he would impartially add, "Or presidents either, if citizens were wise." In a recent letter, dated Worcester, Massachusetts, May 15, he writes:

"It makes my heart sad to say that America has entered the field of blood, and perhaps is to rival the British in India, and the French in Algeria. Our Texas iniquity is bringing forth its first fruits of sin. From one aggression after another, our government has got itself into a condition of war with Mexico, and what is to come of it no human foresight can tell. The sober part of our community and country are taken all aback by this unexpected war; and the whole whig press denounces it with unsparing severity. It should afford us some consolation, that where sin abounds grace much more abounds to set limits to the wrath of man.

"The peace band here will not be cast down or discouraged, though 'the heathen rage and the people imagine a vain thing.' Perhaps the cause of peace may ultimately receive vast accessions of strength from the thousands converted to its principles by a new illustration of the sin and folly of war. We shall redouble our energies and strengthen our faith to meet the exigency. We shall speak out boldly against all war. I hope something may occur to stay the progress of hostilities between the two countries. I shall send you by next steamer, I hope, some returns from the addressees. 'Let us follow peace with all men.' I hope an Anti-War League will be formed in the course of this year, which shall take in as members and officers men of all nations, kindred, and tongues, and hold its anniversary in London. During my stay in England I intend to solicit attention to this idea. I send by Harnden's express 500 'Olive Leaves' for the British press."

We trust that our worthy republican has not thought the worse of England in comparing the manifestoes of Polk and Peel; and when he arrives among us, he will find, even in the dog-days, that the people of England have no belligerent passions to gratify in going to war with his country; and that all they ask of her is reason and justice.

The history of Mr. Burritt deserves to rank among the interesting literary annals of successfully self-taught men. He was born in New Britain, Connecticut, in the year 1811, of honest and respectable parents. He enjoyed the privilege of attending the district school for some months every year, till he was sixteen years old; and by his diligence and attention to his studies he became well versed in the elementary branches of an English education, and by cultivating a taste for reading, he acquired much valuable information. When he arrived at the age of sixteen his father died, and he was apprenticed to the trade of a *blacksmith*; and when the term of his indenture had expired, and he had attained his legal majority, he had gained the reputation of being a young man of good moral and religious character, and a skilful workman in his vocation, and one who cherished an ardent attachment for books. The Bible was the first book which he thoroughly studied; and at a very early age, he was familiar with almost every passage in the Old and New Testaments. He next availed himself of the opportunity of reading afforded by the "Social Library" in the town in which he lived; and afterwards was dependent on the kin-

ness of his friends. Before he reached the age of twenty-one he was conversant with the English classics, both in prose and poetry, and passed delightfully many of his leisure hours in poring over the pages of Milton, Young, Thomson, Cowper, Addison, &c. In the winter of the year in which he attained his majority, he commenced, under the direction of a brother-in-law, who was an accomplished scholar, the study of mathematics. About the same time he entered on the study of the Latin language, for the purpose of reading Virgil in the original. He soon after turned his attention to French, which he mastered with wonderful facility. He then acquired the Spanish, and afterwards the Greek and German languages. During two winters he devoted nearly all his time to study, but he was occupied a large portion of his time during spring and summer in working at his trade as a blacksmith, and in this exemplary way acquiring the means of subsistence.

When about twenty-three years old, he accepted an invitation "to teach a grammar-school," but this employment did not suit his convenience or his inclination. He was then engaged for a year or two as an agent for a manufacturing company, when he returned to his *anvil*, and has since been industriously engaged in the occupation of a blacksmith, to which he was apprenticed in his youth; but he devotes all his leisure hours to literary pursuits. After having mastered the Hebrew, Greek, and Latin languages, and all the languages of modern Europe, he turned his attention to Oriental literature, and in order to avail himself of the facilities afforded by the valuable library of the American Antiquarian Society at Worcester, he removed to that place, where he has ever since resided, and been regarded as a useful and exemplary citizen. He has become a proficient in the most difficult languages of Asia, and in many of those languages in Europe which are now nearly disused and obsolete—among them are Gaelic, Welsh, Celtic, Saxon, Gothic, Icelandic, Russian, Slavonic, Armenian, Chaldaic, Syriac, Arabic, Ethiopic, Sanscrit, and Tamul. It was stated, in a public meeting, in 1838, by Governor Everett, that Mr. Burritt by that time, *by his unaided industry alone, had made himself acquainted with fifty languages.* Mr. Burritt shows no disposition to relax from his labors. He usually devotes eight hours to labor, eight hours to study, and eight hours to *physical indulgence and repose*; and, by pursuing this course, he enjoys the advantages—vainly coveted by many literary men—connected with "a sound mind in a healthy body." Nor does he confine his labors to the mere acquisition of literary wealth—he also diffuses it with a liberal hand. He has written many valuable articles for periodical publications; he has delivered many lectures which have been replete with interest and valuable information; and has been repeatedly listened to by large and highly respectable audiences, in New York, Philadelphia, and other places, with edification and delight. He has not yet reached the meridian of life, and it is to be hoped that many years of usefulness are still before him.

The following extract from a letter written by him in 1839, to Dr. Nelson, a gentleman who had taken some interest in his history, displays the simple, unassuming, earnest character of the man, in a very interesting point of view.

"An accidental allusion to my history and pursuits, which I made unthinkingly, in a letter to a friend, was, to my unspeakable surprise, brought

before the public as a rather ostentatious *débüt* on my part to the world; and I find myself involved in a species of notoriety, not at all in consonance with my feelings. Those who have been acquainted with my character from my youth up will give me credit for my sincerity when I say, that it never entered my heart to blazon forth any acquisition of my own. I had, until the unfortunate *denouement* which I have mentioned, pursued the even tenor of my way unnoticed, even among my brethren and kindred. None of them ever thought that I had any particular *genius*, as it is called; I never thought so myself. All that I have accomplished, or expect or hope to accomplish, has been and will be by that plodding, patient, persevering process of accretion which builds the ant-heap—particle by particle—thought by thought—fact by fact. And if I ever was actuated by ambition, its highest and farthest aspiration reached no farther than the hope to set before the *young men* of my country an example in employing those fragments of time called 'odd moments.' And, sir, I should esteem it an honor of costlier *water* than the tiara encircling a monarch's brow, if my future activity and attainments should encourage American *working men* to be proud and jealous of the credentials which God has given them to every eminence and immunity in the empire of mind. These are the views and sentiments with which I have sat down night by night, for years, with blistered hands and brightening hopes, to studies which I hoped might be serviceable to that class of the community to which I am proud to belong. This is my *ambition*. This is the goal of my aspirations. But, not only the *prize*, but the whole *course* lies before me, perhaps beyond my reach. 'I count myself not yet to have attained' to anything worthy of public notice or private mention; what I *may do* is for Providence to determine.

"As you expressed a desire in your letter for some account of my past and present pursuits, I shall hope to gratify you on this point, and also rectify a misapprehension which you with many others may have entertained of my acquirements. With regard to my attention to the languages, a study of which I am not so fond as of mathematics, I have tried, by a kind of practical and philosophical process, to contract such a familiar acquaintance with the head of a family of languages, as to introduce me to the other members of the same family. Thus, studying the Hebrew very critically, I became readily acquainted with its cognate languages, among the principal of which are the Syriac, Chaldaic, Arabic, Samaritan, Ethiopic, &c. The languages of Europe occupied my attention immediately after I had finished my classics; and I studied French, Spanish, Italian, and German, under native teachers. Afterwards, I pursued the Portuguese, Flemish, Danish, Swedish, Norwegian, Icelandic, Welsh, Gaelic, Celtic. I then ventured on further east into the Russian empire; and the Slavonic opened to me about a dozen of the languages spoken in that vast domain, between which the affinity is as marked as that between the Spanish and Portuguese. Besides those, I have attended to many different European dialects still in vogue. I am now trying to push on eastward as fast as my means will permit, hoping to discover still farther analogies among the oriental languages, which will assist my progress."

Mr. Burritt speaks in glowing words of the blessings in store for the world from the united

agency of the "Anglo-Saxon race" in the dominions of Queen Victoria and in the United States of America. Then, adverting to the unhappy symptoms of disunion which have appeared between the two great families of this race, he says :

"A war between England and America, for any cause, would be a war with God, his Gospel, the spirit and precepts of his religion ; with all living and future generations of men on the whole earth. The discharge of the first paixhan gun in such a contest would not only sink a ship, but it would sink the whole heathen world to the deepest depths of that moral night in which they groped a century ago ! A war between England and America !—it would be the greatest curse that has visited this world since the fall of man !"

There has been an extensive exchange of what are called "Friendly International Addresses," (more than thirty,) signed by a great number of persons on each side of the Atlantic, expressive of their earnest desire to preserve pacific relations and hearty affection between the two countries. One of these addresses was from more than sixteen hundred women at Exeter to their sisters in Philadelphia. Elihu Burritt says, in reference to them, in a recent letter to a friend :

"I rejoice with exceeding joy, at the tokens for good which have greeted our eyes. I am confident that our two countries, immediately on the adjustment of this unhappy question of Oregon, will enter upon a new era of social and commercial intercourse ; which will be facilitated by the interesting correspondence that has been opened through the 'Friendly International Addresses.' What a moral power the friends of peace throughout the world might wield by intercommunications of this kind ! I shall esteem it the most pleasant occurrence of my life to have been interested in this blessed movement. I feel as near to every one of you as if you were my brethren according to the flesh. My thoughts steal out after you by the wayside and by the fireside. I read over and over your kind letters, and wonder that there should be questions of warlike controversy in the world, when such lively susceptibilities to friendship are common to human hearts everywhere ;—when it is so easy to make a friend even across a wintry ocean. I hope to see you face to face in the course of the coming summer, as I am preparing to visit Old England about the middle of June. I have thought that I might do a little for the cause of peace in your country, in the way of writing for the press."

Mr. Burritt describes in his own characteristic style his projected tour in England.

"About the first June, we propose, under certain conditions, to take steamer or packet for England. On our arrival, we propose to take a private hickory staff and travel on, like Bunyan's pilgrim, through the country, at the rate of about ten miles a day.

'With a pocket for my wheat, and a pocket for my rye,
And a jug of water by my side to drink when I am dry.'

Passing thus leisurely on foot through the agricultural districts, we anticipate the opportunity of looking through the hedges and into barn yards ; sometimes into the kitchens of the common people, once in a while into a blacksmith's shop to smite at the anvil. In fact, we intend to pull at every latch-string that we find outside the door or gate, and

study the physiology of turnips, hay-ricks, cabbages, hops, &c., and of all kinds of cattle, sheep, and swine. We propose to avoid the *lions* of the country, and confine our *walks* to the low lands of common life ; and to have our conversation and communion chiefly with the laboring classes. Perhaps we might get together a knot of them some moon-shiny night and talk to them a little on temperance, peace, and universal brotherhood. During such a pedestrian tour, we think we might see and hear some things which a person could not do while whizzing through the country on the railroad at the rate of thirty miles an hour."

Our learned mechanic will have some difficulty in adhering to his project. He may not wish to see "lions ;" but he will be a lion himself, and men, women, and children will crowd to see *him*. There are sixteen hundred eager visitors at Exeter to begin with ; not to mention the other twenty-nine "addresses ;" and if he be as extraordinary a linguist as is stated, the learned and the fashionable of England will not fail to do him honor ; and he will not be allowed to conceal himself entirely behind cottage doors. But apart from his literary claims, and the paucity of very deeply learned men who visit us from America, (not that we mean that his country is *arida* as a *leonum nutritrix*,) his celebrity as a philanthropist will cause his acquaintance to be extensively sought for ; and, in seriousness, the intercourse between England and the United States, of persons of his station of life, and of such friendly and peace-loving dispositions, may be a useful counterpoise to the influence—if they have any—of our Trollopes and Dickenss, who prefer idle jesting and mischief to truth and love. Our learned Theban says in a letter last month to one of his cis-Atlantic friends : "Heaven bless old England forever ! Her maternal leaning towards her American daughter bespeaks the parent." Well and kindly said, Elihu.—If any of our rural readers should hear of a western stranger, with a brawny arm, wielding a hickory staff, visiting the cottages in their parish, and talking words of peace to the admiring rustics, let them accost him in Greek, or one of the Shemitic tongues, if they can master it, and bid him a friendly welcome.

THE ORIENTALISM OF NAPOLEON.—It has been often said, that he was oriental in all his habits. His plan of supremacy bore all the stamp of orientalism—the solitary pomp, the inflexible will, the unshared power, and the inexorable revenge. The throne of the empire was as isolated as the seraglio. It was surrounded by all the strength of terror and craft, more formidable than battlements and bastions. Its interior was as mysterious as its exterior was magnificent ; no man was suffered to approach it but as soldier or slave ; its will was heard only by the roaring of cannon ; the overthrow of a minister, the proclamation of a war, or the announcement of a dynasty crushed and a kingdom overrun, were the only notices to Europe of the doings within that central place of power. But, with all the genius of Napoleon, he overlooked the true principles of supremacy. All power must be pyramidal to be secure. The base must not only be broad, but the gradations of the pile must be regular to the summit. With Napoleon the pyramid was inverted—it touched the earth but in one point ; and the very magnitude of the mass resting upon his single fortune exposed it to overthrow at the first change of circumstances.—*Blackwood's Magazine*.

From the *Britannia*.*Life in the Wilderness; or, Wanderings in South Africa.* By HENRY H. METHUEN. Bentley.

Nothing can be more original and animated than this narrative of travel in the wilds of South Africa. It opens to us a new region and a new state of existence. It is one of those works issued now and then which every one will be eager to read, and which every one will be delighted with.

The author, with three companions, left Graham's Town in April, 1844, to explore the wilds that lay to the north of the British possessions at the Cape. The party consisted of the four gentlemen, and ten or twelve Hottentot attendants. They had three wagons well stored with all necessary baggage and provisions, about fifty oxen, thirty horses, and some dogs.

It inspires one with a strange kind of emotion to hear of this little party boldly venturing into the wilderness, exploring an unknown region, trusting themselves in the heart of savage and unreclaimed deserts, abounding with all descriptions of ferocious life, for the mere love of adventure and novelty. For a supply of food they trusted chiefly to their guns and the swiftness of their horses, for water to the streams and fountains that crossed their track, and for forage to the grass and herbage that were generally met with in abundance. Their travel lasted for eight months, yet during the whole of that time they seem to have suffered nothing from scarcity. They were generally well supplied with one kind of game or another.

By the Orange and the Maragua rivers they met with the best sport and with the most magnificent scenery. In the waters they met with crocodiles and hippopotami; on the banks, in thick jungles, with elephants, lions, rhinoceroses, leopards, and panthers, and in the more open country with herds of buffalos, deer, and giraffes. Their sporting excursions were attended with all the excitement of danger, but none of the party were seriously injured, though they often lost their cattle from the ferocious attacks of wild beasts. From April to December they lived in the freedom of savage life, and returned at last to the Cape in the enjoyment of excellent health, and highly delighted with their travel in the wilderness.

Our extracts from this entertaining volume must necessarily be scattered. The author kept a journal, and has here reproduced it almost *verbatim*. All his details have the rough force of the life he led, and are marked by the high spirit in which he wrote. On the 30th of June, while encamped near the Vaal river, he made his

FIRST ACQUAINTANCE WITH A LION.

"Before daybreak I was roused from my slumber in the tent by Bain saying, 'Something has got hold of an ox,' and, listening, heard the poor creature bellow and moan piteously, but in a kind of stifled tone. The horses had all been fastened to the wagon wheels, but the oxen, having had a hard day's work, had been allowed to lie loose during the night. In the course of half an hour the grey light was, we judged, sufficient for our purpose,

and three of us, well armed, sallied forth in the direction of the outcry, to reconnoitre. We marked a crow hovering, and by its guidance soon discovered one of the best oxen lying dead. We approached with caution, and a quick-sighted Hottentot pointed to the large print of a lion's foot in the sand just by us. The lion had attacked the ox in the rear, and fastened his tremendous claws in the poor wretch's side, one having pierced through to the intestines; he had then bitten him in the flank, and, to show the prodigious power of the monster's jaws, the thigh joint was dislocated, the hide broken, and one of the largest sinews snapped in two, and protruding from the wound: having thus crippled his victim, he had, apparently, seized him by the throat and throttled him.

"We could discern that the cattle had all been sleeping together when first surprised, and the lion, following on the trail of some Griqua horsemen, whom he had met on the preceding evening, had come across the oxen, and sprung on the nearest. We traced his spoor all along the road to the scene of slaughter, and on the retreat after it. He had not eaten a morsel, which was some satisfaction to our feelings. The first scuffle had evidently been violent, for the ground was much indented by it. This having been the outside ox, and the wind blowing from the rest, they had not smelt their dreaded foe, and had only run a little way off, else they would not have stopped for many miles. Execrations and cries for revenge were universal; so, forming a large party, we started in pursuit of the lion, attended by some good dogs. With the greatest difficulty we followed his track over sand and stones, by the assistance of Hottentot eyes; but even these would in one or two cases have failed, if a sagacious dog, perceiving our object, had not run on the scent, stopping constantly to see if we advanced, as if conscious of the fierce creature we were pursuing.

"The search became at intervals very exciting, when the spoor led into a glen of long dead grass or rushes; but, whether purposely or not, the lion always left us to windward, so that his nose would inform him of our approach; and after a fatiguing, unsuccessful chase, the sun growing very hot and our stomachs craving for breakfast, we resought the wagons.

"The habits of the king of beasts are not of that noble order which naturalists formerly ascribed to him. In the daytime he will almost invariably fly from man, unless attacked, when his courage is that of mingled rage and despair. I have seen the lion, suddenly roused from his lair, run off as timidly as a buck. It is said that even at night they do not like to seize a man from a party, especially if the persons exercise their voices; and that the carcass of an antelope, or other game, may be preserved untouched by hanging some stirrups on a branch near, so that the irons may clash together when blown by the wind: a white handkerchief on the end of a ramrod is another receipt for effecting the same object. The lion is a stealthy, cunning brute, never attacking unless he has the advantage, and, relying on his vast strength, feels sure of the victory. The natives tell incredible stories of his

sagacity, which would almost make him a reasoning animal. There are well-authenticated cases on record of lions carrying away men at night from the fireside, but these are quite the exception. They are gregarious, as many as twenty having been seen in a troop.

"Balked of our revenge, we started for the next water, but first of all we carefully cut up, and stowed away, all the flesh of the dead ox, leaving only the entrails, which vultures and crows would speedily devour, and dragging the hide behind the last wagon, that the assassin might follow and be entrapped. We came to a pool, called Papkuil's fontein, surrounded by low clumps of bush and long grass, well fitted to be the head-quarters of *felis leo*. Two guns loaded with slugs were secured to stakes near the water, their muzzles protruding through some bushes, cut and placed so as to conceal them: a string was then attached to the triggers, and fastened to a large piece of meat, in such a manner that any creature laying hold of it would discharge the guns in his face. Care was taken that there should be no path but in front of the battery, and twilight had begun to fade when all our preparations were completed. Much trouble was experienced in tying up the oxen and horses; one young ox broke away, and was of necessity abandoned to his fate. Good fires were made, a slight hedge of thorn boughs was formed round our camp at the least secure point, and, supper over, we all retired to bed.

"At about 2, A. M., Hendrick, ever wakeful, shouted out, 'There stands the lion! shoot!' and, before we could jump from our beds, the discharge of a gun was heard. The horses and cattle had been very uneasy for some time previously, snorting and struggling to get free: one horse actually broke his halter, and ran away, and was brought back by Frolic. It is miraculous how both escaped from the lion, which then must have been prowling round us. On emerging we saw the oxen, like so many pointers, with their noses in one direction: snuffing the air; and found that an old white ox, which had not been fastened up on account of its age and docility, but merely driven amongst the rest, had strayed about thirty yards from our camp, to nibble some grass, and had been assailed by the enemy. Piet said that he saw the brute on the ox and fired, whereupon he relinquished his prey and fled, and the poor terrified ox hurried back to the wagon and his comrades; where he began stretching out first one leg, then another, as if engaged in a surgical examination of his limbs. The air all the while was piercingly cold, and a basin of water in the tent had a coat of ice on it an inch thick. The fires were anew supplied with fuel, and a watch set; the profoundest silence, broken only by the deep breathing of the oxen, reigned again; and, being thoroughly chilled, we nestled once more under our warm blankets. On inspecting the trap in the morning we found, to our grievous disappointment, that a bad cap had prevented the principal gun from exploding; and that the small one had gone off, but missed its aim—the meat bore the mark of a claw, but was none of it eaten. The ox which had deserted was found uninjured, but the white one showed several severe scratches on his neck, which swelled extremely. We resolved to wait another day, and prepare for the lion."

The lion, however, escaped them; but in the night they shot a large hyæna.

From the Churchman.

MR. EDITOR,—It is not out of place, nor out of season to remind ourselves of the ends and object of the daily service. By some, one view may be taken—by others a different one may be appreciated. To all, every view of it will be of use, and therefore as one I send you the following, in the measure of an old English hymn.

A REASON FOR THE DAILY SERVICE.

MAN has few days to live,
And life shall be,
Not here on earth; but in
Eternity.

Here we may love and praise;
And ever dwell
With God; or follow sin:—
Seek heaven or hell.

But there no choice may be!
For with that day,
Which ends our life, will pass
For aye away

Our trial; and old and young
—From sea and land—
Before the "great White Throne"
Shall trembling stand.

When "every knee shall bow"
And "tongue confess"
—They who revile their God,
And they who bless.

Since then before my Judge
This flesh shall kneel;
When flames shall wasting pour,
—My works reveal.—

I'll now anticipate
That fearful day;
And at my Saviour's feet
In dust will pray;

Confess my countless sins,
My loss deplore;
And daily bow the knee,
Till time is o'er.

That so when mountains shake
And pass away,
Thou may'st my soul preserve
In that dread day.

I cannot see Thee now!
My mortal sight
Is far too weak to bear
Thy awful light.

But faith shall view Thee here;
And—as alone—
Will try to think of Thee
As on Thy throne.

Grant me, O Lord, a place
—At Thy blest feet,
Among that "two or three"
Who with Thee meet.

For soon the day will come
When I shall be
Rapt with Thy vision in
Eternity.

From Fraser's Magazine.

HOLLY COTTAGE.

CHAPTER I.

It is strange how much deeper and more enduring is our sympathy with sorrow than with joy. Many a cheerful home do I pass in my country rambles, before many a cottage door do I pause to watch the merry children at their play; but there is one house before which I always linger with a melancholy interest, and, often as I pass it, I still feel the same sinking of the heart when I draw near, as I did when it was first deserted years ago, and when the history of its latest inmates was in everybody's mouth. This sadness may spring, in part, from selfish considerations. In my early childhood I first was led to this cottage; in after years, when the hopes of youth were warm about my heart, my favorite ramble was still in this direction; and now, when childhood and youth have faded like dreams, I bend my steps hither again, and count over the treasures I have lost. Alas! I may well grieve over my diminished store, and, in the exuberant gladness and fertility of summer, this old house seems the only thing that is changed even as I am. But it was not of myself I meant to speak.

Holly Cottage (for by this name was the now desolate habitation once known) stands in the very heart of the New Forest, and on the edge of some enclosed land that once was a stately park. Immediately behind it is a hanging wood of elm and beech, with here and there a tall pine towering above its neighbors. Through this wood and across the cottage garden trickles a little stream, clear and noisy, though now half-hidden by cresses and reeds, and the wood itself is peopled with a large colony of rooks. The cottage contains but four rooms, but its ample porch used to furnish a fifth apartment in summer time, and though the woodbine once trained over it, so glorious in its blossoming season, lies dead upon the ground, yet I love to stand in that spot still, for the view seen thence is one of exceeding beauty. Gentle undulations, clothed in grass and crowned with noble trees, are immediately opposite; while to the left stretches a vista of distant country, blue and hazy, a very dream-land for the fancy; and to the right winds away the long green valley, its termination lost in woods of oak, beech, and holly. Beautiful it is at all times!—when the spring uncurls the fern-leaves, and calls forth verdure on every tree; when the golden furze-bloom makes the summer air heavy with its rich perfume, and the crimson bells of the foxglove wave slowly in the evening wind; when the breath of autumn passes over the heathery slopes and bids them blush into beauty; and even in winter, when the old oaks lift their bare branches in the frosty sunshine. Now and then—nay, almost every evening, the deer steal down to feed in the valley, raising their graceful heads if a step comes near, and bounding away over the hill, so suddenly that you might believe you had but fancied they were before your eyes a few moments ago.

Alas! a change is threatened to this lovely forest-land. Through these calm, green recesses, where the poor man's cattle feed beside the stately deer, disturbed by few travellers, a railroad is to be made. These quiet shades, where now rises no harsher sound than the waving of the boughs, the night-cry of the owl, or the hunter's merry shout, will soon be alive with the shrill whistle of

the steam-engine. Quiet nooks in this great natural temple, long leafy aisles that have been my favorite haunts for years, are to be sacred no longer to high and holy thought. It may be all well, but I could have wished such changes had not been made in my day. Many voices are raised to oppose the making of a railroad through the Forest. The rich man dreads it may be brought too near his drawing-room windows; the lover of hunting fears interruption of his darling amusement; the farmer of small substance trembles for the safety of his cattle; while all talk alike of the injury to the poor, and the invasion of *forest rights*. All good reasons, no doubt; but I have yet another. I grieve that one more breathing-place for the lover of Nature, yet unprofaned by the improvements of man, should be taken away. Perhaps we are hardly able to appreciate the influence—ay, and the usefulness of scenes like these, appealing to us in the midst of a trafficking, ever-moving world, in behalf of beauty and of peace. These are romantic notions, I dare say, but I am indulgent to them, for they are all that remain to me of my youth.

But to return to the cottage. The three noble holly-trees from which it received its name, are still standing on the green before the door; but that green, once so carefully trimmed, is now covered with coarse matted grass. The flower-beds, too, are overgrown with grass and weeds, through which, here and there, a pale and sickly rose struggles to the light, or some half-dead currant-bush displays its shrunken fruit. Some of the tiles from the cottage-roof have fallen about the garden, and it is now hardly safe to enter at the open door and tread the uneven floor, for the crazy building trembles at every step. Immediately at the back of the cottage is an opening, (for the gate has fallen from its hinges,) from which a path leads, through the wood I have mentioned, into the park, now let to a farmer. The ground slopes gently upward to the spot on which stood the mansion of a family now passed away from the face of the earth. I can remember when the old house was pulled down. One of its latest proprietors, in grief for the death of his wife and daughters, left forever the home in which they had delighted; and it remained for many years entirely without inhabitant. There was a pleasure-garden before it, surrounded with an iron railing, and entered by a lofty gate between stone pillars, each surmounted by a rampant lion supporting a shield. The garden had been formally laid out, with straight walks and quaintly shaped flower-beds. Here and there was a statue or an urn, often beautified by the blossoms of some wild plant that had twined its light tendrils about it; and a vigorous wild-rose-tree had almost hidden the somewhat ungraceful Naiad who presided over the ruined fountain. There was nothing beautiful in the architecture of the large old house, but many of the apartments it contained were noble in size and perfect in their proportions. In my youth I often made my way into the hall by a broken window. It was a very fine room, with panels of old oak. Over the broad fire-place still hung a picture representing a hawking party, and a few pieces of armor were attached to the walls. Often, standing alone in that deserted house, have I started to hear the rattling of helmet and shield as the wind swayed them to and fro. The gilded mouldings of the ball-room were falling to the ground, and its painted walls already stained with damp. Latterly, the staircase was in so dilapidated a state that

I feared to ascend it; but at one time I used to range over the whole house, where still were scattered many relics of the dead. Books, vases for flowers, pieces of music—graceful mementos of the youth and beauty which had once made that dwelling joyful—were left, as if to make its present state seem yet more sad and desolate. In one small chamber, commanding a lovely prospect, I found a volume of poems laid open on the window seat, stained by the rain that had fallen upon it through the broken panes. Near it was a glass containing the remains of some withered flowers, and a faded sketch, on which was written the name of “Emily Courtland”—frail memorials that yet had outlasted the beautiful being whose hand placed them there.

From some of the windows at the back of the house was seen the main stream, one of whose branches passed through the wood on the edge of the park, and across the garden attached to Holly Cottage. This stream formed a beautiful feature in the landscape, flowing through rich, green meadows with a strong and rapid current, and sending its sweet music to my ear many and many a time as I sat musing in the neglected mansion. Perhaps it was then and there that I learned to be a dreamer and a moralizer; but I was young; and in youth, in very wilfulness, we seek out sadness as eagerly as in later years we long to cast it from us.

In those days there was little about Holly Cottage in harmony with the melancholy of the “great house.” It was then occupied by a widow, who had formerly been housekeeper to the Courtland family, and her only daughter. The mother I did not like: there was something mean and cringing in her over-acted respect to those whose station in life was at all superior to her own, and whenever she spoke to me, I found myself trying to guess at the motives that prompted her. There was a want of simplicity in all she said that impressed me with a belief there was also an absence of truth; and the expression of her keen, grey eyes and demurely puckered mouth seemed to me—albeit not given to unkind suspicions—full of cunning and duplicity. Her daughter, Ellen Matley, was the very reverse of all this. Simple, ingenuous, affectionate, she won at once my confidence and good-will, and by degrees I became a constant visitor at the cottage, often taking Ellen on with me to wander in the park. I found her always a pleasing companion. The last mistress of Courtland Park had been fond of her, and Ellen had lived much with the young ladies, sharing the instructions they received, so that her education and manners were quite those of a lady. She was very beautiful, her features ~~were~~ regular, and the expression of her countenance varied with every emotion. Her enthusiastic admiration and love of all that was noble or beautiful interested me from the first, and it was my delight to read to her some touching poem, or relate some deed of heroism, that I might see reflected in her speaking face the earnest feelings kindled in her heart. I thought not of the dangers to which, through her trustful and enthusiastic temperament, she might afterwards be exposed; I enjoyed wielding the power I possessed over her mind, and did not trouble myself with fears for the future.

Different as were the characters of mother and daughter, they yet were warmly attached to each other. Sometimes I thought there was a shade of disappointed ambition in Mrs. Matley’s manner,

when she told how the great house had been the home of Ellen’s childhood, and how sadly times were changed; while the daughter’s grief when referring to the past was quite unmixt with selfishness. Many a time has Ellen led me from room to room, describing scenes long past in simple, energetic language, till I have found myself weeping with her at the dying words of her favorite Lady Emily, or smiling at sallies of wit that once flowed from lips long ago mouldered into dust.

But a change came over all this. One day when I went (as had become my almost daily custom) to see Ellen, I found her and her mother in a state of bustling confusion, in consequence, as the former told me, of the unexpected arrival of young Mr. Courtland. This gentleman was the grandson and heir of the proprietor of the estate, which he had never before visited, and he had now come down for a week’s fishing on his grandfather’s property. He had asked Mrs. Matley to let him have a room in her house during his stay, and she was doing her utmost to make him comfortable. It seemed all very natural and proper, so I e’en walked home again, catching, as I went, a glimpse of a young man in fishing costume, following the windings of the little stream through the wood.

When ten days had passed, believing the stranger must have taken his departure, I visited the cottage again, and, finding nobody at home, I passed into the park, and walked on till I reached the bank of the river at the back of the mansion, when I suddenly heard voices near me. I turned and saw Ellen with a young man, who could be no other than Mr. Courtland, seated under the trees within a few yards of the spot where I stood. They did not see me, and I watched them in silence for a few moments. The young man was speaking, gazing earnestly all the while on the beautiful, blushing face of his young companion; and Ellen, who did not answer him a word, listened with a quiet smile, as she idly plucked the flowers that grew around her and threw them into the stream. I thought neither might wish for the presence of a third person, and so I turned unperceived away; but in spite of the pleasantness of that scene, I felt uneasy and anxious, and at the end of a week I went again to look for Ellen, and ascertain how matters were going on. I was on the eve of departure for a visit of some weeks to a relation at a distance, and I determined, if unable to speak to Ellen on the subject, at least to say something to her mother on the folly, if not the impropriety, of her encouraging an intimacy between her daughter and Mr. Courtland. As I expected, I found Mrs. Matley alone. The young stranger was, she said, fishing in the park: and Ellen, as I drew from her with difficulty, had gone to carry him his luncheon.

“Is this wise, Mrs. Matley?” I asked. “I know Ellen to be pure and innocent; it is not that I fear her acting in a manner unworthy of herself, but are you not running a fearful risk of destroying your child’s happiness forever, by permitting this constant association with one who appears in every way likely to win her affections? He is evidently struck with her beauty and sweetness, and will stay here so long as she amuses him; but when he is weary of this quiet life, he will go back to the world and forget her, leaving her to pine here, every hope withered, every kindly feeling blighted—perhaps, forever. And can you as a mother, stand by and see all this misery threat-

ening her, without speaking even a warning word!"

Mrs. Matley hesitated, and there was evidently a struggle in her mind between her habitual respect towards me, and her indignation that a comparative stranger should venture to interfere in her family affairs.

"You are young, madam," she said, at last, "to think so gravely of these things. I have seen much of the world in my time, and I know Mr. Courtland well. There is nothing to fear for Ellen's happiness. Many thanks for your kind anxiety about her, but I assure you you mistake the matter altogether."

"I hope I do," I replied; "but young as I may be, I know something of human nature. I love Ellen, and have studied her character, and I own that I tremble for her now." I then told her of the scene I had unintentionally witnessed a few days before, but she merely seemed annoyed that I should know anything about it, repeating that I took a mistaken view of the whole affair, and that Mr. Courtland was the most honorable of men.

"I say nothing against him," I answered; "but you, who, as you say, know something of the world, must feel the impossibility of his marrying your daughter; and Ellen, with a mind to appreciate refinement, and a heart to feel kindness, what must be the consequence of his present devotion to her! She will love him even as her earnest nature is capable of loving, and then she must be dissatisfied and unhappy for the rest of her life. I have thought it right to speak openly to you, Mrs. Matley, as a sincere friend of your daughter, and because it sometimes happens that those nearest at hand see less than those at a little distance. Give my love to Ellen, and tell her, if you will, all that I have said. I am going from home," I added, rising to depart, "and shall be absent several weeks."

I thought I saw a gleam of satisfaction in my hearer's eye as I spoke; and when on my way homewards I pondered on what had passed, every moment strengthened my conviction that Mrs. Matley's blindness was only pretended. "She is playing a dangerous game," thought I; "she thinks, probably, to draw him into a marriage, and if she succeed, what then! There can be no happiness in a connection so unequal."

I had taken a green path across the forest, skirting the edge of the park, and leading to a slight wooden bridge thrown across another part of the river I have already mentioned. This bridge was half-hidden by a group of alder trees, under whose shadow rose many a tall foxglove, its purple bells musical with bees. I was fond of the place, for I love the sound of flowing waters, and here they have a peculiarly sweet murmur; the bed of the stream being uneven and pebbly. On this day as I drew near, I saw Mr. Courtland and my friend Ellen coming towards me across the bridge. She blushed when she saw me; and, drawing her hand away from her companion, hurried towards me.

"I am glad I have met you, Ellen," I said, "for I am going away to-morrow, and I was anxious to see you before my departure."

"Going away!" she repeated, in a tone of real regret. "You will not be absent long?"

"Probably several weeks," I replied; "but you have not introduced me to your companion, Ellen."

With some confusion, yet more grace, she presented Mr. Courtland, who was energetic in his expressions of admiration of the scenery, "though," he added, smiling, "this stream has been the boundary of my wanderings till to-day."

"Do you make a long stay here?" I asked; and I observed that Ellen seemed scarcely to breathe while awaiting his reply.

"I hardly know, indeed," he said. "I have had good sport as yet; and I am so eager a fisherman that I do not like to go while I am successful. Besides, my good friend Mrs. Matley makes me so comfortable that I have already imbibed an ardent love for forest-life."

"Have you been successful to-day?" I inquired, somewhat maliciously, I confess, for I saw no sign of rod or basket. "Mrs. Matley told me you were fishing."

"I have not done much to-day," he answered, eyeing me suspiciously; "the fish would not rise, so I took to exploring a little."

I turned to Ellen. "May I ask you to walk a little way with me? I have a few words to say before we part. You will excuse my stealing your companion for awhile, Mr. Courtland!"

He bowed with a look of considerable annoyance, and I walked away with Ellen. We were both silent for some time: for my part I did not know how to introduce the subject that was uppermost in my mind, and Ellen seemed full of thought. At length I said—

"Ellen, you are the very soul of truth: do you know what it is of which I wish to speak to you? Answer me from your heart."

For a moment she hesitated, then raising her clear, truthful eyes to mine, she said—

"I will not pretend to doubt your meaning, but I assure you, you are mistaken—you do not know him."

"But I know you, Ellen; and there are few in this world dearer to me than you have long been;" and I repeated the cautions I had already offered to her mother. She listened attentively, and with much agitation.

"Ellen, dear Ellen," I said earnestly, "is it even now too late to warn you? Do you indeed love this stranger?"

The color rose to her very brow, and her eyes filled with tears.

"I am answered, Ellen; yet beware what you do. This man cannot marry you. Beautiful and highly gifted as you are, yet there is a barrier between you which his proud relations would never allow him to overstep. He is, as you know, the last living representative of an old family, and his grandfather is most anxious to see him suitably married. Believe me, my dear Ellen, there is danger about you."

"Indeed, indeed," she replied, eagerly, "you do not know him. He is good and noble. I have no fears. More I must not say, but indeed you wrong him."

"I hope so, Ellen; but I will keep you no longer. God bless you! My warning was well meant; and I shall think of you often, and anxiously."

We parted; and when after a few minutes I looked back, I saw that Mr. Courtland had rejoined Ellen, and I doubted not that all my wise cautions were already forgotten.

CHAPTER II.

Family events, which it is unnecessary to mention more particularly, kept me from home nearly four months. During that time I had heard nothing of Ellen Matley; but, while staying in London for a few days, immediately before my return to the Forest, I caught sight of Mr. Courtland in one of the parks. He looked discontented, I thought, but I saw him only for a moment, and might have been mistaken. The sight of him, however, made me doubly anxious to know something of my poor Ellen, and I had not been two days at home, before I made my way to Holly Cottage. It was already late in October, yet the air was mild and sunny, and the glorious autumnal tints clothed the woods in beauty. Ellen was in the garden, tying up the bough of a rose-tree still covered with bloom. With a ready welcome on her lip, she flew to meet me as I reached the gate, but I fancied there was some constraint in her manner, and when the agitation of our meeting was over, and she was calm again, I saw that her calmness was no longer that of a heart untouched by care, but the stillness of deep though subdued feeling. She questioned me much of my wanderings, and drew yet closer to my side when I said I had been in London.

"Do you not ask whom I saw there, Ellen?" I said, smiling.

She caught my hand.

"Did you, indeed, see him?—Did you see Arthur?" she exclaimed. "What did he say?—how did he look? Tell me—tell me all about him!"

"And pray who is Arthur, Ellen?"

Her eyes fell beneath my look of inquiry.

"Mr. Courtland, I mean."

"I saw him but for a moment," I said, "and was unobserved by him."

She looked disappointed; her countenance a moment before had been absolutely radiant with expectation.

"How long is it since Mr. Courtland left you?" I asked.

"He went to London yesterday week," she replied.

"Only a week ago! Oh, Ellen, are my fears to be realized? Can your friend do nothing for you? Am I once more too late?"

She did not immediately reply, but, putting her arm through mine, led me into the house and upstairs to her own chamber, where she sat down beside me.

"You must not mistake me now," she said, "nor can I allow you any longer to doubt his honor. This will tell you all!" and she drew from her bosom a small chain to which was attached a wedding-ring. "Yes," she continued, observing my start of surprise, "I told you long ago that you wronged him. I have broken a promise in telling you my secret, but whom should I trust if I could doubt you?"

"And when and where were you married, Ellen?"

"I have been his wife nearly three months."

"And does he acknowledge you as his wife in the face of the world? Do his relations know what you have done?" I inquired, anxiously.

"They do not know it yet," replied Ellen, with some hesitation. "Our marriage was celebrated privately at some distance from this place, in the presence only of my mother and a friend of Ar-

thur's. While his grandfather lives, our secret must be kept—and what does it matter? I shall see him very often."

I could not say a word to check her expectations of happiness, and the words in which I expressed a hope they would be realized came from my heart. I inquired when she expected to see her husband again.

"Soon, very soon," she replied, with a gay, bright smile. "He is now with Lord Courtland, but at the end of the week he will be here again. Oh, we have been so happy!"

When I had left Ellen, I could not but reflect painfully on her position. For her—so true, so open—to be leading a life of deceit, to be acting a falsehood day after day, seemed a sad degradation, in spite of all her happiness. Perhaps it was my ignorance of the world that led me to think Mr. Courtland somewhat cowardly in concealing his marriage. If he were not prepared to acknowledge Ellen as his wife, what right had he to seek her affections, and interfere with the peaceful tenor of her life? Such was my reasoning; but when, a few days later, I met Ellen, leaning fondly on her husband's arm, and looking up in his face with the confidence of perfect love, I could almost forgive him.

From this time he was so constantly at the cottage, that I felt my presence there might be unwelcome; and throughout the winter and following spring I seldom saw Ellen. Luckily, her home was in a lonely situation, almost beyond the range of village gossip; but, at length, the frequency of Mr. Courtland's visits was observed, and whispers, such as it pained me to hear, were soon rife respecting my young friend. Perhaps these evil reports were the more readily received, because Mrs. Matley had made herself extremely unpopular by holding herself aloof from persons of her own rank in life, and endeavoring to obtain a footing among those of a somewhat higher class. The village aristocracy, indignant at such presumption, had now an opportunity of revenging themselves, and they failed not to take advantage of it. It was during the summer that these annoying rumors respecting Ellen reached my ears for the first time, and as they gathered strength, I determined to give Mr. Courtland some hint of their existence. For this purpose I called at Mrs. Matley's, and was warmly received by my friend, whom I found busily occupied in the manufacture of some garments of an ominously small size. The conversation that passed was, though not quite unrestrained, lively, and interesting; and I was delighted to observe that, earnest as Ellen's attachment to her husband might be, he was no less devoted to her.

When I took my leave, Mr. Courtland offered to escort me through the forest, and I thus had the opportunity I sought, of speaking to him without witnesses. I told him I feared I had previously come before his notice as an officious person, but I trusted my affectionate interest in his wife would sufficiently excuse me to him; and then merely mentioned the remarks that were going the round of the village society, leaving it, of course, to him to notice them or not as he thought best. He looked perplexed.

"You are very kind," he said, "and I thank you for having called my attention to this matter. I care little enough for the busy tittle-tattle of the village, but it might annoy Ellen. Just now I cannot remove her, but I have often thought of

taking her to some place where both would be alike unknown, and where, under another name, we might live unquestioned and unmolested."

"But *must* there be all this deceit!" I asked, impatiently.

"It is impossible," he replied, coloring, "to acknowledge the whole truth now. It would ruin our prospects, and on my grandfather's death I should find myself a titled beggar. Besides, I am the last of my race, the old man's only hope; and, eccentric as he may be, he has treated me with noble kindness, and I cannot break his heart."

"But can nothing be done?" I pleaded. "Surely if he saw your beautiful Ellen, he would see no reason for breaking his heart because she was your wife?"

The young man shook his head.

"You do not know him," he said; "his prejudices are violent, and he is pleased to entertain other views for me. You will easily believe that I have more than once sounded his feelings on this point, but I have on each occasion been more firmly convinced that all attempts to bring him into my views must ever be totally unavailing—nay, though I believe he dearly loves me, I am yet convinced that he would cast me off if he knew what I had done."

I had no right to argue the matter further, so I began to speak of Ellen.

"I shall be very sorry to take her from your neighborhood," he said. "Pray, come to see her more frequently, and be assured that I, no less than herself, am deeply sensible of all the kindness you have shown her."

I promised that my visits should be more frequent than they had been of late.

"You do not, then, fear that your own character may be compromised by your association with us?" he said, as we shook hands at my own door.

"No," I replied, "I am not very young or very beautiful, so I flatter myself I may do what I please. But," added I, more seriously "am I to say nothing of the true state of affairs between you and Ellen?"

"I have but to repeat that we are ruined if our secret is betrayed. In a few months we will move to some other place, and in the mean time, as Ellen does not leave home, she is not likely to hear anything that could distress her."

It was useless to say more, so, though by no means satisfied, I bade him farewell, and we separated. In the course of the next few months I saw Ellen frequently. Sometimes Mr. Courtland was obliged to go to London for two or three days, but his heart was with his treasure, and he could not long be absent from her side. She was very happy; the past and the future did not trouble her thoughts; it was enough to see him, to hear him, and she had no wish beyond her present joy. Yet a new blessing was given to her. In the month of August she became a mother, and the child, healthy and vigorous, seemed to us all far handsomer than babies usually are. How lovely was Ellen's face when it wore that new and almost holy expression that beams in a mother's smile!

When the child was about a month old, Ellen asked me if I would go with her to his christening, to stand sponsor for her darling. I consented, and we went together one day during the week, when divine service was celebrated in our village. I

have not yet mentioned the church, which has little pretension to architectural beauty, being, in truth, a very plain, ill-proportioned structure, with but one wing and an insignificant tower, surmounted with a wooden belfry and steeple. It stands, however, in a lovely situation, and the grave-yard is shaded by old trees, whose boughs may be seen in summer time through the open windows, waving in the wind, with a sound I delight to hear in the pauses of prayer and praise. Within, the walls of the little church are crowded with monuments and hatchments of the Courtland family; some of the latter dim with age, some bright as if they had been painted but yesterday. At the western end of the side-aisle, divided by an iron railing from the rest of the church, and lighted by a large window bearing still on its highest panes the arms of the family, is a recess, beneath whose paved floor lie many generations of the Courtlands. On each side of the window, at the time of which I have been speaking, hung some tattered silken banners, now fallen into dust; and on the side-walls were a few pieces of rusty armor, of which only a gauntlet remains. There was ever something very sad to me in those perishing memorials of human grandeur. Alas! that recess has a sadder interest for me now.

Mr. Courtland, with the friend who had been witness of his marriage, awaited us in the church, and soon after our entrance the service began. Poor Ellen! I believe it was the first time she had felt any bitterness in her lot. I saw her look round on all the proud records of her husband's family, then bow her head over her baby's sleeping face and weep. Unkind and suspicious glances, too, for the first time fell upon her, and her gentle spirit could ill bear them at such an hour. She was pale and exhausted when the rite was done, and I was glad that a carriage had been provided to convey her home. I accompanied her, and entreated her to let me relieve her for a while of the weight of her boy, but in vain. I know not what thoughts were passing in her mind, but she said she could not part with him then, and she pressed him to her heart with almost passionate eagerness, shedding silent tears, even when he lay awake and placid in her arms.

From this day she seemed anxious to be gone. She had felt that the finger of scorn was pointed at her, and that shame was believed to be her portion. Her husband was not long in putting into execution his plan of moving her to a distance from her former home, and, with much sorrow for myself mixed with rejoicing for her, I saw her depart.

CHAPTER III.

The next three years were, perhaps, the happiest of Ellen's life. We corresponded constantly, and the tone of her letters was always one of entire content. Two events only occurred to disturb the quiet current of her life during the time I have mentioned. One was the temporary absence of her husband, when Lord Courtland required his grandson to attend him on his journey to Naples, where the old man at length fixed his abode, allowing his companion to return to England; the other a severe illness which attacked her mother, and from the effects of which, though her bodily strength was soon restored, Mrs. Matley's mind never recovered. Her memory was almost gone, and she talked incessantly in a rambling, incoherent manner, yet

her shattered mind seemed ever to dwell on pleasant subjects, and her countenance, with its calm, meaningless smile, seemed to me far less repulsive than it had been before her reason was clouded.

Ellen came from her distant home to stay at Holly Cottage during her mother's illness, and remained there some weeks after the old woman's health was reestablished, in the vain hope of seeing her memory and intelligence also restored. Her child was with her, and Mr. Courtland constantly came to see that all was well with them both. The boy, now about two years old, was, indeed, a noble creature; dark hair curled about his fair and open brow, his eyes were large and blue like his mother's, and there was something of his father's proud and beautiful smile about his rosy lips; and never did a child possess richer wealth of love than was poured on that lovely boy from Ellen's full and happy heart. Her eye followed his every motion; his imperfect attempts at speech were full of meaning and of music to her ear, and when he lisped to her some of the terms of endearment she so liberally bestowed on him, how would she wind her fond arms about him, and almost smother him with kisses! I love to dwell on these pleasant recollections; to linger on the image that is present to my memory now, of that young mother and her happy child. I see them still, the boy's round cheek resting on his mother's shoulder; his eyes, full of laughter, glancing at me with pretended shyness, whose real meaning I well knew was to challenge me to play with him. The old woman sat in her large arm-chair, watching with her quiet, unvarying smile, and Mr. Courtland was often there, not the least gay or happy of the group.

Now that house is desolate, and those who dwell within its walls have passed away like shadows. Age is creeping over me, and these events of which I write seem rather visions than realities. I feel half disposed to leave the rest of my tale untold, and yet my grief for them, beloved as they were, is but selfish now. I will finish the task I set myself.

Nearly a year after Ellen had again left Holly Cottage, I heard that she was about to return thither to remain during the absence of her husband, who was called to Naples to attend the death-bed of his grandfather. By her desire, I caused preparations for her reception to be made by the woman who had charge of Mrs. Matley. There was a tinge of sadness in Ellen's manner when she came, arising from her having but recently parted with her husband, for whom she still entertained what some would call a romantic degree of attachment. Her boy, however, was gayer than ever. He accompanied his mother and myself in our frequent rambles, bounding on before us with the grace and activity of a deer. One day when we had wandered far from home, (it was our last walk, though we little thought so then,) we sat down to rest on a prostrate oak, Charlie, meanwhile, moving about us and filling his pinafore with flowers. I have never visited the spot since, yet I remember it perfectly. It was near a large pond, about whose edge grew delicate water-plants covered with white blossoms. Behind us was a thick screen of wood; before us, beyond the opposite bank of the pond, were scattered trees, affording glimpses of distant blue hills. Sloping rays of sunshine fell here and there through the graceful foliage of the tall beeches, stealing down to their massive trunks till the mass that clung about them gleamed like living emeralds. The fern, so

tall that Charlie was often hidden from our sight as he wandered among its beautiful leaves to reach some distant foxglove, was scarcely stirred by the warm noontide breeze. Two noble stags, that had been drinking at the pond, dashed away across the heather as we drew near; but several forest ponies, in a state of drowsy enjoyment, remained standing or lying in the shade close to us, unstartled even by Charlie's merry laughter.

Ellen threw aside her bonnet, and we both established ourselves comfortably, to enjoy the beauty of our cool, green resting-place. Presently Charlie stole quietly behind his mother, and, standing on tiptoe, each little hand grasping as many flowers as it could contain, threw the bright shower over her. How he shouted in gay triumph! how he clapped his hands, and danced, and sang aloud, till the woods rang with his clear, gay voice! Sweet in my memory is that "*pioggia di fior*," sweet even as that which fell of old on her who sat—

"Umile in tanta gloria
Coverta dell' amoroso membo,"

beside the fountain of Vaucluse; and scarcely less fair than Laura seemed to her lover's eyes, did my lovely Ellen then appear to mine. Who could have thought it was her last day of happiness! She was even more than usually confidential in her conversation with me on this occasion. She read some passages from a letter she had that morning received from Mr., or rather from Lord Courtland; for the old lord was dead, and the young husband was hurrying home to avow his marriage publicly.

"Now," said Ellen, as she closed the letter, "there will be nothing to cloud my perfect joy. My child will fill his proper place in his father's house," and she pressed her darling to her heart, and told him his father was coming back to them, then kissed him with increased tenderness on hearing the cry of joy with which he received the news.

We returned home slowly, for we were all fatigued; but before I left the cottage Charlie was fast asleep, his rosy cheek pillowed on his arm, and a smile parting his sweet lips. Silently Ellen bent over him; doubtless many a bright hope rose within her as she watched that peaceful sleeper; and when she turned away she murmured—

"God bless you, my child!" in a tone of fondness even deeper than usual.

It rained incessantly the three following days. On the fourth morning I had scarcely breakfasted when a stranger was announced, and I beheld, to my surprise and alarm, the gentleman who had been present at Ellen's marriage, and whom I had seen at the christening of little Charlie. I felt sure some misfortune had happened.

"You have bad news for me," I said, as he sat down beside me. "God forbid anything should have happened to Lord Courtland!"

"I am, indeed, the bearer of bad news!" he replied, in an agitated voice; "and I grieve to say that it relates to him." I had not courage to speak, and he presently continued, "I have come to you, madam, as the friend of poor Lady Courtland. It is necessary that she should, for the sake of her son, be immediately informed of the sad event which has occurred; besides, the dreadful story will be in the public papers to-morrow!"

"But tell me," I said, after a pause, "tell me what has happened."

"The worst!" he replied.

"You do not mean that Lord Courtland is dead?" I exclaimed.

"It is too true!" he answered, sadly. "Poor Courtland! he was hurrying homewards from Naples, when, between that city and Rome, he was attacked by banditti, and shot dead on the spot. A friend, who was awaiting him at Rome, has caused his body to be brought to England for burial, and it will arrive here in a few days."

It were easier to imagine than to describe the feelings with which I set forth to seek my poor friend, and break to her the dreadful news that had just been communicated to me. On my way, I could not but think of her as I had seen her last; and when I turned my thoughts again to the fearful tale of which I was the bearer, the contrast made my heart bleed. When I reached the cottage, I found only Mrs. Matley in the usual sitting-room.

"Where is Ellen?" I asked.

"Up stairs, with Charlie," said the old woman. "I'm glad you've come, madam, for she's been crying all day. There's something the matter, but I can't tell what it is; I am not as I used to be, I believe —"

And she went rambling on, but I made my escape, and stole softly up to Ellen's room, half fearing, half hoping that the evil tidings had already reached her; but I soon saw she had yet another cause for grief. Charlie, her bright, lovely boy, lay on his little bed: how unlike himself but four days ago! His eyes looked dark and sunken, his features had fallen away strangely, and poor Ellen sat weeping beside him, holding his feverish hand, and feeling as I could see at once, that there was no room for hope.

I could not speak; I sat down beside the little bed, and Ellen looked up gratefully. The dear child, too, recognized me, and tried to say my name, but the sound died away in a hoarse whisper.

"He is very ill," said Ellen, with almost unnatural calmness; "the doctor has just gone, he said he could do no more." She stooped to moisten the child's lips; and when he smiled and tried to thank her, she wrung her hands in bitter anguish. "Oh, my God!" she cried, throwing herself on her knees, "help me, help me! And his father, his fond father! comfort him, or his heart will break!"

I could not bear it; I left the room for a few minutes, and when I returned, Ellen had resumed her place beside the little sufferer. I took my seat again opposite to her. It was a lovely summer's day, and through the open window a light breeze stole in, laden with the scent of flowers from the little garden below. Within the room all was still, save the painful breathing of the child and an occasional and almost convulsive sigh from his mother. I heard the boughs waving in the forest, the singing of the birds, even the trickling of the little stream in the garden. At last a bird came close to the window and began singing a loud, clear song. Charlie turned his languid eyes, and a gleam of pleasure passed over his face. I saw Ellen shudder, but her eyes were dry, and they never wandered from the dying child. Now and then she bathed his forehead and wet his lips, and I sought not to help her, for I felt it was a sort of sacred right with which none should interfere. Almost to the last the child received her attentions with a look of gratitude. Two hours passed, and then I saw that death was coming. Charlie lay for some time motionless, then suddenly throwing his arms round his mother, he cried "Mamma! mamma!" In

that fond embrace, pillowed on that loving bosom, the child of many hopes breathed his last.

Then, indeed, was the silence of the chamber of death broken by cries of agony. I dare not dwell upon a scene like that. Poor Ellen refused to allow the child to be taken from her arms, and for many hours the passion of her grief was not stayed. When at length her mind sank, from exhaustion, into a kind of stupor, I deemed the time was come for me to make known to her the full extent of her bereavement. There, beside that bed where the little child lay in the placid yet fearful beauty of death, I told my sorrowful tale. Ellen listened quietly, and I doubted whether she understood me, till she said, "Both gone! both so dear—so very dear! Tell me all, for I can suffer no more than I suffer now."

And I told her all; told her that she who had lately been so rich in love and happiness, was now almost alone in the world; that none remained to her save her poor old helpless mother. When morning dawned we were still there, watching beside the dead. How lovely he was even then! All expression of pain had passed away; his hair, loosed from its close curls by the damps of death, fell over the pillow; and, in truth, "his face was as the face of an angel."

I must pass over hastily the few days that elapsed before the funeral. Ellen desired her darling might not be buried within the church, but laid in the churchyard, where, when her hour came, she might be laid beside him. I pass over in silence the burst of grief that overpowered her when the little coffin was conveyed from her sight. Lord Courtland's friend, who had remained on the spot, superintended every arrangement, and left me free to devote all my time to Ellen.

In the evening of the day her child was buried, it seemed suddenly to strike her that I had not mentioned her husband's place of interment, and that possibly his remains were to be brought to the tomb of his ancestors, and I thought it best to tell her the whole truth when she questioned me on the subject. She remained for some time plunged in thought, but made no reply, nor did she again allude to the information I had given her.

CHAPTER IV.

Affairs at home requiring my presence, I was obliged reluctantly to leave Holly Cottage for a few days. This, however, gave me an opportunity of communicating with Lord Courtland's friend, Mr. Cayley, from whom I heard that her husband's will left everything that he had to leave to Ellen. When I afterwards told her this she shook her head with sad meaning, and said wealth had lost all value in her eyes now; but every little trifle that his hand had touched she received and hoarded with melancholy pleasure.

The vessel conveying Lord Courtland's remains was, by some accident, delayed long beyond the time at which its coming was expected: but at length I received a note from Mr. Cayley announcing its arrival. "I am desired," he wrote, "to have everything ready for the burial to-night. The funeral procession is to cross Courtland Park on its way to the church. Would it not be possible to remove the poor widow to your own house in the course of the day without her suspecting our reasons for wishing her to go! Anything seems to me preferable to her being exposed to the bare possibility of seeing such a sight."

Of course I went immediately to the cottage, where I found Ellen sitting with her mother. Mrs. Matley had appeared from the first totally incapable of comprehending the nature of the sorrows that oppressed her daughter, and it was in vain that I had frequently, in reply to her ever-recurring question of "Where's Charlie?" endeavored to impress upon her the sad truth. She always listened with the same vacant smile, and in a few minutes repeated the inquiry. Now, as I entered the room, she cried, "Here she is, Ellen; I said she would come this fine day!"

Ellen covered her face, and I saw that her tears were falling fast in spite of her efforts to control them. No doubt at that moment her heart pined to hear again the pattering of the little feet that used to bound forth to meet me ere I crossed the threshold; no doubt her thoughts were of the sweet voice whose glad shout had so often announced my approach. I know that my own heart ached as I remembered these things. I drew a chair beside Ellen, and threw my arm round her, but she did not raise her head. The old woman watched her with an anxious, bewildered look, and said—

"I wish, ma'am, you could tell me what ails her; she sits there all day, crying, crying, and I cannot comfort her. Where's Charlie? She never cries when Charlie is here. Where's Charlie?"

I felt Ellen's whole frame shaken with sobs.

"Come away," I whispered; "do come away!" But she did not seem to hear my words.

"Won't she listen to you?" continued Mrs. Matley. "I try to cheer her. I tell her that her husband will soon be here—somebody said so, I know; and then I talk about Charlie. She used to smile whenever I spoke of his pretty ways, dear child! Indeed, ma'am, she'll be happy again if you only bring Charlie back."

A loud, hysterical cry burst from Ellen.

"This must not be," I exclaimed, as with gentle force I raised her from her seat, and led her into the garden. "You must come to my house, Ellen, for a few days," I said.

She pressed my hand and whispered, "You are very kind to me. God will bless you for it all."

In the silence that followed many a sweet summer sound fell on our ears, and presently the same that had flown to the window when Charlie was dying (tame, because it had been fed at the cottage during the previous winter) came fearlessly almost to our feet. Ellen pointed to it.

"Do you remember?" she said. "I cannot bear all these sounds—all this joy. Life and beauty everywhere; light, and mirth, and sunshine, and my child in his grave! Think what it is, when at last I fall asleep for a while in the long night, to see again that rosy face, to feel his cheek on mine, his soft arm about my neck; to dream we are listening for his father's step, and even at the moment we spring forward to welcome him, to awake and remember what and where they are! And then to hear my mother all day long repeating the question my own poor heart is ever whispering, 'Where's Charlie?' You can feel how dreadful all this is."

"Indeed, Ellen, I feel it from my soul," I replied. "You must live with me for a time. Your being here is useless to your mother, as you may safely trust her attendant, and you are exposing yourself to unnecessary torture. Come, we will prepare at once."

We went up to her chamber. There stood the little bed, with its snowy sheets folded down, even as if ready for the child to occupy that night. His clothes were spread on a chair beside it, and some of his little toys lay scattered about the room, just as his own hands had left them. I understood it all.

When Ellen's preparations were completed, I took the things she had packed up and left the room. Before she followed me, I saw her kneel beside the little bed and kiss the pillow where her child's bright head had lain. My tears blinded me, and I turned away; but she almost immediately followed, softly closing the door and locking it, lest any busy hand should, in her absence, meddle with her precious relics of the departed. A friend's carriage waited for us, and we were soon on our way. The shortest road to my house led by the church, but I had given directions that we should be driven another way. Ellen perceived my design in so doing, and she said—

"I thank you much; but I would rather go by the church. You can show me the place where —"

But she could not finish the sentence.

Under one of the noble elm-trees, of which there are several scattered about the churchyard, Charlie's body had been laid. I led Ellen to the little mound that marked the spot. It was already covered with daisies, and the golden sunshine fell, as if lovingly, upon it. I moved to a little distance, that the poor mother might feel herself alone: but she rejoined me in a few minutes, and in reply to my look of anxiety struggled to smile, saying—

"God comforts me much. I am glad I have been here. It was wrong to murmur at the sunshine and the joy as I did but an hour ago; they have a new and better meaning for me now."

Indeed, during the remainder of the day she appeared more composed than I had yet seen her since her affliction, and when we were parting for the night, she said that her mind was calm, though she thought till that day the suddenness of her trials had so stunned her, that she had hardly comprehended their extent.

As she ceased to speak, I heard a sound of slow and heavy wheels and the tread of several horses drawing near the house. I supposed I looked uneasy, for Ellen inquired, with a searching glance, if I knew what that sound meant. I tried to appear unconcerned as I answered, that it was doubtless occasioned by one of the many wagons that were constantly passing my door, and I urged her to retire to rest, as it was already midnight.

"No," she said, "I must see first what this is." And she placed herself at the window.

I stood beside her, trembling with the conviction that Mr. Cayley's information had been incorrect, and that the funeral procession of her husband was about to pass before Ellen's eyes. The rumbling of the wheels came slowly nearer. Presently there was a glare flung by many torches, which were borne by horsemen; these were immediately followed by a hearse, and the procession was closed by a few more horsemen, cloaked in black.

"It is even as I thought," said Ellen, turning to me. "I must follow at once."

I believed her mind wandered, and I went with her to her own room; but she threw a cloak about her, and tied a veil closely over her widow's cap. I then understood her meaning.

"Stop, Ellen," I cried, as she left the room

"If you will go, at least let me accompany you."

She waited for me on the stairs, and we left the house together, following the sad procession as it moved slowly down the street to the church. She walked steadily, refusing my assistance; but once my hand accidentally touched hers, and I started at its extreme coldness. When we entered the church, the friends and attendants of the dead, already assembled, made way for us, and we took our stand close at the head of the coffin. Not a sound escaped Ellen. Without wavering, without weeping, she stood by while the service was read, and even till the body was lowered into the dark vault. When all was done, and those present were preparing to depart, I laid my hand on her arm. Gentle as was the touch, she fell to the ground as if struck by a mortal blow. One deep groan escaped from her white lips, and then I thought, in truth, that her sorrowful spirit had flown to rejoin those she loved in a happier world. Many rushed forward to raise her from the floor, and she was quickly conveyed to my house, where, after several hours of insensibility, she awoke to a consciousness of all that had passed.

A long and dangerous illness was the consequence of my poor friend's last severe trial; but youth and a good constitution carried her through it. On being restored to health, she returned to her mother, who was rapidly sinking into a state

of utter imbecility. The old woman lingered another year, during which time I was constantly a visitor at the cottage. Her first question whenever she saw me, even to the last, was "Where's Charlie?" for there was some link in her remembrance between me and that beloved child. In all else her memory and intelligence were totally gone. One day I turned anxiously to Ellen, hearing her sigh as her mother pronounced the accustomed words; but she smiled faintly, and said—

"Do not fear for me now: I can bear it better than I once did."

On Mrs. Matley's death, I easily persuaded Ellen to become a permanent inmate of my house, and for fifteen years we shared the same home. I will not trust myself to speak of the hour in which she was taken from me. There is a second and a larger mound now beneath the old churchyard elm, and I often visit it, treading the narrow path worn by Ellen's feet in her daily visits of old to the grave of her child.

Within the church, on the side wall of the recess which contains the vault of the Courtlands, is a marble slab bearing a simple inscription to the memory of Ellen's husband, and recording in few words the manner of his death, and below this inscription are engraved the names of his wife and child, with the dates of their departure from this life.

An influential public meeting was held at Liverpool on 22d July—Mr. Brown, the new member for South Lancashire, in the chair—to memorialize the government on the subject of the present postal arrangements to and from Liverpool. The proceedings expanded from a local to a general character. Mr. Jeffrey spoke of Mr. Rowland Hill as the only man fit to administer with advantage the great reform of which he was the author. The same idea was embodied in one of the resolutions: it incorporated this assertion—

"That a post-office system carried to the utmost possible perfection, at whatever cost short of actual waste, would yield a larger revenue than has hitherto been derived from such a source; and therefore it appears most desirable, on every account—moral, social, commercial, and fiscal—that the whole of Mr. Rowland Hill's plans of post-office management should be carried into immediate effect, with all such further improvements as experience and new facilities may suggest; and that it is the opinion of this meeting that the services of Mr. Rowland Hill himself, in perfecting the post-office system, would be extremely valuable to the country."

A new attempt to raise a fund of 7000*l.* in order to purchase an annuity of 800*l.* a year for the Reverend Theobald Mathew, is advertised in our columns; and we are asked to support the effort. Donatives are suspicious things in Ireland. How can we avoid applying our own rules, and how will they fit this claim? In sooth, we confess that we are not disposed to apply them too strictly here. It is not clear what definite and stable results have followed Mr. Mathew's exertions; and there was no lack of inducement to the service, in the idolizing homage which the missionary of temperance has received. On the other hand, it is certain that a real and great service has been rendered: Mr. Mathew may not have created a well-informed and deliberate opinion against drunkenness; but he has

enlisted the affections of an ardent people on the side of temperance, and he has broken the long reign of debauch. He has removed one obstacle from the material improvement of the Irish people. His personal sacrifices have been very great, unstinted, stretched to the extent of his whole means. There is a generous trustingness in that devotion, which in itself deserves acknowledgment. Fees for future service are of doubtful expediency; but assuredly a free gift to indemnify Theobald Mathew, to repay his generous trust, and to endow a good and benevolent man with the means of ease for the remainder of his life, would in this case be a merited, a graceful, and a pious tribute to virtue.—*Spectator*, August 1.

THE *Universal German Gazette* states, that an imperial ordinance has just been issued, permitting the Jews in Hungary to redeem, by the payment of a sum once paid down, their yearly taxes for leave to reside and carry on business. In five years all special duties on the Jews are to cease.

SPEAKING of the colonies generally, Lord John Russell declared that Lord Grey agreed with him in admitting the justice and expediency of extending free institutions as far as they possibly can be extended; his conviction being, that wherever Englishmen are assembled in great numbers, they are not so well governed by a secretary of state as by institutions which enable them in some degree to exercise self-government.

MR. GREEN, accompanied by no fewer than twelve ladies and gentlemen, ascended from Cremorne Gardens in his large Nassau balloon on Monday evening. The machine passed over London at a low altitude, affording an excellent view of the town to the voyagers, and of the balloon to townspeople. After being in the air fifty-two minutes, descended at Leyton, in Essex.

From *Fraser's Magazine*.

PROPOSALS FOR A CONTINUATION OF IVANHOE.

IN A LETTER TO MONSIEUR ALEXANDRE DUMAS,
BY MONSIEUR MICHAEL ANGELO TITMARSH.*To the Most Noble Alexandre Dumas, Marquis
Davy de la Pailletterie.*

MY LORD—Permit a humble literary practitioner in England, and a profound admirer of your works, to suggest a plan for increasing your already great popularity in this country. We are laboring, my lord, under a woful dearth of novels. Fashionable novels we get, it is true; the admirable Mrs. Gore produces half-a-dozen or so in a season; but one can't live upon fashionable novels alone, and the mind wearies rather with perpetual descriptions of balls at D— House, of fashionable doings at White's or Crocky's, of ladies' toilettes, of Gunter's suppers, of *déjeûners*, Almack's, French cookery, French phrases and the like, which have been, time out of mind, the main ingredient of the genteel novel with us. As for historical novelists, they are, or seem to be, asleep among us. What have we had from a great and celebrated author since he gave us the *Last of the Barons*? Nothing but a pamphlet about the Water-cure, which, although it contained many novel and surprising incidents, still is far from being sufficient for a ravenous public. Again, where is Mr. James? Where is that teeming parent of romance? No tales have been advertised by him for time out of mind—from him who used to father a dozen volumes a year. We get, it is true, reprints of his former productions, and are accommodated with *Darnley* and *Delorme* in single volumes; but, ah, sir! (or my lord,) those who are accustomed to novelty and live in excitement, grow sulky at meeting with old friends, however meritorious, and are tired of reading and re-reading even the works of Mr. James. Where, finally, is the famous author, upon the monthly efforts of whose genius all the country was dependent? Where is the writer of the *Tower of London*, *Saint James*, *Old Saint Paul's*, &c.? What has become of the *Revelations of London*? That mystic work is abruptly discontinued, and revealed to us no more; and though, to be sure, *Old Saint Paul's* is reprinted with its awful history of the plague and the fire, yet, my dear sir, we are familiar with the plague and the fire already; our feelings were first harrowed by *Old Saint Paul's* in a weekly newspaper, then we had the terrible story revealed altogether in three volumes with cuts. Can we stand it rereprinted in the columns of a contemporary magazine? My feelings of disappointment can't be described when, on turning to the same periodical, attracted thither by the announcement of a story called *Jackomo Omberello*, (I have a bad memory for names,) I found only a reprint of a tale by my favorite author, which had appeared in an annual years ago. There is a lull, sir—a dearth of novelists. We live upon translations of your works; of those of M. Eugène Sue, your illustrious *confrère*; of those of the tragic and mysterious Soulié, that master of the criminal code; and of the ardent and youthful Paul Féval, who competes with all three.

I, for my part, am one of the warmest admirers of the new system which you pursue in France with so much success—of the twenty-volume-novel system. I like continuations. I have read

every word of *Monte-Cristo* with the deepest interest; and was never more delighted after getting through a dozen volumes of the *Three Musketeers*, than when Mr. Rolandi furnished me with another dozen of the continued history of the same heroes under the title of *Vingt Ans après*; and if one could get the lives of Athos, Porthos, and Aramis until they were 120 years old, I am sure we should all read with pleasure. Here is the recess coming—the season over—no debates to read—and no novels!

But suppose that heroes of romance, after eighty or ninety years of age, grow a thought superannuated, and are no longer fit for their former task of amusing the public; suppose you have exhausted most of your heroes, and brought them to an age when it is best that the old gentlemen should retire; why not, my dear sir, I suggest, take up other people's heroes, and give a continuation of *their* lives! There are numbers of Walter Scott's novels that I always felt were incomplete. The Master of Ravenswood, for instance, disappears, it is true, at the end of the *Bride of Lammermoor*. His hat is found, that is to say, on the sea-shore, and you suppose him drowned; but I have always an idea that he has floated out to sea, and his adventure might recommence—in a maritime novel, say—on board the ship which picked him up. No man can induce me to believe that the adventures of Quentin Durward ceased the day after he married Isabelle de Croye. People survive even marriage; their sufferings don't end with that blessed incident in their lives. Do we take leave of our friends, or cease to have an interest in them, the moment they drive off in the chaise and the wedding-*déjeûné* is over? Surely not! and it is unfair upon married folks to advance that your bachelors are your only heroes.

Of all the Scottish novels, however, that of which the conclusion gives me the greatest dissatisfaction is the dear old *Ivanhoe*—*Exannoay*, as you call it in France. From the characters of Rowena, of Rebecca, of *Ivanhoe*, I feel sure that the story can't end where it does. I have quite too great a love for the disinherited knight, whose blood has been fired by the suns of Palestine, and whose heart has been warmed in the company of the tender and beautiful Rebecca, to suppose that he could sit down contented for life by the side of such a frigid piece of propriety as that icy, faultless, prim, niminy-piminy Rowena. That woman is intolerable, and I call upon you, sir, with your great powers of eloquence, to complete this fragment of a novel, and to do the real heroine justice.

I have thrown together a few hints, which, if you will do me the favor to cast your eyes over them, might form matter, I am sure, sufficient for many, many volumes of a continuation of *Ivanhoe*; and remain, with assurances of profound consideration,

Sir,

Your sincere admirer,
M. A. TITMARSH.

No person who has read the preceding volumes of this history can doubt for a moment what was the result of the marriage between Wilfrid and Rowena. Those who have marked her conduct during her maidenhood, her distinguished politeness, her spotless modesty of demeanor, her unalterable coolness under all circumstances, and her lofty and gentle-woman-like bearing, must be sure

that her married conduct would equal her spinster behavior, and that Rowena the wife would be a pattern of correctness for all the matrons of England.

Such was the fact. For miles around Rotherwood her character for piety was known. Her castle was a rendezvous for all the clergy and monks of the district, whom she fed with the richest viands, while she pinched herself upon pulse and water. There was not an invalid in the three ridings, Saxon or Norman, but the palfrey of the Lady Rowena might be seen journeying to his door, in company with Father Glauber her almoner, and Brother Thomas of Epsom, her leech. She lighted up all the churches in Yorkshire with wax-candles, the offerings of her piety. The bells of her chapel began to ring at two o'clock in the morning; and all the domestics of Rotherwood were called upon to attend at matins, at complins, at none, at vespers, and at sermon. I need not say that fasting was observed with all the rigors of the church; and that those of the servants of the Lady Rowena were looked upon with the most favor whose hair shirts were the roughest, and who flagellated themselves with the most becoming perseverance.

Whether it was that this discipline cleared poor Wamba's wits or cooled his humor, it is certain that he became the most melancholy fool in England, and if ever he ventured upon a joke to the shuddering, poor servitors who were mumbling their dry crusts below the salt, it was such a faint and stale one, that nobody dared to laugh at the timid innuendoes of the unfortunate wag, and a sickly smile was the best applause he could muster. Once, indeed, Guffo, the goose-boy, (a half-witted poor wretch,) laughed outright at a lamentably stale pun which Wamba palmed upon him at supper-time. It was dark, and the torches being brought in, Wamba said, "Guffo, they can't see their way in the argument, and are going to throw a little light upon the subject."* The Lady Rowena, being disturbed by a theological controversy with Father Willibald, (afterwards canonized as St. Willibald of Barcres, hermit and confessor,) called out to know what was the cause of the unseemly interruption, and Guffo and Wamba being pointed out as the culprits, ordered them straightway into the court-yard, and three dozen to be administered to each of them.

"I got you out of Front de Bœuf's castle," said poor Wamba, piteously, appealing to Sir Wilfrid of Ivanhoe, "and canst thou not save me from the lash?"

"Where you were locked up with the Jewess in the tower!" said Rowena, haughtily, replying to the timid appeal to her husband; "Gurth, give him four dozen!"

And this was all poor Wamba got by applying for the mediation of his master.

In fact, Rowena knew her own dignity so well as a princess of the royal blood of England, that Sir Wilfrid of Ivanhoe, her consort, could scarcely call his life his own, and was made, in all things, to feel the inferiority of his station. And which

of us is there acquainted with the sex that has not remarked this propensity in lovely woman, and how often the wisest in the council are made to be as fools at her board, and the boldest in the battlefield are craven when facing her distaff?

"Where you were locked up with the Jewess in the tower," is a remark, too, of which Wilfrid keenly felt, and, perhaps, the reader will understand, the significance. When the daughter of Isaac of York brought her diamonds and rubies—the poor, gentle victim!—and, meekly laying them at the feet of the conquering Rowena, departed into foreign lands to tend the sick of her people, and to brood over the bootless passion which consumed her own pure heart, one would have thought that the heart of the royal lady would have melted before such beauty and humility, and that she would have been generous in the moment of her victory.

In fact, she *did* say, "Come and live with me as a sister," as the last chapter of this history shows; but Rebecca knew in her heart that her ladyship's proposition was what is called *bosh*, (in that noble Eastern language with which Wilfrid, the Crusader, was familiar,) or fudge, in plain Saxon, and retired, with a broken, gentle spirit, neither able to bear the sight of her rival's happiness, nor willing to disturb it by the contrast of her own wretchedness. Rowena, like the most high-bred and virtuous of women, never forgave Isaac's daughter her beauty, nor her flirtation with Wilfrid, (as the Saxon lady chose to term it,) nor, above all, her admirable diamonds and jewels, although Rowena was actually in possession of them.

In a word, she was always flinging Rebecca into Ivanhoe's teeth. There was not a day in his life but that unhappy warrior was made to remember that a Jewish maiden had been in love with him, and that a Christian lady of fashion could never forgive the insult. For instance, if Gurth, the swine-herd, who was now promoted to be a game-keeper and verderer, brought the account of a famous wild-boar in the wood, and proposed a hunt, Rowena would say, "Do, Sir Wilfrid, persecute those poor pigs—you know your friends the Jews can't abide them!" Or when, as it oft would happen, our lion-hearted monarch, Richard, in order to get a loan or a benevolence from the Jews, would roast a few of the Hebrew capitalists, or extract some of the principal rabbi's teeth, Rowena would exult and say, "Serve them right, the misbelieving wretches! England can never be a happy country until every one of these monsters is exterminated!" Or else, adopting a strain of still more savage sarcasm, would exclaim, "Ivanhoe, my dear, more persecution for the Jews! Had n't you better interfere, my love! His majesty will do anything for you; and, you know, the Jews were *always* such favorites of yours," or words to that effect. But, nevertheless, her ladyship never lost an opportunity of wearing Rebecca's jewels at court, whenever the queen held a drawing-room, or at the York assizes and ball, when she appeared there, not of course that she took any interest in such things, but considered it her duty to attend as one of the chief ladies of the country.

And now Sir Wilfrid of Ivanhoe, having attained the height of his wishes, was, like many a man when he has reached that dangerous elevation, disappointed. Ah, dear friends, is it but too often so in life! Many a garden, seen from a distance,

* I knew an old lady in my youth, who, for many years, used to make this joke every night regularly when candles were brought in, and all of us in her family were expected to laugh. Surely it is time that a piece of fun which has been in activity for seven hundred years should at length be laid up in ordinary; and this paper will not have been written altogether in vain if this good end can be brought about.—M. A. T.

looks fresh and green, which, when beheld closely, is dismal and weedy, the shady walks melancholy and grass grown; the bowers you would fain repose in cushioned with stinging nettles. I have ridden in a caïque upon the waters of the Bosphorus, and looked upon the capital of the Soldan of Turkey. As seen from those blue waters, with palace and pinnacle, with gilded dome and towering cypress, it seemeth a very Paradise of Mahomed; but enter the city, and it is but a beggarly labyrinth of rickety huts and dirty alleys, where the ways are steep and the smells are foul, tenanted by mangy dogs and ragged beggars—a dismal illusion! Life is such, ah, well-a-day! It is only hope which is real, and reality is a bitterness and a lie.

Perhaps a man, with Ivanhoe's high principles, would never bring himself to acknowledge this fact; but others did for him. He grew thin, and pined away as much as if he had been in a fever under the scorching sun of Ascalon. He had no appetite for his meals; he slept ill, though he was yawning all day. The jangling of the doctors and friars whom Rowena brought together did not in the least enliven him, and he would sometimes give proofs of somnolency during their disputes, greatly to the consternation of his lady. He hunted a good deal, and, I very much fear, as Rowena rightly remarked, that he might have an excuse for being absent from home. He began to like wine, too, who had been as sober as a hermit; and when he came back from Athelstane's, (whither he would repair not unfrequently,) the unsteadiness of his gait and the unnatural brilliancy of his eye were remarked by his lady, who, you may be sure, was sitting up for him. As for Athelstane, he swore by St. Wulstan that he was glad to have escaped a marriage with such a pattern of propriety; and honest Cedric the Saxon (who had been very speedily driven out of his daughter-in-law's castle) vowed by St. Waltheof that his son had bought a dear bargain.

It was while enjoying this dismal, but respectable existence, that news came to England that Wilfrid's royal master and friend was bent upon that expedition against his vassal, the Count of Limoges, which was to end so fatally before the Castle of Chalus. As a loyal subject, Sir Wilfrid hastened, with a small band of followers, to the assistance of his master, taking with him Gurth, his squire, who vowed he would have joined Robin Hood but for that, and Wamba the Jester, who cut a good joke for the first time, as he turned head-over-heels when the Castle of Rowena was once fairly out of sight.

I omit here a chapter about the siege of Chalus, which, it is manifest, can be spun out to any length to which an enterprising publisher would be disposed to go. Single combats, or combats of companies, scaladoss, ambuscadoes, rapid acts of horsemanship, destriers, catapults, mangonels, and other properties of the chivalric drama, are at the use of the commonest writer; and I am sure, my dear sir, you have too good an opinion of me to require that these weapons should be dragged out, piece by piece, from the armory, and that you will take my account for granted.

A chapter about famine in the garrison may be rendered particularly striking. I would suggest as a good contrast a description of tremendous feasting in the camp of Richard, in honor of his queen, Berengaria, with a display of antiquarian

cookery (all descriptions of eating are pleasant in works of fiction, and can scarcely be made too savory or repeated too often;) and, in the face of this carousing without the walls, the most dismal hunger raging within. That there must be love-passages between the hostile armies is quite clear. And what do you say to the Marquis of Limoges and his sons casting lots about being eaten?—with a motto from Ugolino and a fine display of filial piety?

The assault may be made very fine, too—the last assault. The old chieftain of Chalus and his sons dropping down, one by one, before the crushing curtal-axe of Richard.

“Ha, St. Richard!—ha, St. George!” the tremendous voice of the lion-king was heard over the loudest roar of the battle; at every sweep of his blade a severed head flew over the parapet, a spouting trunk tumbled, bleeding, on the flags of the bartizan. The world hath never seen such a warrior as that lion-hearted Plantagenet, as he raged over the keep, his eyes flashing fire through the bars of his morion, snorting and chafing with the hot lust of battle. One by one *les enfans de Chalus* fell down before him: there was only one left at last of all the brave race that in the morning had fought round the stout Sir Enguerrand:—only one, and but a boy—a fair-haired boy, a blue-eyed boy! he had been gathering pansies in the fields but yesterday—it was but a few years, and he was a baby in his mother's arms! What could his puny sword do against the most redoubted blade in Christendom?—and yet Bohemond faced the great champion of England, and met him foot to foot! Turn away, turn away, fond mother! Enguerrand de Chalus bewail the last of thy race! his blade is crushed into splinters under the axe of the conqueror, and the poor child is beaten to his knee! * * *

“Now, by St. Barbacue of Limoges,” said Bertrand de Gourdon, “the butcher will never strike down yonder lambling! Hold thy hand, Sir King, or, by St. Barbacue—”

Swift as thought the veteran archer raised his arblast to his shoulder, the whizzing bolt fled from the ringing string, and the next moment crushed quivering into the corslet of Plantagenet.

‘Twas a luckless shot, Bertrand of Gourdon! Maddened by the pain of the wound, the brute nature of Richard was aroused: his fiendish appetite for blood rose to madness, and grinding his teeth, and with a curse too horrible to mention, the flashing axe of the royal butcher fell down on the blond ringlets of the child, and the children of Chalus were no more!

I just throw this off by way of description, and to show what *might* be done. Now ensues a splendid picture of a general massacre of the garrison, who are all murdered to a man, with the exception of Bertrand de Gourdon. Ivanhoe, of course, saves *him* for the moment; but we all know what his fate was. Bertrand was flayed alive after Richard's death; and as I don't recollect any chapter in any novel where a man's being skinned alive is described, I would suggest this as an excellent subject for a powerful and picturesque pen. Ivanhoe, of course, is stricken down and left for dead in trying to defend honest Bertrand. And now if ever there was a good finale for a volume, it is the death of Richard.

“You must die, my son,” said the venerable Walter of Rouen, as Berengaria was carried

shrieking from the king's tent. "Repent, Sir King, and separate yourself from your children!"

"It is ill-jesting with a dying man," replied the king. "Children have I none, my good lord bishop, to inherit after me."

"Richard of England," said the archbishop, turning up his fine eyes, "your vices are your children. Ambition is your eldest child, Cruelty is your second child, Luxury is your third child; and you have nourished them from your youth up. Separate yourself from these sinful ones, and prepare your soul, for the hour of departure draweth nigh."

Violent, wicked, sinful, as he might have been, Richard of England met his death like a Christian man. Peace be to the soul of the brave! When the news came to King Philip of France, he sternly forbade his courtiers to rejoice at the death of his enemy. "It is no matter of joy but of dolour," he said, "that the bulwark of Christendom and the bravest king of Europe is no more."

I need not point out to a gentleman of your powers of mind how aptly, with a few moral reflections in a grave and dirge-like key, this volume of the Continuation of Ivanhoe may conclude.

As for the second volume, King John is on the throne of England. Shakespear, Hume, and the *Biographie Universelle*, are at hand. Prince Arthur, Magna Charta, Cardinal Pandolfo, suggest themselves to the mind at once; and the deuce is in it if out of these one cannot form a tolerably exciting volume.

For instance, in the first part a disguised knight becomes the faithful servant of young Arthur (perhaps Constance of Brittany may fall in love with the mysterious knight, but that is neither here nor there,) attends young Arthur, I say, watches him through a hundred perplexities, and, of course, is decoyed away—just happens to step out, as it were, when the poor young prince is assassinated by his savage uncle.

The disguised knight vows revenge; he stirs up the barons against the king, and what is the consequence? No less a circumstance than Magna Charta, the palladium of Britons. The Frenchmen land under the Dauphin Louis, son of Philip Augustus. He makes the grandest offers to the unknown knight. Scornful resistance of the latter, and defeat of the Frenchmen.

And now I am sure you have no need to ask who is this disguised knight. Ivanhoe, of course! But why disguised? In the first place, in a novel, it is very hard if a knight or any other gentleman can't disguise himself without any reason at all; but there is a reason for Ivanhoe's disguising himself, and a most painful reason, ROWENA WAS MARRIED AGAIN.

After the siege of Chalus, the faithful Gurth, covered with wounds, came back to Rotherwood, and brought the sad news of the death of the lion-hearted Plantagenet, and his truest friend, Wilfrid of Ivanhoe. Wounded to death in endeavoring to defend honest Bertrand de Gourdon, Sir Wilfrid of Ivanhoe had been carried back to his tent, where he expired in the arms of his faithful squire, after giving him the lock of Rowena's hair which he had in a brooch, and his gold thumb-ring, which she had presented to him, and which bore his signature and seal of arms. "There was another

lock of hair round my noble master's neck," sobbed Gurth to Cedric in secret.

"Was it mine?" asked the bereaved old thane.

"Yours is red, my lord, and that was black," answered Gurth—"as black as the ringlets of the fair Jewish maid he rescued in the lists of Templestowe."

Of course not a word was breathed about this fact to Rowena, who received the news of her husband's death with that resignation which became her character, and who, though she did not show any outward signs of emotion at the demise of her lord, must yet have been profoundly affected, because she wore the deepest mourning any of the milliners' shops in York could produce, and erected a monument to him as big as a minster.

That she married again the stupid Athelstane when her time of mourning was expired, is a matter of course, about which no person familiar with life could doubt for a moment. Cardinal Pandolfo did the business for them, and lest there should be any doubt about Ivanhoe's death, (for his body was never sent home after all,) his eminence procured a papal rescript annulling the former marriage, so that she might become Mrs. Athelstane with a clear conscience. That she was happier with the boozy and stupid thane than with the gentle and melancholy Wilfrid need surprise no one. Women have a predilection for fools, and have loved donkeys long before the amours of Bottom and Titania. That he was brutal and drunken, and that he beat her, and that she liked it and was happy, and had a large family, may be imagined; for there are some women—bless them!—who pine unless they are bullied, and think themselves neglected if not occasionally belabored. But this I feel is getting too *intime*. Suffice it that Mr. and Mrs. Athelstane were a great deal happier than Mr. and Mrs. Ivanhoe.

And now, with your permission, I would suggest two or three sentimental chapters. Ivanhoe—disguised of course—returns to this country, travels into the north of England, arrives at York, (where the revels of King John may be described,) and takes an opportunity, when a Jew is being submitted to the torture, of inquiring what has become of Rebecca, daughter of Isaac. "Has she returned to England?" he cursorily asks. "No, she is still at Granada, where her people are held in honor at the court of Boabdil." He revisits her house, the chamber where she tended him; indulges in old recollections, discovers the depth of his passion for her, and bewails his lot in life, that he is lonely, wretched, and an outcast.

Shall he go to Rotherwood and see once more the scenes of his youth? Can he bear to witness the happiness of Athelstane and Rowena the bride of another? He will go if it be but to visit his father's grave, for Cedric is dead by this time, as you may imagine; and, supposing his son dead, has left all his property to Rowena. Indeed it was the old Thane who insisted upon her union with Athelstane, being bent upon renewing his scheme for the establishment of a Saxon dynasty.

Well, Ivanhoe arrives at Rotherwood.

You might have thought for a moment that the grey friar trembled and his shrunken cheek looked deadly pale; but he recovered himself presently, nor could you see his pallor for the cowl which covered his face.

A little boy was playing on Athelstane's knee,

Rowena, smiling and patting the Saxon Thane fondly on his broad bull-head, filled him a huge cup of spiced wine from a golden hanap. He drained a quart of the liquor, and, turning round, addressed the friar—

"And so, Grey Frere, thou sawest good King Richard fall at Chalus by the bolt of that felon bowman!"

"We did, an it please you. The brothers of our house attended the good king in his last moments; in truth, he made a Christian ending!"

"And didst thou see the archer flayed alive? It must have been rare sport," roared Athelstane, laughing hugely at the joke. "How the fellow must have howled!"

"My love!" said Rowena, interposing tenderly, and putting a pretty white finger on his lip.

"I would have liked to see it too," cried the boy.

"That's my own little Cedric, and so thou shalt. And, friar, didst see my poor kinsman Sir Wilfrid of Ivanhoe? They say he tried to defend the man. The more fool he!"

"My sweet lord," again interposed Rowena, "mention him not."

"Why? Because thou and he were so tender in days of yore—when you could not bear my plain face, being all in love with his pale one?"

"Those times are past now, dear Athelstane," said his affectionate wife, looking up to the ceiling.

"Marry, thou never couldst forgive him the Jewess, Rowena."

"The odious hussy! don't mention the name of the unbelieving creature," exclaimed the lady.

"Well, well, poor Will was a good lad—a thought melancholy and milkop though. Why a pint of sack fuddled his poor brains."

"Sir Wilfrid of Ivanhoe was a good lance," said the friar. "I have heard there was none better in Christendom. He lay in our convent after his wounds, and it was there we tended him till he died. He was buried in our north cloister."

"And there's an end of him," said Athelstane.

"But come, this is dismal talk. Where's Wamba the jester? Let us have a song. Stir up, Wamba, and don't lie like a log in the fire! Sing us a song, thou crack-brained jester, and leave off whimpering for bygones. Tush, man! There be many good fellows left in this world."

"There be buzzards in eagles' nests," Wamba said, who was lying stretched before the fire sharing the hearth with the thane's dogs; "there be dead men alive and live men dead; there be merry songs and dismal songs. Marry, and the merriest are the saddest sometimes. I will leave off motley and wear black, Gossip Athelstane. I will turn howler at funerals, and then, perhaps, I shall be merry. Motley is fit for mutes and black for fools. Give me some drink, gossip, for my voice is as cracked as my brain."

"Drink and sing, thou beast, and cease prating," the thane said.

And Wamba, touching his rebeck wildly, sat up in the chimney-side and curled his lean shanks together and began:—

Ho! pretty page, with dimpled chin,
That never has known the barber's shear,

All your aim is woman to win.

This is the way that boys begin.

Wait till you've come to forty year.

Curly gold locks cover foolish brains,

Billing and cooing is all your cheer,
Sighing and singing of midnight strains
Under Bonnybells' window-panes.

Wait till you've come to forty year!

Forty times over let Michaelmas pass,

Grizzling hair the brain doth clear;

Then you know a boy is an ass,

Then you know the worth of a lass,

Once you have come to forty year.

Pledge me round, I bid ye declare,

All good fellows whose beards are gray;

Did not the fairest of the fair

Common grow and wearisome, ere

Ever a month was past away!

The reddest lips that ever have kissed,

The brightest eyes that ever have shone,

May pray and whisper and we not list

Or look away and never be missed,

Ere yet a month is gone.

Gillian's dead, God rest her bier,

How I loved her twenty years' syne!

Marian's married, but I sit here,

Alive and merry at forty year,

Dipping my nose in the Gascon wine.

"Who taught thee that merry lay, Wamba, thou son of Witless?" roared Athelstane, clattering his cup on the table and shouting the chorus.

"It was a good and holy hermit, sir, the pious clerk of Copmanhurst, that you wot of, who played many a prank with us in the days that we knew King Richard. Ah, noble sir, that was a jovial time and a good priest."

"They say the holy priest is sure of the next bishopric, my love," said Rowena. "His majesty hath taken him into much favor. My lord of Huntingdon looked very well at the last ball, though I never could see any beauty in the countess—a freckled, blowsy thing, whom they used to call Maid Marian; though, for the matter of that, what between her flirtations with Major Littlejohn and Captain Scarlett, really —"

"Jealous again, haw! haw!" laughed Athelstane.

"I am above jealousy, and scorn it," Rowena answered, drawing herself up very majestically.

"Well, well, Wamba's was a good song," Athelstane said.

"Nay, a wicked song," said Rowena, turning up her eyes as usual. "What! rail at woman's love? Prefer a filthy wine-cup to a true wife? Woman's love is eternal, my Athelstane. He who questions it would be a blasphemer were he not a fool. The well-born and well-nurtured gentlewoman loves once and once only."

"I pray you, madam, pardon me, I—I am not well," said the grey friar, rising abruptly from his settle, and tottering down the steps of the dais. Wamba sprang after him, his bells jingling as he rose, and casting his arms round the apparently fainting man, he led him away into the court. "There be dead men alive and live men dead," whispered he. "There be coffins to laugh at and marriages to cry over. Said I not sooth, holy

friar?" And when they had got out into the solitary court, which was deserted by all the followers of the thane, who were mingling in the drunken revelry in the hall, Wamba, seeing that none were by, knelt down, and kissing the friar's garment, said, "I knew thee, I knew thee, my lord and my liege!"

"Get up," said Wilfrid of Ivanhoe, scarcely able to articulate; "only fools are faithful."

And he passed on and into the little chapel where his father lay buried. All night long the friar spent there, and Wamba the jester lay outside watching as mute as the saint over the porch.

When the morning came Gurth and Wamba were gone; but the absence of the pair was little heeded by the Lady Rowena, who was bound for York, where his majesty King John was holding a court.

Here you have an idea of the first part of the narrative. And I think there is nothing unsatisfactorily accounted for but Ivanhoe's mysterious silence during four or five years. For though Rowena married the day after her mourning was out, there is not the slightest blame to be cast on her, for she was a woman of such high principle, that had she known her husband was alive she never would have thought of such a thing. As for Ivanhoe's keeping his existence secret, that I consider is a point which, as hero of a novel, he has perfectly a right to do. He may have been delirious from the effects of his wounds for three or four years, or he may have been locked up and held to ransom by some ferocious baron of the Limousin. When he became acquainted with Rowena's second marriage there was a reason for his keeping *incog*. Delicacy forbade him to do otherwise. And if the above hints suit you, and you can make three or four volumes out of them, as I have little doubt you will be able to do, I will take the liberty, my dear sir, of finishing the tale in the September number.

THE SPEAKING AUTOMATON.

VARIOUS attempts have been made by mechanical agency to imitate the human voice, but hitherto, we believe, with very partial success. The praise of overcoming the difficulty has been reserved for a German artist. With the ingenuity for which his countrymen are famous he has constructed a speaking machine, which utters every sound of which the human organ is capable, with surprising distinctness; which whispers, speaks aloud, laughs, sings, talks, in every language, and repeats any form of words that any visitor may require. Professor Faber is the inventor of this new marvel. He has brought it from Vienna, where it was exhibited with great applause; and has, during the early part of the week, exhibited it in a room in the Egyptian-hall, to assemblages distinguished for rank and for scientific attainments. The result has been highly satisfactory.

The machine has been constructed from an attentive observation of the human organs of articulation; and the professor, by closely following nature in the formation of lungs, larynx, and mouth, has been able to make his machine extremely simple and manageable. There is no charlatanry about it; all the arrangements are exposed, and the professor invites the closest inspection of them.

The first thing that strikes the spectator on regarding the machine is a figure, life-size, dressed in Oriental costume. The mouth of this figure alone moves. At the back of the head is an apparatus like the bellows to a blacksmith's forge, which acts as lungs for a supply of air necessary to articulation. Then, on one side are a number of keys, not unlike those of a pianoforte, communicating with the internal arrangements of the figure. By touching these singly, the sounds of the alphabet are produced, and, by touching them in combination, words and sentences are rapidly uttered. Nothing can be more simple and ingenious than the whole arrangement, nothing more surprising than the effects produced. The appearance would, however, be more scientific if the figure, which answers no purpose, were altogether dispensed with.

The German alphabet is uttered more distinctly than the English alphabet—in fact the machine speaks English with a German accent, but some sounds common to both languages are given with astonishing accuracy, as *f*, *m*, *n*, *s*, and *x*. So in sentences the German pronunciation is clearer than the English; but even in the latter tongue many of the words are perfectly spoken. In the sentence, "How do you do, ladies and gentlemen?" it is difficult to believe that the last word is not spoken by a human voice. Generally, too, the numerals are correctly uttered, as "twenty-one," "one hundred and thirty-six," the complex sounds appearing more distinct than the simple ones. The liquid sound of *u* is but imperfectly rendered; all the consonants are pronounced more accurately than the vowels. Professor Faber works the machine nearly, if not quite, as rapidly as a person can speak. Its pronunciation of English is certainly better than his own.

He has been twenty years in bringing this singular and beautiful piece of mechanism to its present state of efficiency, yet it is still evidently capable of great improvement. The principles on which it is constructed allow of the most perfect accuracy in speech and sound being attained. In singing the machine gives promise of brilliant vocalization. Really it would be rash to predict that Grisi and Lablache would much longer retain their fame. Successive improvements may, perhaps, give this machine powers that will rival the trill of the nightingale and the lark, and defy all competition from the human organ.

The most amusement is produced by the laughter of the machine. Without being perfectly natural, it is so grotesquely life-like as to provoke genuine merriment from all who hear it. Another amusing portion of the performance is when it speaks as if laboring under the effect of a bad cold.

Professor Faber seems absolutely devoted to his instrument. A child of his own creation, he has the fondness of a parent for it, and is continually developing new capacities in it. He appears to be a mechanical genius, and to have an extraordinary ear for sound. He is very intelligent, and has an intellectual head; his face is marked with traces of careful study. He is advancing in years, turned of fifty we think, and is short in person, with quick and rapid gestures. Being but very imperfectly acquainted with English himself, he labors under the difficulty of not immediately catching the exact pronunciation of the words his machine has to repeat. But, allowing for this, the invention is truly extraordinary, and a perfect triumph of

mechanical skill. One is tempted to think while listening to the heaven-given faculty of language, so well imitated by art, that this is, perhaps, the nearest approach it is possible for human ingenuity to make, towards realizing Mrs. Shelley's conception of a man-created being.—*Britannia*.

WINTER SPORTS IN NEW BRUNSWICK.

YACHTING on the frozen Kenebekasis was but a frigid amusement at the best. The manufacture of an ice-boat is simple enough; over two long skates are placed any construction sufficient to hold the party, and a long pole is lashed across at right angles, which prevents the boat from capsizing. When the wind is high, she flies over the ice at a most terrific rate; and goes so near the wind that the least touch of the helm sends her round, when she is instantly off again on the other tack. A favorite amusement is coasting. On moonlight nights, a party repair to the top of some steep frozen descent, and ladies and gentlemen in pairs seat themselves upon sleighs or coasters and push them off. After a thaw the frost makes the surface of the snow as glare ice; the pace is then awful, and the roll in the snow proportionate. They are steered in their headlong descent by a slight pressure of the heel; but the Bluenose ladies, being more *au fait* at it than we were, sat in front and guided them.

The meeting of the Tandem Club was a very gay affair; twice in each week, twenty sleighs, painted of the most gaudy colors, and decked out with furs of all kinds, trimmed with fringe of different colors, drove off from the barracks or other rendezvous. The last married lady was selected as chaperon, and there were plenty of fair candidates for the drive. The brass band and merry bells added not a little to the cheerfulness of the scene.

The sleighs used in New Brunswick are of all forms and kinds—from that constructed with a couple of ashpoles (a nick alone distinguishing where the runners terminate and the shafts commence) with a few boards placed across to support a barrel, in which the victim sits or stands, to the double or single sleighs on high runners, not forgetting the Madawaska cariole, the height and luxury and the perfection of locomotion, and in which you recline, covered up to the chin in furs. It is absolutely necessary in the construction of a sleigh that the "runners" should be a good distance apart, and "flare out" sufficiently; for, should the road be covered with ice and "bogged up" in the centre, the sleigh will slide to one side with great velocity, particularly when turning a corner sharp. This is called "*slewing*," and the slightest impediment on the ice will be sufficient to upset the sleigh. When a "*slew*" takes place, it is necessary to pull the shaft-horse *with it*—a beginner is sure to do exactly the reverse, and is certain to be capsized. Even a high wind is sufficient to blow a sleigh round in an exposed situation, and upon "glare ice," when an upset is likely to happen, unless the runners "flare out" well at bottom.

I originally purchased a sleigh with faulty runners, and had several upsets and smashes, on which occasions the wreck alone of the "conveyance" reached barracks. One day, out sleighing on the Kenebekasis, the ice was glare, and in the

most perfect order: there was not the slightest draught, and my horses were trotting along merrily at the rate of twelve miles an hour, when, all at once, a squall of wind caught the sleigh and spun it round; and the runners at the same time encountering some roughness on the surface, the sleigh was upset, and the horses, as is generally the case, instantly set off at full gallop; for some time I was held in by the apron, and slipped along on my side, keeping a tight hold of the reins. The leader was galloping like a Caraboo, and the shaft-horse giving occasional kicks at the mass of encumbrance about his heels. At length the apron gave way, and, still holding on by "the ribbons," I was jerked off in the manner of one of those swings used in gymnastic academies, to be as quickly banged against the splash-board; and, four or five of these *coups* coming in quick succession, I was obliged to shorten my hold of the reins, and, the distance between the shaft-horse's heels and my head being in consequence much diminished, I thought with the knight "*thrt discretion was the better part of valor*," and—let go.

On getting up and shaking myself, I saw my servant, who had been pitched out of the hind seat, some three quarters of a mile behind, and the distance between him and myself preserved in perspective by sundry cushions, skins, linings, and bits of fringe; and, on turning to look after the sleigh, I had the felicity to see the horses still going "*Derby pace*," and just debouching from the ice, "*steering wild*" for a gap in a "*zigzag*" fence. Bang they went against the rails, giving the *coup de grace* to the proceeding, and going well away into the woods with the shafts dangling about their heels. I then built a new sleigh.

The painting and trimming up of the sleigh depend much upon the taste of the possessor; the general colors are dark bodies, with scarlet runners. I found that a white ground, picked out with bright vermillion, and bear and buffalo skins, with a liberal quantity of deep scarlet curtain fringe, and scarlet cloth, cut into scallops, arranged in studied confusion, the whole furnished with a huge pair of moose-horns in front, looked extremely light and gay on the snow; and the white, from being relieved by the vermillion, had no dirty appearance when contrasted with the snow.—*The Backwoods*.

POPE PIUS the Ninth proceeds excellently with his intelligent career: the political amnesty is published, and it is right hearty in its terms. The exceptions are not extensive, nor absolute, nor altogether improper. It has created quite a sensation in Rome, and the warm applause which it has elicited may be a good lesson to persevere. Should the pope continue in this track of wise liberality, it must have an effect far beyond the pale of his own secular domain: Austria would be quite unable to withstand so new an influence in her neighborhood, and her system of hard tyranny must be broken up. It is curious to see the germs of a peaceful revolution in Rome, the head-quarters of the old despotic bigotry; but Pius seems, from present appearances, to have the heart, the head, and the courage, to know what a wise pontiff might do to save his country from the rebellious consequences of intolerable oppression.—*Spectator*, August 1.

From the North British Review.

The Life and Correspondence of John Foster. Edited by J. E. RYLAND. With Notices of Mr. Foster as a Preacher and a Companion, by JOHN SHEPHERD, Author of *Thoughts on Devotion*, &c., &c. In Two Volumes. London, 1846. Republished by Wiley & Putnam, New York.

ALTHOUGH so recently removed from among us, and so lately employing his pen upon the themes of the day, John Foster—every reader of these volumes must feel it—belongs to an era gone by—an era not defunct in the course of natural decay, or because it had lived on to spend its forces, but because it has been thrust out by the energies of the now present period. Foster's "times" have been superannuated by the vehemence of the times we live in; himself possessed, as he is, unquestionably, as a writer, of a bright and fair immortality, the things with which he was concerned, the opinions he maintained, along with the opinions he so warmly denounced, have already faded into the distance of history; few, if any, of his ominous forebodings have come upon us, and as few of his anticipations of the spread and triumph of the principles he so confidently deemed to be good, have been realized. The cycle of a very few years, with their mighty changes—changes, some ostensible and some occult, has brought us to a position whence John Foster's period may be looked at along with John Milton's.

It was not so with Arnold. Arnold died, as if designedly, at a moment the best for bringing before the world, with a startling vividness, the greatness and the high import of those transitions, theological, moral, and political, which we were then, and are now, passing through. His "Life and Correspondence" was like a sudden and an unlooked for summing up of the evidence, while the cause is still in hearing. Those signal letters, dated "Fox-How" and "Rugby," were "dispatches" written upon the field, and sent off while the enemy is still in sight and intrenched; and the hold they took of men's minds was attributable, not simply to their intrinsic force, but to the reader's own consciousness of being personally implicated in the issue:—hopes and alarms, touching a man's social or political well-being, or that of his children, opened a way for those letters into all hearts, and imprinted them indelibly on the memory.

The points of resemblance or analogy between Foster and Arnold are too few and indistinct, and the points of contrariety are too many and too prominent to allow of the attempt to institute a comparison, such as should be fair to both these great men, or profitable to the reader. We shall attempt nothing of the sort, and, in truth, are reminded of Arnold's name in this instance by the merely incidental fact, that the volumes before us stir the mind in a manner which nothing, in this department of literature, has done—of late years—Arnold's *Life* excepted. How many thousands of persons, wherever the English language is known, have felt that, so long as they could eke out the perusal of Arnold from day to day, they were possessed at once of a source of the most intense intellectual gratification, and of the most solid moral benefit. Feelings, far less vivid, will attach to the perusal of Foster's letters, and fewer, probably, will be the readers; but, to a class much more select, the perusal will afford a most delicious revival of trains of thought, and of emotions,

which everything around us tends to dissipate, or to render impracticable or incongruous. To Foster's contemporaries—we mean to those who remember the first appearance of his essays—these volumes will furnish a refreshment of a bright, early intellectual season—the morning hour of life, oftener regretted than revived. We could gladly hope that, within younger bosoms, they may kindle tastes which little at present serves to nourish, and the decline of which marks, as we think, the decay, in this country, of what is, in the highest sense, THE MIND—the life of the soul.

We do not know, and should not care to ask, to what extent Foster's *Essays* is now a selling book: but, in frequent instances, have been vexed to meet with educated young persons, and who were conversant, quite enough for their welfare, with German mysticism, but who were not even cognizant of the name of an English writer so well able to stir the spirit and to awaken the loftiest emotions! It is surely a mistake—it is a bad fashion, to import and consume an inferior foreign article, while neglecting a home growth of far finer quality! Is Foster sometimes obscure? Yes, but there is *always* a meaning to be had, and a rich meaning too, within the compass of his paragraphs. German pantheists are hard to be understood, because with them so often the crust of words overlays nothing that is intelligible—or, what is so absurd, if intelligible, that we reject it as "certainly not the intention of so fine a writer."

It will, we fear, be inevitable, once and again, to make an allusion to Arnold: yet, deprecating as we do any design to institute a formal comparison or to offer a contrast. Arnold supplies us in his letters with the means, indirectly, of acquiring a knowledge of the constitution of his mind, and of his moral structure: but he forgets himself in the heat and haste of his beneficent concernment with the well-being of those around him, and of the human family. Foster sits down to paint, to describe, to anatomize himself—his individual soul; yet he does not do this from egotism, or at the impulse of an excessive self-esteem: far from it: but because, as a meditative recluse, misliking the world, he is glad always to run into an enclosure where none could follow or annoy him. With as much perhaps of the rudiment of benevolence at the bottom of his heart as swelled the bosom of Arnold and sparkled in his features, he is too lofty in his notions, and too sensitive, and too captious, to think of the world as a thing worth the mending, or of mankind as reclaimable: too indolent also to enter upon any course of life which would have given the moral emotions their due advantage over the imaginative sentiments. He profoundly laments, therefore, the prevalence of those evils which Arnold lived and died to remove, or at least to alleviate. What would not the head master of Rugby have done; what personal comfort would he not have relinquished, for the sake of raising, only a little, the "moral tone" of the "Rugby boys," or how many martyrdoms would he have endured, could he thereby have brought the millions of India within hearing of the truth! Foster was indifferent to none of those moral interests which occupied Arnold's hands and soul; but he looked abroad upon the moral world in another manner; as thus:

"What is the use or value of communities, extending beyond actual communication—of states, republics, kingdoms, empires!

"How can we take interest enough in distant beings of our own sort, to feel anything that deserves to be called universal benevolence? Why did the Supreme Disposer put so many beings in one world, under circumstances which necessarily make them strangers to one another?"

"Views which strongly realize to the mind the vast multitude of mankind, tend to contract benevolence. The mind seems to say, What can I do with all this crowd? I cannot keep them in my habitual view; I cannot extend my affections to a thousand millions of persons who know nothing, and care nothing about me or each other; I can do them no good, I can derive no good from them; they have all their concerns, and I have mine; if I were this moment annihilated, it would be all the same to them;—there is no connection, nor relation, nor sympathy, nor mutual interest between us. I cannot therefore care anything about them; my affections cannot reach beyond these four or five with whom my own personal interests are immediately connected."—Vol. i., p. 355.

The world—the human system—being in his view an uncouth mass, not to be looked at without disgust, and not to be touched without defilement, Foster gathered himself up—sympathies and energies—within, not the cloak of the misanthrope, nor the tub of Diogenes, but the dust-coated attic, whence issued writings that will finely temper the products of other men's activities. His essays—his letters—his journal, exhibit the converse of a mind, a mind of gigantic stature, a mind of the keenest sensitiveness—with itself! Everything in these writings is genuine and true, and noble, that relates to this one soul. Most things in them that relate to the world exterior are, if not false, yet mis-stated; or true only in some partial sense. There is no modern writer whose thoughts are of more weight than Foster's; none (of any note) whose opinions are of less. We shall endeavor to hold out to view this interior universe grand and beautiful, while, with a becoming gentleness and reverence, we animadvert upon those strange mistakes that attach to his notions of things around him. The comparison which we disclaim, between Arnold and Foster, will, alas! haunt us still! Arnold, within his sphere, (and had his sphere been immensely wider than it was, the same would have been true,) ruled his firmament as the sun, enlightening all things, warming all, vivifying all: Foster (the passage is inimitably beautiful) describes the moon in terms that might not unaptly be taken to depict himself.

"Have just seen the moon rise, and wish the image to be eternal. I never beheld her in so much character, nor with so much sentiment, all these thirty years that I have lived. Emerging from a dark mountain of clouds, she appeared in a dim sky, which gave a sombre tinge to her most majestic aspect. It seemed an aspect of solemn, retiring severity, which had long forgotten to smile; the aspect of a being which had no sympathies with this world—of a being totally regardless of notice, and having long since, with a gloomy dignity, resigned the hope of doing any good, yet proceeding, with composed, unchangeable self-determination, to fulfil her destiny, and even now looking over the world at its accomplishment."—Vol. i., p. 211.

That individuality, the absence of which is precisely what makes the "many" the many, and the presence of which in excess, along with common qualities and a narrow intellect, renders a

man absurd in the eyes of others, and often intensely miserable within himself, is the very rudiment of its greatness, and the reason of its power over other minds, when it attaches, in a high degree, to splendor of the imagination, and to compass and force of the reflective faculty. "A painful sense of an awkward and entire individuality" belonged to him, as he says; so early as his twelfth year; no doubt from his earliest childhood; and this insulating consciousness—a dim consciousness of intellectual dimensions out of all proportion to his worldly condition, and to the opinion entertained of him by others—even his parents and his instructors, had time to congest, and to become the unalterable habit of his character, while as yet he had not surmised anything distinctly as to his own powers of mind. His "individuality" had thoroughly crusted itself at eighteen; his great faculties had not fully become known to himself at eight-and-twenty. Even four years later—a period when men of eminent intelligence, born in a higher sphere, and enjoying the advantages of education, have usually won half their laurels—Foster was barely beginning to suspect that the lofty prerogatives which his "individuality" made him long for, were actually his own, by the gift of nature.

"Long as it is since I wrote to you before, no incident worthy of particular notice has occurred—or perhaps the very circumstance of my being apt to suffer things to pass without notice, is itself the reason why I do not distinguish and recollect particulars. Many events may possibly have engaged the attention of other men, which I was too thoughtless to observe, or too ignorant to comprehend their consequence. I am a very indifferent philosopher, I confess, for I have neither curiosity nor speculation. This inattention to the external world might be excused if the deficiency were supplied from within. If I were, like some men, a kingdom or a world within myself, superior entertainment should soon make my friends forget the uninteresting particulars of ordinary intelligence. How enviable the situation—to feel the transition from the surrounding world into one's own capacious mind, like quitting a narrow, confined valley, and entering on diversified and almost boundless plains—if this felicity were mine, I might be equally unconcerned to obtain or to recollect the news of the town. I might explore new and unknown regions of intellect and fancy—and after having carried my career to a distance which the most erratic comets never reached, return with the most glowing and amazing descriptions of the scenes through which I had passed."—Vol. i., p. 25.

Many passages in the Journal are to the same purpose.

"Feel this insuperable individuality. Something seems to say, 'Come, come away; I am but a gloomy ghost among the living and the happy. There is no need of me; I shall never be loved as I wish to be loved, and as I could love. I will converse with my friends in solitude; then they seem to be *within* my soul; when I am with them they seem to be *without* it. They do not need the few felicities I could impart; it is not generous to tax their sympathies with my sorrows; and these sorrows have an aspect on myself which no other person can see. I can never become deeply important to any one; and the unsuccessful effort to become so, costs too much in the painful sentiment which the affections feel when they return mortified from the fervent attempt to give themselves to some heart

which would welcome them with a pathetic warmth."—Vol. i., p. 220.

"I have long been taught and compelled by observation to form a very bad opinion of mankind; this conviction is irresistible; but, at the same time, I am aware of the Christian duty of cultivating a benevolence as ardent as if the contrary estimate of human character were true. I feel it most difficult to preserve anything like this benevolence; my mind recoils from human beings, excepting a very few, into a cold interior retirement, where it feels as if dissociated from the whole creation. I do not, however, in any degree, approve this tendency, and I earnestly wish and pray for more of the spirit of the Saviour of the world."—Vol. i., p. 319.

We have said that everything in Foster's letters and journal relating to himself—this inner world—this retreat wherein he took refuge, is genuine and true. It can barely be necessary to exclude a misunderstanding, as if we accepted as literally true his own estimate of his dispositions, when he reports himself to be misanthropic, unsocial and cold. Nothing could be farther from the truth than such a representation: it was the loftiness, the purity, the fervor of his moral perceptions—it was the intensity of his social instincts that drove him out of the "world" into his attic, and that encased him in ice when unavoidably mingling with ordinary minds. *Psychologically understood*, Foster's own report of himself, as "a misanthrope"—a being "cold and unsocial"—contradicted as it is so copiously by other evidence—his own evidence given under other influences, as well as the entire character of his various writings—is quite true and genuine, in as much as it is a *symptom of his case*—a diagnostic of his moral constitution—a constitution not altogether healthful. Real misanthropes do not mournfully make such entries in their journals as this: "Alas! I am a misanthrope." Beings who indeed are cold-hearted, unsocial, and selfish, neither write it down that they are so, nor speak it. Too clearly conscious of the dread fact, they would not give evidence against themselves in a case which they know lacks no sort of proof, unless it be such a confession.

Foster's case, although indeed rare, if we think of the faculties of mind which, in this instance, signalize it, is by no means uncommon. Affections deep, tender, and refined—moral instincts of the purest sort, and the most vivid, a sense of right—and therefore a sense of wrong, the most passionate—even tempestuous, and imagination alive to the great and beautiful, but always swayed by an infelicitous animal temperament towards what is terrible or sombre.—Such elements of character imperfectly governed by the higher reason—perhaps owning no submission to any such authority, constitute the man—such as was Foster—ever reviling himself as a misanthrope, because born into a world where the impulses of a seraph's bosom are so often outraged, and must always be repressed.

On subjects remote from those questions which had enlisted—shall we say which had "retained"—his imagination and his moral sensibilities, Foster's judgment is sound, his perceptions acute, his decisions discriminating, his conclusions apt and just. Reason, with him, was an energy of a high order—although not at all of scientific quality: but the misfortune was, that it bore no proportion to the combined forces—and they were ever in combination—of his imagination and his moral sense, and so it is that, whenever he nears the ground of political

or ecclesiastical controversy, he starts forward in a sort of bison gallop—fiercely breaking through enclosures—trampling down fair fields, and butting outrageously at whatever dares stand erect in his course. The best thing that can be done by quiet folks on such occasions, is to stand on one side until the gigantic creature has finished his sport, and plunges again into the jungle; but we protest against the error of calling the buffalo either tiger or crocodile.

In this view of the case, we must warn off from these volumes party writers and sectarian reviewers. Such, if any such there be, will be prompt to snatch at, and adduce many passages which might seem to bear them out in saying—"See what the party is—what is its spirit—what its intentions—what its malignity—which John Foster represented in his time, and of which he was the idol!" Conclusions such as this would only indicate a want of intelligence, a lack of philosophic perception, a misunderstanding of the instance. Not a little that is absurdly sectarian, violent, uncharitable, intemperate, might be culled from the letters and journal; and if, in the course of this article, we advert to passages of this kind, our intention in doing so will be not to set the particular question right—whether ecclesiastical or political, which were a superfluous task, but to set Foster's personal reputation clear of the imputations to which these crude portions will probably render it obnoxious. Fairly to interpret them, one should duly consider his own mental structure, the narrowing influences of his early course and position, and, not less, the peculiar aspects and provocations of the times when his opinions were formed and proclaimed. Born in the humblest rank, and enjoying, in early life, very scantily those advantages of education or association which may avail to remove from a vigorous mind its plebeian notions, and which, with a mind such as his, would not less have mellowed his moral nature, than have disciplined his reason, Foster began to think and to feel, in relation to political and ecclesiastical questions, just at that enigmatic juncture, the misunderstood phenomena of which perverted the views, and set wrong the public course, of some, greater than he in intellect, and far better taught.

We take it for granted that everybody will read these volumes, and shall, therefore, attempt no summary of Foster's life—a tale soon told—nor quote from them, except such passages as may be necessary to give coherence and support to our remarks. Like all who indeed *think*, and who muse painfully upon the mysteries of the system in which they find themselves placed, Foster early doubted concerning many things ordinarily held, in his connexion, to be true, and some such points of belief he continued to reject to the last. He wandered not, however, from the precincts of serious faith—faith in Christianity; and no reader of the letters and journal can hesitate to admit that a deep, a solemn conviction of the reality of things unseen and eternal—a conviction meekly submissive always to the testimony of Scripture—possessed his mind, and governed it. Besides that the high moral tone of his character, and the grandeur of his imagination, held him ever near to the radiant centre of truth, his mind wanted entirely the scientific rudiment, and therefore he was never in peril of skepticism. If he disbelieved some things which others believed, it was not from *disbelief* that he did so; but rather from an overpowering belief—a vivid sense of certain truths which were seemingly incompatible with such and such articles of an ortho-

dox creed. There are men, and many such, who believe everything firmly, precisely because they believe nothing deeply. They doubt nothing, because they never ask themselves what their belief includes and implies; and if only they could, for a moment, get a glimpse of the interior of a mind like Foster's—if they could creep into his bosom, they would come away bereft of a third of their "articles." Foster believed, as superior natures in an upper world believe; and he, on earth, doubted, just where they, in heaven, veil their faces with their wings.

Whatever shocked or countervailed the powerful impulses and genuine instincts of his soul, he cast from him as utterly to be rejected. Christians should love each other; but, alas! church members too often "bite and devour one another;" and the inference with him is instantaneous—not that church members should be admonished and reformed, but that churches are nuisances, and should be dissolved, one and all!

"On the occasion of a violent dissension between two religious societies, which came under his immediate notice, he speaks of obtaining plenty of confirmation, if he had needed it, of his old opinion, that churches are useless and mischievous institutions, and the sooner they are dissolved the better. * * * He believed that there was more of appearance than of reality in the union of church-membership; and that, at all events, its benefits were greatly overrated. With the exception of public worship and the Lord's supper, he was averse to everything institutional in religion. He never administered, nor even witnessed in mature life, (it is believed,) the ordinance of baptism, and was known to entertain doubts respecting its perpetuity. In writing to a friend, (Sept. 10, 1828,) he says:—'I have long felt an utter loathing of what bears the general denomination of the church, with all its parties, contests, disgraces, or honors. My wish would be little less than the dissolution of all church institutions, of all orders and shapes; that religion might be set free, as a grand spiritual and moral element, no longer clogged, perverted, and prostituted by corporation forms and principles.'—Vol. i., p. 61.

The very same melancholic fastidiousness gave its character to Foster's opinions on the most ordinary subjects, and impelled him toward extreme conclusions in relation to any object, which at once woke up the moral sense—in him so painfully sensitive—and overclouded his imagination with lugubrious images. The premises leading to such conclusions were furnished wholly by his moral instincts and his imagination, nor were his inferences modified at all by a regard to the simple facts of the case. Witness the crudities of the letters "On the Metropolis." An intense commiseration of want and woe—a high, indiscriminate wrath against the possessors of luxury, of comfort, and of authority, who are assumed to be the authors, remotely or directly, of human sufferings; and then the resentment of a countryman against brick walls, noisy vehicles, smoke, and the sundry nuisances of such a city as London—combined, if not to convince him that London should be shoved into the Thames, yet to exclude from his view, as if no such things existed, all that incalculable amount of good—good of the highest order—good, not merely for the metropolis itself, nor merely for Britain, but for the wide world—of which London is the focus, the germinating centre, the direct and active cause. We can scarcely believe that Foster would himself have reprinted, in his later years,

letters such as these:—that he had reached the age of three-and-thirty at the time they were written, affords a striking evidence of the slow growth, and the late development of his mind. They are, in fact, worthy of a sensitive, romantic youth of eighteen, and are very fit to be addressed to "a young lady!" Nothing in them is simply according to fact—nothing that tends to guide or to inspire benevolent enterprises. Well is it for London, and for the world, that its hundred charities, religious and secular, find men and women to support and carry them out, whose sensibilities are more practical, and whose imaginations are less sublime! So moody was Foster's mind, when once it had been smitten with a sad theme, that probably, if one had ventured to whisper in his ear something about hospitals, dispensaries, visiting societies, city missions, and churches, or even chapels, besides innumerable benevolent agencies, purely private and individual, all would have been interpreted by him in an ominous sense, as affording more proof of his argument! Take Foster to a "Ragged School"—what confirmation does it yield of his darkest surmises as to the misery and the vice of the metropolis! "Yes, sir," we should have said, "but grant us at least this—that if the scholars belong to, and if they are a sample of, London, the school also belongs to, and is a sample of, the same awful concrete." The squalid urchins are "the Metropolis;" but the master, and the mistress, and their patrons, are also "the Metropolis." Let it be true, that the noble and the wealthy do not attempt all they might and ought, in behalf of the want and woe around them; and let them be urged and incited, by all proper means, to acquit themselves better than they do of their responsibilities; but we doubt if much good will be done in this way by those who would handle the subject after such a fashion as the following:—

"I am sorry not to have gained the knowledge which thirty or forty shillings would have purchased in London. At the expense of so much spent in charity, a person might have visited just once eight or ten of those sad retirements in darkness, in dark alleys, where, in garrets and cellars, thousands of wretched families are dying of famine and disease. It would be most painful, however, to see these miseries without the power to supply any effectual relief. At the very same time you may see a succession, which seems to have no end, of splendid mansions, equipages, liveries; you may scent the effluvia of preparing feasts; you may hear of fortunes, levees, preferments, pensions, corporation dinners, royal hunts, etc., etc., numerous beyond the devil's own arithmetic to calculate. This whole view of society might be called the devil's *play-bill*; for surely this world might be deemed a vast theatre, in which he, as manager, conducts the endless, horrible drama of laughing and suffering, while the diabolical satyrs of power, wealth, and pride, are dancing round their dying victims:—a spectacle and an amusement for which the infernale will pay him liberal thanks."—Vol. i., p. 258.

It is curious, we will not say amusing, to observe the manner in which men of Foster's order are apt to be carried away by their impulses. There is, perhaps, a terrible sublimity in the idea of tens of thousands of wretches thought of as living and dying the victims of luxury and power! But there is no sublimity in the thought or spectacle of fifty or a hundred methodist-looking men, in

shabby black, dingy stocks, and pale faces, setting out to visit these tens of thousands? A *dirty* pale face is the symbol of masses of dirty pale faces—and all the victims of “vicious institutions,” and evidences of “wicked government!” A *clean* pale face is only a clean pale face! nevertheless, if the wearer of it be the martyr of Christian benevolence, and if, moreover, he be salaried by Christian wealth, then, surely the pale clean face might just be named, when the dirty pale face is made the text of a sweeping condemnation, thundered against “the diabolical satyrs of power, wealth, and pride!”

The editor, we think, might very well have suppressed more than a few pages of this sort of puerile sophistry. Finding them where they are, we are free to refer to them, as furnishing proof that the preponderance of certain unhappy elements in his constitution was such as should be held to screen his *opinions* from any severe treatment, as if they had been the products of reason. The adherents of such opinions will, we think, be wise if they abstain from boasting of Foster as a champion of “sound principles,” and of “great truths;” while, on the other hand, those of the contrary part, will show right feeling, and good taste, if they deny themselves the spiteful gratification, which these volumes would supply, of bringing Samson forth “to make them sport.” As to those who *will* do so, we stigmatize them, beforehand, as men of an ill temper, and of narrow intellect. John Foster belongs to us all, as a writer who, beyond any other, within the compass of a century, has enriched our English literature with full-toned and impassioned eloquence—has gone deeper, than any other of our times, into the deep waters of religious and ethical meditation—shedding upon such themes the splendor of an imagination of high order, and who, in a word, has, on lofty ground, occupied an ample space, quite his own, and where he is little likely soon to find his superior.

Foster's proper sphere was that vast region wherein there is neither pathway nor rest for the foot of man—a region into which every serious and reflective mind makes an excursion early in its course, and from which calm and well-ordered minds presently retire trembling, and forbidding themselves any renewed endeavors to penetrate its awful gloom.

“I sometimes fall into profound musings on the state of this great world—on the nature and the destinies of man, on the subject of the question, ‘What is truth?’ The whole hemisphere of contemplation appears inexpressibly strange and mysterious. It is cloud pursuing cloud, forest after forest, and alps upon alps! It is in vain to declaim against skepticism. I feel with an emphasis of conviction, and wonder, and regret, that almost all things are involved in shade, that many things are covered with thickest darkness, that the number to which certainty belongs is small. * * * I hope to enjoy ‘the sunshine of the other world.’ One of the very few things that appear to me not doubtful, is the truth of Christianity in general; some of the evidences of which I have lately seen most ably stated by Archdeacon Paley in his book on the subject.”—Vol. i., p. 89.

Not merely did he hold fast his profession as a Christian, amid these cheerless musings, but, even while indulging them without restraint, he became more and more decisive in his adoption of the most serious form of theological belief. Writing from Chichester to his parents, March 25, 1799, where

he was surrounded with a deadening heterodoxy, he says:—

“My opinions are more Calvinistic than when I first came here; so much so as to be in direct hostility with the leading principles of belief in this society. The greatest part of my views are, I believe, accurately Calvinistic. My opinion respecting future punishments is an exception.”—Vol. i., p. 99.

Similar professions occur elsewhere, and they are entitled to the most entire confidence. Minds of less compass, clearness, and depth than his, and equally addicted to meditation, very usually run off into mysticism, gnosticism, pantheism, as their place of repose. Foster's was too profound not to know well that these several illusions serve to alleviate nothing, to solve nothing, to illuminate nothing;—that they are vapors which may indeed show bright and gaudy colors when seen at a great distance, but in the bosom of which, if one enters them, there is nothing but chill and gloom. By the aid of those moral instincts which attach to a great mind, he kept himself anear to the effulgent source of light and heat, although “clouds and darkness are round about it.”

His letters to his “honored parents” exhibit, with a sort of boyish simplicity, and continue to do so even after he had passed the meridian of life, the interior of his soul, as a devout Christian. Those addressed to his early and most congenial friend, the late accomplished Joseph Hughes, take, as might be supposed, a higher tone, and they beautifully develop that which the former only indicate, namely, the deepest reverence toward God, the most ardent desires for Christian advancement and usefulness, and a readiness, the very opposite of the skeptical feeling, to bow to the undoubted testimony of Scripture when once it is ascertained. His friend had, as it seems, with a faithful but overdone severity, called him to account on the question of evangelic piety; in reply, and with a child-like humility, he pleads his own cause, (Letter XXIX.,) and makes an ample profession of *sufficient* orthodoxy—a profession, we confidently think, which, although Dr. Gill might perhaps have spurned it, St. Paul would have accepted with tears of love. To the same purpose—we need not cite it—is a letter to his tutor, Dr. Fawcett, (XXXIII.,) breathing a tender conscientiousness, and an ingenuous warmth. But at this period, and just before his reputation had set him safe from such annoyances, he was paying the penalty, or was expecting every moment to be called upon to pay it, which is exacted always, by narrow sects, from an individual, beneath their sway, who is suspected of daring to keep a soul and mind of his own.

It is a vexation to find, and we must infer it, from the tone of Foster's expostulations, that his friend Hughes, candid and kind-hearted as he was, had given in to this prejudice of the sect, and, while much his inferior intellectually, was treating him in something like a supercilious manner, as a man compromised by suspicion of the plague, and who should, therefore, keep himself off from clean folks. Foster does not resent this unworthy treatment; he only says, “You do not understand me.” Hughes could not fully—although somewhat more than did the good folks assembling in the vestry of Battersea Meeting House on “a week evening,” understand the man who, with a discriminating sense of his individual character, and without arrogance,

notes it of himself, that he holds easier correspondence with God, than with his fellows.

"(In the vestry of Battersea Meeting, during evening service.) Most emphatic feeling of my individuality—my insulated existence—except that close and interminable connexion, from the very necessity of existence, with the Deity. To the continent of human nature, I am a small *island* near its coast; to the Divine existence, I am a small *peninsula*."—P. 183, *Journal*, (434.)

At a prayer-meeting the "peninsular" relationship is naturally uppermost in his thoughts:—in a party, the "insular."

"How often I have entered a room with the embarrassment of feeling that all my motions, gestures, postures, dress, &c., &c., &c., were critically appreciated and self-complicitly condemned, but, at the same time, with the bold consciousness that the inquisition could reach no further. I have said with myself, 'My *character*, that is the *man*, laughs at you behind this veil; I may be the devil for what you can tell, and you would not perceive neither if I were an angel of light.'—Vol. i., p. 206.

What was needed (early discipline and intercourse with persons of highly-cultured minds, might perhaps have supplied the deficiency) was such a rectification of his piety as would have rendered it less imaginative, and such an invigoration of the social affections as would have brought his piety into combination with benevolence: too far the one overlaid and stifled the other. Nevertheless the yearnings of the social affections, intense and tender, meet the eye everywhere in Foster's journal.

"Why is this being, that looks at me and talks, whose bosom is warm, and whose nature and wants resemble my own, necessary to me? This kindred being whom I love, is more to me than all yonder stars of heaven, and than all the inanimate objects on earth. Delightful necessity of my nature! But to what a world of disappointments and vexations is this social feeling liable, and how few are made happy by it in any such degree as I picture to myself and long for!"—Vol. i., p. 228.

Foster felt himself insulated in general society from a cause analogous to that which insulates a man in a foreign land; for there was no medium between himself and the beings around him; and the forced endeavors made to break through the obstruction serve only to confirm his resolution not to repeat the attempt. "Spent part of an hour in company with a handsome young woman and a friendly little cat. The young woman was ignorant and unsocial. I felt as if I could more easily make *society of the cat*." The inference that he was not social, because his behavior and habits were those of a recluse, would have been as erroneous as the supposition that he had no sense of the beautiful in nature, because his practice was—even when residing in the midst of scenery the most agreeable—to shut himself up for weeks, nay months, treading the boards of a dingy and dusty attic, to and fro, many miles every day. In the enjoyment of abundant animal energy—with the most absolute command of his time—unquestioned by any one, the very man who, when abroad, would stand an hour fixedly gazing at a tree, and to whom a tour in Wales afforded unutterable delight, freely imprisoned himself in a garret through a large portion of his best years! An inconsistency seemingly so strange may, no doubt, in good part be attributed to constitutional animal indo-

lence; perhaps in part to his dread of encountering on the way—just at the corner of a street, or, worse still, midway on a field path, where a turn off could not be effected—some worthy biped with whom he must have exchanged (terrible annoyance) a few phrases of civility! But besides; as Foster shunned common society because his converse with himself afforded him a higher enjoyment than he could derive from intercourse with others, so he shut himself in his attic, even during the most splendid seasons, because the luxuries of the imagination—luxuries purely intellectual—were more exquisite than the primary, or *elementary* gratifications, which the mind admits direct from the eye. The sight of beautiful objects affords, indeed, a vivid pleasure; yet it is a crude pleasure. But while the eye-balls glare vacantly upon a stained and cobwebbed wall, the mind revels in some bower or glade of its own paradise. Will a man put on a hat, to walk as far as Longleat, who can, at his ease, perambulate Elysian fields, where

— lawns, or level downs, and flocks
Grazing the tender herb, are interposed,
Or palmy hillock; or the flowing lap
Of some irriguous valley spreads her store;
Flowers of all hue, and without thorn the rose.

Or shall he risk the hearing of a factory's din, who can listen while

— murmuring waters fall
Down the sloped hills;

and where

The birds their quire apply; airs, vernal airs,
Breathing the smell of field and grove, attune
The trembling leaves.

His attic window, he tells us, commanded a peep at the green fields; but we doubt if he actually availed himself much of this advantage. He who could stand at an attic window, looking at the fields, would assuredly, unless lame or imprisoned, walk forth to look at them.

"I am still all alone here, and since I wrote to you, have lived a more solitary life than ever in my life before. This last six months I have lived a little way out of the town, in a house amidst the fields. However, I hardly ever go out, because I can see them so well through my window, the window of an upper room. I hardly ever what can be called take a walk, except merely in the garden adjoining the house. The beauties of nature are brought so directly under my eyes and to my feet, that I am rarely prompted to go in quest of them, even as far as from your house to the top of Wick Lane. Excepting my journey to Bristol, I have hardly ever taken a good long walk for the last nine months. If this rigid limitation were imposed upon me by some external authority, by the will of somebody else than myself, what a wretched prisoner I should think myself, and should watch day and night for an opportunity to make my escape. I almost decline all visiting, and have not dined from home, I believe, six times these last seven months."—Vol. i., p. 288.

Happily, the social element—in few bosoms of greater intensity than in his—was at length rescued from extinction by the opening of the conjugal and parental affections. Had it not been so, the writer of passages such as the following might have ended in actually becoming—what he had long been erroneously calling himself—"a misanthrope."

Let those take a warning who indulge sentiments, at first for the mere sake of intellectual excitement, but by which, at length, they are mastered. This sort of moody luxury is, in truth, always a perilous sporting with the demon—it is a tempting of Satan:—

“I should nauseate the place (Frome) if I had been habituated to it a century. At first I felt an intense loathing; I hated every house, timber, stone, and brick in the town, and almost the very trees, fields, and flowers in the country round. I have indeed long since lost all attachment to this world as a locality, and shall never regain it. Neither, indeed, for this do I care; we shall soon leave it forever. * * * I now seldom, comparatively, think of politics; when I do, it is with a hatred of the prevailing system, which becomes but more intense by time.”—Vol. i., p. 304.

“When I see people good and sensible, I am glad of it for *their* sake, not for my own.” This is precisely the indication of a mind’s having reached the line of demarcation between the world of love and the world of *unlove*, or hatred. He who has actually passed that border—in the wrong direction, is *not* “glad,” even for “*their* sakes,” when he encounters those who are distinguished by wisdom and goodness;—not glad, for he writhes, stung with his own venom. He who lives on the bright side of the border is glad, not *severally*, as if *first* for his *own* sake, and then for theirs, but with a suffused, indiscriminating joyousness, the same in element as that of a brighter world, where there is a “fulness of joy,” in which all that is restrictive is drowned. Foster’s character was in very great danger at this period; yet a hopeful revulsion seems to have commenced—a symptom, or an incidental cause of which was a returning converse with nature.

“I have done more justice to the beautiful season this year than in many former ones; for I have taken many solitary walks, and, with a book and pencil in my hand, have done my best to catch all the ideas, images, objects, and reflections that the most beautiful aspects and scenes of nature could supply. I have felt it of some consequence to me, if I am to write again, to assemble as many natural facts and images as possible, to supply what may be called colors to writing. I must increase the stock, or else I shall soon be *out*, as I have expended a great deal of material on what is already written.

“Into company I cannot actually take this book and pencil, but I endeavor to seize fast every remarkable circumstance, and each disclosure of character that I witness, and then, when I return to my room, they go by dozens into my book. I keep to my text on the subject of forming new friendships; I am quite too old for it. When I see people good and sensible, I am glad of it for *their* sake, not for my own.”—Vol. i., p. 324.

“I never have been more enchanted with a summer since I left whatever part of creation or chaos I lived in in former ages, and came to this our green orb. I took frequent solitary walks; even as matter of duty, I did it sometimes, when the attraction of pleasure might have failed to overcome my great indisposition to move. Those walks were commonly in the retired fields and woody lanes, of which I found a number this last summer in this neighborhood, some of them very beautiful, as well as extremely quiet. There are, besides, two or three extremely beautiful valleys not far from this town. As to the town itself, I

do not know whether I told you how much I nauseate it; but no length of time would ever cure my loathing of it. But sweet nature! I have conversed with her with inexpressible luxury; I have almost worshipped her. A flower, a tree, a bird, a fly, has been enough to kindle a delightful train of ideas and emotions, and sometimes to elevate the mind to sublime conceptions. When the autumn stole on, I observed it with the most vigilant attention, and felt a pensive regret to see those forms of beauty, which tell that all the beauty is going soon to depart. One autumnal flower (the white convolvulus) excited very great interest, by recalling the season I spent at Chichester, where I happened to be very attentive to this flower, and once or twice, if you recollect, endeavored to draw it with the pencil. I have at this moment the most lively image of my doing this, and of the delight I used to feel in looking at this beautiful flower in the hedges of those paths and fields with which both you and I are so well acquainted.”—Vol. i., p. 333.

This returning converse with nature was a sort of anastomosing in his moral constitution; for it maintained a vital connection with his social system, after the trunk arteries of love and fellowship had been, or seemed to be, severed. Whoever, with a *genuine* delight, still relishes green fields and flowers, should be treated as recoverable to humanity. So important, therefore, in education is the culture of tastes which, among the ill influences of after life, may, when themselves refreshed, become the channels for conveying refreshment to the better affections of the soul.

At length, however, those channels of the heart through which life’s blood had flowed feebly to sustain the social sentiments, became invigorated by a thorough reanimation of the loving faculty. Foster was soon to be united to the woman of his choice—a companion “mete for him”—an intellectualist, and one, we should presume, very much of his own order—even the “Friend” to whom the Essays were addressed. It is curious to hear him, a few weeks previous to his marriage, greeting the spring in new strains of pleasure. Heretofore, it was not the verdant glories of June that could avail to entice him from his lumber room; but now, behold him! within a mile of the “nauseated” Frome, thus revelling amid the beauties, not of June, not of May, not of April, but of March, and even of the first week in March;—

“Frome, March 3, 1808.

“Yes! the spring does open upon me with a fascination which I have not felt before, notwithstanding that I have often felt a kind of worship of nature on the return of that delightful season, with its flowers, birds, and genial gales. This once I certainly do feel in its first indications a deeper charm than I did even in my youth, when I was as full of fancy and sentiment as any poet. For several years I have been much less susceptible of the vernal impressions, and have considered myself as advancing fast towards the state of feeling which I recollect P—, a few years since, described himself to me as having reached—the state of feeling no impression at all. And no doubt it is from the new and adventitious cause, that I have felt such luxury in the beautiful days which we have had for a week past.”—Vol. i., p. 352.

This marriage—he was then in his thirty-seventh year—appears to have been thoroughly a happy

one; nor was it rendered otherwise by the personal sufferings and the domestic sorrows that attended the lapse of years. It occurred just time enough in his history to save Foster from the miserable fate which had seemed to threaten him—that of being eaten alive by his own cyclopean and pampered imagination. Far more happy now than heretofore, he could, and did, without effort, put himself in the way of those kindly sentiments towards himself, of which, spite of himself, his amiable qualities and real worth had made him the object. Some months after his marriage he visited Frome, and thus reports his reception:—

“At Frome I was received with the most animated kindness, both among the richer and poorer class of my acquaintance—a kindness to which I could not make an adequate return in the way of giving much of my company, as I had determined not to stay more than three days. I felt the propriety, even as a matter of appearance, of not being like a rambler from home, besides the impatience of affection to be again with my dear, domestic associate. I returned to her at the time I had determined, found her well, and was welcomed with inexpressible tenderness. The felicity of thus rejoining her seemed to me to exceed even the joy of being first united to her. Nearly four months have now elapsed since that time, and on both sides the affectionate complacency has very sensibly increased. We both every day express our gratitude to Heaven for having given us to each other, and we hope that it will continue a cause of the most lively gratitude as long as we live, and also in a state after death. I most entirely believe that no man on earth has a wife more fondly affectionate, more anxious to promote his happiness, or more dependent for her own on his tenderness for her. In the greatest number of opinions, feelings, and concerns, we find ourselves perfectly agreed; and when anything occurs on which our judgments and dispositions differ, we find we can discuss the subject without violating tenderness, or in the least losing each other's esteem, even for a moment. Greater trials of our mutual affection and respect than any that have yet occurred, will undoubtedly arise in the course of life, if it is considerably protracted; but the experiment thus far has given us a stronger confidence in the perpetuity of tenderness and harmony than it was possible for us to have previously to any experiment at all.”—Vol. i., p. 373.

What would the now-vaunted “holy celibacy” have done for Foster? Had he lived in the times of its influence, he would doubtless have plunged into that horrible pit, and would there have become a monster—not indeed of wickedness, but of misery. None but those who have dipped into the memoirs of monkery can understand, just in a case like Foster's, what is the *infinite moral value* of ordinary expressions such as these that follow.—Writing soon after the birth of a son, he says:—“Physically, the chap is deemed, I understand, as promising as his neighbors. My wife is still extremely well for the time, and I hope will soon be restored to her full health and strength. It is she that I care fifty times more about than I should about any infant.” Nevertheless, he was not the abstracted, or the indifferent father which literature sometimes renders a man. Let the reader look to the Letters, which we cannot cite, relative to the illness and death of this son. Married life was a new birth to Foster, and it overtook him precisely at the right moment; for at length his mind had

reached its maturity; he had firmly taken his place, too, in literature; and those depths of thought he had plunged into, (enriching his writings) which a man with a wife at his side—not being a Xantippe—is little likely to attempt; and, moreover, the moody recluse was still in a state to be recoverable as a man.

The very same sort of feeling that is inspired, at the moment while we write, by the sudden falling of a plentiful rain after a long and ominous drought, is awakened by the altered tone of Foster's Memoirs, from the period of his marriage. During the arid, scorching time of his solitary existence—when the heavens over him were brass, and the earth under his feet iron—the fields did not seem worth walking in. Frome was “nauseated,” and the good folks in it were shunned, if not abominated. But now, a while after, when reporting a visit to Frome, “accompanied by Mrs. Foster”—oh! what miracles of moral cure are latent in those three consonants!—he says:—“I revisited, at their houses, a number of the good people I had once preached to, especially the poor people, who manifested a lively pleasure in seeing me again.” No doubt of it: they had probably been used to think Mr. Foster “rather a particular man in his ways—wonderful shy, and not everybody's liking in the pulpit;” but they had always felt sure that “the root of the matter was in him,” and that he had a kind heart too; but *now*, who could help loving him, and “Mrs. Foster as well.”

A beautiful feature of Foster's personal character, and a very prominent one too, as well as an infallible criterion of the genuineness of his moral sentiments, is his filial piety. From the first to the last, and long after he had begun to call himself an old man, his letters to his “honored parents,” if they do not conspicuously exhibit *his intellect*, yet are such as prove *theirs* to have been—their rank and education considered, of an unusual sort. What must that old woman have been, if indeed letters, such as some of those addressed by Foster to his then very aged mother, could have been intended by him to meet *her* level of thought! These letters, conjoined with the pertinent fact that to the last, and through years when his income was narrow and precarious, he “contributed liberally to the support of his parents,” exhibit him in a light which sheds a steady effulgence upon his character as a great writer and a man of genius.

“My wife and the brats are still well,” he says; and “papa,” having in his nature all the needful elements of paternal philosophy, early learned to adjust his habits to his new position.

“Those brats are just now making a great noise, and running about to make themselves warm, in the house under me. I have noticed the curious fact of the difference of the effect, of what other people's children do and one's own. In the situations I have formerly been in, any great noise and racket of children would have extremely incommoded me if I wanted to read, think, or write. But I never mind as to any such matter of convenience *how much* din is made by *these* brats, if it is not absolutely in the room where I am at work. When I am with them, I am apt to make them, and join in making them, make a still bigger tumult and noise, so that their mother sometimes complains that we all want whipping together. As to liking freaks and vivacity, I do not feel myself much older than I was twenty years since. I have a great dislike to all stiff, and formal, and unnecessary

gravity. If it were not so, I should be to children quite an old man, and could have no easy companionship with them. It must be a great evil for parents to have with their children an immovable, puritanical solemnity, especially when the disproportion in age is so unusually great as in my case. But I feel no tendency to this; of course, to avoid it is no matter of effort or self-denial."—Vol. i., p. 387.

Foster's correspondence, as presented in these volumes—and it is not for us to conjecture why the list does not include names which we had presumed we should meet with—does not boast the recommendation of having been carried on with the chief spirits of the age. But, and incidentally from this very cause, it is of a sort that sheds upon his personal character a peculiar grace. The one quality that pervades these letters—shining full in a large proportion of them—is the beautiful simplicity, the artlessness, the humility, of a man who never thought of himself as "great writers" and "great men" are too apt to do. Not by any means comparable to Cowper's, Foster's letters are nevertheless equal to them on the one ground of their thorough genuineness, and in the total absence of egotism and consequence. A large proportion of them turn upon personal or domestic matters—his own feelings, his habits, his engagements, (as do Cowper's;) but not one of them betrays the disguised selfist;—not one indicates the anxiety of a man who is tormented with the apprehension that his friends are underrating his importance, or do not yield him, in their thoughts, the place which he thinks due to him, as a public personage.

Foster's correspondents were, for the most part, his early personal friends, and most, or all of them, were, more or less decisively his inferiors, intellectually. Nevertheless, in not one of these letters is there any note of arrogance; not a line is there, the plain English of which would be—"I hope you know who I am; don't be too familiar; don't presume upon the accident of our early acquaintance. I am John Foster, the Essayist." The very same quality—the same indication of real greatness—shows itself, though under a varied condition, in those of the letters that are addressed to men of intelligence and accomplishments—that is to say, to his *quasi* equals, such as Joseph Hughes, W. Anderson, Josiah Hill, and Daniel Parken.* No asserting of himself, no elbowing for his seat at the head of the table, shows itself in these letters. In truth, and still more strikingly than his letters to his early friends, they serve to show that Foster's habitual converse with his own heart had been such as to bring him into a mood utterly abhorrent of all pretension and self-complacency; while his communion with infinite wisdom, and his daily meditation of things "unseen and eternal," suffused through his moral nature much of that "humbleness of mind" which we are wont to attribute to the beings of a higher sphere.

Such was Foster! We say, such was Foster, thinking, as we do, of those who will be snatching some paltry controversial advantages—some occasions of ranting, from these volumes. He was

* We do not know why we should conceal an expression of disappointment in not finding the name of Josiah Conder in these volumes. Unless we are quite in error, Foster's letters to the then Editor of the *Eclectic* were of a kind to be eagerly read by the public, and for which room might, with manifest advantage, have been made, by the exclusion of some pages that are puerile in the first volume, or of passages that are sophistical and unseemly in the second.

one whose violences of opinion did not spring from rancor of the heart, but from the ungoverned vehemence of his indignation against wrong, and from the undisciplined turbulence of his imagination. Such opinions, therefore, while they are not worth anybody's picking up and boasting of, cannot, consistently with candor or fairness, be cited in evidence against either himself or his party.

The editor, we think, might well have gratified the curiosity of the reader, by supplying a few characteristic notices of Foster's correspondents, at least of such of them as do not now survive. We must not attempt to supply this deficiency, unless it were in relation to one, the letters to whom bring Foster out as a social being, and as a Christian, and as an intellectualist, more fully, perhaps, than any other parcel of the (published) correspondence. We mean Josiah Hill. Josiah Hill, whom, in due deference to the statistics of "Conference," we must consent to designate as "a preacher in the Wesleyan connexion," might, seeing him only in the street (we mean thirty years ago) or meeting him in a select party, have passed for anything as soon as for a Methodist minister. He became such, in fact, we rather think, because a *calculus* of Arminianism, too deep-seated within his ample brain to be extracted, conjoined with a severe conscientiousness, forbade his exercising the functions of the Christian ministry within any Evangelic communion holding a Calvinistic creed; and the "seventeenth article," as he read it, must have kept him out of the Established Church. Richard Baxter, much rather than John Wesley, (we hope no offence,) was his Rabbi. But it was delightful to hear in what way, and with what fine tact, he would bring *Christianity* clear and clean out of *Wesleyanism*, and present it, intelligibly and attractively, to a congregation of Cornish miners. Even the old women liked, and, if we should credit their audible "amens," understood Josiah Hill, little suspecting the largeness of the soul that lodged itself, and that sported, unbeknown to them, within the walls of that ample forehead!—woe to him, if aged class-readers could have looked in at the large windows of his blue eyes, and read the unuttered mind of their teacher! and yet, even such would have found there no just ground of offence, could they have deciphered the entire man. He was "theirs" in truth and sincerity, although not theirs after the fashion, and according to the notions, of a customary Wesleyan superintendant and preacher. The sage wearers of those portentous Cornish broad brims, some of whom, thirty years ago, still remembered "good John's" preaching in the hollow near Gulval, or Huel Abraham, and who admired "Josiah Hill," knowing not a thousandth part of him, would perhaps have denounced him to "Conference" had they known a little more; and yet these, even these, would again have loved him, and listened to him as an angel, had it been possible to *them* to know the whole.

But how agreeable, how tranquillizing, and, at times, how elevating, were the hours he gave to those who, as he thought, could understand him, and whom he could trust! Well fitted was he, we should think, to be Foster's companion and correspondent. The many domestic afflictions which he passed through, after the time of his intimacy with Foster, seem—so we should suppose, judging from the tone and topics of the letters in these volumes, to have abated very much of the spring and energy of his understanding, such as it was at the period

when he could report that "Mrs. Hill and the children were all quite well." Death—death—and death again, inasmuch as it could not render him more serious than before, at length quelled his intellect: not that he became imbecile; but, as to its vivacity, his mind bled out at these open wounds. This imperfect notice, and we are not qualified to complete it, may perhaps serve to engage the reader's attention the more for this portion of the correspondence. The letters themselves are not on the whole, we must admit, such as a man of Foster's intelligence might be expected to address to a friend, like Josiah Hill. Some of them are prosing—many are too lugubrious; and yet all indicate a sincere and serious piety, and a thoroughly cordial temper, as a friend. But it is evident that, with his heavily burdened animal system, his want of elasticity and cheeriness, he needed all the stimulus of "going to press" to put his faculties fully in movement. The dreaded and long procrastinated labor of writing, even to a highly intellectual friend, brought with it far more of the oppressive sense of a painful duty to be acquitted, than it did of easy pleasurable excitement. And hence it is that a large proportion of the "Correspondence," while it will be read with a vivid pleasure by those who have already become intimate with Foster as the essayist, and the Eclectic reviewer, will seem flat or rapid to those who have no such preoccupation of the mind in his favor.

He protests, indeed, (vol. ii., p. 53,) that *letter writing did not cost him the painful toil, the utter misery, which, in "ninety-nine cases out of a hundred," attended his literary occupations.* But if he did not, in these instances, undergo so much torture, it was because he made no effort to provoke his sluggish faculties; and the consequence is, that these letters—read with no reference to the author, do but incidentally betray the secret that the writer was so distinguished an author. And if, when no special circumstance relating to himself, or to his friend, roused his mind to action, he is often dull—when some such circumstance—a death, for instance, of one dear to his friend, or to himself, did awaken and powerfully move him, it was not his *intellect* but his *heart* that was stirred—it was not the author, but the man, that then took up the pen. Everything in Foster's nature was so thoroughly genuine, and he so absolutely the creature of his moral instincts, that to have written a letter, on a sorrowful occasion, bright with mind, and such as would read well in a book, was what he was no more likely to do than he was to dance at a funeral. His consolatory letters to his friends, as well as those announcing to them his own domestic griefs, might easily be matched in the family records of many a private circle. Many a man, and many a woman, who could not have written one page of what Foster has printed, has, under the stimulus of sorrow, written what he, *in sorrow*, could never have approached; for, in sorrow, his mind, accustomed to obey an impulse altogether of another order, woke not up—acted not at all:—his mind—the author-mind, knew too well its subordination to the soul, to dare to intrude ever upon the sacred seasons of deep emotion. The tenderness of his affections lulled, on such occasions, both imagination and reason.

"On Foster's return to Stapleton he wrote immediately to Mr. Hill, with whom his friendship had acquired a deeper and melancholy interest, from the striking coincidences in their domestic trials. 'I have returned *hither*,' he says, 'but

have an utter repugnance to say returned *home*—that name is applicable no longer. You may be sure I am grateful for your kind sympathy and suggestions of consolation; not the less so for its being too true, that there is a weight on the heart which the most friendly human hand cannot remove. The melancholy fact is, that my beloved, inestimable companion, has left me. It comes upon me—in evidence, how varied and sad! and yet, for a moment, sometimes, I feel as if I could not realize it as true. There is something that seems to say, *Can it be that I shall see her no more—that I shall still, one day after another, find she is not here, that her affectionate voice and look will never accost me; the kind grasp of her hand never more be felt; that when I would be glad to consult her, make an observation to her, address to her some expression of love, call her "my dear wife," as I have done so many thousand times; it will be in vain—she is not here!* Several times a considerable number—even since I followed her to the tomb, a momentary suggestion of thought has been, as one and another circumstance has occurred, "I will tell Maria of this." Even this very day, when I parted with Dr. Stenson, who, out of pure kindness, accompanied me a long stage on the road, there was actually, for a transient instant, a lapse of mind into the idea of telling her how very kind he had been. I have not suffered, nor expect to feel any overwhelming emotions, any violent excesses of grief; what I expect to feel is, a long repetition of pensive monitions of my irreparable loss; that the painful truth will speak itself to me again, and still again, in long succession; often in solitary reflection, (in which I feel the most,) and often as objects come in my sight, or circumstances arise, which have some association with her who is gone. The things which belonged to her with a personal appropriation; things which she used or particularly valued; things which she had given me, or I had given her; her letters or my own to her; the corner of the chamber where I know she used to pray; her absence—unalterable absence at the hour of family worship, of social reading, of the domestic table; her no more being in her place to receive me on my return home from occasional absence; the thought of what she would have said, or how she would have acted, on subjects or occasions that come in question; the remembrance how she did speak or act in similar instances—all such things as these will renew the pensive emotions, and tell me still again what I have lost—what that was, and how great its value, which the sovereign Disposer has, in his unerring wisdom, taken away. Yes; it is *He* that has taken away what it was *He* that gave me, and what was so dear and valuable to me; and I would not, I think I do not, rebel against his dispensation; I would not even repine or complain beyond that degree which he will regard with a merciful compassion. I should, and would be, thankful for having been indulged with the possession so long. Certainly, neither of us would, if such an exception *might* be made to an eternal law, recall our dear departed companions from their possession of that triumph over sin, and sorrow, and death, to which they have been exalted. However great our deprivation, how transcendently greater is their advancement in the condition of existence! And we should be unworthy to be loved by them still, as I trust that, even at this very hour, we are, if we could for a moment entertain such a wish.'"—Vol. ii., p. 209.

The ruling idea in Foster's mind, as a religious

man—the centre towards which his thoughts reverted, was the condition of the soul immediately on its quitting the body. Religious men, of a thoughtful turn, and of a higher and more elastic animal temperament, look onward to that bright immortality wherein, and under happier auspices, the spirit incarnate is to set forward anew upon the high way of action, acquisition, service. Foster's meditative wing faltered as if in front of the precipitous bulwarks of Paradise—not daring to soar toward the empyreal noon. We read this sort of feeling always when his imagination would go forward toward eternity, in such passages as the following:—

"Any view of eternity is overwhelming to thought, but peculiarly to the thought that we, that this very soul shall exist forever. Sometimes, even apart from the idea of retribution, it seems almost fearful. 'How can I sustain an endless existence? How can I prolong sentiment and action forever and ever? What may or can become of me in so stupendous a predicament? What an accumulation of miracles to preserve my faculties, my being, from becoming exhausted and extinct!' How can there be an undecaying, ever new, and fresh vitality and animation, to go powerfully along with an infinite series of objects, changes, excitements, activities?"—Vol. ii., p. 376.

But although melancholic enough in temperament, he was far too much the intellectualist, and too devout, in a scriptural sense, to stop short at the grave: he was no moping frequenter of churchyards; he did not haunt charnel-houses; he did not gather wise saws from the sexton's lips. The strong tendency of his mind toward *actuality* led him to lay hold of that which was the *nearest*:—that condition of the soul which those who had recently left him, and who were vividly present to his feelings, had *now* undergone. The state of the dead was his recurrent theme—the home of his meditations, from the first to the last, as when, in prospect of his own dissolution, believed to be not very remote, and on hearing of the death of a friend, he exclaimed:—"They don't come to tell us," (the secrets of the invisible world,) and then, after a short silence, emphatically striking his hand upon the table, he added, with a look of intense seriousness, "But we shall know *some time*."

Very many passages might be cited from these volumes, bearing upon this one subject, and in which, with not much variety of thought, the one feeling of baffled and astounded curiosity is expressed. A letter also, or essay, "On the Intermediate State," expounds the same feeling, and serves rather to state forcibly the supposed difficulty connected with our utter ignorance of the world of souls, than to throw light upon the general subject, considered as an article of Christian belief.

The death of his wife—not his wife merely, but his soul's companion and intimate, naturally gave a deep intensity to his customary meditations on this ground.

"Can it be—how is it—what is it—that we are now not inhabitants of the same world—that each has to think of the other as in a perfectly different economy of existence? Whither is she gone—in what manner does she consciously realize to herself the astonishing change—how does she look at herself as no longer inhabiting a mortal tabernacle—in what manner does she recollect her state as only a few weeks since—in what manner does she think, and feel, and act, and communicate with other spiritual beings—what manner of vision has

she of God and the Saviour of the world—how does she review and estimate the course of discipline through which she had been prepared for the happy state where she finds herself—in what manner does she look back on *death*, which she has so recently passed through—and does she plainly *understand* the nature of a phenomenon so awfully mysterious to the view of mortals? How does she remember and feel respecting *us*, respecting *me*? Is she associated with the spirits of her departed son, and two children who died in infancy? Does she indulge with delight a confident anticipation that we shall, after a while, be added to her society? If she should think of it as, with respect to some of us, many years, possibly, before such an event, does that appear a *long* time in prospect, or has she begun to account of duration according to the great laws of eternity? Earnest imaginings and questionings like these arise without end; and still, still, there is no answer, no revelation. The mind comes again and again up close to the thick black veil; but there is no perforation, no glimpse. She that loved me, and I trust loves me still, will not, cannot, must not answer me. I can only imagine her to say, 'Come and see; serve our God so that you shall come and share, at no distant time.'"—Vol. ii., p. 230.

"The deep interest of the subject has led me to think more, and to read a little more, concerning that mysterious *hades*. How strange that Revelation itself has kept it so completely veiled. Many things in that economy probably could not be made intelligible to us in this our grossly material condition; but there are many questions which could be distinctly and intelligibly answered. How striking to consider that those who were so *late*ly, with us, asking those questions in vain, have now the perfect experimental knowledge. I can image the very look with which my departed Maria would sometimes talk or muse on this subject. The mystery, the frustration of our inquisitiveness, was equal to us both. What a stupendous difference *now*! And in her present grand advantage she knows with what augmented interest of solemn and affectionate inquisitiveness my thoughts will be still directed, and in vain, to the subject. But she knows why it is proper that I should for a while continue still in the dark—should share no part of her new and marvellous revelation."—Vol. ii., p. 238.

A very remarkable letter, addressed to his friend Hughes, of whose nearly approaching end he had been informed, contains the following passages:—

"But oh! my dear friend, whither is it that you are going? Where is it that you will be in a few short weeks or days hence? I have affecting cause to think and to wonder concerning that unseen world; to desire, were it permitted to mortals, one glimpse of that mysterious economy, to ask innumerable questions to which there is no answer—what is the manner of existence—of employment—of society—of remembrance—of anticipation of all the surrounding revelations to our departed friends? How striking to think, that *she*, so long and so recently with me here, so beloved, but now so totally withdrawn and absent, that she experimentally knows all that I am in vain inquiring!

"And a little while hence, you, my friend, will be an object of the same solemn meditations and wandering inquiries. It is most striking to consider—to realize the idea that *you*, to whom I am addressing these lines, who continue yet among

mortals, who are on this side of the awful and mysterious veil—that you will be in the midst of these grand realities, beholding the marvellous manifestation, amazed and transported at your new and happy condition of existence, while your friends are feeling the pensiveness of your absolute and final absence, and thinking how, but just now, as it were, you were with them.”—Vol. ii., p. 241.

“It does always appear to me very unaccountable (among, indeed, so many other inexplicable things,) that the state of the soul after death, should be so completely veiled from our serious inquisitiveness. That in some sense it is proper that it should be so, needs not be said. But is not the sense in which it is so, the *same* sense in which it is proper there should be *punitive* circumstances, privations, and inflictions, in this our sinful state? For one knows not how to believe, that *some* revelation of that next stage of our existence would not be more influential to a right procedure in this first, than such an *absolute unknown*. It is true, that a profound darkness, which we know we are destined ere long to enter, and soon to find ourselves in amazing light, is a striking object of contemplation. But the mind still, again and again, falls back from it, disappointed and uninstructed, for want of some defined forms of reality to seize, retain, and permanently occupy it. In default of revelation, we have to frame our conjectures on some principle of analogy which is itself *arbitrary*, and without any means of bringing it to the test of reason.

“* * * * It is a subject profoundly interesting to myself; my own advance into the evening of life is enough to make it so; and then the recent events! You have your own special remembrances, though, as to the several objects, going to a considerable time back, I have one most interesting *recent* object: and there are—were—*Hall, Anderson, Hughes*; where and what are they now? at this very instant how existing, how employed!”—Vol. ii., p. 248.

To the allied subjects—that is to say, to subjects that are allied, either by some real connection existing between them, or by the homogeneity of the feelings they excite—there are very frequent allusions in Foster’s letters. In truth, a sort of monotonous pensiveness—the mood into which one unconsciously falls while listening to the continuous tolling of the funeral bell—coming across a silent valley, in a summer’s evening, prevails throughout. The brevity of life; the decay of the body; (and Foster begins to call himself an old man as early as possible, and a broken man while he was apparently in firm health;) the death of friends; the shifting of all earthly interests; the solemnities of the future life—these are the staple of his letters varied by references, more or less formal, to the sad condition of the moral world—the hopelessness of any remedial means—and to those weighty and insoluble problems which have ever been the burden of reflecting spirits, relating to the position and the destinies of the human family, and its relationship to the justice, the wisdom, the power, the goodness of God. Politics also, and literature, take their turns; nevertheless to whatever topics he may divert, in his converse with his friends, or when writing for the press, *these* were his own themes; these the constitutional material of his thoughts: and he himself, with his high and over-wrought moral sensibility—his rich, vivid, and awe-struck imagination—his mel-

ancholic animal temperament—and his deep and reverential piety, might, better than any one else, who has become known to the world in modern times, be taken and regarded as a type of the MEDITATIVE SPIRIT. His mind was so fashioned as to fit it for reflecting, in portentous outline and lurid color, the lot and fate of man, as severed from the favor of his Maker, and yet as not released from his eternal obligations to sovereign justice.

That special mood of mind which we here intend, and which, as we think, Foster so signally realized, should, were there any practical purpose in view, be distinguished from those conditions of the mind with which it might perhaps be confounded. Foster’s mood, then, was not that of the mystic, whose mental structure must include more of the abstractive faculty than he possessed, (who was in fact wanting in this power,) and far less vividness of the moral instincts. With the mystic—and this is his criterion—moral sensibility—heart-power, is either originally deficient, or it has become paralyzed. Foster again and again, and in the most impassioned manner, says, “take away the atonement and I am utterly wretched.” But the mystic, although the *doctrine* of the atonement may find a place in his written creed, is little conscious of its presence, nor does he much need it; his soul does not turn upon that pivot; he has made his way, by dint of contemplation, so far within the orb of the Deity, that he does not think of a mediator, or desire a way of reconciliation and of access to God. Besides, the mystic is of too calm a mood to trouble himself with the ills that are affecting his fellow-men; it is not *he* who kindles into tempestuous indignation at the hearing of injustice, misrule, hypocrisy; *he* could never annoy us, as Foster so often does, by the utterance of intemperate denunciations, or by uncharitable violences of language. The mystic makes himself as happy in his airy region, as is the insect that takes its circuit, high in the bright sunshine, over a battle field, or a city smote with pestilence.

Nor was Foster’s mood (if we are free to speak of it without reserve) that of more happily constituted Christian minds. Devout as he was, and eminently serious and energetic too, as to his settled belief—his morbid instinct, and his gloomy imagination, stood between him and that “light and peace” which, notwithstanding the state of the world, belongs to, and distinguishes, the genuine Christian temper. Paul, assuredly, was as much alive, as a good man ought to be, to the condition of his fellow-men; nor was he, either in a mystical, or in a secular sense, of an abstracted and insensitive temper; and yet his epistles do not contain a line indicative of a mood of mind resembling Foster’s. One feels, even when not able to detect the sophism precisely, that there *is*, and must be, a capital fallacy somewhere, in his line of reasoning; there *must be*, for the whole tenor of the apostolic writings implies the very contrary to his conclusions. If space permitted we could exemplify this discordance in several remarkable instances. A fellow traveller, sometimes, who has unluckily chanced to get off the road, is seen making great strides in the right direction, but yet over ground so rugged and impracticable, that though he *does* keep abreast of the company, one expects to see him fall exhausted at every step. Such a feeling attends the perusal of Foster’s letters.

Nor is Foster to be numbered among metaphysic reasoners; for neither the limit of his faculty, nor his moral tastes, would have allowed him to grasp pure abstractions, or to pursue the interminable track of those who have attempted to solve the problems of the moral world, by an analysis of primary ideas. The *Theodicæa* was not his book; Leibnitz was not his master, any more than Malebranche, or Clarke, or Jonathan Edwards. He frankly acknowledges, more than once or twice, that he found the greatest difficulty in attempting to prosecute any purely abstract course of thought.

It can scarcely be necessary to say, that Foster's pensive musings had no alliance whatever with the inquiries, with the deductions, or with the hypotheses that belong to Science—to philosophy, properly so called. While he pays respect, as so intelligent a man would be sure to do, to science, he does not conceal the fact that his acquaintance with its processes or deductions was superficial; nor does he anywhere himself attempt to follow out a course of reasoning in a scientific mode.

But, though neither mystic, metaphysician, nor philosopher, we claim Foster as a clearly defined type of the MEDITATIVE MOOD; and he is so, not in any vague sense, but in a special manner, as related to the progress of the human mind, and its recent development. He is the meditative man of *this present epoch*—he represents the passing crisis of that economy whereto he actually belongs. His intense moral sensitiveness, the refinement of his notions on ethical questions—a refinement bordering always upon sophistication and extravagance, and, especially, that reflective habit, which brings before the mind—ever and again, and with a painful sense of its being an urgent reality—the actual condition, and the destiny of the human family—these elements of Foster's intellectual life are not simply *his*; for they mark the ripening and development of christianized civilization at this moment. Remarkable men, it is often said, *represent*, as well as mould their times: Foster represents, quite as much as he has moulded his.

Many pages would barely suffice to convey, even in outline, an idea of what we have here in view—namely, the rise and progress of that REFLECTIVE MOOD which makes the lot or fate of man on earth, and his future destiny, its object and its burden. We must entirely resist the temptation to enter upon a theme so copious, so fertile, so wide in its range, so momentous in its bearings upon the future history of the human mind. We must not dare even to name the men whose names mark the changing aspects of this occult history—this recondite progression of the intellectual system, from the oriental era to the present age—the history of *man's own feeling* concerning his place in the universe, and the treatment he meets with in it. It must here suffice to remind the thoughtful reader, that what takes place in the development of the character of an individual, takes place, in its essential element, during the development of a race or community; or indeed of the human family, so far as it is civilized and christianized. The brute man—untaught, and occupied wholly with the toils, pains, and sensuous enjoyments of animal existence, does not stay to inquire concerning his own lot, *as better or worse than it might be*; much less concerning the lot of his fellows—his clan or nation:—least of all, concerning the destiny of his species, as dependent upon, and as related to

Almighty wisdom and beneficence. But, now, let us impart culture to this being; and with culture, so improve his condition, as to allow him leisure—leisure to ponder his lot, and to ask himself whether he be happy or miserable; and then he will begin to think himself—if not miserable, yet far less happy than he might be, and ought to be. And if his position be subordinate—if his well-being is dependent upon the will of those who are, or who seem to be, more blessed than himself, and then we go on to cherish in him the moral instincts—to quicken those sensibilities that kindle, and are again kindled by the imagination. Do this, and the man resents his fortunes—his bosom heaves with pride—he challenges his master to establish his right of domination, and he revolves the purpose, and contrives the means of liberty. Still farther, call up the affections, give him social excitements, refine his good-will, talk to him of the well-being of those whom he has never seen, wake up that mighty force of the human soul—the faculty of moral abstraction—school him in the science of rights, of duties, of privileges:—thus train him, and teach him, too, to think himself immortal; thus make him a thousand times more than he was at the first; and far happier too, in any genuine and worthy sense of the word, and then he will have learned to believe himself wronged and unhappy;—he will have exchanged brute hilarity for a painful sensitiveness toward innumerable ills, and for a moody petulance, ever questioning the heavens, and asking—“Hast thou made all men in vain?”

Christianity and philosophy exerting their influence upon the human family, first severally and then conjointly, and continuing to act upon each other, so as to enhance the influence of each; Christianity and philosophy thus quickening and refining the human spirit, have done, and are doing for civilized communities that which we have just now imagined to be done for the individual man. And now at length, that is to say, within these “last days,” the reflective mood, under its various phases—political and religious, threatens all institutions, convulses nations, perplexes philosophy, and almost endangers Christianity itself.

And yet how wonderfully are the forces of the moral world held in equipoise amid perpetual movements!—even as the planetary masses are preserved in equilibrio while all are running their circuits! Those excitements of the reflective mood which now seem to be giving it a dangerous intensity, are themselves abated by a reaction that comes on, as if in obedience to some deep law of nature. Real advances in the social condition of a community render men so much the more painfully sensitive of political ills, and dangerously resentful of political wrongs; in consequence, the entire fabric of society is threatened; the course of improvement is therefore necessarily arrested, the community falls back on its course, and it awaits another season. And so if we look to Christianity, which in our times has done very much more to refine the sentiments of nations than to reform their morals—which has winged the thoughts of the thoughtful, has lent philosophy an upward impulse, has suffused those gentle sympathies that lead men to *consider* their fellows even when they do not love them:—Christianity has taught, it has trained, it has driven men to think at large of “human well-being, of human responsibility, of human frailty,” and of the individual import of the

pains and joys of life, and all this in a manner that now recoils upon Christianity itself, and leads—it has led extensively—to a silent but resentful rejection of its own claims!

To individuals professing to reject Christianity on such grounds, the question might fairly be put, "What is it that has taught you to think Christianity and its revelation of futurity incredible?" The true answer, although it is an answer which we should obtain only from ingenuous bosoms, would be, "It is Christianity itself that has taught us a mode of thinking, and has suffused through our souls a moral instinct, which, to us, renders it, taken as a whole, incredible, or, if not incredible, insupportable!"

It surely would not be a difficult task to prove that a scheme of spiritual principles which in any such manner as this operates to expand and to rectify our notions of FIRST TRUTHS, to purify the moral temperament, and to soften and to vivify the instinctive sympathies, and to refine the tastes, as well as to raise the standard of virtue in a community, can itself be nothing but TRUTH. "Can you indeed believe?" we should say to such persons, "Can you deliberately believe a system to be earth-born, and (which if it be not from heaven must involve frauds and errors that are of lower origin than earth) can you think a system false which is capable of working upon a civilized and instructed community in the way which Christianity works! Can you give verdict against it, and say that it is a fraud?"

It is, however, quite beside our present purpose, as well as wholly superfluous, to attempt an apology for the Gospel. We have another and a special object in view—an object obtruded upon us by the consideration of what might be termed—Foster's case. This case is of a kind that involves deep consequences, and demands, we think, the most serious regard at the present moment.

It has been usual at all times during the last fifty years, and especially among Protestant writers, to expatiate upon the corruptions of Christianity, such as have attached to Romanism in Spain, Italy, and France, as the fertile sources of infidelity and atheism. The mass of men, it is said, knowing little or nothing of the religion of Christ, beyond what priests and monks have taught and shown them, have concluded all to be an imposture, where so much of profligacy and of fraud was apparent. This is quite true, and it is obvious too; meantime something else—something not so obvious, and yet not less momentous, or less deserving of regard, is also true, namely—That the wide suffusion of a purified Christianity on the surface of society, and the indirect influence of the refinement of tastes which thence results, especially among the cultivated classes, is generating infidelity and pantheism among us, silently, but to a great extent. Popery, with its barbaric polytheism, its miracles, its cruelties, has probably done, or nearly done its work, as the parent of infidelity. Men of education, throughout Europe, have at length come to see that Voltaire's inference, carried over from Popery to the Gospel, was as incorrect and unphilosophical as it was wicked. German neology has undug French flippancy; nor need more be said in confutation of this sophism, for it is obsolete.

But that other, and more deep-seated source of perplexity and of unbelief to which we are here adverting, is *not* obsolete, it has *not* spent itself;

for it has only of late come into operation; it is only now making itself felt; and barely does it draw upon itself, as yet, any observation, even from the most observant and thoughtful minds. And yet what can be of more serious import! Our space admits of nothing beyond a hasty reference to a subject which might well employ the undiverted attention of any who may be competent to pursue it.

John Foster, such as he appears in these volumes, lay prostrate and helpless amid the desolations of the moral universe: he clung to his belief as a Christian; yet, in doing so, he held fast also to a very dark despondency. But minds more elastic than his, and less profound too, will leap up from the same slough, leaving behind them as well their despondency as their belief. They will go away lightened, just as a ship is lightened, which, in a gale of wind, has thrown overboard, not its ballast only, but its stores of food and water: the vessel dances now over the billows—and will dance—until the crew has perished! Foster's mood of mind exhibits, in a marked manner, what the last fifty years have been doing for us, under the light—light rather than warmth—of a purified Christianity. It is not that tendency to unrestrained speculation and skepticism which is said to attach to Protestantism, and which has had its course in Germany, that we are now speaking of; but it is a silent influence over the imagination, and over the moral sentiments of a cultured people, which springs from the wide diffusion of the Gospel itself; we mean the Gospel *freed from corruptions, but bereft of power*.

We are, however, accosted—and perhaps angrily—by the question, "What then! Do you intend to say that truth, purely enounced, can operate to bring about its own rejection?" Yes, we are bold to affirm, that it does so, if it be not ministered in the plenitude of its forces: it is doing so *now*, to an extent little thought of; and it will go on doing so, unless those renovations of the spiritual life come in, which might lodge Christianity far more firmly, than at present, in the minds of men.

Take a sample of quotations from Foster's letters, such as should fairly represent his habitual views, his ordinary state of mind, and the deep gloom that oppressed him through the greater part of his course. It may be well to strengthen our argument by a passage or two;—five times as much might be cited.

"I hope, indeed may assume, that you are of a cheerful temperament; but are you not sometimes invaded by the darkest visions and reflexions, while casting your view over the scene of human existence, from the beginning to this hour? To me it appears a most mysteriously awful economy, over-spread by a lurid and dreadful shade. I pray for the piety to maintain a humble submission of thought and feeling to the Wise and Righteous Disposer of all existence. But to see a nature created in purity, qualified for perfect and endless felicity, but ruined, at the very origin, by a disaster devolving fatally on all the race—to see it in an early age of the world estranged from truth, from the love and fear of its Creator, from that, therefore, without which existence is a thing to be deplored—abandoned to all evil, till swept away by a deluge—the renovated race revolting into idolatry and iniquity, and spreading downward through ages in darkness, wickedness, and misery;—no divine dispensation to enlighten and reclaim it,

except for one small section, and that section itself a no less flagrant proof of the desperate corruption of the nature;—the ultimate, grand remedial visitation, Christianity, laboring in a difficult progress and very limited extension, and soon perverted from its purpose into darkness and superstition for a period of a thousand years—at the present hour known, and even nominally acknowledged, by very greatly the minority of the race, the mighty mass remaining prostrate under the infernal dominion of which countless generations of their ancestors have been the slaves and victims—a deplorable majority of the people in the Christian nations strangers to the vital power of Christianity, and a large proportion directly hostile to it; and even the institutions pretended to be for its support and promotion, being baneful to its virtue—its progress in the work of conversion, in even the most favored part of the world, *distanced* by the progressive increase of the population; so that even there, (but to a fearful extent if we take the world at large,) the disproportion of the faithful to the irreligious is continually increasing;—the sum of all these melancholy facts being, that thousands of millions have passed, and thousands every day are passing, out of the world, in no state of fitness for a pure and happy state elsewhere. Oh, it is a most confounding and appalling contemplation!"

—Vol. ii., p. 444.

Upon passages such as the foregoing we should remark, *first*, that it is a style of speaking which, although not often *heard*, is truly characteristic of—it is symptomatic of—this present era. It is not the style of any *past* era. We could adduce striking illustrations of the fact, by citing what should be parallel passages, from the writers of successive ages. To go no further back, Foster's language is not that of the sober non-conformists whom he would have called his ecclesiastical predecessors and fathers. It was in a light essentially differing from this, that Baxter was accustomed to look upon the very same objects. And, assuredly, the robust disputants of the Westminster Assembly were not soul-troubled in any such manner! Theologically, as well as logically, and to their own entire ease of mind and "comfort," they dealt with, and finally determined questions, the mere thought of which broke Foster's heart! Had he, with his mournful strains, come in *their* way, they would have regarded him as little better than a blasphemer; and it is a doubt if even his hatred of prelacy would have been held good for "bailing" his ears. No—in their time the recovered Christianity of Luther's period had not, in any such manner, purified the moral or the intellectual atmosphere, as is implied in breathings, and in sighs, such as those of Foster's correspondence with his friends. Two hundred years ago the great truths of the Gospel beat strong in the trunk arteries; but had not sent fine feelings and a fine complexion to the surface of man's moral nature. All modes of thinking were barbaric, and the modes of feeling were such as might allow good men, with an easy conscience, to burn one another; and such as strengthened them to endure their hour when their own time came to be burned. The conventional ideas of the divine government had been compacted out of men's recollections of the ways of the Holy Office, and their experience of Star Chamber mercy. They read Scripture by a Smithfield light, and were not appalled at that which we read with heart-stricken discomfort. The very same things

which stagger our belief in Christianity, strengthened theirs.

But we have a *second* remark to make upon the passages we have just now cited, and it is this, namely:—That as the appearance of sentiments such as these is characteristic of the times, and is an indication of what is going on around us—occultly perhaps—so, the diffusion of these modes of feeling, through the religious community, ought at once to be met, on the part of whoever is competent to the task, in a wise and effectual manner.

There are those who will say—Leave this sort of melancholy and unprofitable moodiness to itself; it will never spread; it will never affect more than a few minds of morbid structure, similar to Foster's. This is, we think, an inconsiderate conclusion, and it is one which will be accepted only by those who are living in too great a bustle to find leisure for *thinking*, and who, accustomed to look down, from pulpits and platforms, upon areas filled with faces, surmise little or nothing of what is going on in the secrecy of bosoms. It is quite true that you may find means for discouraging and for dissipating melancholy modes of thinking; but, if you wholly succeed in doing so, you bring a community that once was deep-feeling into the frivolous shallows of literary, scientific, and sensuous emptiness. What is the gain of this process to religion? Look at the general condition of society in France! Nothing can be more perilous than the attempt to turn off religious meditation from its path, by means that are not of homogeneous quality.

The further spread of Christianity is not merely devoutly desired by Christians, but is looked for as a probable event. We ought, however, to remember that it *may* spread—it may continue to spread in the way in which, of late years, it has—superficially, but not deeply;—that is to say, everywhere raising the tone of moral sentiment—purifying the domestic atmosphere—removing from view, throughout Christian countries, whatever is morally offensive—cherishing and promoting beneficent enterprises—and, in a word, diffusing, on all sides, a vital sensitiveness, and bringing all minds into a habit of *benevolent reflectiveness*. It may do all this—and it may do it to an extent of which we cannot now calculate the consequences—and yet, as at present, it may be making little or no progress as a deep spiritual power, evolving mighty counteractive influences within the bosoms of men *individually*. What, then, ought we to anticipate as the inevitable consequence? The consequence, infallible, irresistible, is—and we ask that the import of our words may be seriously considered—the result of the expected and desired diffusion of Christianity, in highly civilized countries, *under its present aspect* of a mild, purifying, but powerless influence, is an antagonistic reaction from Christianized sensibilities, upon Christianity itself, and which must bring about, unless the course of things be early arrested, the substitution silently of a Christianized Pantheism.

Let it be remembered, that what we are now dealing with are not those definite causes which may be capable of being scientifically stated and logically followed out to their effect. We are speaking of a thing so indeterminable as the moral sensitiveness of communities, and of the consequences that are involved in the presence of this vague force. We are speaking of the nebulous matter of the moral universe; but, because it is imponderable, unfixed, and not to be mapped, is

this influence therefore unimportant? If any could think so, we might remind them of what this same unappreciable power, slowly rising, by a few degrees yearly, and suffusing itself wider and wider, has effected in our times. The adjuncts of the national movement thrown out of our estimate, it was this silent swell of the moral sensitiveness of an entire people, that at length denounced the "trade in blacks" as a horrible crime, and which, so far as the people's will and acts could go—suppressed it. Again, the same tide of feeling, rippling upward always in the British bosom, at length denounced slavery itself as an intolerable evil, and annulled it, and paid the price, cash down, for buying relief from that anguish which the thought of slavery had come to inflict upon the keen moral sensitiveness of the British people. But where was this same mighty influence fifty years ago? Latent, yet not latent, simply because the appalling facts regarding slavery had not then been presented to the British mind;—but it was latent, just as the vigorous affections of manhood—the determined energies of five-and-twenty—are asleep in the brain and bosom of the rude, reckless, purposeless schoolboy. The reflective mood had not been ripened until of late.

To the development of the same slow-working forces, must be attributed that great movement of our times—the Evangelic Mission to the heathen world; and to the same, a hundred forms of Christianized benevolence; and to the same, a rise in the moral energies of the domestic economy. Whence come the anxious inquiries of parents as to the disposal of their children at school and afterwards, consistently with their highest welfare? Was a solicitude of this sort prevalent fifty years ago? We think not. And whence arises the eagerness with which books are caught up, professing to treat of the moral domestic economy, and of the functions and duties of the maternal character? All these things are the indications, and they are the results, of that enhancement of the moral consciousness which has been in progress in England especially, which is now in progress, and which, in its silent course, is swelling and heading itself up to act, we will not say when, or in what precise manner, upon Christianity;—yes, upon that very Christianity whence the whole influence has taken its rise.

In whatever way this looked-for reaction should be met, and whatever those means are which thoughtful men should labor to render effective for the conservation of religious belief, the motives for an early consideration of the subject, are rendered imperative by some collateral facts, the influence of which upon religious belief at large, and upon the *meditative consciousness* of the educated classes, has rendered itself obvious, and must become more and more so every year. The reader will know that we here refer to that indirect modification of religious notions and sentiments, that results insensibly from the spread and consolidation of the modern sister sciences—Astronomy and Geology, which, immeasurably enlarging as they do, our conceptions of the universe, in its two elements of space and time—expel a congeries of narrow errors, heretofore regarded as unquestionable truths, and open before us, at once, a Chart, and a History of the Dominions of Infinite Power and Wisdom!

We should hasten to exclude the supposition that, in thus mentioning the relation of the modern sciences to Christianity, we are thinking of anything so small and incidental as are the alleged discre-

pancies between the terms of biblical history in certain instances, and the positive evidence of science. All such discordances—whether real or apparent, will find the proper means of adjustment, readily and finally, in due time. We have no anxieties on this subject. Men "easily shaken in mind," will rid themselves of the atoms of faith which perhaps once they possessed, by the means of "difficulties," such as these. But it is not from causes so superficial that serious danger to the faith of a people is to be apprehended.

What we have in view is that involuntary, and suddenly affected shifting of our intellectual position, which the discoveries of astronomy and geology have brought about:—a change of position, involving a change equally great, in the apparent magnitude of all those objects in the presence of which our religious conceptions have hitherto been formed;—a change, too, in our notions both of the processes, and of the principles of creative power. We had formed our ideas, very distinctly, of what God had done, and *when* it was done, and *why*, and now, not without amazement, we read on all sides a startling comment upon the words—"My ways are not as your ways—nor my thoughts as your thoughts, saith the Lord."

It would be idle to imagine that these vast revelations of Time and Space—God's own providential revelations of his own works and ways, should exert no influence—or that they *ought* to exert no influence upon those notions of the divine government, and of the moral universe, which were formed in the dark, and during the times of our ignorance of everything more remote from us than a few hundred miles, and a few hundred years. It is in vain to imagine that a Chinese wall can be carried up around the celestial empire of superannuated theological formulas—a wall which must be as lofty as the stars, and so impervious as to intercept all communications between that sacred enclosure, and the open world of philosophy! This cannot be done; and assuredly it ought not to be desired.

The one science—call it astronomical geology, or geological astronomy, is daily bringing home to all minds the conviction that the universe is *one place*—that it is built of one material—that it is governed by one set of laws, and is adapted to the support of analogous, if not of identical modes of conscious existence; and that it presents, amid infinite diversities of forms and conditions, the prevalence of principle—shall we term it, *THE DREAD UNIFORMITY OF FIRST LAWS*! All discoveries bear this same inference, every deduction brings forward the same conclusion. The colossal telescope—the infinitesimal analysis—which gives expression to the revelations of the telescope, say the same thing; and what else do those *aérolites* say, that dash upon our planet? what are they but epistles from the skies, charged with a symbolic message to this effect—That the planetary stuff is all one, and the same!

In rigid logic—logic after the fashion of the mediæval theology, it makes no difference in the working of a metaphysic or ethical problem, whether the consequence attaches to "few—that is to eight souls," or to millions. Whatever it is that can be made to appear to be certain, or probable, as relating to the *few*, must be granted to be certain, or probable, also, even when the conclusion is discovered to embrace the well-being of the million. But it is not, and it will not be the same in relation to the meditative consciousness—to that

involuntary conviction which seizes the mind under the influence of vast and unlooked-for discoveries. The strict logician may hold in contempt our groundless impressions, our unproven and our undemonstrable notions. Yet these impressions, and these notions, spring, we tell him, from the very ground of our moral nature; they are products of the rudiments of the intellectual life.

Henceforward, whatever is held to be true, on well ascertained scriptural testimony—that is to say—true as *law* and *principle*—when brought to bear upon the human family, will be held to be true also, as law and principle, bearing upon the breadth of that realm which astronomy describes, and taking effect throughout those eras of which geology is the chronicle!

In what manner then will expanded conceptions, of this kind, come in, and operate upon, that future, and much enhanced moral consciousness—upon that refined sensitiveness, upon that reflective mode, which, on no very uncertain grounds, we assume as likely to attend the suffusion of a diluted Christianity? We retreat from the ground we have here reached, nor will we dare to conjecture, with any definitiveness or specification of particulars, what these results may be. The practical end we had proposed is attained, if we have shown a probability that—under all the actual circumstances of the present times, the wide diffusion of *such a Christianity*, refining more and more, but not deeply moving, the minds of men, would be likely to bring about a religious revolution not less extensive in its consequences than any which Christianized communities have hitherto undergone.

But if such a revolution is of a kind that must excite alarm, where is the remedy, or what are the available means of safety and prevention? We cannot be of opinion either that the true remedy is far to seek, or that it is of doubtful efficacy. We do not believe that the means proper for counteracting the influences we have referred to, are such as lie beyond the range of human wisdom to ascertain, or of the zealous endeavors of intelligent men to put in operation. Not indeed as if we would attribute more than is due to the sagacity, or to the energies of man, in relation to the sustentation and growth of religious belief. A deep sense of our absolute dependence, for wisdom and might, upon the divine aid, should impel Christian men devoutly to hope that both may be granted, and granted early, to some who shall set about to do what may be done for the renovation of the CHRISTIAN MIND, and the restoration of a profound and well-established religious belief.

A word is yet due to John Foster's memory—deserving as it is, of tenderness and reverential affection; and something should be said too, relative to that feature of this signal case which has given occasion to the preceding suggestions. In some of the passages we have cited, and in several we have not cited, every reader, whose mind is governed by religious awe and pious affections, will be tempted to draw back; he will tremble as if some one were inciting, or dragging him on, to look over the brim of a volcanic crater! Enough, enough! he will say—let us descend again to the tranquil levels of the Christian life! A feeling is generated as if these sombre and daring meditations must, at the next turn, lead to blasphemy; as if there were but a thin partition between John Foster, and Shelley, or Byron. Foster's genuine piety, his deep and unfeigned humility, held him

always off from taking that next step, beyond which lie the regions of atheism and despair! But it is impossible to watch the development of these ominous feelings, and to observe their parallelism with another class of feelings of similar aspect, without being convinced that a causal connection ran on from the one to the other.

Foster's prime years of manhood were contemporaneous (as we have already observed) with those dire events which turned many of the best formed brains in Europe. His intellectual and moral temperament was ill-fitted to resist those maddening influences; his early habits, his religious connections, his position in society, everything about him lent its aid to carry him forward in the one direction of democratic enthusiasm, and to breathe into his soul the frenzy of political and ecclesiastical demolition. "Overturn—overturn—overturn"—these were the notes ringing in his ears, day and night. But the course of events, at home and abroad, soon brought in upon such minds, and upon his, a crushing disappointment! Foster lived to see even his latest hope disappointed—that of the happy revolutions which were to ensue upon parliamentary reform!

"Unfortunately for me," he says, "from a temperament somewhat sanguine and ardent in youth, I am dried and cooled down to that of old age. The course of the world's events since that 'season of prime,' has been a grievous disappointment. No one who is not toward twice your age can have any adequate conception of the commotion there was in susceptible and inflammable spirits. The proclamation went forth, 'overturn, overturn, overturn,' and there seemed to be a responsive earthquake in the nations. The vain, short-sighted seers of us had all our enthusiasm ready to receive the magnificent changes; the downfall of *all* old and corrupt institutions—the explosion of prejudices—the demolition of the strongholds of ignorance, superstition, and spiritual, with all other, despotism—man on the point of being set free for a noble career of knowledge, liberty, philanthropy, virtue—and all that, and all that. A most shallow judgment, a pitiable ignorance of the nature of man, was betrayed in these elated presumptions. But they so possessed themselves of the mind as to prepare it to feel a bitterness of disappointment as time went on, through so many lustrums, and accomplished so negligently a portion of all the dream."—Vol. ii., p. 443.

Disappointment as to the course of political events drove him first into egregious misapprehensions of the motives of public men, and then wrought in him a mood, or temper, which mastered his reason, and which, had it not been powerfully counteracted, would have broken up his religious convictions.

"I was pleased, not at all surprised, at your coincidence with me in opinion about dissenting ordinations, and also about a widely different matter, the principles of Wellington's policy in the measure so favorable to Ireland.

"One cannot help suspecting, that one of his chief motives was a wish to have the military force of the country more disposable for aid (under possible circumstances,) to support their infernal Mahomedan domination in the east of Europe, which one earnestly wishes—all mere political calculations out of the question—to see crushed by the Russian invasion. Under sanction of that old humbug, 'the balance of power,' and to prevent

some eventually possible inconvenience to our trade to the Levant—that is to say, reduced to plain terms, some pecuniary disadvantage—our government would not scruple to sink the nation a hundred millions deeper in debt. But Ireland again! who would have thought that the session of parliament, commencing with the beneficial *political* measure, would pass off without one particle of anything done for the internal relief and improvement of your miserable population—some plan for cultivating the waste land, or providing for the ejected cottagers? * * * Unfortunate Ireland, and England, too, in having, from generation to generation, a set of statesmen, and a court, who care really nothing for the public good, any otherwise and further than as it may serve the production of revenue! Still the world, our part of it included, is destined to mend. The sovereign Ruler over all has declared so. And the present extraordinary diffusion of knowledge, accompanied, we may hope, by augmentation of religion, the *mobility* so visible in the state of the world, the trembling and cracking of parts of the old fabric—the prostration of some of the inveterate tyrannies; these are surely signs that the changing and meliorating process is at last beginning. When our race arrive at such a state as prophecy unquestionably predicts, what will they, can they, think of the preceding ages, and of ours!”—Vol. ii., p. 163.

If Foster had only mixed in general society enough to find out the simple fact, that *all* peers are not stupid scoundrels, and that *some* Tories are amiable, benevolent men, and that a few such are in a moderate degree wise, (of course not *so* wise as whigs!) he would not merely have corrected his views of political parties and events, but have learned to think more soberly, and more cheerfully too, and in a manner more in accordance with the tone of the Scriptures, on subjects of greater difficulty than are any mundane revolutions. Alas! that dusty attic at Stapleton, how much of sophistry, and how much of despondency has it to answer for!

“I have little hope of any material good for either nation from the present parliament, or from the new monarch about whom there is so mad a rant in fashion. What is such a man likely to know or care about the good of the nation, whose only notion of kingship, as far as yet appears, is that of enjoying himself at his ease (and putting other people at their ease with him) in a jolly, dashing, gadding sort of hilarity? Think of such a character, and then of the stupid baseness that, even in parliament, is calling him ‘the best king that ever ascended the British throne.’ It would be quite enough to say, that it is to be hoped *he is better than the last*, and there could not well be a *cheaper praise*.

“I am sure you cannot fail to contemplate, with great and serious interest, the portentous aspect of the affairs of the nations. There is coming into action, on a vast scale, a principle of change and commotion—of hostility, hatred, and defiance to the old established ‘order of things,’ which absolutely can never be quieted nor quelled—which must be progressive with augmenting knowledge (‘knowledge is power,’) but which in pervading and actuating a mass so dreadfully corrupt as mankind is in every nation, must inevitably, while a righteous Governor presides over the world, be accompanied in its progress by awful commotions and inflections. My settled impression is, that the rising generation

are destined to witness a process more tremendous than all their predecessors have beheld. While exulting at what has taken place in France, I have yet no confidence of a peaceful result in Europe.”—Vol. ii., p. 190.

And who shall dare to deny the probability that a woe may be still impending over Europe, and the world? Nevertheless, those who have lived to see cloud after cloud pass over and disappear, will be encouraged to put their trust in Him whose compassion is infinite, and will, with a cheerful importunity, repeat daily the prayer—“That it may please thee to have mercy upon all men.”

This disappointment of his hope of political revolution worked itself into his constitution in a form which we do not say was rancorous or malignant—for his nature was incapable of this—but of a settled vindictiveness—an implacable, undistinguishing resentment, of which all existing institutions, civil and ecclesiastical, and all persons in high places—all holders of rank, wealth, power—all “dignities, thrones, principalities,” were the luckless objects. That animosity of which power and office were the butt, was, with him, little short of a monomania. To an extent of which we were not aware previously to the perusal of these volumes, such were unhappily the tendencies of this great, and, by *constitution*, of this benignant mind. Alas! our brother!

But it is evident that a mind thus accustomed to trace all the ills of life to the wicked selfishness of rulers, and which could never entertain the thought of domination, especially of *irresponsible domination*, apart from the recollection of those complicated woes to which humanity is liable, and of which tyrants are assumed to be, directly or indirectly, the authors—such a mind, we say, will not approach, without extreme peril, those deeper subjects of religious meditation that were, in fact, only too familiar to Foster’s solitary musings. We need not pursue this painful subject further, and will only add an expression of our strong feeling—a feeling already hinted at in this article—that good taste, generous feeling toward a great mind departed, together with a calm and philosophic consideration of Foster’s “case,” and of his personal history, will avail to screen a name so dear to all of us, on the one hand, from the mockery of any who might, by aid of these letters, endeavor to hold up his opinions, extreme as they were, to contempt, and on the other, from the worse mistake of those who would strive to bolster doctrines such as Foster’s with a reputation such as his.

Of Foster’s literary course, or of his standing as an author, we do not think it incumbent on us to say much. Few circumstances of a marked or animated kind attended the production and appearance of his several works. They made a powerful impression at the time, and procured for him a widely extended and an undisputed fame; nor can we doubt that his essays will hold a permanent place in English literature;—they will always continue to nurture thought among the thoughtful. As a writer too, Foster has, in a very special manner, aided in bringing about that revolution, as to style, which signalizes the present era. Discarding at once, or cutting his way through that net-work of conventional phraseology which had embarrassed English literature, he took hold of the English language with an energetic grasp—wielded it as an implement of mind—bent it, this way and that, at his pleasure, and compelled it to convey, so far as any symbols can convey, the mind of a writer to the mind of a reader. Just what he was thinking—pen

in hand—that, and nothing more, nothing less, Foster compelled words and sentence to make known: he is one of a few who have brought the English tongue back from a sapless conventionality, to a vital actuality. He has helped to render words, phrases, sentences, paragraphs, a medium of intercourse between mind and mind, in the most abbreviated form possible. If his sentences are long and complicated, and his paragraphs cumbersome, it is because they are—for brevity sake—overcharged with meaning.

"Holdsworth sent me the *British Review*, in which, in the terms 'exquisite precision of language,' I fancy I see a recognition (and the only one I ever have seen or heard) of that which I consider as the advantageous peculiarity of my diction; namely, if I may use such a phrase, its *verity* to the ideas—its being composed of words and constructions merely and distinctly fitted to the thoughts, with a perfect disregard of any general model, and a rejection of all the set and artificial formalities of phraseology in use, even among good writers: I may add, a special truth and consistency in all language involving figure. If you are beginning to say, 'Let another praise thee, and not thyself,' I may ask whether it should not be an excepted case when that 'other' has not sense to see anything in me to praise. Quite enough, however, of the subject."—Vol. ii., p. 35.

"I am very glad, not that indolence has so long kept me from being an author, but glad of the fact of having not become an author sooner. A more advantageous impression will be made by the first production of so mature a character, than I should probably have made by a progressive improvement to the present intellectual pitch from such an inferior commencement as I should have made, even six or seven years since. I am gratified in feeling that my mind was reserved, either in consequence of something in its essential constitution, or from the defectiveness of its early discipline, for a late—a very late maturity. It is yet progressive; if I shall live six or ten years, and can compel myself to a rigorous, especially if to a *scientific*, discipline, I am certain it will *think* much better than it does now; though in the faculty of invention it has probably almost reached its limit.

"My total want of all knowledge of intellectual philosophy, and of all metaphysical reading, I exceedingly deplore. Whatever of this kind appears in these letters is from my own observation and reflection, much more than from any other resource. But everything belonging to abstraction has cost me inconceivable labor; and many passages which even now may appear not very perspicuous, or not, perhaps, even true, are the fourth or fifth labored form of the ideas. I like my mind for its *necessity* of seeking the abstraction of every subject; but, at the same time, this is, without more knowledge and discipline, extremely inconvenient, and sometimes the work is done very awkwardly or erroneously. How little a reader can do justice to the labors of an author, unless himself also were an author! How often I have spent the whole day in adjusting two or three sentences amidst a perplexity about niceties, which would be far too impalpable to be even comprehended, if one were to state them, by the greatest number of readers. Neither is the reader aware how often, after this has been done, the sentences or paragraphs so adjusted were, after several hours' deliberation the next day, all blotted out. The labor of months lies in this discarded state in the manuscripts, which I shall burn

when I know that the volume is all printed. Less of this kind of loss, however, would be sustained in making another volume; the long revision which I have now finished having given me a most excellent set of lessons in composition, in consequence of which I should much better execute the *first* writing, in the case of producing other works. You will forgive this egotism; none of it appears in the book."—Vol. i., p. 308.

Foster has not, however—such is our humble opinion—in any permanent or very appreciable manner, controlled the world of opinion. He has not visibly swayed a sceptre in the realm, either of thought or of action. Beside that he needed—for fulfilling any such function—a more solid structure of the reasoning faculty, as well as more of discipline and breadth;—more working force—more spring—more appliance—he must, before attempting the task which his eminent powers might seem to impose upon him—he must have mastered the despondency of his nature:—he must have known how to entertain *hope*, apart from *excitement*;—hope, as the mind's moving force and guide. He must, moreover, have laid aside absolutely—he must have handed over to the inferior spirits of his party that congeries of preposterous prejudices, in the midst of which, as if stifled and choked, he rather gasped than breathed;—struggled, rather than moved!

One great quality, however, and a true mark of a great mind, and which, had other faculties and dispositions been congenial, would have fitted him for office as a master of his times—as a leader of the people; and better, as a servant of God, discharging an arduous function; was his superiority to the egotism, the petty solicitude about literary reputation, the small ambition of the "author." On this ground, Foster must be allowed to stand higher than Robert Hall, and he was, we think, more capable of an act, or a course of self-sacrifice than he. If the alternative had even been distinctly placed before Hall of throwing the universe overboard, or of risking his fame as an accomplished master of sentences, there is no doubt he would have risked it; and yet not without an effort; whereas Foster would have done so with little or none. Great, not merely in mind, but in soul; yet he would have been greater if at all times Robert Hall could have forgotten "Robert Hall;" but the day he lived in offered trying temptations to a mind such as his—a mind exquisitely sensible of the very finest qualities of style, as well as alive to the grandest conceptions. He lived through the closing years of the era, gone probably forever, in which a bright fame might engage much of men's attention. The era of genius is past; and we live amid things, amid events, amid interests, amid masses, and in the midst of "the public welfare." Thirty and forty years ago personal fame was at a premium; now, it is at a discount.

As to the breadth and the depth of his soul, as to his sense of the urgency of whatever touches the well-being of man, as to his constitutional mindfulness of eternity, and his "conscience towards God," Foster might have done that which at the present moment is so much needed to be done. He was personally capable of resolving to compromise his literary *status*, if by doing so he might have woken the dull ear of his fellow-men, and have prevailed with them to listen to the "things pertaining to their peace." He might have dared to sound heaven's trumpet, although forecasting the probable consequence—that the wearers of nice ears would

severely criticise the performance. It was not any egotism (vanity he had none) that would have stood in his way in attempting the highest and the most perilous tasks. Had it been possible for him to banish forever from his thoughts the irritating recollection of that "intolerable nuisance, the established church," Foster might have done much in awakening men to a sense of their indefeasible relationship to eternal justice, and eternal mercy.

But John Foster is gone! Has his soul, his deep heart, his self-forgetting mind, his sorrowful and resentful sense of whatever bears upon the weal and woe of millions; has this intensely-feeling soul been breathed into any younger bosom? Among the men of twenty-three, the men who are to transact the affairs of the coming time, are there any who ~~may~~ be capable of the greatest services—ambitious of working—ambition apart; are there any, firm in reason and well-disciplined, calm in temper, immovable in resolve, and sound in belief, who would form the uncommunicated purpose of laboring to recall the Christian community to a sense of great truths, and to bring to bear upon the mass of minds, the unabated powers of the Christian Revelation?

Supposing there were the men to undertake such a work, they must remember that although it must be carried on from the pulpit *in part*, yet, as the world is now constituted, it must be mainly through the press; and so to carry it on demands years of sedulous preparation; it demands, at the least, a purpose formed, and steadily adhered to, through that seven years which rules a man's destiny—the period from three-and-twenty to thirty. But now if one should aspire to the task of schooling such a mind, one must remember that he whom one has in idea will not be *that very person*, unless he be moved from within, unless he be guided from within, unless he be instinct with that wisdom which never can be conveyed, as a *lesson*, from one mind to another.

But this is a theme too special and peculiar for the place and occasion. To descend for a moment to a lower ground, we must ask leave to express the earnest wish—a wish vividly renewed by our consideration of Foster's course and temper—that, in schools and colleges a loftier and *wider* feeling than seems at present to pervade many of such places were cherished. Nothing is more sickening

to the hopes which a Christian man fondly entertains for the coming time, than to find young booms—fresh from college, heaving with sectarian fervors!—to find that the acrid ecclesiastical temper of the present moment—this narrow, burning mood, is the mood, not of soured seniors, who are leaving the stage, but of young men! With perfect patience we could sit and hear grey inquisitors talking about "our church," and ringing changes upon the old "no salvation" bells; but it is nothing less than an anguish of the soul to listen to the heartless and hateful solemnities of church or sectarian bigotry—from ruddy lips! John Foster left his college with such views of the world and the church as were given him *there* and *then*, and which should not be heavily inculcated, considered in relation to the political and religious state of things in England, at the close of the last century, and more than fifty years ago. But is it so, that these fifty years have done so little for us, that the fear may be entertained lest another John Foster may even now be leaving college—his head perturbed with notions not more philosophically sound, or more becoming a Christian teacher, than were those held to be unquestionable truths at Bristol, and elsewhere, in the year 1793?

Let none say that we are seizing the occasion to aim a shaft at "the sects," or at "radicalism." It is not this religious community, or that—it is not this political doctrine, or that, which we deprecate; but it is that vehemence and rancor, ecclesiastical and political, which are turning men aside, everywhere, from the consideration of those truths which take a firm hold of the conscience, which, instead of irritating the temper, tranquillize it; which make man far more sensitive toward his own delinquencies, than toward the ecclesiastical or theological faultiness of others; which sicken men of the habit of dealing in denunciations; which make them tremble for themselves at the thought of God's thunderbolt, rather than grasp it to hurl at others. The diluted Christianity, the advances of which we dread, may well consist with sectarian fervor; but it will not consist with a deepened belief of the Gospel. The world has, in past times, seen church zeal, and pantheism, and polytheism, enthroned together; and may see them again associated: but not if Christianity entire, lodges itself in the hearts of men.

JULIET'S TOMB.—A sulky German woman showed me the sarcophagus, called Juliet's tomb, which still stands in a dirty shed at the bottom of a slovenly but luxuriant garden, evidently once belonging to a convent, no doubt that of Friar Lawrence. The coffin was half full of water; the edges of red marble were much mutilated, having been chipped to make relics; there is a circular depression in the stone to receive the head of the corpse, and it is of very large size, and clumsily constructed. It is certainly, although earlier than the date assigned as the period when the lovers lived, not Roman, as has been asserted, and that is all that can probably be known about it. A shabby old house, now a common inn, is shown as the palace of the Capulets; the antique vaulted passage, under which I passed to the yard behind, is curious, and there is much in the building which proves it to belong to the thirteenth century: a row of pretty ancient pointed windows may have faced the garden, and to one of them Juliet's balcony might have been attached; though this is one of the few houses in Verona which has

no balcony. I never saw so many in any place before, and a few are extremely ancient, some of carved wood, and some of ponderous ornamented stone.—*Miss Costello's Italy.*

COMMERCIAL VALUE OF INSECTS.—The importance of insects, commercially speaking, is scarcely ever thought of. Great Britain does not pay less than 1,000,000 of dollars annually for the dried carcasses of the tiny insect, the cochineal; and another Indian insect, gum shellac, is scarcely less valuable. More than 1,500,000 of human beings derive their sole support from the culture and manufacture of silk; and the silkworm alone creates an annual circulating medium of nearly 200,000,000 of dollars. 500,000 dollars are annually spent in England alone for foreign honey—at least 10,000 cwt. of wax is imported into that country every year. Then there are the gall-nuts of commerce, used for dyeing and making ink, &c.; while the cantharides, or Spanish fly, is an absolute indispensable in materia medica.—*Boston Transcript.*—*[Athenæum.]*

From *Fraser's Magazine*. (Conservative.)

WILL THE WHIG GOVERNMENT STAND?

THERE IS NO employment more profitless, in public as well as in private life, than to look back upon misfortunes that are beyond remedy, and to complain of their occurrence. Peel's corn-bill, whether for good or for evil, has become the law of the land. The great principle of free trade is established as that on which the commercial policy of this country must henceforth be conducted, and let its remote consequences be what they may, there is no power in any quarter to avert them. We have taken a step in politics which does not admit of recall. Lovers of the Arcadian state of existence may mourn over this, hankers after feudalism complain or threaten, and men of soberer judgment than either doubt the wisdom of measures which bid fair to convert England, at no distant date, into a huge manufactory. But the impulse having been fairly given, we may no more hope to stay the progress of events than to arrest the speed of the railway carriage, or the descent of the loosened rock into the lake. We are in the beginning of changes, of which it would puzzle the sharpest-sighted to foretell the end, and there is positively no help for it.

Entertaining these opinions, and heartily subscribing to the doctrine that "the brave never repent," we purpose for the future, as often as the projects of politicians make a demand upon our attention, to look at them with a forward rather than with a backward glance, forgetting, as far as we are able, party feelings that have been engendered of old associations, and delivering our sentiments on men and things more with reference to the effects which they seem calculated to produce upon society hereafter, than in the idle purpose of trying them by the test of bygone arrangements. And here we must be permitted to observe, *in limine*, that in thus proposing to act, we are guilty of no abandonment of principle, that we have submitted to no change even of opinion. We believe now, as we always did, that the only true end of government is—to ensure the greatest amount of happiness to the greatest amount of persons. We are satisfied, likewise, that the ancient institutions of the country were admirably calculated to forward this end, so long as all classes, high and low, rich and poor, acted in the spirit of these institutions; for the settled institutions of a country have grown out of a state of things which had little or nothing to do with mere money-power; which linked territorial possession and political influence inseparably together; which made the owner of the soil the natural protector of the families, be they many or few, that dwelt within his domain; and held the church to be the teacher of all in divine things, and the ready and willing administrator of help to the needy. But if the course of time, and the changes wrought by it in the habits of society, have damaged all this, then we must be prepared to meet the evil in the best way that circumstances will permit. Now it is vain to think of denying that new elements have arisen, and entered into all our social relations. Commerce has become a science, towards the cultivation of which a high order of mind is directed. Trade, in point of importance to the well-being of the community, outstrips agriculture greatly. The relative numbers of the population employed upon the land, and in pursuits that congregate our masses in towns and cities, are quite changed. The amount of persons to whom

agriculture, in one shape or another, gives occupation, does not now exceed one fourth part of the population of Great Britain; if we take Ireland into account, it hardly reaches one third; and the proportion is continually growing less. In like manner the church, though still embracing a large majority of the people, is not the religion of the whole, and has long ceased by the legislature to be treated as if she were. Now it is obvious that, let our tastes and wishes take what direction they may, we have not the power to deal with a nation so circumstanced as if it were a purely agricultural and church nation. The masses must be fed and taught; and though we are satisfied that fed they would have been, both with temporal and spiritual food, quite as abundantly under the arrangements of 1842 as under those of 1846, we must not wonder if they, and still more their employers, entertain a different opinion. Besides, the wealth of the country is no longer monopolized by the lords of the soil. Men like Lord Ashburton, Mr. Jones Lloyd, Mr. Joseph Neeld, and many more whom we could name, regard their broad acres, abundant though they be, as mere playthings. Their riches are counted in stocks of various sorts, and they are by no means singular in this respect. We will undertake to name a dozen manufacturing firms in the north of England alone, of whom it would be no empty boast to say, that they could buy up one half of the squires in England, and that they give employment to a greater amount of persons than ten times the number of landowners, even if we include among them the most influential members of the house of lords. And as to the dissenters, if they lack the power to press important measures forward, they are sufficiently influential to stop all improvement if they choose, as is abundantly testified by the deplorable neglect into which the education question has fallen. With these facts staring us in the face, and remembering that we live under the constitution of 1832, it is no matter of astonishment to find that the feelings of the country are changed; that new men, with new opinions, are gradually usurping the places of our ancient aristocracy, not in regard to precedence or etiquette, or the polite forms of society, but in the power and the will to give to society itself a direction; and that, being able to wield the constituencies to their own purposes, they have fairly won the ascendant in the house of commons, and, as a necessary consequence, in the government.

He who sees all this—and he must be blind indeed who cannot see it—must with us acknowledge that we are in a state of social transition, and that such progress has been made towards a reorganization of the machine, that to stop short at what we have attained is impossible. At the same time there is no just cause to assume that our course is necessarily one of deterioration. Danger there may be—there always must be while a great people are changing their views of things—while ancient prejudices, or principles, if the term be preferred, are losing their hold upon men's minds, and the principles or prejudices that are to take their place remain as yet immature. But never surely was revolution—if a revolution it deserve to be called—carried forward with greater moderation than among us. Nobody makes an attack upon property. Many, in their secret souls may regret that it should have got into heaps, that hundreds should be overlaid with it, thousands moderately cared for, and millions in poverty. But the thinking among the poor themselves feel and understand, that they, far more than

their betters, would suffer from any attempt to break in upon the established order of things by violence. Nobody, as far as we can understand, seriously meditates an attack upon the house of lords. The custom of voting there by proxy will probably be discontinued; and, for our own parts, we shall be glad to see it quietly got rid of, for not on any principle of common sense can it be defended. But the house of lords, the chamber of hereditary legislation, is just as dear to the hearts of Englishmen as the house of commons; they would not endure that the hand of the spoiler should interfere with it. In like manner, we have no fear for the *church*. The *establishment* may be still more shaken than it has already been, and in Ireland it will probably cease to hold its ground altogether. But as to the *church*, as we believe it to be founded upon a rock, so we are confident that there does not exist the smallest inclination, where there is power, to molest it. On the contrary, we believe that sound church principles were never more respected by the great body of the middle classes, the real strength of the empire, than they are now; and we are confident that there needs but common prudence, mixed with increasing zeal in the clergy, to confirm this feeling. And, finally, is the crown in danger? Does any human being, in parliament or out of parliament, indulge in dreams about a presidency? Very much the reverse. We may be, we are, in a state of social transition. We are scheming, indeed living, for the nineteenth century—perhaps for the twentieth—and not for the eighteenth; but it is not, therefore, a settled thing that we are going to rack and ruin; digging at the throne, laying barrels of gunpowder under the house of lords, or mustering for the overthrow of the altar.

That the opinions which we have ventured to express are held by the great body of the people is apparent from the perfect apathy with which they looked on during the whole course of the recent struggle. Except in the house itself, no human being seemed to be roused. The city of London sent no addresses either for or against the proposed changes. We heard of no gatherings in the Bull-ring at Birmingham, or on Penenden Heath, as in other days. And now that Peel is out and Lord John Russell in, *the people* seem to care as little about the matter as if Lord Johnstone had merely removed from the Mansion-house, in order that Lord Thomson might come in his place. And the people are right. Events *must* now take their course; though whether they are to move too fast or too slow, both extremes being perilous, will depend mainly upon the measures which, in the beginning of their reign, the whig ministers shall propose.

We write it with regret, but a consideration of the materials of which the whig ministry is composed, compels us to avow our belief, that Lord John will not be able to carry on the government. There is no principle of cohesion in his cabinet. Not only do the individual members hold opinions on all important subjects diametrically opposed, but they boast of these discrepancies to the world. Take one great question, which we defy them to blink—the Irish church question, and see how they are circumstanced.

In 1835, Lord John Russell forced Sir Robert Peel out of office by proposing and carrying his appropriation clause. Lord John did not, it is true, persist in this policy after he had won his way back to Downing Street, but he made a boast of retaining

the opinions which he had advocated while in opposition, and claimed credit on the ground of moderation while putting them in abeyance. He now tells the world that he cannot conceive a more fatal measure than the disestablishment of the Protestant church in Ireland, and declines taking any further notice of the project of 1835. Meanwhile Earl Grey has published a manifesto against the Protestant establishment of Ireland. He considers its existence to be the monster grievance in that portion of the empire, and conceives that there is imposed upon the government no more pressing duty than its overthrow. Lord Grey is supported in his opinions by Mr. Seil; whereas Mr. Macaulay appears to have arrived at the unexpected conclusion that even to pay the priests out of the consolidated fund would be injudicious. Not so my Lord Morpeth. He is all for a state-endowment; and, if we understand him right, he would rather take it out of the property of the church than supply it through the treasury. Mr. Ward, on the contrary, is for no state-payments at all. He would have religiousists of every sort to provide their own parsons as they provide their own physicians, and, saving vested interests, he would seize the property of the church, as incumbencies fell vacant, and apply them to the general education of the people. Mr. Ward may be a small man in the estimation of the noble lords to whom he plays second fiddle; but he is not small in his own estimation, nor in that of the radicals, of whom he is one of the representatives; and having Mr. Benjamin Hawes to support him, he flatters himself that he will be more than able to counterbalance Mr. Charles Buller, whose views on religious points are somewhat Puseyite, and who is too honest a fellow to sanction the spoliation of any class of the queen's subjects, even if the class proposed to be plundered be the clergy.

So much for the state of feeling in the new government on a question which is just as sure to be brought forward early in the next session, as day is sure to succeed to night. Let us consider one or two points besides, in regard to which, if there be greater unanimity in the cabinet, there has been too much of coquetting out-of-doors to sanction remissness in the executive, or to ensure success after the movement is made. And, first, let us take the sugar question on which Lord John is pledged to speak out forthwith. It was during the former reign of the whigs, when Lord John was rising to the first place among them, that in order to get rid of the incubus of slavery in our own sugar colonies, the British parliament voted to the holders of slaves a compensation of not less than twenty millions sterling. The vote was opposed, of course, by the Joseph Humé clique of economists. But a sense of justice prevailed over the opposition, and, with the hearty concurrence of Quakers and philanthropists of every sort, the whigs, supported by the conservatives, gained their point, and the planters their money. So bold a confiscation of the property of Englishmen was tolerated only upon the plea that our West India growers must be placed in a very unfavorable condition of rivalry towards the growers of sugar in the Brazils, and in the Spanish and French colonies. It was held that, taking into account the natural habits of the negro, the planter who cultivated his canes by means of free labor could not possibly compete with the slave-owner; and that to give him any chance at all it was necessary first to compensate him for his loss of property in his

laborers, and next to afford him such protection as a proper adjustment of import duties between him and his rivals might establish. Indeed the levying of duties, comparatively heavy, upon slave-grown sugar was regarded as a measure not merely of fiscal arrangement, but of Christian duty; and as such the whigs proposed and triumphantly carried it. Now see what they are prepared to do.

On the plea that the repeal of the corn-laws has entirely revolutionized the commercial policy of the country, the head of the whig government talks of equalizing the duties on sugars, whether fabricated by slaves or by free laborers. Christian duty has thus ceased to have any weight with him. The Quakers, it appears, were mistaken in the use which they made of this argument; and his lordship, with his friends, accepted their view of the case, simply because it suited their convenience to do so. Perhaps Lord John is right, looking at the matter in a purely religious point of view. A state of things which has existed ever since the world began, which was sanctioned by the example of Abraham, and is nowhere denounced in the New Testament, cannot be opposed to the spirit of the religion which we profess; except, indeed, in its abuses. But we are quite sure that Lord John will never persuade the Quakers to understand this; and we are apt to suspect that he will find more than the Quakers averse, on other and less sublimated grounds, to sanction the arrangement which he proposes to make. John Bull retains a lively recollection of the twenty millions which it cost him to get rid of slavery in his own dependencies; and will not see, all at once, that there can be any fitness in the encouragement of slavery elsewhere. Besides, John cannot endure to be humbugged; and so if the Peelites and protectionists unite to resist the move, Lord John will be obliged to dissolve and go to the country on a question by no means calculated to win recruits to his standard.

But worse remains behind. Lord John has taken new ground, such as we cannot believe that he will be permitted to hold throughout a single session. He is for waiting the progress of events. Whatever his own views and the views of his cabinet may be touching the arrangements which would best promote the permanent welfare of the empire, he is determined to do nothing—to propose nothing, till public opinion shall have declared in favor of a change. Now we shall be exceedingly surprised if gentlemen on either side of the house permit this. The purpose for which a cabinet exists is to take the lead in legislation, to think for the people, and to provide them with laws and usages which shall carry them forward in civilization and prosperity; and the people know this so well that they will not readily be put off with a continued waiting upon Providence. Moreover, there are those, apart from the people, the leaders of faction both here and in Ireland, whose very nature must change if they abstain from goading ministers into action. Does anybody suppose that Mr. O'Connell will be quiet? He may patronize the whigs to a certain extent, and count upon getting a good deal out of them; but he is no more willing to relinquish the trade of agitation than he is able. The Repeal cry may be softened for a brief space out of deference to that show of decency which even he is constrained occasionally to put on. But that it will be raised again in due time, assuring the cabinet to persevere in doing nothing, is just as inevitable as that without it the rent

would not come in. Lord John may feel and express the utmost reluctance to open a campaign against the Irish church, but we defy him to escape from it. And what is more, we do not believe that his half-and-half scheme—his popish establishment here and Protestant establishment there—will content anybody. *Delenda est Carthago*. The Irish church is, in the councils of O'Connell and the whig-radicals, doomed; and the sooner and the more boldly Lord John or Lord Grey breaks ground before it, the better it will be for all concerned.

But we have not yet done with the difficulties of the new cabinet. The members of the present government are as much divided on the subject of labor in the factories as upon the Irish church question. An influential section of them, with Lord John at their head, supported Lord Ashley in his last attempt to carry a ten-hours' bill, while Lord Grey and the more decided of the economists denounced the project as worse than visionary. What is now to be done? Will the government leave to Lord Ashley—on whose reelection next year we count as surely as we do upon anything that is in the future—the honor of fighting once more the battle of the factory children, and winning it? or will Lord John assume the initiative at the inevitable risk of exasperating his supporters of the League and of coming into direct collision with Sir Robert Peel? or, finally, knowing that Lord Grey is against him, will he be content to keep aloof, or possibly vote against his own wishes? These are points which it remains for time to determine. And, let us add, that their settlement, be it managed as it may, cannot fail of causing very great embarrassment to the cabinet.

So much for some of the questions in domestic policy, about which the new government is at issue with itself. Look now to the *personelle* of the cabinet, and judge how far such men are likely to go on smoothly together. But a few short months are fled since Lord Grey refused point-blank to sit at the same council-table with Lord Palmerston. This reluctance has, somehow or another, been overcome; but he must be very simple-minded indeed who supposes that the feeling in which it originated can have passed away, or that the noble earl of July, 1846, is not just as full of crotchets as was the noble earl of 1845. The noble viscount, on the other hand, has neither forgotten nor—and our readers may take our words for it—forgiven the fracas of last autumn. Lord Palmerston has the happy knack of laying all personal slights and wrongs in the secret recesses of his memory, where they are nursed and kept warm, that they may be brought into activity on the first favorable occasion. Neither would it be just towards the head of the house of Grey to conceal that in this respect his memory is to the full as tenacious. Macaulay's letter, more plain than pleasant, has never departed from his mind, and some fine day, when his colleagues least expect it, this will be shown. Moreover, it is not one Grey, but many, whom these feuds affect. The noble secretary for the colonies may count fairly on the support of the home-secretary and the chancellor of the exchequer; and two secretaries of state, with the principal member of the treasury board, seem to us to be capable of holding their own against all the other limbs of the cabinet put together.

Again, it is a matter of grave doubt with us whether Lord John Russell, with all the prestige that surrounds his name, really possesses the confidence of the whig party. That he does not pos-

see the confidence of the country we take to be an admitted fact. Just at this moment the country cares very little whom her majesty may be pleased to raise to the office of first lord of the treasury. It is the general belief in society that Sir Robert Peel has left nothing really useful for his successor to accomplish, and that the best thing that could happen would be a suspension for a few years of the labors of a legislature, which cannot meet without making or changing laws, whether the operation be in itself desirable or not. But the people know that Lord John is a very ambitious statesman. His character for courage, too, is more universally admitted than for discretion; and he has been too long in the hands of the movement to sanction a hope that he will be able to shake himself free. Something his lordship feels that he must do; and when men are operated upon by this sort of conviction, the chances are at least even that rather than do nothing they will do mischief. For example, was ever admission made by a minister of the crown more perilous than that which Lord John was drawn into on the subject of the estimates? Let the principle be once conceded that the house of commons has a right to examine by committee before they are brought forward the estimated expenses of each current year, and there is an end to all power in the state, except that of the commons. There is an end, likewise, to all responsibility by the minister. He ceases to be answerable for the conduct of public affairs. He has no further control over the expenditure of the revenue; embarrassment at home and disaster abroad may befall as fast as they may, but he will not withdraw from the councils of his sovereign on account of either, because the financial committee of the house, and not he, has occasioned them. Could the admission in question, or rather the hesitating reply of the noble lord, be dictated by the misgiving which always affects men's anticipations of the future when the memories of the past are unpleasant? Was Lord John thinking of the progressive decline of the national credit from 1835 to 1841; and considering how, in the event of a similar decadence, he might still hold place and pay in 1850 and beyond it? We suspect that he was; nevertheless, we take leave to assure him that neither the English people nor their representatives will permit the minister of the crown to devolve his gravest and most onerous duties on a committee of the house of commons. No, not even if the reward of acquiescence in the arrangement should promise to be a monopoly for life to the firm of Russell and Co. of the treasury benches, with all the agreeable concomitants thereunto attached, namely, lodging, presidency, patronage, and pay, with royal dinners *ad infinitum*.

There is yet another damaging circumstance connected with the position of the new government, that in their Irish appointments they have not been happy. It is the general impression—and we believe that the impression is a correct one—that the whig lord-chancellor of the sister kingdom owes his rise to O'Connell. Not that O'Connell directly patronizes the Rt. Hon. Mr. Brady, but it was necessary to place Mr. Brady where he is, in order that another and a surer berth might be provided for the *protégé* of the Liberator—who is understood, in like manner, to have imposed upon the authorities at the castle their law adviser. And of the opinions of the O'Connor Don on the great question of repeal, nobody is ignorant. Now an individual repealer, like an individual

Radical, may find it convenient to change his views when he comes into office. Indeed, we will go farther by allowing, that on all questions affecting the government of the empire, men in office receive of necessity so much more light than can be afforded to persons in private life, that it is not to be wondered at, assuming them to be reasonable beings, that, with their privacy of station, they should usually lay aside both the language and the sentiments of demagogues. But in the case of one who has spoken in favor of repeal, whether it were in the House of Commons or in Conciliation Hall, we cannot but think that the cabinet labors under a fatuity which advances him to a post of honor and responsibility under the crown. That Mr. Smith O'Brien should make something of the fact that the repeal functionary never gave in his formal adhesion to the Association, we are not surprised. Mr. Smith O'Brien is certainly not the Solomon of his party, but weak as he is, nature has given him brains enough to apprehend that it is a good thing for the cause of mischief to get a repealer into place; and that it is prudent on his own part to excuse the repealer to the mob for having accepted it. And Mr. O'Brien is right. Say what they will, the whig cabinet need not expect that they can ever succeed in persuading the British people that the association of the O'Connor Don with themselves is other than an act either of political treason or political cowardice.

Meanwhile, the enemies of the English connection are elated—the friends of the Union exasperated rather than depressed. The former anticipate a ready compliance with all the demands which they make immediately, and calculate, at least the more sanguine among them, on forcing a separation by and by. The latter, disgusted and outraged in their bitterest prejudices, are ready, through sheer dissatisfaction with times present, to make common cause with the wildest of the disclaimers against Saxon injustice. We think that measures which go to produce such results are the reverse of wise; for though it be impossible to deny that in former years the Protestants somewhat abused the powers that were entrusted to them, we defy their worst enemies to bring against them now any charge of the sort. And let it never be forgotten, that their worst outbreaks were the results of a loyalty peculiar, but perfectly honest; of a principle which partook as much, perhaps, of hatred to popery, as of love for protestantism or for the throne; and could not be disavowed from the remembrance, that their fathers having won Ireland with the sword, kept it, not for themselves but for England, and devolved upon them the solemn duty of keeping it still. We think, then, that a policy which forces the protestants into hostility, even if it seem for the moment to win the favor of the Roman Catholics, is neither a just nor a wise policy. For the party whom you strive to conciliate make no pretence of loving you for your own sakes, far less desire to be considered one with yourselves; whereas the outraged protestants used to boast that they were English, not Irish subjects, and were ready to sacrifice property and life itself in defence of the English connection.

Hitherto we have spoken of the whig government as of a self-existent and isolated body. We have pointed out the causes of the weakness which we attribute to it, as far as they are to be sought for within the cabinet circle itself. We have

shown that the management of public affairs has been undertaken by a body of gentlemen, hardly any two of whom think alike on any subject; that the points concerning which they differ among themselves are not secondary, but of the first importance; and that the tempers of the men are, in many instances, such as to preclude all hope of their being able, for any length of time, to keep their peculiar humors under control. What sane man expects that Lord Grey will give up the very least-valued of his crotchets, were the existence of the government shown to depend upon his doing so? Who professes to believe that Lord John Russell, after he has once made up his mind to any given course of action, will yield a jot in order to conciliate Earl Grey or any other member, either of the cabinet or the legislature? Who is so innocent as to anticipate that Lord Palmerston's repentance will prove to be sincere, or that, either at the Foreign Office or in his correspondence with the ministers of other states, he will abate a tittle of the petulance which in a few short years brought us to the very verge of an European war? These are grave considerations—rocks ahead of the new régime, which no steering, however skillful, can, in our judgment, for any length of time, avoid. But if they be avoided, what then? The whigs are by far the weakest party in the House of Commons, and among the constituencies they are as nothing. Will they be able to go on? We think not. Their colonial policy, when last in power, produced a rebellion in Canada. If we may judge from what the new premier promises, it will bring total ruin upon the West India islands now. They showed themselves on former occasions miserable financiers, and are not likely to do better amid the confusions inseparable from a total change of system. Our facetious contemporary, *Punch*, has risked a prophecy in regard to this matter, which it will in nowise surprise us to see realized. And of this we can assure them, that as the people give them no credit for moderation or magnanimity—as all the world is alive to the eagerness with which they joined in driving Peel from office, so there is little disposition anywhere to overlook their blunders when they fall into them, or to tolerate their feebleness whenever it shall begin to show itself. They have no hold whatever upon the country, and they know it. Now we sincerely regret this, for go when they may, there seems to us no prospect of replacing them by a cabinet which shall be stronger; for parties are utterly dissolved, and till they take again some form and consistency, we defy any man or set of men to guide with effect the councils of the nation.

Finally, let the whigs beware how they endeavor to get up, at a crisis like the present, what they expect to become a popular cry, whether it be on the subject of education or cheap sugar. Legislation carried on in a state of excitement invariably ends ill; for be the particular measure good or bad, the manner of pressing it forward is fatal. There is more truth in Lord Castlereagh's much abused aphorism than it might be judicious to acknowledge. "The people have little [we will not exactly say that they have *nothing*] to do with the laws, except to obey them." Clear heads, sound judgments, great circumspection, a keen insight into the future, are all requisite in men who would provide for the permanent well-being of the country; and to look for any one of these quali-

ties in mobs, or in the leaders of mobs, is ridiculous.

We give it, then, as our deliberate opinion, that Lord John Russell's government will not last a twelvemonth. We repeat that we are sorry for it; and as the best proof of our sincerity, we hereby declare that from us it shall receive a fair trial. We shall try its measures, be they what they may, on their own merits; and give judgment in each separate case according to right.

From Tait's Magazine, (Radical.)

POLITICS OF THE MONTH.

SINCE we last wrote, great changes have occurred. The Corn Law Repeal Bill has become the law of the land, and the Anti-Corn-Law League has been dissolved; the Oregon question has been settled; the Irish Coercion Bill has been thrown out; Sir Robert Peel has resigned; and we have, once more, in the direction of the national affairs, Lord John Russell and a whig ministry.

The retirement of Sir Robert Peel, after carrying his great measure of Free Trade, was seen to be inevitable; yet it has been much regretted. During five years he has conducted the business of the nation with admirable skill and success; he has effected the most important measure of reform since the reform bill itself became a law; the measure, above all others, to obtain which the people strove to obtain parliamentary reform. He has left the government to the whigs with a grand difficulty subdued, the national finances in a flourishing state, the country prosperous and at peace, and agitation for organic changes unheard of. With the exception of the protectionists, whose monopoly he has destroyed, and those whig partisans who profit, or hope to profit by his fall, the whole nation regrets the loss of Peel. No minister, in our time, has left power, followed by so much popular sympathy and affection. Who could have thought that this would ever be said of the tory premier? While he served a party, opposed to the interests of the people, he was the most unpopular of public men. He threw off party, and worked for the people, and speedily became the most popular man of the day. Let it never be said that the people are ungrateful.

The course the whig leaders pursued in relation to the measure which caused the downfall of Peel, was not without suspicious circumstances. No doubt, the Irish coercion bill was a bad measure; unconstitutional, oppressive, and, above all, useless as a cure for the evil against which it was directed. Any minister who should propose so tyrannical an enactment deserved to be driven from power; and it was the duty of all the liberals in parliament to oppose the bill. But this was not the first Irish coercion bill. Ireland has never wanted such blessings. The two immediately preceding were both brought in by the whigs. Peel only followed the established practice; and this last of all the Irish coercion bills, as we trust, was passed in the upper house of parliament, with the concurrence of the whig lords; and not ill received by the whigs in the Lower House, at its introduction. But Lord George Bentinck and the protectionists, who had at first supported the bill, and who were ready to support it to the last, if Peel would have consented to postpone to it the Free Trade Bill, having, in revenge of Peel's disregard of their selfish propo-

sal, sworn to effect his downfall at the first opportunity, the whigs became suddenly aware of the enormities and absurdities of the Irish measure; and by them and the protectionists the minister was outvoted. The act at least was right; let us hope the motive was right also. Ireland must now be governed otherwise than by coercion; and owes that immunity to Lord John Russell and the whigs.

To Lord John and his friends, no small share of the merit of carrying the Free Trade bill is also due. Ever since his memorable letter, of last autumn, to his constituents of London, Lord John has steadfastly adhered to the principle he then announced, and has zealously cooperated with Peel in pushing the measure through the House of Commons. To Lord John's firmness, and his influence with his party, is ascribed the support given to the measure by nearly all the whigs in the house. He has merited the place he now occupies. All the shortcomings and misdeeds of the whigs have, for the time, been forgotten; and the people are well content to see them once more in place and power. Those of the party who had to vacate their seats, in consequence of appointment to office, have in every instance been reelected, with general satisfaction, if not with acclamation. In only two cases (Edinburgh and Plymouth) has there been the shadow of opposition. In one of these it was only the shadow: in the other the opposition was real, and, from special circumstances, might have been formidable. But even there, the opposition was directed against the person and not against the party to which he belonged.

Apparently, the circumstances in which Lord John Russell has succeeded to power, are most auspicious. The danger of war with America is over; with France we are again on cordial terms; and with all the world, (except Rosas, at La Plata,) at peace. C'Connell, and Ireland, represented in his person, are well disposed to whig government, (witness the unopposed return of Mr. Sheil, although not a repealer, by the repeal constituency of Dungarvon;) and the chartist agitation is asleep. Very little dissatisfaction, at the announcements of whig policy, made by the ministers who have had to face their constituents at the hustings, has been anywhere expressed. Such social improvements as have been promised, are all highly acceptable; and more is scarcely expected or required at present. People have become tired of political agitation, and desirous of a period of repose. Under the whig rule, it is felt there is a prospect of quiet and prosperous times. The advent of the whigs to power is, therefore, welcomed by the great majority of the nation; and deprecated, in so far as we have observed, by only Mr. Duncombe, Mr. O'Connor, and their followers, if, indeed, their followers are with them at present. If infinitely less ardent, the welcome of the whigs to office has been far more general, than it was in 1830, when so much national benefit was expected from a liberal ministry. Everything seems, at first sight, to promise a long and happy whig reign.

The whigs reënter office in circumstances unprecedented in our history. There is no opposition; for an opposition implies leaders who could be supposed to aspire to office without provoking a laugh, and this can scarcely be said of the party represented by the hundred patriots who, under the auspices of Mr. Banks, ate white-bait at Blackwall, and, intrenching themselves behind the walls of the church, swore to maintain an armed neutrality, unless the church was attacked. These gentlemen

apart, every man appears to be of every man's way of thinking. Within the cabinet, every man is allowed to have his own opinions: Earl Grey, who would crop and dock the Irish church; Lord John Russell, who would leave the Irish church its revenues, and establish the Romish church in Ireland in addition; and Mr. Macaulay, who would neither assail the Irish church, with Earl Grey, nor endow the Romish, with Lord John; have made up their minds to a harmonious difference of opinion. Outside of the cabinet, the Peel party having been worsted on the Irish Curfew Bill, have given up the hope, and apparently even the wish, to try another. They have adopted the same eclectic system of politics as the whigs, and differ from them in no essentials. Sir Robert Peel having been fairly complimented out of office, bowed down stairs with an excess of civility, Lord John is welcomed, not exactly with *empressement*, but with a fair amount of cordiality. Whig, tory, and radical—the lion, the lamb, and—any animal the reader pleases to select as typical of the third party, have couched together amicably in parliament.

Out of doors the people are looking on to see what is to be the "upshot" of all this cordiality, what the first fruits of this political millennium. "*Haud equidem invidio, miror magis*," is the prevailing sentiment. Notwithstanding the famine and railway panics, there is no general pressure at this moment beyond what men have got accustomed to. Agitators (except in Ireland) find the masses, worn out with protracted struggles, rather difficult to excite. No-popery and free-churchism made as indifferent a rally in Edinburgh as chartism did at Nottingham or Plymouth. There is a general disposition—now that the old whig and tory and parliamentary radical parties are broken up, pounded down to a uniform consistency, and prepared for fusion—to wait and see what kind of a government is likely to be produced by the amalgamation. In this state of the public mind, it is not so rash in Lord John to take office without a numerical majority in parliament as might at first sight appear. Where there is little difference even of *professed* principle among parliamentary men, place is a wonderful eradicator of mere personal incompatibilities. The treasury bench is a magnet that, except on exceptional occasions, is sure quietly to draw a majority to it. Then if with the support of such a majority for one year, ministers can contrive to avow principles and carry measures that may, in the taper and tadpole language, serve as a "cry;" what with watchwords under which no political Dalgetty may be ashamed to rally, what with the influence of office, and what with the excellent organization of the whig standing electioneering committees, ministerial chances of a majority in the next parliament are as fair as could be desired.

But, to those who scan the whole political horizon, the prospect is not without clouds. One dark cloud, especially, seems not unlikely from the course of the wind to overshadow, ere long, the ministerial position. The state of Ireland cannot fail to bring on the question of church establishments or the voluntary principle; the most formidable question of the day. Other vexed questions will be brought forward, in the course of next session, to say nothing of the sugar duties in the present. For although the ministers and their partisans will do their best to prevent the introduction and the discussion of troublesome questions, and although the nation is likely, for some time, to prefer quiet to agitation, it is scarcely possible but that

offences will come. By the resistance to every successive measure of reform, a whole generation has been trained to agitation. There is a reform press, which must have topics for discussion: there are reform orators, who must have grievances about which to declaim; there are independent members, representing reform constituencies, who must bring forward reform measures to please those who sent them to parliament, and to acquire distinction; and there are countless thousands of reformers, whose aspirations after progress must be gratified. In the course of time, all the old questions will again be propounded. Extension of the franchise, ballot, repeal of the rate-paying clauses of the reform act; the legacy duties, and other inequalities of taxation; currency reform, repeal of death punishment; church rates, &c., will all reappear, notwithstanding every attempt of the party in power to keep them in abeyance. Above all, the state of Ireland, and the Irish church question, will force themselves on public attention. Verily there will not long be peace for peace-loving whigs.

The elements of disturbance are not dead, but sleep. The chartists are scarce seen or heard of at present: but the chartists still exist. Let there come a season of monetary pressure, accompanied by want of work, and the millions will become uneasy; let the millions feel uneasy, and the natural and necessary distrust of a government over which they exercise no control, which is entirely under the management of classes who have stored up means to weather a season of distress, will revive. We have not heard the last of extension of the franchise; no, nor of the five points either.

Again, the spirit of sectarian bigotry is scarcely even asleep. If it slumbers, it is a nightmare slumber, and its groans and tossings are as full of meaning as those of Richard the night before Bosworth field. Old Intolerance is preparing for a last rally, and, like Captain Macheath, he will "die game." The cause of religious liberty has been more rapidly advanced in practice than in theory. Two parties have coöperated in this, who but imperfectly felt the divine nature of the mission they have been fulfilling, and who cordially distrust and dislike each other—the latitudinarians on the one hand, and the sectarians on the other. By the latitudinarians, (we use the word in no dislogistic or offensive sense,) we mean the scholars and thinkers, and the statesmen and lawyers, who, by reflection or mere habit, have come to look with indifference upon the minor controversies of sects, so long as the great essentials of devotional feeling and moral convictions are safe. Under every form and phasis of society, this class of intellect must be the governing one. Religious controversies are so many impediments to their political schemes, and they would fain suppress them. When men of this class are intolerant, (and there is sometimes a natural intolerance of disposition which no schooling or training can subdue,) it is of sincere, impracticable, narrow-minded religious conviction. Our Chesterfields and Bedfords, and our literary promoters of Catholic and Jewish emancipation, have belonged to this class. They are not truly tolerant; for, incapable of conceiving the deep devotion to peculiar dogmas, which seems inseparable from many of the highest virtues of human nature, they would emasculate public opinion, by suppressing it. The other class to whom we alluded, are the sectaries, or dissenters. There is a grandeur and single-heartedness about the readiness of the better minds of this class to sacrifice everything for con-

science sake, that commands involuntary homage. But linked with this, even in the best of them, there is a habit of attaching exclusive importance to those opinions by which they differ from others, a repulsive and polemical tendency, that confines their most genial feelings to the narrow circle of their sect, and chides the sympathy of those who do not entirely concur with them. Various sects from time to time ally themselves with each other, and even with the latitudinarians, to ward off danger; but their consciences check them for such compliances; when they can, they prefer standing aloof, and even in aggressive relations to all who think differently from them. Such intellects are incapable of governing a state wisely; woe to the nation which is subjected to their sway! but they have many of the sturdy and independent qualities of the good hater, and in our country they are numerous, and as powerful as a multitude of independent self-willed guerilla troops can be. The conscious and avowedly intolerant section of society, still too numerous among us, is ever ready to avail itself of the distrust and want of cordiality between the statesmen and scholars who compose the latitudinarians, and the innumerable communions who compose the sectaries, and, among the latter, in regard to each other. And already we have had symptoms preparative for a fierce Exeter Hall campaign.

Ministers may make up their minds that the present lull is deceptive; that all the elements of as fierce a political strife as this country has ever witnessed, are actively fermenting beneath the surface. It is not by fair words, or graceful concessions, that they are to neutralize, pacify, or divert them. The drawing-room liberalism of politics is too diluted—the bookish policy of the metropolitan press too unreal, to serve the purpose. They must look at the cravings of the densely-packed quivering masses in the manufacturing districts, at the dull chronic nightmare suffering of the agricultural districts, at the deranged social relations of Ireland, and apply real remedies to real agonies. Thus only can they render permanent their precarious tenure of authority.

And how will the new ministry meet the rising demands of reformers? The question is of more importance to themselves than to the people; for the spirit of progress is so powerful that, if resisted by the whigs, their resistance will only be fatal to their retention of place.

Their position is not so secure as it seems, from the ready acquiescence of the nation in their return to power, and the present lull of political agitation. There are dangers within and without the camp of the whigs. From Lord Grey within, and from Sir Robert Peel and Mr. O'Connell without, they have much to apprehend. If they act rightly, Lord Grey will be to them a tower of strength. We trust the same thing may be truly said of Sir Robert Peel, and also of Mr. O'Connell. But certainly in Lord Grey, the whig officers have a dangerous messmate. Should they retrograde or march in a wrong direction, he will assuredly desert them, and join the more dangerous party of their enemies. The danger to be apprehended from Sir Robert Peel, is not less. He has promised them his support in all good measures; and there is no reason to doubt either the sincerity of his intention in their favor, or that he will faithfully perform what he has promised. But that he should have any personal favor for them, or that he should wish to see them longer in office than they use their power for the

public benefit, is not to be supposed. We believe that he will act towards Lord John Russell, with more magnanimity than Lord John displayed towards him. For, while supporting Peel's great measure, Lord John could never refrain from unnecessary and mischievous sallies, depreciatory of its author. No petty ebullitions of spite or spleen are likely to proceed from Peel. But it may be expected that he will be quite ready to withdraw his support from Lord John Russell, at the very time when support shall be most required; that is, when the whigs are doing something both wrong and unpopular; turning his force suddenly against them, to their destruction as a ministry, and his own restoration to office as the minister of progress. From Peel as again a conservative, the whigs have not much to fear. If they attack the church establishment of Ireland, the friends of that church would scarcely choose Peel as their champion. They would feel instinctively that *their* cause would not be safe under his charge. The part he acted in the cases of Catholic emancipation and corn law repeal, could not fail to impress on their doubting consciences, what they might anticipate from Peel. Should the whigs attempt organic reforms, there might be more danger from Peel; again become leader of the conservatives, protectionists and all. That danger, the whigs, however, will not incur. It is more likely that Peel may go beyond them, in that direction, by originating or supporting a new reform bill, retaining the £10 franchise, but abolishing all the corrupt small constituencies, and establishing equality of districts, with triennial parliaments; a measure which, although far short of radical reform, would immensely increase the power of the middle classes to return men of their own sentiments to parliament.

From Mr. O'Connell, the danger to the whig cabinet is not so great, as from either Lord Grey or Sir Robert Peel; that is, if Mr. O'Connell continue to agitate solely for repeal of the union. Against that agitation the whigs will have the support of the whole British public, including, with scarcely an exception, the whole British press. But if he should direct his force against the monster grievance of Ireland, the established church, the church of one tenth of the population, which yet monopolizes the whole national church property, the case would be very different. That grievance is utterly indefensible. Apart from the opinion so rapidly gaining ground, that all church establishments are injurious to the cause of true religion, and, where there is not one sect of religionists but many, flagrantly unjust to all the dissenting churches; there is no gainsaying the truth, that, on every principle of equity and common sense, if there must be a church establishment in Ireland, it ought to be that of the national religion of Ireland—the religion, not of *one* tenth of the people, and the richest portion of them, and therefore the best able to provide religious services for themselves; but that of above *eight* tenths of the people, and these the poorest. England has its establishment; the church of the majority of the English people. Scotland has its establishment; the church of, till very lately, the majority of the Scottish people. Why should not the establishment of Ireland, if establishments are to be maintained in each of the three kingdoms, be that of the majority of the Irish people? a majority greater than the English church can boast in England, or the Scottish church ever could pretend to in Scotland. The Episcopal church is more odious to the dissentients, in Ireland, than the es-

tablishments in the other two kingdoms are to the dissenters in these kingdoms. Besides being the churches of a present majority in the one case, and of a very recent majority in the other, these churches were the original choice of the English and Scottish people. Not so the church of Ireland. It was forced upon the Irish nation by invaders and oppressors. It was established by force, on a reluctant people; it has been maintained, by force, among a people whose original aversion to it has never known diminution; and it is maintained by force, at the present time. Without the vast body of troops quartered in Ireland, amounting to about one third of the British army, the English church establishment in Ireland could not maintain itself for a single day. It is nonsense to pretend that the English church in Ireland is not an injustice and an oppression, because it takes nothing from the Irish people, but subsists on its own funds. The whole property and possessions, as they are called, of that church establishment, were taken from the church of the Irish people, who are forced to pay their own ministers of religion; the funds and possessions formerly devoted to that purpose being forcibly appropriated by an alien church. Can such a violation of every principle of religious liberty be supported by Englishmen and Scotsmen? Can it be expected that such a degrading infliction on the feelings of Irishmen should be much longer submitted to? The thing is impossible.

Had there been no Presbyterian establishment in Scotland—had the English church been established there also—the insult, if not the injury to the people of Ireland would have been less palpable. It might have been said that the Episcopalian was the church of the majority of the people of the United Kingdom; and, as it is the duty of the state to maintain an establishment of religion, that establishment could only be the Episcopalian. But the successful armed resistance of the Scottish people to the thrusting upon them of an alien and hated church establishment, has destroyed that plausible argument, and leaves the Episcopal establishment of Ireland a crying injustice, a degrading insult, and a monument of foreign oppression, which cannot be maintained with the smallest pretence to fair dealing, or conformity with the great Christian principle of doing to others as we would that they should do unto us.

The whigs, it is only justice to admit, have long been sensible that this state of things in Ireland ought not to be maintained. Lord John Russell and other leading statesmen of the party have proposed a remedy. The Rev. Sydney Smith advocated the same remedy, in an eloquent and powerful appeal, published after his decease. And the great whig organ, *The Edinburgh Review*, at various times, but especially in an elaborate article in the number for January, 1844, (vol. lxxix., p. 189,) took the same view of what was required to give peace to Ireland. We doubt not the sincerity and good intentions of the whigs. But *their* mode of redressing the grand Irish grievance will not do. They wished to pension the Romish priests, and have *two* church establishments in Ireland. A better way of putting the Catholics and the Episcopalian on a par, would be to have no church establishment in that country. Nothing can be more clear than that either the Roman Catholic religion must be there established, or the Episcopalian church be dis-established. It is to the honor of Lord John Russell and the whigs that they acknowledge the wrong and wish to redress it. Most

of them probably think the double establishment the better mode of doing justice; and all of them that it is the more practicable. There we believe them to be mistaken. They have not taken sufficient account of either the religion or the bigotry of the people of England and Scotland. Any attempt to pension the Romish priests would be instantly fatal to the whigs, or to any ministry. Their generous purpose must needs be abandoned. Its avowal at any time was a great imprudence. Mr. Macaulay, at his meetings with his constituents, found it necessary to disclaim all intention of paying the Irish priests; and to assure his hearers, that if the ministry to which he belongs had contemplated such a measure, he would not have joined them. Lord John Russell, also, in his exposition in the house of commons, of the ministerial intentions, declares that although "he retains his opinions with respect to Roman Catholic endowment, he does not think it necessary that he should urge these opinions at present; for he should be doing that which he must confess at the present moment to be impracticable." Impracticable, no doubt, at the present moment; impracticable, we believe, at any future time; and as improper as impracticable, there being another way of doing justice between Catholic and Episcopalian. To that other and better way, we recommend the whigs to turn their attention. Although it, so, at the present moment, may be impracticable, public opinion is taking that direction; and it may, before long, be as practicable as it is just.

It seems strange that, supposing the religious and the bigoted feelings of the British people would permit the pensioning of the Catholic priests, sensible men should believe that such a measure would remove Catholic discontents. The Catholics cannot forget that to their church belonged the chapels, revenues, and dignities now occupied by another church. Yet it is not unreasonable to suppose that they might be quite contented with an equality with the adherents of the rival sect, by the abolition of the present establishment; and not aspire to attain their original ascendancy. But with less than equality, how can it be supposed the Catholics would be contented? And what equality would there be, if the Episcopalian church were allowed to retain all, or nearly all its present possessions, and the Catholic church were merely to obtain pensions for its priests, with perhaps a number of cheap and inelegant chapels built for them? Could the Catholic priests be contented with the very moderate stipends proposed for them by *The Edinburgh Review* in the article above alluded to, while the Episcopalian clergy had hundreds of pounds for the Catholic tens, and the Episcopalian dignitaries thousands for the Catholic hundreds? It is not possible that the Catholics could be satisfied with such a meagre and degrading allotment of state pay; although they might take it as a step towards obtaining more. The cry of Justice to Ireland would soon be raised; and the principle that the Catholic church was entitled to be made a state establishment, having been admitted, the inequality of the two establishments would be utterly without defence. After working together for a few years, with anything but harmony and brotherly love, the rival establishments would assuredly get to a state of war for supremacy; a war possibly of more than words.

It must not be forgotten that there are other religious sects in Ireland besides Catholics and Episcopalians. These sects, of course, would require to

have their religious services paid for by the state, were the Catholic religion endowed. Justice requires that all should be endowed or none. Not even those sects which are not allowed by others to be Christians at all, could be fairly excluded. We trust that the proceedings at the late election in Edinburgh will receive due attention from the whig ministers, and that we shall hear no more of pensioning the Catholic priests. Edinburgh is far from having an extra quantity of bigotry; we believe it has less than the other large towns of Scotland and England, London perhaps excepted; and it is not behind any of them in enlightenment. Yet, if Mr. Macaulay had denied the intention of endowing the Catholic religion in less strong terms than he did; had he said no more to his constituents than Lord John Russell said in the house of commons in answer to Mr. Thomas Duncombe, he most certainly would have exchanged places at the poll with Sir Culling Eardley Smith.

In writing as we have done, we do not affect to be disinterested. As friends of religion, and of religious liberty, we are opposed to state churches, and do not wish to see the number of our enemies increased. Religion and church are very different things. Religious liberty and church establishments are totally opposed to each other. We know how churchmen of different sects, however antagonistic their respective church establishments may be, are disposed to fraternize, for mutual defence of their respective positions. What sects were more opposed to each other than Episcopalians and Presbyterians? Scorn on the one side was met by detestation on the other. But Episcopacy in England, and Presbyterianism in Scotland, being established, the scorn has diminished, and the detestation has ceased. The English establishment now regards the Scottish with some small measure of respect. It is felt that the former may be one day in danger from the enemies of all establishments. Black prelacy has ceased to be hated by the Scottish establishment, because the latter finds itself already in danger, outnumbered and surrounded by foes who have sworn its destruction, that is, its separation from the state. Let popery be established in Ireland, and the other two establishments will speedily recognize her as a sister; of a different and not over-lovely favor, compared to themselves, but still a daughter of the same lordly family. The friends of religious liberty in Britain, deserted by their Irish allies, would have three enemies to contend with, instead of two, as at present; and although, their cause being that of truth and righteousness, ultimate victory might be certain, it would undoubtedly be postponed to a day comparatively distant.

We hope for good government from the whigs. But what security for it have we, under the present reform act, when the country shall be delivered over to whig rule for seven long years of a new parliament? None but that of public opinion, and the possibility of some new league for giving effect to it. But such monster associations are not the proper remedy for misgovernment. They are difficult, laborious, and costly; and would be highly objectionable, were they not necessary, owing to the deficiency of the proper constitutional remedy. All who desiderate civil and religious liberty, must wish for other and more regular and easily-working means of letting the popular will be imperatively felt.

THE PHYSIOLOGY OF FLOGGING.—Amid the storm of indignant correspondence which has been extorted by the horror with which a recent fatal instance of this disgraceful practice has filled the public mind, the following letter, addressed to the *Times*, is so significant, that we feel called upon to assist its argument by bringing it under the notice of our own readers. Such new and striking light is thrown by its propositions, and by the evidence of Mr. Erasmus Wilson given at the coroner's inquest, on the barbarity of this revolting species of punishment, that there is every hope of their, at length, compelling an abandonment of a usage which—like some others that have lingered amongst us in spite of all our boasted civilization—would be a reproach to a nation of savages. Through the length and breadth of England, we will venture to believe, that the disgusting details of this military execution have been read by no man without the throb of indignation and the blush of shame. If the use of torture be essential to the maintenance of discipline in the army, it were better and more humane to release from the Tower some of those horrid instruments which have been hung up there for the execration of ages, and regulate the comparative dignities of colonel, and sergeant, and private, by means of the thumb-screw:

"It may seem very hard if I say that the effect of flogging is not fully appreciated even in my own, the medical profession. But I have studied the subject, and I beg to send you a few medical hints upon it. Every lash, like every other kind of laceration or cutting, affects the power of the heart. A patient sometimes never rallies from the effect of a severe accident, (such was the case with Mr. Huskisson,) or a severe surgical operation. But this is not all. The skin, which some persons seem to think may be treated like an inorganic substance, has a special relation with the internal organs:—1. A current of air falling partially on the surface is sufficient, by its action on the skin, and the sympathy of this, through the ganglionic system, with the internal organs, to induce inflammation of the lungs, or of the heart, or of the membranes which cover these organs. 2. The same event occurs from burns or scalds. 3. The same event occurs from flogging. It is not the extent of the infliction merely which is to be considered; much depends on the peculiarity of the constitution. The healthy are less affected than the unhealthy, the sober than the drunken. But any person may, as the effect of any of the inflictions to which I have adverted, become *diseased—diseased for life, or diseased unto death*; and no man—no medical person—can tell, *à priori*, who is to suffer or who is to escape. Flogging is not to be treated of, then, as a thing skin-deep. Many a soldier whom it was only intended to flog has been slain, unknown even to the inflicter of the punishment; for, as I have said, the medical bearings of the subject have not been duly investigated. It is somewhat singular that those persons who seem to bear a surgical operation best are precisely those whom it affects the most, and most dangerously. There are, besides, what we call idiosyncrasies, or peculiarities, which, besides the fact of ill-health or bad habits, render an infliction which might generally be borne without risk most dangerous. In the tendency to disease of the brain, in disease of the heart, flogging would be dangerous; and this punishment has actually induced epilepsy and tetanus (or locked jaw.) I may refer to the writings of the late Mr. Rose and Sir C. Bell, of Mr.

Travers, &c., for examples of internal disease, especially inflammation of the lungs, induced by severe accidents or operations; but, if this be true in regard to the tissues in general, it is specially so in respect to the skin. The great fact is, that as exposure to a current of air, so a burn, and so a flogging, may induce disease—lingering disease and death."—*Athenæum*.

THE COPPER REGION.—The stories which reach us from the copper region on Lake Superior, almost daily, startle our credulity; and were it not that we have ourselves seen some of these large masses of native copper, we should find it difficult to credit them, however well authenticated. A gentleman from Zanesville, now on his way to Lake Superior, thus writes from Detroit, on the 28th of May, to the *Zanesville Courier*:—"The explorations on Lake Superior prove that it is, beyond compare, the richest copper region in the world; and four or five veins have, thus far, been discovered which contain silver in sufficient quantities to render the mining highly profitable. Some of the copper ores carry with them 10 per cent. of silver; which would make its commercial value between 4,000 and 5,000 dollars per ton. The explorations during the past winter, I learn, have been highly satisfactory. One day last week, a boat took down about 50,000 dollars' worth of copper and silver ore belonging to the Pittsburgh Company, destined for the Boston Market. The Boston and Lake Superior Company (Eagle River) have struck a vein which is represented to be very rich in silver. The Copper Falls Company, you will recollect, uncovered a mass of native copper, last winter, some 13 feet in length—which proved a very serious obstacle to the presecution of their work. The Eagle Harbor Company, on the adjoining location, have met with an obstacle still more serious. They have come to a mass of native copper, which serves as a brazen barrier to all further operations—at least for the present. They have 'drifted' longitudinally about 90 feet, without finding its length; they have sunk down about four feet in places without finding its depth. Its average thickness is about 18 inches! The mass thus far uncovered is estimated at about 90 tons; and its commercial value, when raised and smelted, will exceed 25,000 dollars. This seems almost incredible, and yet it is literally true. Nothing in the previous history of mining operations can compare with this. The Ontonagon copper rock, weighing about two tons, was regarded as one of the wonders of the world; and yet, between that mass and this, the difference is as great as between a mustard-seed shot and a cannon ball. The company propose erecting a steam engine for the purpose of sawing this immense mass into blocks, and thus raising it from the mine. I saw some of the fragments or rough 'strings,' that were cut off from the exterior; and, with the exception of an occasional admixture of spar, it resembled more the product of the furnace than the mine."—*Toronto Patriot*.

THE Turkish government has just ordered the establishment at Constantinople and Smyrna of a body of firemen. This step is a victory over the doctrine of fatalism of the Turks, which enjoins them to remain inactive when a fire breaks out. In order, however, that the object of the government may be fully carried out, the new corps of firemen is to be composed of Armenians and Jews. —*Morning Chronicle*.

From the North British Review.

1. *Memoirs of the Pretenders and their Adherents.* By JOHN HENEAGE JESSE. 2 vols. London, 1845.
2. *Memoirs of the Jacobites of 1715 and 1745.* By MRS. THOMSON. 3 vols. London, 1845-6.
3. *Memoir of Prince Charles Stuart, commonly called the Young Pretender, with Notices of the Rebellion in 1745.* By CHARLES LOUIS KEOSE, Esq. 2 vols. London, 1845.

TWENTY years ago, James Hogg published the lyrical poetry of the Jacobites, which was fast receding from us, as each year carried off another and another of the stragglers who had been out in the '45. He did service to literature and the world, by fixing down forever so many exquisite lyrics, which constitute the most enduring record of the feelings and the misfortunes of the extinct party who composed them. With the natural leanings of an editor to his subject, he found genius in every poem, and looked at Jacobitism in such a manner, that the extinction of the Stuarts alone prevented the authorities from asking an interview with the Shepherd, on the application of the treason laws. But though the arm of the law was paralyzed, the police of literature—the critics—were in their prime. The *Edinburgh Review* pounced upon the unhappy author and his book, and dragged before a court of whig jurisdiction the compiler, who, by covert hints, and often by direct statement, advocated the exploded doctrines of the exiled family, and thus blackened the memory of the whigs, who had done it all. Hogg is termed everything but a man of sense; and the poetry itself is classed among the fugitive political squibs, which, like the ephemerides, should die on the day of birth.

Times are changed, indeed, when the doctrines which Scott could just insinuate, and for mildly asserting which Hogg endured martyrdom, have been urged in four octavo volumes with an earnestness that could not be surpassed, though the restoration of the Stuarts were yet attainable. We had thought that Jacobitism had died away, even amid the scenes which cradled it into youth, and saw the brief triumphs of its maturity. In the mixed and variegated shades of modern party, we had imagined that the search would be in vain for the principles of our Jacobite fathers. Their gallant achievements and their heroic deaths came to us through the cold medium of history, or in the plaintive melody of Jacobite song. Time was doing its usual duty of reducing heroes to ordinary proportions, and the romance of the '45 ran the risk of an eclipse. Even the long list of terrible proscriptions which swept over a ruined party, extinguishing ancient families, and changing the very names of the districts that for ages had belonged to them, had been forgotten, under the benign civilization which has followed the consolidation of the throne of the house of Brunswick.

The end of Jacobitism appeared to be approaching, from very want of an object for which to live. After a flickering life, kept up by the genius of Scott, it hastened to its exit, and ought ere this to

have disappeared from the stage of existing politics. It still, however, exists to plague us. Though not as an active principle, capable of practical application, by the reestablishment of the Stuarts, it has been made the foundation of speculative opinions, which tear up by the root the principles of constitutional government, and of a whining sentimentality which misleads the judgment by arousing the sensibilities of the heart. The calamities of the wars of ambition are effaced by a year of peace; those of the wars of opinion, political or religious, make a profounder impression, since they touch at the core the principles on which society is based. Accustomed, therefore, to the immortality of party—finding, not in the glens merely but in the crowded cities, the spirit of the covenants still animating their descendants, and the principles of the puritans the principles of English descent—it were strange if a great party like the Jacobites, so resolute in their schemes, so generous in their sacrifices, so ardent in their devotion, had passed away without leaving on society an impression of their existence.

Be it from conviction, or from morbid sentimentality, or as a bookselling speculation, we have been favored by Mrs. Thomson and Mr. Jesse with two books filled with the most rampant Jacobitism. This would be pleasant reading now, were it not the germinating false principles, and the giving assistance to a party who wish to roll back the free opinions of the revolution. The phantoms of hereditary right and ecclesiastical supremacy, which had long slept quietly in their graves, have astonished the world by the tale of their strange resurrection. Under another name, every doctrine against which our fathers protested, and for the enforcement of which the Stuarts fell, has been made the subject of elaborate eulogy. Thus the departed great are robbed of their reward, and sentimental historians and tractarian polemics destroy, by distinctions and exceptions, all political morality and all constitutional freedom.

Yet the three works which have just appeared on the history of Jacobitism are an agreeable accession to our literature. They give the history of the empire subsequent to the revolution; they do it, too, in the form the most engaging and instructive. Memoirs increase the interest, by individualizing the narrative, and centring the attention on a single object. Painting men in dishabille—exhibiting them in their retirement—associating us with the history of their private life, in those moments when nature speaks—these writings create an interest always superior to that of history, which hampers itself but little with details, and elevates its heroes upon a pedestal. We see the past more fully than was ever wished by the men whose doings constitute public history—we can unravel the secret motives and outrageous pretensions of an age divided from ours by a hundred years, and as each rotten reputation is dug up from the ruins of this moral Herculaneum, we find many an illusion vanishing as to character and actions.

We do not mean to say that the important period of fifty-seven years, from the revolution to the last rebellion, has found historians full in all things, in

the three writers who have published the *Memoirs of the Jacobites*. They have confined themselves only to one party, whose history, however, must always be interesting to Scotland and to Scotsmen. Commencing with the statesmen of the days of James the Second, we have a continued biographical narrative to the death of the last of the chiefs of the '45. In regard to the mode in which this has been accomplished, we have—barring the Jacobite leaning—much to praise, and but little to condemn.

Both Mr. Jesse and Mrs. Thomson have the merit of adding, from unpublished papers, something new to what is already known. That which is old they have placed in an intelligible garb, and dragged considerable information from the obscurity of volumes which the world had forgotten. But, while Mr. Jesse displays great industry, he has little discrimination. All that has been written on the subject he has given us—truth, falsehood, exaggeration, nonsense—compiled, with great fidelity, from every source accessible to investigation and industry. With the indifference of a practised writer, he is not ambitious of originality. Provided the book is made, it matters not to whom belongs the merit of the writing; and accordingly, every third page is a quotation of the interesting passages in all the pamphlets, histories, and memoirs which have enlightened the world on the history of Jacobitism. By using his scissors rather than his head, Mr. Jesse has furnished us with a better book than a stricter attention to originality, or a higher intellectual activity, would, in all probability, have given us. It is only to be regretted, that in the preference bestowed on his quotations, he has not labored at all times for the honor of his sagacity, and has inserted much to increase the volume rather than the interest. In regard to what is original, we might have had a more distinct narrative of those *minutiae* that illustrate personal character, national manners, and the feelings and opinions of the time. Much of the general speculation—in high Cambyse's vein—not very consistent or profound, might, with advantage, have been supplanted by a few of those numerous anecdotes which escaped the industry of Forbes, Scott, and Chambers, and which, though still circulating in society, are fast dropping into oblivion. The Jacobitism of the volumes is, moreover, evidently not native here, and to the manner born. It has, with him, only the appearance of being the medium for fine writing, like those old airs that musicians take, in order to produce upon them a thousand new variations.

Yet, after all, Mr. Jesse's book is interesting and instructive. The greater part is occupied with the history of Prince Charles. There is also a full sketch of the life of the old Chevalier, the father of the prince, more complete and accurate than any other we know of in the English language. Add to these the *Memoirs of the Countess of Albany*, the wife of Prince Charles—of the Cardinal York, his brother, the last and best of the Stuart line since the days of James the First—of the gallant old Balmerino—of the Earls of Kilmarnock and Cromartie—of Lord George Murray, and the celebrated Flora M'Donald.

Mr. Klose's book is one with greater pretensions to originality, and is confined exclusively to the history of the young chevalier, with a prefatory sketch of the character of the Stuart reigns. Mr. Klose, though a foreigner, has fallen into a few of the blunders which might have been excusable in

him, when treating of the antique history of another land. He brings to his task all a foreigner's impartiality, with few of a foreigner's prejudices. Had he referred more to his authority, and told the sources of his knowledge, we would have had greater confidence in his narrative, and given a more implicit respect to his speculative opinions. These in general are just, liberal, and philosophic; and while the romance of history is not lost by prosaic dulness, the writer never rides the pegasus of imagination, to excite a "thrilling" interest, by a burst of forced and metaphorical conceits.

Mrs. Thomson's work is one which has agreeably disappointed us. It is a genuine book, a little too pompous and ambitious in its style for memoirs, yet written with an earnest honesty of feeling, that goes far to palliate its errors of opinion. We began to read it, in a spirit of hopeless resignation, determined honestly to discharge the task of only judging it on trial. We anticipated that it would have been a production of the same school, as that of all the lady writers on Scottish history—feeble in statement, erroneous in its facts, sickly in its thought, but above and beyond all, with an intolerable mouthing of the most maudlin sentiment. We have found it, however, a book, with regard to facts, carefully compiled—drawn not merely from the ready sources patent to all, but from the secrecy of ancient cabinets, in which was entombed a large collection of interesting correspondence, now, for the first time, made known to the world. We see that this lady has spent a large portion of her time in the study of books containing the history of the events of which she treats; she cites them as one who loves them and knows them well; she borrows from them a crowd of piquant passages and interesting anecdotes, drawn principally from forgotten sources. Freshness and animation reign throughout; and in the passages most Jacobitical in their tendency, the good nature, good spirit, and agreeable writing silence rebuke. She has never allowed what she terms "a leaning for the unfortunate cause of the Stuarts" to pervert the impartiality of history. Neither do we meet with any cruel outrages upon logic, or any perversion of those great principles on which rests the column of British freedom, erected with such painful effort, and guarded with such unsleeping zeal.

The work has evidently been revised by persons capable of saving the writer from mistakes. When we find a lady versant in the technical jargon of the Scottish law, and rivalling Bailie Macwheele himself in the correct description of "fee and liferent," and of all the mysteries of "dispositions of lands, heritages, tenements, annual rents, together with the goods, jewels, gear, utensils, horses, sheep, cattle, nolt, corn, and others pertaining and belonging to," &c., &c., (vol. ii., p. 301, and vol. ii., p. 180-6,) we are scarcely in error in supposing that some modern bailie has given the aid of his inspiration to the history. There are, however, some errors in regard to localities that might have been avoided, by a judicious employment of any bailie who, (according to Mrs. Malaprop,) by being "instructed in geometry, might know something of the contagious countries." Thus we have the village of Logierait, near Dunkeld, transmuted into Logaret, (vol. i., p. 87.) The house of Stewart of Gairntully, is changed into "the house of Stewart of Grandtully," (vol. i., p. 155,) which might be confounded with Stewart of Grandtully—a different family. The river Earn becomes Eru, (vol. i., p. 181,) and the Trosachs are trans-

muted into *Trosachs*, (vol. ii., p. 156.) Many other blunders of the same kind—some typographical and others editorial—we do not mean to dwell upon in regard to a work which possesses so many recommendations.

Mrs. Thomson, by not giving a history of Prince Charles, has ample space for separate memoirs of the subordinates. Her first volume contains an admirable biography of the Earl of Mar, in which we are carried back to the old parliament of Scotland, and enlightened as to all the details of the rise, progress, and suppression of the rebellion of the '15. We have also a memoir of the young Earl of Derwentwater, who closed his short career, amid universal sympathy, on the scaffold; of the Master of Sinclair, whose opposition to Mar and graphic history of the insurrection, have saved his memory from the oblivion that his insignificance otherwise would have ensured him; and, finally, of Cameron of Lochiel, the most patriotic, disinterested, and bravest Jacobite of them all. The second volume commences with the biography of the Earl of Nithsdale, who was saved from the scaffold by the heroic intrepidity of his wife; of Viscount Kenmore, and the Marquis of Tullibardine; of Sir John Maclean, an illustrious obscure, of whom the world has heard little and cares less, and of whom all that is necessary to be said, may be summed up by saying, that he was one of the officers of Claverhouse, and was out in the '15. The latter half of the volume is, however, occupied with two names, with which Scotland once rang from side to side—Rob Roy and Fraser of Lovat. The former, though at the battle of Sheriffmuir, could scarcely be enrolled among the Jacobites. At the same time, we like to read his history, though it might have been told with somewhat less of the tone of a sermon on human frailty. Of the life of Lovat, we can only say that it gives a good but rather stilted and grandiloquent portrait of that extraordinary being, who, with all the vices of human nature, could simulate virtue so admirably, that he sometimes convinced himself that it was real. Of this incomparable rascal, we meet with a new incident somewhat peculiar. It appears that, besides being an outlaw, prison-breaker, and perpetrator of every crime, including rape, perjury, assassination, arson, treason, he was guilty of rather successful hypocrisy. He took holy orders when he found time hanging on his hands in France, joined the Jesuits, and attracted vast crowds to the evangelical sermons of the Curé of St. Omer! Of the third volume, we need only mention, that it contains a very full memoir of Lord George Murray—of Flora M'Donald—of the Earl of Kilmarnock—of the Duke of Perth, and of Charles Radcliffe, brother of the Earl of Derwentwater.

The most defective passages in these three books are the history of party. While nothing is left to be desired in regard to the history of persons, we have little or nothing of the doings of those great parties that divided the empire. While we have a faithful narrative of the antics of the puppets, we are told nothing of the people who pulled the strings. The mode in which the whigs and tories of the days of William and Anne conducted themselves, relative to the exiled princes, constitute by far the most interesting chapter in the history of Jacobitism. They exhibit a series of intrigues without example in profligacy, unparalleled in blunders. The battles of the cabinet and the senate rise in interest above Sheriffmuir or Culloden. It was in the cabinet alone that the danger of a re-

peal of the act of settlement was ever imminent, and it was by the doings there that the Stuarts had ever a chance of a second restoration.

On this subject all our three historians are either erroneous or mute; and we regret to add, that Mrs. Thomson is the greatest offender of the three. We are surprised that she has omitted a history of the Jacobite intrigues in the days of William, and of the policy of that sagacious monarch. Of the still more interesting events of the reign of Anne, little is told, and that erroneously. Parties are confounded; and the crimes of the tories are mercilessly laid upon the whigs. Yet unless there be a correct and even minute account of the intrigues at court, the first rebellion, in its origin, is absolutely unintelligible; and the second, in its apparent imprudence, criminal and dishonest. The first was the result of passion, a start of phrensy, on the part of the baffled intriguers of the last ministry of Anne. The second, where the cloak required to be made after it began to rain—where an insurrection was raised without a regiment organized, can only be redeemed from being a crime, as great in morals as in law, by the state of parties at '45. To tell that Charles raised his standard at Glenfinale—gained the battles of Preston and of Falkirk—was routed at Colloiden—hunted in the Hebrides, and finally escaped, is to tell us half the story, upon which no judgment can be pronounced on the character and conduct of the chevalier. The same difficulty surrounds us here, that fetters the judgment in regard to the history of Mary. Compassion for misfortune perverts the truth of history. It represents the victims of their own excesses as abandoned to party fury, instead of being condemned by all the majesty of national justice. Thus the men who wanted an excuse to begin the tragedy of their country, appear as martyrs by the heroism of their death. Our only resource is in what Mr. Klose alone has attempted. Before we can strike the balance of good and evil in the history of the Stuarts, we must recall the story of their expulsion—the succession of abuses—of obstinate and enormous error—of fatal folly, by which a family, delivered to all the elements of decay, marched rapidly to its ruin. We had a long experience of its incapacity. By that light we are enabled to reduce to its level, a romantic story, which, by exhibitions of courage and generosity, would otherwise ennoble human infirmity, dignify the nature of vice, and make ambition virtue.

The two prominent characters in the volumes under consideration, are the old chevalier, the son of James the Second, and Prince Charles himself. They are interesting contrasts; the gloomy, desponding, unambitious father—the sanguine, gay, light-hearted, and enthusiastic son. Both were engaged in unsuccessful rebellions, and have thus afforded us an opportunity of comparing their capacities—both were the victims of domineering necessities, enabling us to contrast their powers of endurance, and their philosophy. Where, against hope, the son struggled so nobly, and with his ragged mountaineers advanced within three days' march of London, we are often driven to suppositions as to the fate of the empire had Charles been the leader in the '15; a better account would, at least, have been transmitted to posterity as to the conduct of the war; force of character would have obtained its accustomed preëminence, and the penalties of treason would not have been incurred without a provocation equal to the punishment.

Of the causes of the first rebellion we shall after

wards have something to say. The immediate agent who took the management which produced the ruin, was one of those restless men unfit for a leader, and unwilling to be a subordinate. The Earl of Mar was one of the adventurers of the period, whose estates had suffered a quick process of decay under the forfeitures of the civil wars. He had entered life with a determination to retrieve his position, if it were possible, by honor—if not, by any means consistent with safety. It embarrasses historians now to ascertain the causes of that extensive influence exercised by this intriguer in the north. Ambitious mediocrity, insatiable vanity, a sublime genius in a coterie, an assumption of skill in all things, were his principal characteristics, while selfishness and expediency were his principles of action. After some rather dishonorable trimming, he had allied himself with the tory party, and partook of their disgrace. Like Oxford and Bolingbroke, he made an attempt to ingratiate himself with the German sovereign, and forwarded to him a letter, which, for fulsome adulation, was too strong even for the German appetite of George the First—"I beg leave by this to kiss your majesty's hand, and congratulate your happy accession to the throne." The vile columnies of slanderers had aspersed his character, he said; wicked insinuations were made against his loyalty. His own services to his country, his share in promoting the union of the crowns, and the consequent imposition upon Scotland of the act of settlement—which the Scottish parliament had never passed—his exertions in baffling intrigues adverse to the Hanoverian succession in the days of Anne, with lavish promises of his determination to secure it now, were topics on which he dilated only a few months prior to the celebrated hunting match at Breemar, at which he unfurled the flag of the Stuarts. (Mrs. Thomson, i., p. 51.)

Not contented with this, he exerted his great influence with the Scottish chiefs, to procure an address of congratulation to the new monarch on his accession. This address was signed by heads of the clans, who subsequently became parties in his rebellion. But it was all to no purpose. The German elector, in ascending the throne of a great empire, was only a German elector still. His views were early bounded by the confines of his petty principality, and he could never realize an estimate of the nation whom necessity had compelled to call him to be their chief. England was too big for him; and his politics were based upon the narrow prejudices of his education. To the throne he carried all the petty resentments of a schoolboy, and, in their gratification, forgot the prudence becoming a monarch whose power rested upon the quicksands of a disputed succession. To have secured the attachment of Mar, would have only cost the easy gift of some bauble honor, or lucrative appointment. To have done so, would have been to extinguish in its origin any chance of immediate insurrection.

All hopes of honorable or dishonorable ambition being thus cut off—all excuses for allegiance being crushed by threats of impeachment and attainder for past misconduct—all the hereditary feelings of his family to the Stuart race, being strengthened by all manner of insults to himself;—disappointed ambition—baffled hopes—safety—false honor—all concurred to one object; and the famous Breemar hunting-match was held. Here, the Earl invited all the chiefs of influence whom hereditary principles had made Jacobite, and whom

reverse, with all its dread apparatus of punishment, had not yet made prudent. Scott has well sketched the scene in Waverley, though he has placed it at a later date. Never was there a gathering in Scotland for such an object, which displayed a greater array of ancient names. The hunting was changed into a council of war, opened by the Earl with a long harangue, apologetic of his past tergiversation, and energetic with the promise of future resolution. Assurances of a general rising in England, and of aid from France, mingled with appeals to those national feelings so powerful with such an audience, carried away at the last all the suggestions of prudence; and the whole assembly committed themselves by an oath of fealty to the Stuarts.

The cause, at this juncture, had much of the elements of success. A party unbroken in spirit by defeat; resolute, active, united; an unpopular foreigner on the throne, estranging the affections of the ancient nobility of England by crowding his court with the obscure officials of his petty principality, wriggling themselves into the government of a nation of whose very language they were ignorant, and stilted themselves into greatness, by measures which compromised the security of their master and the peace of Europe;—discontent universal; the tory chiefs constituting the ministry of Anne pursued with forfeiture, and threatened with death; the absence of any statesman of capacity to direct with energy the defence of government; the abundant supply of funds in the hands of Mar; these were advantages which in abler hands would have sent the Hanoverian Elector to learn the philosophy of patience in his hereditary dominions.

But no Claverhouse with ruthless energy, no Montrose with his rapid movements was there, to give life to a party who only wanted a leader. Now when they had all the *materiel* of war, they wanted the gallant youth, who, in the '45, often reduced to his last guinea, was obliged to carve his way to a throne with three thousand mountaineers armed with scythes. But the supple courtier could neither command the respect of his followers by his wisdom, or inspire them with confidence in his military skill, which he began to acquire when circumstances elevated him to command. Throughout all Scotland, however, to the north of the Forth, the flame of rebellion spread with amazing speed, and the incompetent commander found himself at the head of a well supplied army of ten thousand men.

Had Charles Edward been so equipped in the '45, the retreat from Derby might have been changed into a victorious march on London. But the leaders of the rising in '15, knew better how to write gloomy letters of anticipated disaster, than to gain victories or animate soldiers with their prospect. Every scheme was discussed with the verbosity of diplomatists negotiating a treaty; and, in general, the tide had passed before they had resolved to unloose their moorings. The impatient Highlanders, instead of an immediate onslaught, were turned for a long period into Perth, to sow, in inglorious inactivity, the seeds of vexation and disappointment. The capacity of Mar for the leadership, may be judged of by two extracts from his letters—the one exhibiting the trifling society he resorted to, in the midst of a rebellion, and the other the childish impertinence he indulged in, when charged with such momentous responsibilities.

He was very fond of the praises of women ; but he appears to have had a surfeit :—

"The only inconvenience I had by Kate Bruce lodging in the same house with me was, it brought in too many women upon me, and some of these brought in others, and to this minute I cannot with discretion get quit of them."—(*Thomson*, i., p. 183.)

Having the pen of a ready writer, he threw off an abundance of rebel proclamations at Perth ; and he chuckles heartily at the fact, that "besydes other dispersings, I did yesterday cause putt in fifteen copies of it in the *Lords of Sessions Boxes*."—(*Thomson*, i., p. 183.)

The old chevalier landed in Scotland when all necessity for his presence had passed—when dissensions had destroyed all unity of action—and cowardice had consummated the ruin which incapacity had made sure. The chevalier himself was but little calculated to exhilarate the drooping spirits of the rebels. From the moment of his landing to his speedy flight, he never ceased to use his handkerchief to dry the incessant torrent of his tears. His whole conduct in Scotland reminds one of the blubbing of a child. At the first interview with his followers, he addressed them in the following style of lachrymose rebuke :—

"He had come among them, he said, merely that those who were backward in discharging their own duty, might find no pretext for their conduct in his own absence. For myself, it is no new thing for me to be unfortunate, since my whole life from my cradle has been a constant series of misfortune ; and I am prepared, if it so pleases God, to suffer the extent of the threats which my enemies throw out against me."—(*Jesse*, i., p. 54.)

The effect of this mode of speech, and the appearance of the man himself, have been graphically described in a work supposed to be written by the Master of Sinclair, who was in Mar's camp, a continual thorn in the side of his commander.

"The chevalier had a speech grave, and not very clearly expressive of his thoughts, nor over much to the purpose ; his words were few, and his behavior and temper seemed always composed. Neither can I say I ever saw him smile. If he was disappointed in us, we were tenfold more so in him—we saw nothing in him that looked like spirit. He never appeared with cheerfulness and vigor to animate us ; our men began to despise him ; some asked if he could speak. I am sure the figure he made dejected us ; and had he sent us 5000 men of good troops, and never himself come, we had done other things than we have done."—(*Spottiswoode Miscellanies*.)

His conduct was as disheartening as his appearance and his words, and exhibits to us the fate that awaited us in the successful issue of his enterprise. While at Scone, among the presbyterians of Perth, he would not allow a protestant even to say grace before him—ostentatiously retaining a confessor to repeat the paternosters and ave-marias. Notwithstanding all Lord Mar's anxiety, too, in collecting the necessary ribbons, and "making a crown, in pieces, at Edinburgh, and bringing it over here," he deferred the important mummery of his coronation, as he could not take the usual coronation oath. A day or two before the flight of the Jacobite army from Perth, we find this able commander busying himself in getting together, "a collection of all papers relating to the corona-

tion of King Charles the First and Second," with the view of not committing any violation of the rules of etiquette, in the important ceremonial for the chevalier.

The news of the advance of Argyle, spread consternation among the leaders of the rebel force, while the Highlanders, chafing under an inactivity so foreign to their character, insisted on being led to immediate action. A retreat was ordered—the chevalier shedding tears over the miseries of his position, and whining, as usual, against the men who had risked their all for him. "Instead of bringing him a crown," he groaned, "they had brought him to his grave." The indignant Highlanders were dragged along the coast sullen and dejected. They were at last deserted by the chevalier, Mar, and the instigators of the rebellion, who took shipping for France, leaving the miserable dupes of their incapacity to a universal military execution, which crushed the impotent resistance of undisciplined despair.

The defeat of the rebels, and the horrors of their execution, had less effect in laying Jacobitism in ruins, than the appearance, character, and conduct of the old chevalier. All enthusiasm vanished—all the lofty ideas of the chivalrous valor announced as one of his characteristics, were chased away by the miserable reality ;—all the tory anticipations of his complying spirit in religion were disappointed. They had licked the dust in vain. They had, to no purpose, thrown themselves into the hopeless struggle of determined loyalty, against the settled power of an usurper. On their country they had brought the devastations of a civil war ; on themselves they had dragged a retribution either in their victory or their defeat. The nature of the latter was exemplified by the event ; the former could be correctly guessed, when they found in their future king, a weak, impracticable man, who would yield nothing—conceded no point to civilization and established freedom, whose counsellors were Jesuits, and to whose favor the surest passport was his confessor.

On his return to France, his first act was nearly as foolish as his conduct in Scotland. He dismissed from his service the only Englishman who could conduct it, and give his cause respectability. Bolingbroke had submitted to the degradation of being appointed "secretary of state" to a monarch who could not obtain the means of life but from eleemosynary aid. He had, with his usual skill, negotiated with the court of France for the effective assistance of all its power. He was in constant communication with the Earl of Mar, when that commander was leading his victims on to ruin. Yet the first act of the chevalier on his return was his written dismissal on a miserable scrap of paper, from "all his honors and emoluments !" "The kingly heroic style," says Bolingbroke in his noted letter to Wyndham, "of the paper was, that he had no farther occasion for my services, accompanied by an order to deliver up all the papers in my office to Ormond, all which might have been contained in a moderate sized letter case." Horace Walpole, describing the feeling of Paris, also tells us the cause of Bolingbroke's disgrace. "They use poor Harry most unmercifully, and call him knave and traitor : and God knows what. I believe all poor Harry's fault was, that he could not play his part with a grave enough face ; he could not help laughing now and then at such kings and queens."

The consequence was immediately visible in the

conduct of the English Tories. Although the letter to Wyndham was not published at this period, yet that it was printed and circulated we can have no doubt. There are some passages in this letter drawn by the hand of a master. Denounced as a traitor, he throws back with insulting sarcasm, the scorn and contempt of a man who knew his accusers. He did worse than this, by pounding in the crucible of a dry logic which he seldom used, the doctrines of divine right and passive obedience, which constituted the Stuart creed. These doctrines, hitherto kept in abeyance, were now held up to the ridicule of mankind, with every bitter personality necessary to the enlivening a political disquisition.

The most amazing effect was produced by this manifesto of the exiled tory chief. The chevalier's ingratitude to Bolingbroke wiped out the sin of George the First in regard to his attainder; the natural weakness of understanding which the chevalier inherited, held out no encouraging prospect in success, and the mixture of gross licentiousness with fanatical observance of the punctilios of his religion, displayed a character not of a kind to invite the enthusiastic devotion of a Protestant empire. The more minute accounts which daily arrived of the character of the man, and of his priestly counsellors, completed the disgust which the sarcasms of Bolingbroke had excited, and led the Tories to the conclusion, that the worst lot for themselves as for their country would be the restoration of such a king.

This was not the last attempt at the overthrow of the German sovereigns, prior to the memorable '45. Wherever Great Britain had a quarrel, the emissaries of the chevalier appeared to hatch it into life, and excite compassion by an exhibition of his sores. The iron-headed Swede, Charles XII., enraged at the conduct of George the First, had determined, at the head of 10,000 troops, to make a descent on England. A cannon-shot stopped the career of the royal madman, and the hopes of the chevalier now rested upon the barbarian power of Russia. This having proved a broken prop, he repaired to Madrid to implore the compassion of Alberoni. The result was a new expedition, of which general history makes no mention, under the guidance of the once popular Duke of Ormond, and having for its object a descent on Scotland. The elements conspired against the adventurers; most of the ships were shattered ere they had properly got to sea; and two only could proceed to their destination, where the Earl of Seaforth, Tullibardine, and the Earl Marischall, had no sooner landed than they were obliged to seek safety from the pursuing royalists, among the coverts of the Western Isles.

All attempts to restore the Stuarts having thus partaken of the usual fatality of his race, the chevalier resigned himself with great composure to his destiny. Occupied with his mistresses and his confessors, he gave up, without a sigh, the hopes of royalty; and the Tories of England, instructed by his example, forgot him and his principles. The quarrel with Bolingbroke laid all hope of tory support forever in the dust, and the decaying faction of the Jacobites beheld themselves left alone to dream of a restoration. The Tories changed their tactics with their circumstances, and the calls of an overruling necessity—they abandoned the pretender, and they were obliged to seek safety from the reigning monarch. They could no longer, therefore, enroll themselves as the defenders of royal prerogative, because they had no monarch to seek their assistance; the loyalty

of the cavaliers was never displayed by their descendants to the Brunswick race; from being royalists they became aristocrats, and, partly by the aid of popular excitement, partly by the force of their own influence, their history for a hundred years is the opposition to any extension of regal prerogative.

The long domination of Walpole, the great leader of the second generation of the Whigs, reconciled the country to its new sovereigns. His sagacious schemes, so wise in their object, so unjustifiable in the means by which they were attained, broke up the parties of the days of Anne, and fused them into new combinations. The statesmen who had clung to the hope of a Stuart restoration as the means of power, abandoned at last the impracticable representative of the dynasty to his fate. They found him unfit for a master, too obstinate for a tool, too helpless for an ally, too dangerous as a friend. His cause was left to find adherents amid the wild glens and mountains of the north, where attachment could linger on unaffected by the shocks of party tactics, or the tortuous policy of ambitious politicians. Here the highland chieftains, living in their solitudes, without communication except with their exiled brethren in France, and ignorant of the silent settlement of feeling, and reconciliation of opposing interests in the south, could drink Jacobite toasts with enthusiastic shouts, and find vent to feeling in treasonable harangues against the German lairdie.

Thirty years, with its many changes, had expired; age had crept over the chevalier; a new generation had arisen, a new king sat upon the throne of the British empire, and the career of Walpole had closed. The long period of fifty-seven years had swept over the ruins of the Stuart monarchy, when another of the line made a last attempt to recover his inheritance. A striking episode it is in the dull history of the reign of George the Second, when a youth, attended by seven followers, landed in the wilds of Moidart, to shake the government of the greatest of modern nations, and to embarrass the world with the problem of his success. Without a friend to counsel him to proceed—with his father's entreaties ringing in his ears, to think of the hopeless enterprise as a dream—with all the adherents to his family, in the land to which he came, protesting against it unless supported by 10,000 bayonets—without the knowledge or assistance of the court of France, the pretender landed in the Western Isles, which he was so soon to traverse as a hunted wanderer. History has few chapters so romantic; fiction cannot embellish it, and poetry attains its loftiest flight when engaged in the narrative of facts. Had success crowned the enterprise it would have been renowned as one of the astonishing feats in history; but a civil war without the probability of triumph, is a crime greater than all others, since no other is so productive of enduring calamity. It annihilates all reverence for justice, all the amenities by which humanity has incorporated into warfare the gentle spirit of compassion, forbearance, and generosity; it generates a ferocity which resents not merely a present injury, but a worse calamity in a foreseen future of destruction on the scaffold; it leaves behind it the bitter feuds which disturb a nation's repose for successions of generations; in short, it ranges on opposite sides, if not brethren joined by the ties of blood, at least the citizens of a common country, entailing upon many of them the ruin of their fortune, and a perpetual exile. No cause, how

deeply soever based in the principles of eternal justice, could sanction the instigation of such calamities, without a surer ground than a mere hope of triumph; and it is this which must be looked to by every leader of revolutions, who does not desire the execrations of his victims, or the condemnation of posterity sitting in judgment upon his tomb.

If at any time there was the probability of success, it was at the period when the chevalier arrived. Two causes of this we shall have occasion shortly to advert to, in relation to the parties of the days of the two first Georges. At this period George the Second reigned with a character as unpopular as his father's. His personal licentiousness, as it was little known, created only a small part of that sum of indignation which had no measure in its expression, and threatened, when put in action, to effect another revolution. The monarch's predilections for his German principality involved the country in the great continental war. The people became disgusted with their monarch, and his ministers were involved in the same torrent of obloquy with their master. Throughout the empire the name of Hanover became odious to a proverb, and various pamphlets appeared as to the legality of changing kings.

The tories, too, in the gloomy region of opposition to which the long domination of Walpole had consigned them, began to see a morning rising on their despair. They began to treat the unhappy Jacobites with kindness. They had fought with hopeless endeavor for thirty-two years, the battle of faction in the legislature, and were uniformly beaten by the organized phalanx of the whig ministers. At this time, the fame of the accomplishments of Charles Edward was carried over Europe, and the tories dreamt once more in him of a Stuart king. A forgotten incident in parliamentary history illustrates this. When the expedition under Marshal Saxe, in 1743—destined for the invasion of England—was about to sail, an opportunity was afforded by a royal message, for an ebullition in parliament of tory feeling. Sir Francis Dashwood broke out into a rapture on revolutions, and hinted that the subverter of a monarchy might not be a usurper. The inference was cheered by many of the party; and, contrary to all precedent on such a subject, the address in answer to the royal message was bitterly opposed. The arrest of Jacobite members in correspondence with the Stuarts was pronounced illegal, and the suspension of the *habeas corpus* act was only carried by the whigs, after the keenest struggle in the parliamentary history of the times.

The ministry were culpably remiss in procuring information as to the expedition of Charles Edward. He had been three weeks in the country before they knew he had landed; and had it not been for Duncan Forbes, the president of the court of session, the rebel leader might have been at Edinburgh without a man to oppose him. With reference to the question as to whether the rising was justified by a probability of success, we may cite a passage from the work of Mr. Klose, which is evidently colored by the passions of the moment.

"The population could not be said to show any open favor to the cause of the Stuarts; but there seemed to be a cold indifference as to the issue of the struggle. Henry Fox, a member of the ministry, and a man by no means of a desponding character, in a letter to Sir C. H. Williams, dated the 5th of September, says: 'England, Wade says,

and I believe, is for the first comer; and if you can tell whether the 6000 Dutch, and the ten battalions of English, or 5000 French or Spaniards will be here first, you know our fate.' Writing to the same gentleman a fortnight later, he says: 'The French are not come, God be thanked! but had 5000 landed in any part of this island a week ago, I verily believe the entire conquest would not have cost them a battle.'"—(*Klose*, i., p. 280-1.)

This may be the exaggeration of fear; at the same time, it is an important testimony to the imminency of the danger of the Brunswick princes. Nothing could be worse than the means of defence adopted, except the mode of revenge when the rebellion was at an end. The Marquis of Tweeddale, the Scottish secretary of state, could provide nothing. There was no order, no soldiers, no *matériel* of war—nothing but the indomitable patience and the cool sagacity of Duncan Forbes, to oppose to the rebellion now rolling to the south.

"All Jacobites," says the president, "how prudent soever, became mad; all doubtful people became Jacobites, and all bankrupts became heroes, and talked of nothing but hereditary rights and victory. Under these circumstances, I found myself almost alone, without troops, without arms, without money or credit; provided with no means to prevent extreme folly, except pen, ink, and a tongue, and some reputation; and if you will except Macleod, whom I sent for from the Isle of Skye, supported by nobody of common sense or courage."—(*Culloiden Papers*.)

The government after being aware of the organization of the rebels, were guilty of the fatal mistake of despising them. The following is the description of them in the government paper—the *Edinburgh Courier* of 10th September, 1745:—

"Not one half of them have tolerable arms, and they are such a pitiful ignorant crew, that such as have spread themselves to seek for arms are fit for nothing. They can give no account of their strength, of their designs, or even of themselves, but talk of *Sneeshin*, (snuff,) *King Shamesh*, (James,) *Reshent*, (Regent,) *Plunter*, *new brogues*, &c., and diminish daily."

We have no intention of following the movements of the rebel army from Glenfinlas to Culloiden. The story is too well known, and its merits and defects have been too often canvassed. When we see errors, or imagine them, in the generalship of the chevalier, we must remember the nature of his army and the circumstances of his expedition. We can never separate a thing from the epoch in which it happened, and if unsusceptible of justification, it may not be so of palliation. We confess, however, that after a renewed study of the campaign, we can see no great blunder except the battle of Culloiden. There, the field was deliberately chosen, to meet the views of the Duke of Cumberland—none more suited to enable his artillery to mow down the unprotected foe. Lord Mahon, Klose, and Jesse have, however, condemned the retreat from Derby, for which the chevalier is not responsible, as he opposed it to the last. This condemnation appears without grounds, when we look at the position of the rebel force. At Derby it was almost surrounded by three armies, the Duke of Cumberland having, within a few miles, a force nearly double. Another of 6000 men, under Marshal Wade, was skirting along the western side of Yorkshire; while, for the defence of the capital, an army was concentrating on Finchley Common. To oppose, without artillery, his breechless moun-

tainers to a collision with these forces in a foreign land, would have been justifiable only as an act of despair at last, since a defeat would have resulted in the utter extermination of an army which had no native mountains of refuge to hide them from the pursuing cavalry.

All depended on the coöperation of France, and no prospect of this arriving, retreat was indeed the only alternative. On this subject Mr. Jesse, however, repeats what others have formerly asserted, but which cannot be adopted without better evidence. He states, that at the moment of retreat, 10,000 French troops were on the point of embarking for England—the Duke of Norfolk and other peers were on the eve of declaring in favor of the chevalier, and Welsh gentlemen and their followers were on the road. All these schemes, however, failed when the retreat began. The French were countermanded, and the rising insurgents of England returned to their homes. "I believe," says Lord Mahon, "that had Charles marched onward from Derby, he would have gained the British throne."

There is scarce any civil war we have ever read of where cowardice so great, and ferocity so brutal, was exhibited, as by the troops of government in this. Falkirk and Preston are illustrations of the former. The whole progress of the war presents numerous examples of cold-blooded and deliberate butchery, unprovoked by similar excesses, and—be it said to the eternal honor of the rebels—unavenged by similar atrocities. These were not triumphs to be consecrated at altars. They were, however, the subject of contemporary rejoicing. It was not against the victims merely that the outrages were committed, but against humanity in all times—against the cause of freedom, which depended on the issue.

The scenes which followed the victory of Culloden constitute one of the darkest pictures in the history of modern Europe. Seldom has the melancholy truth been more sadly realized, that a good cause is often stained with infamy by the infamy of its agents. The accounts which have come down to us present an almost incredible detail of barbarities, and yet they are vouched by testimony which it is impossible to reject. When all resistance had ceased, the wounded and the dying were put to death by deliberate command.* Prisoners were taken out in files, under the assurance of honorable safety, and coolly shot; † they were enclosed in huts, which were set on fire,‡ the yells of despairing agony from amidst them being not louder than the shouts of exultation from the craven troops of Falkirk, who, with their bayonets, tossed back into the flames the miserable wretches who attempted an escape. The wounded were dogged to the hiding-places which their strength enabled them to reach, and which compassion was ever ready to afford them. Here their zealous victors entered, not to assuage the tortures under which they groaned, or to afford the relief which would not have been a virtue—because to give it is an instinct—but, with hands reeking with the blood they had already shed, they cut the throats of sick and mutilated rebels.§ Eye-witnesses describe murders perpetrated by the direct command of the Duke of Cumberland—wounded on the field ordered to be shot—one man hanged by his orders, without even the ceremony of investigation or of trial ||

another lashed to the limit of physical endurance*—others "hashed" with the broad-sword to death. Add to this, that when the work of deliberate butchery had ceased, no regard was had to the cries of the wounded and the groans of the dying—no surgeon was allowed to apply proper remedies for their recovery, and when any of these were in the same unhappy circumstances, their instruments were taken from them, that they might give no relief.†

These accumulated wrongs were not confined to the vicinity of Culloden. The Duke of Cumberland advanced into the Highlands as far as Fort Augustus, from which he detached numerous squadrons to hunt down the wrecks of the army of the chevalier. The country was laid waste with fire and sword. The castles of Lovat, Glengarry, and Lochiel were burnt. Huts and hovels were destroyed; without distinction of age, or sex, or rank, without proof of guilt or the existence of suspicion, the miserable inhabitants were shot like wild beasts upon their mountains, or driven with their cattle to be butchered with them in the south, while naked women were compelled to ride on horses, and were thereafter violated. The unhappy privates were involved in the same treason with their chiefs. No distinction was made in the fate of the ignorant mountaineers, who, without knowledge of the past or foresight of the future, only obeyed the command of their master, without finding in their code of legislation any precedent to question its object or dispute its power. Of the immediate consequences of the disastrous defeat of "Drumossie Muir," the historian sums up all in telling us of silence and desolation over fifty miles; of the widows' and orphans' tears, shed amid the desolation of ruined villages; of the groans of the expiring victims who perished beneath the withering blast of that unrelenting vengeance which hunted them from their humble home, and from the quiet glens in which, after the storm had passed, they might have lived to display all the tender charities which have shed a lustre on the Highland name.

In describing this portion of the career of Cumberland, our three historians very strangely waste their space in vague generalities and eloquent declamation. Had they merely repeated from the memoirs gathered by the Jacobite devotion of Bishop Forbes, a few particular instances of the atrocities indulged in by the victors, they would have created an impression which they have failed to do, and done justice to the murdered Jacobites whom they wish to commiserate.

Cumberland, unfortunately, was not alone in the command. He had a lieutenant of the name of Hawley, who has exceeded anything we know of in the history of civilized warfare. "He is," says Horace Walpole, "called lord chief justice, (as if another Jeffries;) frequent and sudden executions are his passion."

"Hawley was a ruffian of a low order, though placed by fortune in a high place. He was an admirable foil to his royal patron, for, compared with Hawley, Cumberland was humane and generous. Hawley found an occasion to outrage decency even in his will, into which he introduced this expression: 'The priest, I conclude, will have his fee; let the puppy have it.' It was a common saying among his soldiers, that he conferred more frequently with his hangmen than with any other of his aides-de-camp."—(Klose, i., p. 371.)

* Forbes' *Jacobite Memoirs*, p. 232. † *Ib.*, p. 233.
‡ *Ib.*, p. 234. § *Ib.*, p. 235. || *Ib.*, p. 237.

* Forbes' *Jacobite Memoirs*, p. 238. † *Ib.*, p. 246.

We will not follow this man's footsteps. It would lead us into a detail neither calculated to please nor suggestive of instruction. Yet his military executions were scarcely equal to the lingering torments of deliberate justice. In the storm of troubled times, amid the eagerness of pursuit, and the rage of conflicting passions, men are apt to forget, in the blindness of their fury, that the being whom they torture and mutilate, is made in the image of God.

Here is the mode in which the rebels were executed:—

"Every preparation having been made, the executioner drew the cap of each from their pockets, and having drawn it over their eyes, the rope was adjusted round their necks, and they were almost immediately turned off. After having hung about three minutes, Colonel Townley, *who still exhibited signs of life*, was the first who was cut down, and having been stripped of his clothes, was laid on the block, and his head severed from his body. The executioner then extracted his heart and entrails, which he threw into the fire; and in this manner, one by one, proceeded to the disgusting task of beheading and disembowelling the bodies of the remaining eight."—(*Jesse*, ii., p. 254.)

These unworthy indignities offered to the last wrecks of mortality—these persecutions beyond the scaffold—cruel insults added to misfortune—have something in them abject and degrading, and cannot be justified by any necessity of punishment. Human laws only disgust the living by attempting to carry their infamy beyond the grave; and the outrages on the mangled corpses of their victims are worthy of beasts of prey, who mutilate the carcass which repletion has rendered them unable to gorge. When we recall the judicial murders of that time—the condemnation without trial, or after a mockery of trial—we cannot forget the sublime judgment of Lord Digby on the death of Stafford, "He that commits murder with the sword of justice, heightens that crime to the uttermost. The eye, if it be preternatural with any color, is vitiated in its discerning. Let us take heed of a blood-shot eye in judgment."

The wanderings of Charles after the battle of Culloden, give us some of the most romantic sketches in history. His patience, fortitude, manly courage, and at times his childish terror—the fidelity of the clansmen, who spurned the splendid bribe that would have made them wealthier than the greatest of their chiefs—the heroic courage of Flora M'Donald—the succession of lucky accidents that announced a danger, or prevented the evils of one past—the shifts and misery to which the scion of a royal race was obliged to stoop—the uncomplaining serenity with which he bore it all—constitute a succession of pictures so interesting, that the baldest history of it could not deaden emotions of sympathy. Nor will the most cynical heart find scope for a sneer at that fervent devotion which generous minds, measuring their love by their enthusiasm, ever felt to the object of their affections.

The following is an illustration of the prince's sufferings:—

"At this period of his wanderings, Charles appeared to his guide to have reached the last stage of misery, for, owing to the filthy holes in which, during the last two months, he had often been obliged to take shelter, he was now covered with vermin."—(*Klose*, ii., p. 75.)

He often ran great risks in going into the small

huckster's shops in the villages to which he came, for three half-pence worth of tobacco. The mode in which he enjoyed himself after receiving it, is thus described:—

"Charles, we are told by one of his companions in adversity, used to smoke a great deal of tobacco, and would sometimes sing them a song to keep up their hearts."—(*Jesse*, ii., p. 17.)

"After supper, he produced a pipe, the only one which he ever made use of, which is described as having been as black as ink, and worn or broken to the stump! He had suffered much, he said, from the toothache, and tobacco usually alleviated the pain."—(*Jesse*, ii., p. 51.)

His escape to France, his expulsion from the French territory, and final settlement in Italy, have long formed portions of familiar history. After his return to Italy he kept up little or no correspondence with the expatriated Jacobites. He seemed to think that they had only done their duty, and that any attention to them was unlooked for and unnecessary. Perhaps there was also another cause which left to him the upbroken solitude of a recluse. In his wanderings in the Highlands he contracted the degrading habit of intoxication, to which he resorted in later life to drown the remembrance of his sorrows. It estranged him thoroughly from all the friends who had any regard for their respectability or his. Cameron of Lochiel could never see him more, and his gentle brother was a stranger to his house. His fine figure became bent with premature decay, and the energy of his mind was gone. Disreputable associates crowded round him; his wife quarrelled with him, became unfaithful, and then deserted with Alfieri. Twenty-five years after Culloden, the continental kings induced him to contract a marriage, at fifty, with a girl of seventeen, in order to prolong the race as a lasting uneasiness to England. The consequence of the inequality soon became apparent in aversion and indifference; and the chevalier found relief from domestic misery in the insensibility of intoxication.

It is difficult, in judging the character of Charles, to measure him by the ordinary proportions. Right and wrong in any case, are never divided with so clean a cut that we can with justice hold that our admiration has not exalted, or our hatred depressed, the objects of our thoughts. The last scion of a line of kings, by a common exaggeration, (the offspring of education or prejudice, rather than the conclusion of reason,) is elevated to virtues he never exercised, and to which vulgar humanity can never aspire.

That Charles was fitted for the enterprise he undertook, may be deduced from the success attained. In an enemy's country he raised an army, with which he marched within 150 miles of the capital of England. Fresh from the sunny land of Italy, he learned, as if by intuition, to guide the "wild Highlandman," so impracticable and unbending, often sacrificing, as at Culloden, to the folly of clanship, not merely conquest but safety. To manage and reconcile the jarring interests and conflicting claims of every petty chief—to soothe the fierce barbarians into cheerfulness and temper, by an appeal to honor when that to their feelings failed, or to their interest when both were unavailing—to adjust, amid the perpetual anxieties of a rebel leader, the quarrels of the clansmen, with whose language and manners he had only for a few weeks been familiar, were duties which he effected with the open eye, the quick ear, the lively perception,

which enabled him to probe so quickly the secret of little Rose Bradwardine's love. His winning tact was nature's gift which circumstances improved. He knew everything he ought to know as to the management of his followers, without learning it. He was never weary when he should be watchful. No degrading vice cursed him during the brief season of his active manhood—there was no insensibility to his duty or his fame. Yet his superiority had no overpowering greatness. It did not awe by arrogant domination, or profound sagacity. It was the power of pleasing by rendering power gentle, and making obedience have the flattering aspect of voluntary submission.

His intellectual capacity is a matter of controversy. Lord Mahon denies that he had education sufficient to enable him to write grammatically. The evidence for the charge is somewhat slender. Although a man, in the off-hand carelessness of private correspondence, does not adhere to the rules of logic in his argument, or the rules of grammar in his mode of stating it, it is too rapid a conclusion to fix down the charge of incapacity or of ignorance. Open the Ellis correspondence, and the letters of Marlborough will display rare specimens of barbarous outrages on good taste and grammar. Cobbett's grammar gives illustrations of the same description from the Wellington Dispatches; and on an average we will undertake to point out two Scotticisms in every page of the history of David Hume.

Had Charles triumphed, he professed, when a hunted wanderer in the Western Isles, that he would have used victory with moderation. He perhaps at the time gave an honest meaning to his words: and there can be no question that a general amnesty and oblivion of feuds would have been only consistent with the humanity of his character. But his father lived—a narrow bigot, tyrannical in his politics, and full of all the towering notions, from the top of which the Stuarts were thrown headlong. Where was the guarantee in the history of the Stuarts, or in the equivocal declarations of the old chevalier, which would have rendered improbable another scene like that enacted by the parliament of drunkards, who, under the dictation of a ruthless soldier, repealed in a single night the whole statutes passed in the parliament of Scotland during the protectorate of Cromwell! Where was the grounds for disbelieving, that, following this famed precedent, the legislation for half a century from the time of the revolution would have been affected, titles of nobility extinguished, attainders reversed, and many of rank and influence compelled in turn to seek safety in exile? Add to this the purging of the seats of justice, the dismissal of the officers of the army, the administration of new oaths, with all the guilt of past or future perjury.

Fielding has given us a journal of the reign of the old chevalier, on the supposition that he had been successful. He commences with the 12th of January, and carries it on to March 17th, with which he closes the duration of misgovernment by intimating another insurrection and deposition. In the course of these two months, the twelve judges were removed; Father M'Dagger, the royal confessor, was sworn of the Privy Council; three anabaptists hanged for pulling down the crucifix set up in St. Paul's churchyard; an act passed to reestablish the writ *de heretico comburendo*, and another to restore the abbey lands; Father M'Dagger made president of Magdalen College, Oxford;

an eminent physician fined for saying that Bath water was preferable to holy water; the pope's nuncio received with great acclamations; and two watermen and a porter burnt for heresy, &c., &c. And thus in two months ends the restored monarchy.

Such a career would have only reduced to practice the application of the principles of the old chevalier. On the subject of religion he would immediately have come into collision with the people. He only demanded, he said, toleration for himself. Whether he would have stopped at this, we can only judge by the past history of his family, keeping in view his own characteristic haughtiness, and the equally characteristic obstinacy of his son. As to the religion of the latter, we find in these volumes evidence contradictory. He implores the pope's blessing on his enterprise, (Jesse, i., p. 166,) and, at the same time, Helvetius tells David Hume that he knew from the chevalier himself that he was an infidel, (Klose, ii., p. 206.) At a later period, long after the '45, a Monsieur Massac had an interview with the prince, and the Frenchman was of opinion, that "he was rather a weak man, bigoted to his religion," (Jesse, ii., p. 120.) But, on the other hand, he writes, in 1762, to one of his friends in England, that "I shall live and die in the religion of the Church of England, *which I have embraced*," (Jesse, ii., p. 124.) The truth appears to be what is stated by Dr. King, that the chevalier was everything to all men—a Catholic among the Catholics, and ready, like his grand-uncle, to be a presbyterian if it suited his convenience.

The misfortune of prince Charles was, that his father lived before him, and that the mill cannot grind with the water that is past. He was ready to conform to the religion of the British people, when conformity was useless; when he had no aunt on the throne to recommend a restoration, and no Bolingbroke, backed by a great party, to secure it. He lived a generation too late; and no merit—not the united virtues of all the Stuarts, the Sobieskis, or the Henrys of Navarre, could have reversed the stern rejection made by all the British factions of him and of his race.

It was lucky for the house of Hanover, and for all posterity, but unfortunate for the chevalier himself, that the Highlanders were too faithful. Had they given him up to the royal troops, he would have had a similarity to Mary and Charles I. in the manner of his death. We can imagine no other fate for the prime instigator of the commotion, when the petty instruments were so fiercely massacred. When, in those dreary months of privation among the Western Isles, he, in the forced leisure of his hiding places, sometimes contemplated the worst side of the uncertainty in which he rested, he could not bring himself to the belief that government would bring him to the scaffold. He dreaded poison, assassination, or a lifelong imprisonment; but a public trial, with a public death, were things which he did not think the government had courage to resort to, (Jesse, ii., p. 62-3.) In this, many will think that he was mistaken, and that George the Second had sufficiently high notions of his rights, to induce him to defend them in the accustomed fashion. How just a source of opprobrium has been removed from the throne of the reigning sovereigns, but how unfortunate for the chevalier himself it was, that, after dazzling the world with his heroic gallantry, he did not end his career by a death that would have ex-

cited all the sympathies of mankind for his fate, and saved them from emotions of pity and contempt in looking upon his sad decline.

A great mistake is committed by many writers in tracing the two rebellions to the same origin. Many of the unhappy Jacobites who perished on the scaffolds of '15, were actuated unquestionably by the same motives that impelled the Highlanders to follow the Pretender in the '45. Attachment to the ancient line of kings, who claimed their allegiance on the sacred ground of divine right, coincidence of religion, and hatred of a prince with whom they had no community of feeling, of language, and of country, were the causes for which many rushed into an enterprise, which their most sanguine hopes could never color with the probability of success. There were many, too, who in the general calamity, hoped to reap their individual advantage. Many, tempted with empty titles, extravagant promises, or hurried along by the excitement of the moment, threw for coronets or coffins. In regard to such men, we have little admiration of their selfish heroism, little sympathy for their sufferings or their death. They made it a matter of prudent speculation, in which they necessarily trusted to chance, and found the chances against them. But, for the credit of the Jacobites, it was not so with all. Derwentwater, Lochiel, Balmerino, Perth, and many others, in extraction noble or respectable, having some stake at issue, or deriving, in certain cases, a stronger claim to our regard, even from their poverty itself, were not men actuated by the spirit of mercenary adventurers. Yet even the most disinterested of the rebels of the '15 could lay claim to none of the spirit of personal enthusiasm with which the presence of the young chevalier inspired the men who followed him. The rebels of the '15 rushed into rebellion, not from affection to the Stuarts, but from hatred to the Brunswick race; and had it not been for the impolitic party spirit of the first sovereign of that dynasty, many of the pseudo patriots of the first rebellion would have felt towards him all the pride of submission and all the dignity of obedience. This involves a reference to the state of parties, of which the works before us present no account.

When, upon the accession of George the First, the Earl of Mar proclaimed the restoration of the Stuarts, a great party who had no special attachment to the race, and who abhorred their religion, were ready, had there been an energetic commander, to have "stood the hazard of the die." The tory or high church party, which numbered then as it does now the larger portion of agricultural England, had been driven, on the death of Anne, with every contumely from the power which they had imagined forever their own. The Hanoverian elector, with the sagacious policy of William before him, made himself the head of a party and not the impartial monarch of a great empire. He reaped his reward in two insurrections, which threatened the stability of his throne, and which were only crushed by the ruin of many gallant men, whose untimely and cruel deaths might have otherwise been changed into lives of patriotic usefulness.

At the revolution the country was divided into three parties, with principles incapable of amalgamation, but susceptible of being modified to the exigencies of the time. The great party of the whigs—the offspring of the misgovernment consequent on the restoration—the advocates of limited monarchy, but the uncompromising opponents of the doctrine of the absolute prerogative of kings, num-

bered in its ranks, the bold spirits who had risked the penalties of treason, by inviting the prince of orange to rescue their country from oppression. But they advocated, at that early period of their history, a nobler revolution than the change of one dynasty for another. They anticipated the civilization of a century, by insisting on the repeal of those persecuting enactments which barred the universal toleration of all opinions civil or religious—the extinction of those hatreds generated by class legislation, which furnish food to the declamations of sedition and the calculations of statesmen, but which, to the people, were productive only of calamities without end—the encouragement of the arts, which increase the sphere of industry, and cast a polish over life—the more enlightened exercise of power, by beneficent legislation, adapted to the progressive movement of society—and a keener sense of the honor and independence of a country, which has ever stood in the van in the cause of freedom.

The high church or tory party again, while they wanted the energy and the intelligence of the whigs, supplied their deficiency by the overwhelming influence of numbers, and by the ceaseless influence of property. This party included all the squirearchy and all the clergy of England, and all the mass of the population engaged in agricultural pursuits. Many, too, of the old nobility, in forsaking popery, slid down only to the party which had the chief resemblance to that which they had left. They renounced the religion of their fathers, but asserted in all their wide extent, the doctrines of prerogative, which had raised the storms of the civil war. The doctrine of the indefeasible hereditary right of kings, was only less influential with them in that age, than the well established yell of "the church in danger," which, with persevering energy, they have resounded to all tunes for two hundred years. This great party could not be neglected by a sovereign whose throne was supported by none of the prestige of hereditary right; and if the successors of William had taken care to prevent latent dislike breaking out into active opposition, the party of the Jacobites would have died away. For with that section the tory party had no community of feeling, except on the doctrine of prerogative. On the cardinal question of religion they were irreconcilably opposed. The tories of the times of William and Anne, were as much averse to the restoration of the Stuarts, did they retain their religion, as they were to any toleration of Catholic or Protestant dissent. Had the fanaticism of the infatuated exile permitted him to deliver his son into the hands of William, to be educated in the Protestant religion, the restoration of the Stuart line would have been effected by the tories. Fortunately for our country, the same obstinacy which worked his ruin prevented his restoration, and the party who would have supported him became reconciled to the change.

These were the parties in the nation on whom its destiny depended. There existed, however, another, which has now absolutely disappeared; but which in that age, and till the insurrection of '45, received the jealous watchfulness of government. The Jacobites, if not so numerous and influential, compensated for this by their restless energy and their enthusiasm. They had some men of ancient family and extensive possessions, whose seclusion in the country had freed them from the immediate presence of the tyranny of the government of James, and whose hereditary prejudices the tale of his distant

outrages could not extinguish. They were joined too by the discontented and more furious section of the tories, who only wanted the excuse afforded them by the two first monarchs of the Brunswick line, to raise their murmurs into the clamors of sedition and rebellion.

Such were the three parties which agitated England at the revolution. But when we turn to Scotland, we find ourselves in a new scene, where the party cries told a different history, and where the actors, though pressing to the same object as the authors of the English revolution, proceeded towards it by a different road. We had Jacobites, but the name of tory at least, is only a modern importation. We had a church party too, but it was officered not by the clergy but by the people. We had high-churchism, but it was a word confined to an insignificant portion of the population, and utterly alien to the whole of Lowland Scotland. After twenty-eight years of dreadful persecution, during which the best blood of Scotland had been poured out like water, the exhausted country at the revolution seemed animated by one impulse. The principles of the Scottish reformation had only been driven deeper into the affections of the people, by the sufferings of the martyrs who had died for it; and men, scorching under the influence of protracted wrong, might be excused if they could not descend at once from the fury of retaliation to all the liberalities of unbounded charity.

The whole of the country south of the Forth, and all the west, professed the principles of Presbyterianism, to which all secular politics were made subordinate. Towards the Stuarts the whole of Lowland Scotland entertained feelings of hatred, which had reached the limits of passion. The whole history of these kings, from the accession of James VI., was a continued denial of popular demands. The establishment of episcopacy by James—its continuance under the first Charles—the treachery and persecutions of the second—the torture-room directed by the last of the race—in short, that inextricable chaos of passions and of crimes, which constitute the history of the Scottish government for half a century, had driven the most enduring of people to the last remedy of the oppressed. Their memories were yet fresh on the events of that dreadful epoch, from the restoration to the revolution, when all crimes menaced them, when no law could protect, and no authority defend. The social compact was broken by the legislation of the parliaments of Middleton and Lauderdale and the atrocities of Claverhouse's dragoons. The community was dissolved, their country had disappeared. All the sentiments of love they still cherished to its memory, all the sacrifices made on its behalf were voluntary and generous; the tyrants who oppressed them had no right to command an obedience they abused; and they exercised the sacred right of all subjects to fly from a country so governed—to refuse submission to legislators so unjust, their allegiance to masters so merciless and unrelenting.

That was the darkest era of our history, where, throughout the whole dreadful series and intercourse of enmity, one side only was armed and void of mercy, as the other was of help and hope. Title, quality, fortune, were proscribed. Patriotism was a snare, and whatever furnished out the ease and ornament of life became a call for taking it away. The members of government grew wealthy on confiscations. The industry of years, the fruit of a thousand cares were swept into the rapacious grasp of an insatiable herd of petty ty-

rants—such was the penalty imposed on fortune and merit, and such the government which converted what was law into a crime. The sufferers were not slow in tracing the commission of such crimes to the abuse of power which accident had given to their authors; and in struggling for religious toleration the Scottish Presbyterians acquired a lesson on civil government, which they practically applied at the great era of the revolution.

There were none of the class of politicians in Scotland who professed the principles of the English tories. The Episcopalians either became Jacobites, or joined with the Presbyterians under the toleration laws of William. The great majority took the latter course. Many of them, at heart, had still a longing for the exiled family; but the prospect of a restoration was distant, and the penalties of non-juring were at hand. Under these circumstances, there were few of this party who became open Jacobites, or did more, at farthest, than talk the treason which wine inspires. In Scotland, the Jacobites were left to their own resources; and in regard to these, if we enumerate the Highlanders of the west—Jacobites from ignorance—and add a few respectable names from the lowland nobility, we include the whole of that party in Scotland. The feverish triumphs of the '45 tell how much might be expected from their enthusiasm; but the ominous silence of the nation—the want of all sympathy in the masses—the indifference, ridicule, and contempt with which they were regarded, even in the sunshine of their short success, show how little hold their cause had upon the population, and how small a prospect of its permanent establishment.

In England and Scotland both, therefore, the party of professed Jacobites were relatively insignificant, and time only was wanting to blend them with the English tories, who had made a compromise of their inclinations on the altar of their religion and their interests. To effect this object, or at least to prevent the conversion of toryism into Jacobitism, was the sedulous labor of William the Third, whose throne, established amid a chaos of discordant elements, required his profound sagacity to uphold it, when there appeared against him in arms the most powerful of the continental nations. His whole policy, accordingly, was to conciliate the great faction of the tories, whose hostility he could not altogether disarm; and this he effectually accomplished by excluding no man fit for duty from the honors of public life, and by not regarding prior opposition to himself in the light of a perpetual infamy.

Anne was a monarch of the very weakest understanding—a sincere Protestant, but who, in her slavish devotion to "the church," emulated the most devoted Catholics. Nourished in the belief that the authors of the revolution were republicans and atheists, she resolved, so far as such a mind could display independent resolution, to place the government in the hands of men accordant with her prejudices and beliefs. She hated the whigs from personal considerations, too. They had opposed her demand for an independent income, and her success was solely attributable to the policy of the tories, who used the circumstance as a means to embarrass the government of William. The revolution itself, in placing her upon a throne, caused her only some pleasure and many tears, and nothing could allay remorse for ingratitude to her father, but frowning upon the men who were the promoters of his ruin.

The Harley administration—the creature of court intrigue, and of the veteran cry of "the

church in danger," consequent on the fatal error of the whigs in the impeachment of Sacheverell—was created from the ultra section of toryism, and nearly changed the destinies of Europe. Unscrupulous in their means to obtain their power, they were alike unscrupulous in their manner of securing its solidation. The most brilliant of their number, narrating their history in a foreign land, when attainder had annihilated youthful ambition, and when age had cooled the rage of party, has exhibited the precipice on which the nation stood at the turning point of its history. The welfare of the country they were summoned to rule, its honor and independence, raised to a pinnacle of unequalled glory, were considerations which did not enter into the code of their political morality. "The principal string of our actions," says Bolingbroke, "was to have the government of the state in our hands. Our principal views were—the conservation of this power, great employment to ourselves, and great opportunities for rewarding those who had helped to raise us, and of hurting those who stood in opposition to us."

They called a house of commons, frantic with high churchism, which the blunder of the Sacheverell trial had blown up to unprecedented heat. This fanatic house were not merely tories; they would have gloried in Jacobitism, if they could only have induced the unbending bigot to yield a little. But on this point he was invincible. He resisted the temptation, and called upon the world to honor his magnanimity, seeing that all the great men of the days of Anne had, with concurrence of the sovereign, offered him their assistance if he would only humor them in this.

Somewhat greater unity of purpose and energy of action, on the part of the leading tories who composed the Harley administration, and a more pliable conscience, or abstinence from pushing prejudices to their limits, on the part of James, were alone required to lay the country a second time at the mercy of the Stuarts. It is now beyond the reach of question, that this administration had pledged themselves, if not collectively as a government, at least individually, to such a change. This assertion, so often advanced, so frequently denied, has been established by the correspondence of the ministers themselves. The collections of Macpherson contain the record of the intrigues of the leaders with the agents of the pretenders; and the researches of Sir James Mackintosh in the French archives have brought to light the measure of their treason, the conditions on which they were to act, their indifference to the public good, and their anxiety for their own. The only doubt is in regard to Harley. That he expressed a friendly feeling to the fortunes of the pretender, there cannot be a question; but that he ever entered into the scheme with the energy requisite to success, we cannot find evidence of, in the history of those old intrigues, or in the mutual accusations and recriminations of the baffled traitors.* His careless, procrastinating, *insouciant* disposition, ever leading him to put off till the morrow the duty of to-day, his love of relaxation with the literary coteries that have made his age illustrious—his keen remembrance, drawn from his accurate acquaintance with the classics, that the Tarpeian Rock was near the capitol—all hindered him from attempting an imitation of the exploit of Monk. Had he moved, however, and had

the old chevalier yielded to the tories on the subject of the church, the restoration, according to existing evidence, would have been at once effected. But the obstinacy of the latter was incurable. He remained deaf to all the remonstrances of the French monarch, and all the entreaties of the English ministry. "The Grand Turk" (Bolingbroke told him in reply) "is as likely to become king of England as the chevalier, as long as he remains a Catholic."

The sudden death of the queen upset all, preceded, as it was, by one of the most dramatic scenes in history. When, as a means of safety, Harley and Bolingbroke were considering the necessity of a proclamation of James, as king, on the death of Anne, the Dukes of Somerset and Argyle entered the presence-chamber when the queen had sunk almost into lethargy, and compelled her to appoint the Duke of Shrewsbury, a whig, as treasurer. Bolingbroke, with baffled hopes, came from the council-chamber in lamentations. "The grief of my soul," he said, "is this—I see that the tory party are gone." The whig peers kept the heralds waiting for the sovereign's death, who, when it happened, immediately proclaimed George the First. He ascended the throne by surfeiture rather than consent—the consequence of surprise, terror, and disunion reigning in the councils of the tory ministry.

The parliament was called by George the First. Instead of burying in oblivion the tory misdeeds of the reign of Anne, and conciliating enemies to his rickety throne, the monarch and his parliament began with violent threats of impeachment and attainder. William's example was cited only to be rejected. The convention parliament, to their eternal honor, would not dabble in blood. Though the chiefest of the miscreants who had desolated England were in their grasp, they proceeded with determined reluctance to their punishment. Jeffries relieved them by death from awarding to him his inevitable doom, and they refused to forfeit his honors and estates. Somers, the Delphic oracle of the whigs, remembered these things in his old age, when he one day received a visit from Walpole. The future minister was then in full cry after the fugitive chiefs of the ministry of Anne; and as, in the exultation of his heart, he told his story, the old statesman shed tears at the prospect of the calamities resulting from a course so impolitic and intemperate.

The consequence was apparent, not in remote or future prognostication. Around them and about them dangers grew. The man who was on the eve of being prime minister of England walked over to the same post in the service of the old chevalier. Bolingbroke would have calmed down to a sober loyalist had he been allowed to live in peace. He was compelled, however, to enlist with a sovereign he despised, and whose religion even—the chief object of his thoughts after his mistress—was only the subject of a bitter scoff.

Yet such was the man whom the tories, now committed as a party, had determined to place upon the throne. The violence of faction had given place to personal hatred, and men became blind to all consequences to their country, and to themselves. Passion was allowed to be the rule of conduct; all the past notions of expediency—of prudence—of waiting for a time convenient—of securing means to obtain an effect, were cast aside; all the causes of the overthrow of the ancient dynasty were forgotten, and the restoration of the Stuarts

* See Townshend, *Hist. House of Commons*, i., p. 124. See also Bolingbroke's Letter to Wyndham.

was hailed as the only palladium of the country's safety, because this seemed the only means of securing their own. In the reign of Anne such a scheme was only whispered in corners, and made the subject of secret intrigues; in that of George the First the great faction—who saw all their leaders, Bolingbroke, Oxford, Ormond, Stafford, attainted and exiles, and all the avenues to power resolutely closed against themselves—expressed their wishes and their hopes with the boldness of despair.

The rebellion of '15 was the consequence. It was the revenge of a disappointed party. It failed, and another blunder was committed by the mode in which victory was abused. It roused indignation to see the studied indignities offered to misfortune. British peers—men of ancient family and of personal amiability—honorable men—unhappy in their politics, bound hand and foot like common malefactors, and paraded through the streets of London with the slow agony of an ancient triumph. The severity of the sentence by which they died—their honors lost—their estates forfeited—their families reduced to ruin, met with little approbation. The grace of carrying matters with so high a hand, sat uneasily on the shoulders of one over whose title to reign had passed only the mellow influence of a few weeks. With the fierce reaction that had set in, it would have been insanity to have met the nation at an election. The monarch became thoroughly detested and abhorred, and a parliament of Jacobites, pledged to recall the Stuarts, would have been returned. The whig ministry and their master accordingly determined on the boldest violation of the constitution since the days of James. To prolong a triennial into a septennial parliament, saved the Brunswick race from being proclaimed usurpers by a tory house of commons, and the nation from the miseries of a civil war. When the bill had passed, the scheme of a restoration was at an end, and the country proceeded in that career of civilization and improvement which has outstripped in glory all the glittering deeds inspired by the lust of fame and dominion.

For when we turn from the picture of anticipated misfortune under a restored Stuart, to look upon the actual happiness enjoyed under the Hanoverian electors, we find no cause for sorrow at the unsuccessful issue of the rebellion. Though George the Second was as unpopular as his father, from the same causes of Hanoverian predilections and immorality of life, his reign was a continued period of prosperity, and progressive civilization. It was, certainly, a prosaic age of hoops and periwigs, of dull contentment, and, until its close, of peaceful moderation. The passionate phrensies of the era of the Revolution, which had boiled with unabated fury in the reign of Anne, and which the impolicy of George the First increased in virulence, were stilled in the calm atmosphere of venality and corruption. There were no laborers politicians; there were few of the needy class of political adventurers in the senate; public life was overarched by the dreary firmament of common place, in which was seen no meteor except Pitt, to keep in remembrance the brilliancy of the times that had passed. Though Walpole reigned by corrupting the national representatives, he was no friend to the extension of his system to ordinary life—he adopted an expedient forced upon him by the corrupt parties of the age in which he lived, while the whole of his legislation for the people displayed anxiety to put in vigor, by the love and habit of labor, enlarged notions of morality and justice; to render clear the

trite truth, that individual happiness is intimately allied with the general good, and that there is nothing more beneficial to individuals than a religious respect for the rights of all.

After the series of proscriptions on the death of Anne had terminated, the whig administrations, during the reigns of the two first Georges, returned to the liberal principles of their creed. They saw that the nation's happiness could not be secured except by an obliteration of its feuds, the union of wills, the moderation of party triumphs, the permission of a measured but wide use of freedom, and the use, not less measured, of power, respect for established interests, and a denunciation of exaggerated doctrines by an exposure of their lamentable effects. There were, indeed, no great reforms accomplished, because the age had not yet learned to appreciate their necessity. Yet the practical administration of the laws took the sting from the intolerance of persecuting statutes. Under Walpole no man was hunted to ruin for his opinions; the press teemed with libels, which he only answered or despised; the Jacobite meetings of the north no entreaties would induce him to suppress; he endeavored to free the Quakers from the disabilities under which they groaned, and his defeat only prevented him from accomplishing the repeal of the Test Act, which he invariably denounced, but which continued unrepealed for another age, till lagging justice and tardy toleration were at length permitted to erase the scandal from our laws.

His quiet unostentatious policy was, to do nothing that would heat the subsiding passions, or shock the decaying prejudices of the time. He required to educate the people before he could lead them to the reforms essential to their happiness; and for this he paved the road, by diffusing among them, in ample abundance, the materials of physical comfort, and by withdrawing attention from the excitements of political and polemic rancor.

At no period of our history did the springs of our commercial greatness act with more energy; in none, either before or since, were the mass doomed to labor, more supplied with the means of happiness. Malthus, in stating the quantity of subsistence procured by the laborers' wages in different ages, confers the preference on the period from 1720 to 1755, (p. 279.) "It was certainly," says Hallam, "the most prosperous season that England had ever experienced; and the progression, though slow, being uniform, the reign, perhaps, of George II. might not disadvantageously be compared, for the real happiness of the community, with that more brilliant but uncertain and oscillatory condition which has ensued."—(*Const. Hist.*, iii., p. 401.)

It might also justly challenge a preference with the ages that preceded it. Compare it with any of the reigns of the Plantagenets, the Tudors, or the Stuarts. Under the first, the wars of the Roses inundated the land with blood. Despotism reigned unchecked under the Tudors; the royal prerogative and the rights of the subject kept up a perpetual misery under all the Stuarts. Under William and Anne, the nation acquired a renown in arms; but the triumphs of war are no indications of national happiness; and the balance of power which they preserved was maintained at a cost beyond its value. After these storms had swept past, a period of repose was necessary to enable the tree of enlightened legislation to take root; and being tended with sedulous care, we reap the benefit in our day in the luxuriance of its blossom.

The story of Jacobitism has become interesting

at present, not so much from the romantic incidents in the lives of its adherents as from the important principles involved. Opinions appear to have a regular orbit. They revolve in a cycle which makes certain their reëpearance; and those which had long tenanted with the dead, are evoked again. The principles on which the revolution rests have been denied as sound in theory or as safe in practice; and that great event is itself denounced as a rebellion. The tractarian *illuminati*, after their weary excavations among the records of ancient Christianity and the "dark ages," have directed their attention to matters upon which their country are more sensitive. They are giving us novel expositions of that "deplorable schism," the reformation—earnest appeals to unprotestantize are offered us; and denunciations of "the rebellion" of 1688 establish how much true liberty we lost by the headlong zeal of the authors of that immortal change.

It is amusing to hear these arrogant pacificators of our disputes, swelling in the pride of knowledge, lecturing the world in the style of the famous Oxford decree of the days of the second Charles. Their arguments, and those of abler men, on the legality of the revolution, are only of importance now that they are supported by some literary talent. All the principles of that great event—productive as it has been of indelible consequences to nations—have been denied, or twisted into deformity, or absolutely changed. We see new systems springing up from the supposed principles of the revolution, and new theories advanced as to the relations of government, which it was intended forever to extinguish. The facts and texts are forced to obey the hand, and to become pliable to the genius of the architect, who, to determine the form of the edifice, has more consulted his prejudices than truth.

When we think, however, of the beneficent legislation consequent on it in both countries, we must ever regard that event as one of the great epochs of social order. Its peaceful moderation, too, renders it illustrious; persecutions for past misconduct rejected—the policy that could silence passion adopted—the danger of impending evils only looked to at the same time with the peril of remedy—the change upon the ancient monarchy made with a grave dignity becoming the national character of the people it affected—a proper regard paid to differences of opinion, never made to degenerate into quarrels of self-love and the war of factions, which are inseparable from the constitution of the human mind under the multitude of aspects in which objects so complicated present themselves, and are, moreover, essentially useful to the public in the vast relations of legislative discussions. From the history of these, how apparent is that fundamental error which declares the revolution to be an accident consequent on the misrule of James. It was something more than this. It was the close of that long struggle of freedom with prerogative, which had produced the hostile collisions between the sovereign and parliament from the days of Elizabeth, and which were only the type of what would inevitably follow, were the same uncertainty to last. To describe it as an accident, therefore, is to misrepresent its character. To attribute it to the passions of the moment, is to forget the necessity of a revolution which ages had prepared.

It is impossible to close a review of the times to which we have been referred, without summing up the terrible tragedy of the Stuarts, and the romantic

alternations of fortune of which their history is composed. From first to last we see only temporary triumphs, to be succeeded by long and fierce commotions, heavy prostrations, and defeat. Robert II., the first of the line, commenced by a concubinage with Elizabeth More, which has left lawyers in doubt as to the legitimacy of his descendants. His feeble reign was disturbed by continual tumults, partly fomented by his own children, and particularly by the savage "Wolfe of Badenoch." He lived in misery, and died surrounded by the wrecks of the monarchy that Bruce had reëstablished. He was succeeded by his son Robert III., who, in his old age, lived in a continued scene of crimes, crowned by the murder of his own son, the gay Rothesay of the Fair Maid of Perth—supposed to be effected by the agency of his uncle. A tragedy equally horrible was performed by James the First, on his uncle's children, in revenge for his brother's death. That monarch—himself the only man of real ability the unblest race ever furnished—was, after eighteen years' captivity in England, murdered in his turn in the town of Perth, at the instigation of Athole, his own kinsman. The mode in which his widow avenged his death, in ingenuity in the art of torment outstrips the Inquisition. James the Second, after procuring the judicial murder of his two nephews, killed another with his own hand, and was himself shot at the age of twenty-nine, when besieging Roxburgh. James III. was embroiled in bloody feuds with his brother, and afterwards with his son, against whom he fought and lost the battle of Sauchieburn, and was assassinated in his flight. James IV. was killed at Flodden. James V., after losing the battle of Solway Moss, died broken-hearted at the age of thirty-two, a few days after his daughter's birth. Of the misfortunes of Mary Stuart we need say nothing. Her descendants for three generations, and four reigns, were involved in continual quarrels with their people; one died upon the scaffold; another lived for many years an exile, and was restored in order to endure a greater degradation in becoming the pensionary of France; another, (James II.,) after presiding in the torture chamber in Scotland, scoffing at the inhumanities of Jeffries, ordering his nephew to the scaffold, declared himself a despot, and terminated his career in exile. His descendants, if they did not perish by the hands of the executioner, escaped only to die in a lower degradation; and thus closed the career of a race, of whom it is difficult to say whether they were more unfortunate, or more deserving of misfortune.

Put aside the first James; and we can only find in this unhappy line, men and women with weak or narrow understandings, strong prejudices, and stupid obstinacy, easily inflamed by their passions, and made incurable by their presumption. Their rigid hands could never gently use the reins of government, and operate their purpose by the silent means of peaceful conciliation. Never were they able to violate ancient usage, or infringe on established right, without choosing the course the most arrogant and irritating.

Our remarks upon the principal characters of the works we have been reviewing, and on the principles at issue, preclude us from any lengthened examination of the subordinate, but not less interesting memoirs. In the whole range of historical investigation, we know of none so exciting as the story of the actors in our civil wars. Those of England, in particular, in the days of Cromwell,

are full of romantic and heroic incident. Each side, too, contributed its contingent. The unbending perseverance and dogged bravery of the puritans found a counterpart in the chivalry of the cavaliers. The parties were equally matched. It was not a hopeless struggle by a few enthusiastic barbarians against the disciplined armies of an empire. It was one in which each called in the majesty of the law; and in the long fierce struggle, on which the fate of a kingdom rested, abundant materials have been left us for a history of all the virtues and all the vices that can honor and degrade humanity. Over all, there were two leaders whose fate excites our deepest attention. On the one hand, an unhappy prince, destined to the same death with so many of his line; and on the other the stern puritan soldier—whose body was torn with savage ferocity from the grave, to suffer indignities he never offered in life, and whose memory, assassinated by all historians, has been redeemed from the ignominy of two hundred years—presents one of the greatest examples in the records of human actions of the influence exercised by a human being over a contemporary generation.

We cannot look for such fertile topics of instruction, or actions of such momentous interest, in the civil commotions of the '15 or the '45. They were the result, not of a nation's resistance to intolerable wrong. They appealed to no personal interest of the masses; and the few who were engaged, had little time, and less opportunity, to do more than exhibit how rashly brave men may venture—how patiently suffer. There are, however, names that have claimed the notice of posterity; some for qualities of virtue in a period of corruption, some for a superiority in infamy, where infamy was common. Both classes will be found on both sides. The virtues of Duncan Forbes and of Colonel Gardiner shed a lustre on a cause disgraced by the Duke of Cumberland and his myrmidons; the generous devotion of Lochiel elevates a party for which such a victim as Lovat died.

Enough has not been said of the man who saved his country by the seasonable energy of an unconquerable resolution. A few traditional anecdotes, confined to the gentlemen of the law, give a faint idea of the great accomplishments of Duncan Forbes; but his exertions for the public good, when paralysis overtook the councils of government, and when incapacity led its armies, are lost in the conciseness of general history, and have been deemed unworthy of separate record. Had this man not directed the measures which his wisdom planned—composed, reconciled, united, and animated with his own energetic spirit, the lagging loyalty of the people—restrained, by prudent counsel the prudent among the Jacobites, or by the terror of the law influenced the mass who were only accessible through their fears, the whole Highlands would have been in arms. The number is not exaggerated which limits to 10,000, the clans whom the exertions of Forbes kept from following the cavalier. "But for his indefatigable exertions," says Mr. Klose, "the house of Hanover would infallibly have been driven from the British throne." He received his reward in the ruin of his fortune, which he had spent in supplying the troops of the nation, and of which he never received re-payment. He exerted his influence to stay the massacre which followed the victory of Culloden, and found his humanity regarded as intrusive. He heard the cry of wailing throughout the glens without ability to succor, and he who had braved the storm and pilot-

ed the vessel in safety to her harbor, was thrown aside as a wreck when the danger ceased. The treatment, though it could not subdue his patriotism, broke his spirit, and hurried him to his grave.

The Culloden papers are the evidence of the unwearied energy of a public man, who endeavored to meet a great calamity with insufficient means. But all the accounts we have ever read of this admirable patriot, speak, moreover, of an intellect so profound, and a knowledge on most subjects so exact, that his intellectual fame has been dimmed only by the virtues which his heart ever cherished. The kind, good-humored gentleness, the indulgent view of human errors, the magnanimity under all distresses, and the whole equipage of kindred virtues, present us with a character among the noblest of the age that is gone. At all times, the world delights to linger on the memory of a man firm in adversity, moderate in victory, humane in every fortune, beloved by all men though the leader of a party; one who, by a destiny not uncommon with those who have done equal service to their country, died in the obscurity of private life, broken in spirit by disappointment and ingratitude. In reading his history, we almost imagine ourselves perusing a lost life of one of the illustrious whom Plutarch has made immortal.

No history of this man is given in any of the works before us. Of the feeble sketch prefixed to the Culloden papers, the general public know but little; and the generous tribute paid to his memory many years ago by the Edinburgh Review, is the only modern attempt to rescue from the oblivion into which a few years would otherwise plunge the brightest reputation.* In no place more suitable could there be a history of the fall of clanship, than in the life of the man who suggested the enactments which destroyed it. On this subject, we have now no space to enter, though the contrast between the half-savage highlander of the '45 and the intelligent northern farmer of the present day, presents many points of instruction and of interest. We must, however, leave the consideration of the consequences of the victory of Culloden, and the generally sagacious laws which the condition of the Highlands called forth. Our space forbids us also to notice any of the interesting memoirs of some of the subordinate, but still celebrated personages, whose memory has been embalmed in Jacobitical history. Of these not the least interesting is Flora M'Donald, by whose presence of mind, devotion, and perseverance, the chevalier was saved. Mrs. Thomson's memoir of this lady is extremely interesting and detailed; as full of anecdote illustrative of perished things, as is the story of Lovat, whose doings, from their extraordinary character, deserve a notice we are unable to give them.

There is also another very interesting subject, in regard to which we can do no more than make a passing remark. Of the Jacobite literature, poetical and prosaic, much deserves to be written, on account of its general ability—the cleverness of the prose, and the exquisite pathos of the poetry. The conquerors did not continue their abuse of victory by proscribing the writings of the vanquished. The issue of the brain was left an equal chance of life with the issue of the womb, and no envious

* Edinburgh Review, vol. xxvi. We have been directed to this article by Mrs. Thomson, who informs us that it was written by Lord Cockburn, now a learned and able judge in the court over which Forbes presided—than whom, the patriotic Scottish lawyer of other times could have found no more fitting biographer.

Juno sat cross-legged over the nativity of any man's intellectual offspring. The prose, however, is not nearly equal in merit to the poetry, and degenerates into the virulence of personality little interesting to another generation. A different account may be given of the ballads of the Jacobites. Many of their lyrics were the testimony of affection to the gallantry and worth of the unreturning brave. Soldiers covered with wounds threw flowers upon the graves of the heroes who had served them as a model. Their song rises at the description of their glory, and sinks to sadness at the uniform story of their fate. They have the spirit to reach the elevation of their subject, and a pathos equal to their misfortunes.

These histories of the eventful times we have been considering, are of somewhat greater use than to gratify an idle curiosity, or to form the means of amusement for an idle hour. They enlighten the present age by past experience and example. They are dragged from the obscurity of manuscript to teach us, that the same errors now urged upon the world as discovered truth, have been met and vanquished by our fathers. They show us their former origin, their progress, and decline, and by instructing us how to avoid them, we have the true philosophy of history, which does not render the present an abstraction when discoursing of the past.

STEEPLE CHASE IN FRANCE.

Oh! England, how much you have to answer for! Until within a very few years the Normans, and the same may be said of the French in general, thought it absolutely impossible for any man to ride a mile straight a-head over fences. About five years ago an English gentleman of my acquaintance, residing at Avranches, offered, one evening, at a French party, a bet that he would ride his horse a mile and three quarters across the country in less than ten minutes. His proposal was immediately accepted, the French gentleman giving him odds, and allowing him twelve minutes for his work, for they thought it impossible he could do it in less. Several thousand persons assembled to see the performance, it was so new, and seemed so difficult. The enthusiasm of the spectators, some of whom were people of high rank, was intense; and some ladies were so complimentary as to assure the rider that "he was the admiration of the whole world."—He had a thorough bred English hunter, and, without any difficulty, rode the distance in four minutes and fifty seconds.

To give my sporting countrymen some idea of the light in which this performance was regarded, I shall translate a passage from an article which appeared in the Avranches Journal, written by and bearing the signature of the Count St. Germain, a gentleman of education, property, and distinction: "This fine animal glided like a serpent through the branches which opposed his progress, stooped his head with great sagacity, and then, stretching his limbs, passed, at a single bound, the fences in his way, giving to the imagination the notion of a disembodied form moving in open space. He cleared in two bounds the wooden fences protected by streams, gathering up his legs, sometimes like a stag in its attempts to escape from the hounds, proportioning his efforts to the difficulty of the jump, and altering his style of going according to the nature of the ground. Yielding to the least inti-

mation of his rider, he neither felt the want of a directing hand, nor failed to take advantage of it. No refusal, no hesitation of any kind stopped him for a moment; on the contrary, his multiplied bounds seemed only to increase his pace.—Long and reiterated bravos were soon heard at the winning post, which Mr. Moggridge reached in four minutes and fifty seconds."

The rider appeared to have experienced fatigue, but not so the horse, who finished with a leap of more than twenty-three feet over a brook. He had cleared in his progress fifteen fences, one of them a hedge six feet high, with brushwood at each side.—Some people had anticipated sensations of dread at witnessing a sight which they believed to be excessively dangerous; but, on observing the mutual confidence between the rider and his horse, they were soon relieved from their apprehensions. The emotions felt at an ordinary horse race are dull compared with the palpitations excited on witnessing an exertion which some cavillers have been disposed to compare with the combats of the circus, which should rather recall the remembrance of the rude tilts of the middle ages. Since that period steeple chases have been regularly established, and the French government and local societies, anxious to improve the breed of horses, give annual prizes both for flat races and steeple chases. The latter expression, like the word *beefsteak*, or rather *bifstiek*, has been adopted by the French, who have not any corresponding term in their own language. They also employ the compound word *gentleman-rider*, I presume, from the extreme difficulty of defining that personage.—[*Hairby's Rambles in Normandy*.]

CITY OF MATAMORAS, ITS CATHEDRAL.

CLEVERLY in Matamoras, the first impression you receive is the desolate feeling created by the prison aspect of all the houses. They have a semi-Moorish appearance, and you cannot divest yourself of the idea that a city thus built must be inhabited by people of jealous dispositions, subject to civil war and of unsocial habits. As you pass along you see, peeping through grated windows, pairs of dark eyes that flash strangely with fear and curiosity, and little children retreat before you with that gait peculiar to the young of timid animals, that flee from instinct, before they do it from reason. The double door, opened at an angle to admit the air, gives glimpses of deep brunettes, throwing remarkably luxuriant and dark tresses over their heads, previous to arranging them for the evening listlessness.

Men sit sullenly about in their fantastic dresses, half of them looking as if they had been stolen from a stock company of a theatre, while engaged in playing a "brigand piece." There is a flaunting, stiletto-you-in-the-dark expression about them. As you wander on you find the city remarkably well laid out, and although giving evidences of having seen better days, still it is far from being destitute of attractive buildings. Once fairly in the *Plaza Hidalgo*, the principal square of the city, you can rest yourself under the shade of some stunted China trees, and then commence examining at your leisure.

You will at once be attracted by the unfinished cathedral, which is so managed that the houses on its wings appear to be part of the cathedral itself, giving to the mass a very imposing appearance; it

bounds one entire side of the plaza. The architect commenced with most excellent intentions, and but for a want of funds would have made a splendid building. Two fine but unfinished towers command the sides of the cathedral, upon one of which is rudely laid a piece of timber from which are suspended a couple of bells. The large gothic door in the centre would have exposed the interior with great effect, but alas, some misfortune overwhelmed its progress, and left the bare walls, to provoke the imagination into contemplating the reasons why a work so well begun was not completed.

In front, seated in the angles formed by the bases of the pillars, or upon the bases themselves, are fifty or more poor miserable creatures, who seem, in their poverty, to have nothing in abundance but sunshine, and that they are determined to enjoy. Many are disgustingly disfigured by slow cankerous diseases, that appear to render their victims hideous, and yet will not kill. Some are slightly wounded soldiers, who have crawled out of the hospitals for fresh air. Few well dressed persons linger in their vicinity, but pass decorously on and disappear in a narrow alley way on the right of the cathedral, where we enter.

Having done so you soon come to a small room, no doubt intended originally for the sacristy, but now used as a chapel. The walls are plain, and there is no wealth about the altar to tempt sacrilegious hands. The adornments, on the contrary, are of little value, and of a kind in no way harmonious with the objects for which they are appropriated. The priest is at the altar in the act of celebrating mass, the worshipping congregation is impressive, and tempts the heart to join in the solemn service.

Before you are kneeling some twenty Mexican women, many of them quite handsome, all calculated to excite curiosity. They kneel gracefully, and accidentally as possible expose a fine foot, tastefully set off with a small slipper. There are but two Mexican men in the house, shame upon the sex, but there are men there beside, noble and true-hearted men, who form a curious sight, all the circumstances considered. Some twenty United States troops, in their uniforms, are on their knees at prayer, among the most devotional in the House. It was a sight to see those thus engaged who but a few days before were surrounded by the terrors of the battle field, busy, prominently busy, in the work of death.—Such is one of the cathedrals in Matamoras, and the principal building in the city.—*N. O. Tropic.*

WE have sometimes thought that a few of Southey's small poems, which are hardly known, are the most felicitous in expression of all his writings, and the most beautiful in sentiment. The following we have read perhaps a hundred times, but never without feeling it breathing over us like a cool breeze in one of these sultry days. We publish it with the hope that it may have a similar influence on our readers.—*C. Register.*

ON A PICTURE BY J. M. WRIGHT, ESQ.

[Engraved for the Keepsake of 1829.]

The sky-lark hath perceived his prison-door,
Unclosed; for liberty the captive tries:
Puss eagerly hath watched him from the floor,
And in her grasp he flutters, pants, and dies.

Lucy's own Puss, and Lucy's own dear Bird,
Her foster'd favorites both for many a day,

That which the tender-hearted girl preferred;
She in her fondness knew not, sooth to say.

For if the sky-lark's pipe was shrill and strong,
And its rich tones the thrilling ear might please,
Yet Pussybelle could breathe a fireside song
As winning, when she lay on Lucy's knees.

Both knew her voice, and each alike would seek
Her eye, her smile, her fondling touch to gain:
How faintly, then, may words her sorrow speak,
When by the one she sees the other slain.

The flowers fall scattered from her lifted hand;
A cry of grief she utters in affright;
And self-condemned for negligence she stands
Aghast and helpless at the cruel sight

Come, Lucy, let me dry those tearful eyes;
Take thou, dear child, a lesson not unholy,
From one whom nature taught to moralize,
Both in his mirth and in his melancholy.

I will not warn thee not to set thy heart
Too fondly upon perishable things;
In vain the earnest preacher spends his art
Upon that theme; in vain the poet sings.

It is our nature's strong necessity,
And this the soul's unerring instincts tell;
Therefore I say, let us love worthily,
Dear child, and then we cannot love too well.

Better it is all losses to deplore,
Which dutiful affection can sustain,
Than that the heart should, in its inmost core,
Harden without it, and have lived in vain.

This love which thou hast lavished, and the woe
Which makes thy lip now quiver with distress,
Are but a vent, an innocent overflow,
From the deep springs of female tenderness.

And something I would teach thee from the grief
That thus hath filled those gentle eyes with tears,
The which may be thy sober, sure relief,
When sorrow visits thee in after years.

I ask not whither is the spirit flown
That lit the eye which there in death is sealed;
Our Father hath not made that mystery known;
Needless the knowledge, therefore not revealed.

But didst thou know, in sure and sacred truth,
It had a place assigned in yonder skies,
There, through an endless life of joyous youth,
To warble in the bowers of Paradise,—

Lucy, if then the power to thee were given
In that cold form its life to reëngage,
Wouldst thou call back the warbler from its heaven
To be again the tenant of a cage?

Only that thou might'st cherish it again,
Wouldst thou the object of thy love recall
To mortal life, and chance, and change, and pain,
And death, which must be suffered once by all?

Oh, no, thou say'st: oh, surely not, not so!
I read the answer which those looks express;
For pure and true affection, well I know,
Leaves in the heart no room for selfishness.

Such love of all our virtues is the gem ;
 We bring with us the immortal seeds at birth ;
 Of heaven it is, and heavenly ; woe to them
 Who make it wholly earthly and of earth !

What we love perfectly, for its own sake
 We love, and not our own, being ready thus
 Whate'er self-sacrifice is asked, to make ;
 That which is best for it, is best for us.

O Lucy ! treasure up that pious thought !
 It hath a balm for sorrow's deadliest darts ;
 And with true comfort thou wilt find it fraught,
 If grief should reach thee in thy heart of hearts.

FAITH AND HOPE.

A PARABLE—BY WORDSWORTH.

ONE morning as the sun arose, two spirits went forth upon the earth.

And they were sisters ; but Faith was of mature age, while Hope was yet a child.

They were both beautiful. Some loved to gaze upon the countenance of Faith, for her eye was serene, and her beauty changed not ; but Hope was the delight of every eye.

And the child sported in the freshness of the morning : and as she hovered over the gardens and dewy lawns, her wings glittered in the sunbeams like a rainbow.

"Come, my sister," she cried, "and chase with me the butterfly from flower to flower."

But her sister was gazing at the lark, as it arose from its low nest and warbled among the clouds.

And when it was noon the child said again : "Come, my sister, and pluck with me the flowers of the garden, for they are beautiful, and their fragrance is sweet."

But Faith replied : "Nay, my sister, let the flowers be there, for thou art young and delightest thyself in their beauty. I will meditate in the shade until the heat of the day be past. Thou wilt find me by the fountain in the forest. When thou art weary, come and repose on my bosom."

And she smiled and departed.

After a time Hope sought her sister. The tear was in her eye ; and her countenance was mournful.

Then Faith said : "My sister, wherefore dost thou weep, and why is thy countenance sad ?"

And the child answered : "Because a cloud is in the sky, and the sunshine is overcast—see, the rain begins to fall."

"It is but a shower," Faith replied, "and when it is over, the fields will be greener than before."

Now the place where they sat was sheltered from the rain, as it had been from the noontide heat. And Faith comforted the child, and showed her how the waters flowed with a fuller and clearer stream as the showers fell.

And presently the sun broke out again, and the woods resounded with song.

Then Hope was glad, and went forth to her sports once more.

After a while the sky was again darkened, and the young spirit looked up, and behold, there was no cloud in the whole circle of the heavens.

Therefore Hope marvelled, for it was not yet night.

And she fled to her sister, and cast herself down at her feet and trembled exceedingly.

Then Faith raised the child, and led her forth from the shade of the trees, and pointed to the sun and said :

"A shadow is passing over the face thereof, but no ray of his glory is extinguished.—He still walketh in brightness, and thou shalt again delight thyself in his beams. See, even yet his face is not wholly hidden from us."

But the child dared not look up, for the gloom struck upon her heart.

And when all was bright again, she feared to wander from her sister, and her sports were less gay than before.

When the eventide was come, Faith went forth from the forest shades and sought the lawn, where she might watch the setting of the sun.

Then said she to her young sister : "Come and behold how far the glories of sunset transcend the beauties of the morning. See how softly they melt away, and give place to the shadows of night."

But Hope was now weary—her eye was heavy, and her voice languid. She folded her radiant wings, and dropped on her sister's bosom, and fell asleep.

But Faith watched through the night—she was never weary, nor did her eyelids need repose.

She laid the child on a bed of flowers, and kissed her cheek. She also drew her mantle round the head of the young sleeper, that she might sleep in peace.

Then Faith looked upwards, and beheld how the stars came forth. She traced them in their radiant courses, and listened to their harmonies, which mortal ear hath not heard.

And as she listened, their music entranced her soul.

At length a light appeared in the east, and burst forth from the portals of the heavens. Then the spirit hastened to arouse the young sleeper.

"Awake ! O my sister ! awake !" she cried, "a new day hath dawned, and no cloud shall overshadow it. Awake, for the sun hath arisen which shall set no more."

WORDS WITHOUT POWER.

WE were struck with the following instance of Christian faithfulness, in admonishing a young disciple, as affording a beautiful specimen of the meekness of wisdom. It would be well for many a "young hand," both in the pulpit and the prayer meeting, to have such a faithful Mentor, to warn of the danger of "superfluous expressions" both in preaching and in prayer. It is extracted from *The Friend*.—*Presbyterian*.

Peter Yarnall, when on a visit to Philadelphia in the second month, 1781, while he was yet young in the ministry, appeared in supplication at a meeting held in the Market street house. George Churchman, a judicious elder, was present, and soon after sent him the following letter. It is said that Peter Yarnall preserved this message of love with care, it having, no doubt, been "a word in season" to him. In preaching or praying it has a scattering effect upon hearers—to find words continue, after the power has passed.

London Grove, second month, 20th, 1781.

Respected Friend—Feeling a degree of sympathy toward thee, under the exercise which of latter time has attended thy mind, and, I trust, has measurably engaged thee to be anxious about redeem-

ing time that is passed and gone—I have divers times witnessed desires for thy preservation in a state of stability; and that the Divine hand may be near for thy support, under the provings which may be permitted to attend, for the trial of thy faith, the advancement of thy experience in the path of self-denial. I may just inform thee, that my attention was turned more particularly to thy present state on my being present at the week-day meeting in Market street, the fifth day following the late Quarterly Meeting in the city; where I heard a voice in supplication, at a considerable distance from the place I sat in. And though I knew not whose voice it was, I was afterwards told it was thine. I then felt a degree of sympathy, upon hearing the first sentence uttered, and was willing to believe it was not without the savor of life, and could by no means condemn the motion. On remembering several times since, I felt a freedom gently to hint to thee the sense which attended me before thy conclusion: which was, that perhaps it might be as well to have closed it rather sooner or with fewer expressions, for that time. I hope thou wilt clearly understand me, in the hint, that I am not censorious about it, but feel great tenderness; yet withal a care that thou, in thy infant state, may be preserved from getting out of, or swimming beyond thy depth in the stream, with which thy acquaintance and experience have been but short; although thy mind has been mercifully turned, I hope, towards the way everlasting.

I have apprehended some danger has attended, and may attend young hands, without great care, in regard of repetitions; public prayer in a congregation being a very awful thing, and He to whom it is addressed, being the Author of infinite purity. I believe there is no occasion of discouragement; but if the mind is sincerely devoted to the merciful Father, to seek for preservation out of every danger of forward stepping; superfluous expressions, and fleshy mixtures, there will be Divine assistance afforded to contrited souls. So that experience and strength will, from time to time be enlarged, and a gradual growth witnessed, in a state which is sound, healthy, and safe. That this may truly be thy state, is the sincere desire of thy well-wishing friend,

GEORGE CHURCHMAN.

THE HUTCHINSONS.

THESE "sweet singers" have become so widely known throughout the land, and in other lands too, and the report of them which goes abroad is so creditable, that a sketch of their homestead and domestic way of life will probably be read with interest. We extract the following from a letter in the Worcester Spy, written at Milford, New Hampshire:—

There are many interesting localities here, and not the least among them is the residence of the tribe of Jesse. The world has become intimate, as it were, with this remarkable people. Their names and generations have been sung in all places, and whether with their consent or otherwise, their history, both public and domestic, has been laid before the world.—The residence of the patriarch is a mile and a half east of the village. The family mansion is a stately building, erected in former

times for a hotel, but many years since turned to its present uses. It stands upon a gentle slope upon the northern bank of the Souhegan. In front is a beautiful meadow of many acres of rich bottom land, through which the river rolls sluggishly along. I visited them on a Sunday evening, and a most extraordinary scene I there beheld. It was the occasion of a meeting of nearly every member of the family. It was a scene that would have made the heart of a stoic rejoice.

We met there eight sons, six of whom were accompanied by their wives, two daughters, and there were from twenty to thirty grand-children, from two to twelve years of age, frolicking around. The old folks were seated at the door as we approached, and we waited while they received each one of their children, as they arrived, with a patriarchal blessing. It recalled to my mind the account of the children of Jacob with their little ones, gathering about the aged patriarch as he sat in the door of his tent. There seemed to be joy and pleasure in every heart, and brotherly love, and kindness were visibly manifest. When we approached to pay our respects to the aged couple, we were received, if possible, with more affectionate welcome than their own children, with many kind inquiries and a wish that prosperity and happiness might ever attend us. Our fathers had been their intimates, and their minds ran back over the incidents of those old years, with a freshness that brought tears to their eyes. Jesse and Judson reside in Lynn—the other members of the family are here.

The three boys, Judson, John and Asa, and their sister Abby, will, in the course of two months, start upon a singing tour. They tell me they will visit Worcester soon after leaving home. Should they go there, you may expect to hear better music than has greeted your ears for many a day. I once thought their singing perfect, and so it was in its way; but "Excelsior" is their motto, and they will prove to you that their experience in England has not been lost to them. The character of their singing is not changed, but their style is improved. There is a richness, a fulness, a brilliancy in their tones, and an expression of life in every breath, which will thrill the coldest blood in your heart. But it is natural, simple melody; they have acquired no foreign habit or accent—their turns and appoggiaturas are all their own, and occur just in the right places. For me, the beauty of their singing is in its expressive truthfulness. It speaks to the heart and makes it vibrate to music, as though it were itself a musical instrument, responding to the voice of God.

I have noticed an article copied from some of the Manchester papers, giving an account of the wealth which their tour in Europe produced to them. There is very little, if any, truth in the statement, which was made without their knowledge. Their residence is about twenty miles from Manchester, instead of seven and a half.—They have not purchased nor are they about to purchase a farm for \$10,000. Indeed, I am well assured there are no such farms for sale in the county of Hillsborough. They won golden opinions, and left England with the hearty good will of the English, but they did not bring home a fortune of thirty thousand dollars.

From Fraser's Magazine.

APPARITIONS.

"What is here
Which looks like death in life, and speaks like things
Born ere this dying world? They come like clouds!"
BYRON.

It was a gloomy autumnal evening; all was hushed and still in the interior of the dwelling in which we sat, while the tall trees without kept up a continual mysterious and confidential whispering, as though they had a thousand things to tell one another; and the wind went searching round the old house, and down the wide chimney, and through the long corridors, as if it had lost something. Or practised all the ancient tunes which it sang hundreds and hundreds of years ago, in a low wailing voice, half human in its melancholy sweetness, or wild revelry. Sometimes it seemed to go a long way off, and then, when you least expected it, back it came again as though it were singing under the window, or in the very room itself, while the heavy drapery swayed to and fro with a strange sympathy. Presently, in restless mood it went out to play with the old trees before mentioned, which at first only shook their heads gently at his frolics, but afterwards laughed and gambolled till their branches creaked again! And finally, elated with its sports, came sweeping along the old corridor and burst open the room door where we sat.

Startled a little from our dreamy reveries we looked hastily up, but perceiving no one, naturally concluded that it was only the wind; and were in the very act of putting the finishing stitch to the work on which we were employed, seeking at the same time for the tangled thread of our former pleasant musings thus rudely broken, when a passage which we had been lately reading in a very clever paper, entitled "*Miscellanea Mystica*," but without making any deep impression upon our minds at the time, came back like a lightning flash—"How often do we say, '*Tis only the wind,*' when former inhabitants of the houses we live in may be sweeping past us!"

The words had been uttered in reference to a spirit-story of a poor emigrant's wife, yearning for her forsaken home; the door of which was seen to open wide, one windy night—just such an one, perhaps, as that on which we write. To common eyesight this was all; but a certain woman, gifted with the rare faculty of ghost-seeing, was enabled both to distinguish and describe this strange visitor, who was dressed after her usual fashion, and wore a sad and troubled expression of countenance, as though grieving for all she had left behind.

Not being gifted with this same supernatural clearness of vision, which must be by no means desirable, if any "forms of the departed entered at the open door," it was unknown to us. And we only remember coming suddenly conscious that the evening was drawing in, and it might be as well to ring for candles. After which we fell into a train of thought far from unpleasant, in the which all that we had heard and read of such things came back as vividly as though it were but yesterday; the wind, meanwhile, keeping up a sort of running accompaniment to the wild harmony of by-gone recollections.

The house where we were born, and around which some of our earliest reminiscences are entwined, was said to be haunted; but a residence of many years never warranted us to give a less vague assertion than the common one, "it was

said to be." Neither are we aware that any member of the family is able to speak more confidently on the subject. It was curious enough, however, that several casual visitors, without the possibility of any previous communication passing between them, and in most instances without their even hearing it mentioned, have united in giving a precisely similar description of the phantom. By which we understood it to be tall, of the male sex, and wearing a loose pepper-and-salt coat, probably the fashion in those days. My father, who was frequently up writing until long after the rest of the family had gone to bed, has repeatedly heard or fancied footsteps upon the stairs, followed by a distinct tapping at his study door; on which occasions he never failed to call aloud "Come in," although his ghostly visitant seems invariably to have declined availing himself of the invitation.

We can remember one thing, however, which as children made a deep impression upon us. All of a sudden a strange noise, like the ticking of a watch, only slower, began to be heard night after night in the room where we generally sat. Some said it was a cricket, or a spider; others spoke of the *death-watch*! while a few took the opportunity of displaying their entomological knowledge by ascribing it to a certain beetle, belonging to the timber-boring genus *anobium*, which frequently finds its way into old walls and wainscoting. Anyhow, it was a very solemn sound; and remarked all the more for a curious coincidence which took place about the same time. A large Newfoundland dog, hitherto perfectly quiet, commenced a series of the most dismal howlings; and it was discovered one morning, had actually scratched up a deep hole in the ground, which certainly did look very like a grave! This was repeated more than once, until they took to chaining him. Not long afterwards a little child residing in the house sickened and died; and from that hour we never heard the *death-watch* again!

Of our own experience in these matters we have little more to tell; but a whole host of incidents heard at different times, and from some who are now spirits themselves, comes thronging into our memory with a strange distinctness, so that we feel tempted to relate a few: for who does not love a ghost story, however they may laugh at it afterwards!

The first is told by a distant relative of our own, living far away in a quiet country place, where a belief in these things comes quite natural. Her father had been long ill, and as she lay thinking of him one summer night, and how improbable it was they should ever meet again, she became suddenly conscious of a heavy weight, as though a head rested upon her bosom, and stretching forth her hand, distinctly felt the thick, crisped curls with which she had played a thousand times when a child, and which were only just beginning to be tinged with grey when she married and left home. She knew that it was her father, and yet, somehow, she was not frightened, but lay quite still; and presently heard a sweet voice singing an old familiar hymn, which he had often taught and sang to them long ago. And when its last tones died lingering away, the spirit, if it were one, had also departed.

Many have said it was only a dream—that she had gone to bed thinking of her poor father, and so dreamt the rest. Well, it might have been thus. But it is curious enough, nevertheless, that the old man actually died upon the very night, and, as near

as could be ascertained, the very hour when all this happened.

Our next anecdote was frequently related by the individual himself, and with a serious truthfulness, that seems to have made a deep impression on several who heard it from his own lips. He had, it appeared, been the only child of a good and pious woman, who was early left a widow; and after struggling with poverty and ill health for above twelve years, during which she maintained herself and child by the poorly remunerated labors of the needle, died at length of very weariness and exhaustion, preserving her meek and cheerful spirit to the last, and recommending her orphan boy, with many prayers, to the protection of Him who is "the Father of the fatherless."

For the first week or two after her death every one thought that the poor lad would have broken his heart for grief, and soon followed. Instead of which, as its passionate violence passed away, and its yearning affections were repelled and thrown back upon themselves, it hardened. And forgetting all her warning admonitions, he soon became as idle and restless as those into whose society he seemed henceforth cast. We will draw a veil over the next few years. It will be sufficient to mention, that at the time of which we are about to speak, his character, if he could be said to have one, was at its lowest ebb. And even those who out of pity for the boy, or from some lingering recollection of her who was gone, had hitherto continued his friends, dropped off one by one, until he was left an alien, as it were, from all good.

He had been out one evening with some young companions as wild and reckless as himself, and it was late before they thought of separating. It chanced that his nearest way home lay through the churchyard. Most of them would have preferred the high-road, although it was nearly a quarter of a mile farther round, rather than pass so lonely a spot; but the young man of whom we write used to make his boast that he feared neither the living nor the dead! It was a bright moonlight night, and as our hero walked onwards through the green, quiet fields, the bacchanalian song which he had commenced out of defiance upon separating with the rest died away upon his lips, and he lapsed into silence.

Late as it was a female form sat on one of the gravestones wringing her hands, and swaying backwards and forwards, as though in deep affliction. Naturally kind-hearted, the young man turned out of his way to see if there was anything he could do for her; but somehow, as he approached nearer, the figure seemed strangely familiar—aye, even the old bonnet with its faded black riband, and the well-worn dress; and while he was still attentively regarding it, it vanished suddenly away! It was, as we have said, a bright moonlight night—so bright that, stooping down over the spot from whence the figure had so strangely disappeared, the orphan distinctly read the name of his lost parent, together with the date of her death; and he knew now that it was her spirit he had seen! But why did she weep? She whose deep trust in God had kept her always cheerful amid poverty and disease, so that she died at last blessing and thanking Him for all His mercies! The conscience-stricken youth felt that it was his sins that would not let her rest even in the grave; and bowing down his face upon the damp grass, asked pardon of Heaven and of her.

It seems that for a long while past his old master had meant to give him warning, but had put it

off from time to time in hopes he would amend his present wild course of life; but his protracted absence on the night in question determined him, and he met his young apprentice with a sternness that disappeared all at once at the sight of his pale and agitated countenance. And he spoke kindly instead, bidding him get to bed as fast as he could. Touched by the mild and pitying tones of his voice, the youth told his master everything, who, although he had no great faith in ghosts, took care not to say a word which should lessen the evident impression made upon the mind of his companion, who became from that time a changed and better man.

"Well," that is all natural enough," exclaims the philosopher. "The boy, you tell us, ceased to sing soon after parting with his comrades. The stillness and the moonlight evidently subdued and saddened him, bringing back memories of old times, until from thinking of his mother, and how grieved she would have been had she lived to see this day, his active imagination was worked into the conviction that he actually saw her, wailing and wringing her hands as he describes; although the impression must have been a powerful one, certainly, to have given a coloring to his whole future life."

Oh, let ours, gentle reader, be a simpler, and a holier faith! The finger of God might have been in all this; and if so, it was easy for grace to hal-
low and perfect a work begun in mercy.

The next incident that we shall relate is of a more complicated and mysterious nature, and the purpose to be answered less clearly defined, although we can see no cause to question its authenticity, the narrator being one whose veracity was beyond dispute.

She had, it appears, been kept from church one Sunday evening, in consequence of ill health; but her indisposition not being of sufficient importance to warrant her detaining any one else, even the servants were permitted to go, and she remained at home alone. This was, however, a matter of too frequent occurrence to be much noticed; and having ascertained that the doors were securely fastened, the young lady took her book and began to read. It may be as well to mention that the work in question was a volume of sermons, of by no means an exciting nature; and from the perusal of which she presently rose up and proceeded to the library, with the intention of consulting some book of reference. What was her surprise on pushing open the door, which was only half closed, to see her father sitting in the easy chair which he generally occupied! She instantly addressed him in a cheerful voice, thinking he must have returned without her knowledge, for she distinctly remembered seeing him depart with the rest. Until upon receiving no answer, the utter impossibility of such a thing suddenly came over her, and she had only strength to totter from the room and seat herself upon the stairs outside, where she remained until the return of the family from church; when, having with difficulty unfastened the door, she instantly fainted away.

The young lady's first question upon coming to herself, was for her father; and seeing him bending over her she became gradually more composed, and had sufficient self-possession to forbear mentioning what had occurred to any member of the family, although she afterwards related it to one or two intimate friends. Had she done so, it is probable that the effect upon the imagination of her father might, as it has been too frequently the case,

have brought about the realization of her worst fears; instead of which they gradually passed away; although for some time afterwards she continued to watch over him with the most affectionate anxiety, and was observed to be restless and uneasy whenever he was out of her sight for long together. The old man lived, however, many years after this occurrence, and in the full enjoyment of his usual health.

We have heard tell of a gentleman of high literary attainments, possessed of a peculiarly nervous temperament, combined with a very powerful imagination, who was in the frequent habit of seeing persons coming towards him, as it were, and then suddenly vanishing all at once; so that he was occasionally puzzled to distinguish these illusions from what was actually taking place around him. Very much of this may be explained away by simple pathological causes. But the incident which we are about to relate, in which the same illusion was present to *two persons at once*, is less easy of solution. The parties to whom it occurred are well-known to us, and the neighborhood by no means remarkable for any associations of a romantic or spiritual nature.

It happened a few years ago, that two sisters passing along the outside of the Regent's Park, on their way home, and somewhat later than was their usual custom, in consequence of having been unavoidably detained, saw an old woman a few paces before them, the ancient appearance of whose dress and manner seems to have at first afforded them ample materials for criticism. And yet there was nothing extraordinary about her attire, which consisted of a dark cotton dress and shawl, with a black silk bonnet, which, it was facetiously observed, might from its size and shape have been made in the "year one!" And still they could not help noticing her.

It was just that soft twilight hour which is so rapidly followed in England by the dusk of evening; but as yet all was clear and easily defined; when on a sudden the sisters simultaneously missed the old woman from before them, although she had been there but a moment previous, laughingly exclaiming, that she had most decidedly vanished! And so it appeared. She was certainly nowhere to be seen; and being about the middle of one of the terraces, it was impossible that she could have escaped down any turning in such an instant of time. It was also evident that she had not crossed the road, or if so, no traces of her were visible in that direction. The sisters said little at the time, but involuntarily quickening their steps, were soon at home. And to this day, it is the strong impression upon both their minds that the old woman was no woman at all, but an apparition! It has, however, never since been visible to either, although they have passed over the same ground times and often.

The last anecdote we mean to relate will doubtless call up a thousand similar ones in the hearts and memories of our readers, which skeptical as we may all be on the subject, somehow we cannot find it in our consciences to laugh at.

Clara M——, was the second daughter of a clever but far from wealthy artist, with a large family dependent upon his genius and exertions. Until her sixteenth year she had been in the constant enjoyment of unbroken health; but about this period it suddenly declined, and symptoms of pulmonary consumption became daily visible in her fevered

cheek and attenuated frame, the more unexpected as the disease was by no means hereditary. A warmer climate was recommended as the last resource, and then it was that the heavy hand of poverty was felt for the first time among this hitherto happy and attached family; and they prayed for wealth only as the means of restoring life and health to this dear one! And not, as it seemed, altogether in vain.

A lady of good property, with a warm, benevolent heart, that ached sometimes amid its affluence for something to love and cherish, chanced to hear of Clara's ill health; and touched by the air of patient resignation with which one so young and beautiful looked calmly forward to her early death, resolved within herself that no human means should be left untried to avert so sad a doom. And amid the prayers and blessings of her parents and sisters Clara quitted England with her kind protectress, full of hope and gratitude.

Naturally gentle and sweet tempered, she was much beloved by every member of her family, but more particularly by her next sister Effie, between whom and herself there subsisted a most tender affection. And now that Clara was about to leave her, perhaps forever, the poor girl's grief and anguish became uncontrollable, until reminded of its selfishness by the increasing paleness of that beloved one.

"You will come again?" whispered Effie, as she slowly disengaged herself from the encircling arms of her half-fainting sister, and placed her in those of her kind friend, who would willingly, had it not been too late, have taken both of them with her. "Oh, promise me that you will come again!"

"Yes, I promise you faithfully, dear Effie, let what will happen!" replied Clara, with sudden animation; and the sisters parted thus.

The first letter they received was from Mrs. L——, and it was full of hope. Her young protégée was already better and stronger beyond her most sanguine expectations. A few weeks afterwards the girl wrote herself, in high spirits. The physician doubted whether she was consumptive at all; and at any rate predicted her speedy restoration under the discipline which he prescribed, united with the mild and genial air of that beautiful climate. She spoke of her gratitude to God, and that kind friend whom he had raised up for her; and of her one only wish, that dear Effie were but with her!

What rejoicing there was over that letter! What happy tears shed upon every recollection of it! While the sunshine of domestic peace once more diffused itself around the humble home of the artist. After a time, Clara's warm encomiums upon Mrs. L——'s kindness and affection, awoke a thousand wild, ambitious dreams in the heart of her fond mother, at which her husband did but laugh and shake his head. After all it was only natural, they both agreed, for every one to love their darling girl!

Better than a year had passed away. The travellers were on their road home. Clara had written a letter full of unabated affection and remembrance, and a little wee note to Effie, to say how she yearned to embrace them all again, and how she was half afraid they would scarcely know her, she had grown so tall and stout; and handsome too, if she were to credit all the pretty things she had said to her; which she did not, of course. This latter piece of information was apart to Effie, who.

verily believed in the depths of her simple and loving heart that it was impossible for Clara to have become more beautiful, anyhow!

It was a pleasant summer noon. All were busy as bees in the artist's humble but cheerful dwelling, either with the pencil or needle, for one or two bid fair to inherit a portion of their father's genius. They had been silent for some moments, so silent that the earnest tones of Mrs. M——'s voice actually startled them.

"Effie! my dear Effie, what ails you?"

The girl did not answer, but still sat rigid and motionless, with her strained eyeballs fixed upon what seemed a little streak of sunlight that came in through the artist's half-closed shutters.

"Effie!" exclaimed her mother again; and then she looked up, shuddered slightly, and, pointing with her finger towards the spot before indicated, whispered the name of her sister Clara, and immediately fainted away for the first time in her life.

Upon coming to herself, she persisted in declaring that she had seen Clara, standing pale but smilingly in the sunlight, looking at her with so sweet and loving a countenance, that she thought her heart would have burst.

"Ah, you had been thinking of her, no doubt!"

Effie confessed that she had continually, and bore to be laughed at as one anxious to be convinced that it was even as they had said, nothing more than a dream of her own vivid imagination; but, nevertheless, she could not help feeling restless and unhappy, with a yearning and troubled anxiety to hear from the travellers. The artist laughed, too, when he heard the story, but was observed to note down the time when it occurred upon the back of the picture which he was painting.

It was some time before the long-expected letter arrived which was to name the very day and hour of Clara's return, but it was sealed with black! The poor girl had died on her passage home of a rapid fever, which carried her off the third day after she was attacked. To the last she raved continually of her parents and sisters, more especially Effie; and passed away at length on a bright summer noon, the very same, and even the very hour, on which Effie maintained that she saw her, unconscious of the presence of Mrs. L——, who watched by her with a mother's love until all was over.

But we have well nigh exhausted our reminiscences, and with them, it may be, the reader's patience, but we hope not. The very wind of which we erstwhile spoke is tired out at length, and sobbing and crying itself to sleep like a weary child. The old trees nod gently in the quiet moonlight; and the church-clock, with its still, solemn voice warns us to our rest. For ourselves we have no fear of spirits; and, to own the truth, but little faith in mesmerism, clairvoyance, or any of the fashionable mysteries of the present age. But we verily believe there is nothing impossible to God, and are ready to confess with Shakspeare—

"There are more things in heaven and earth
Than are dreamt of in our philosophy."

WILDERSPIN, HIS PENSION AND TESTIMONIAL.

ALTHOUGH the promoters of the Wilderspin Testimonial are naturally unsatisfied until they succeed in raising their anticipated amount of 2,000*l.*, it cannot be said that their efforts have even thus far been unavailing. The barrier of 10*l.*

subscriptions, which was hitherto the highest rate in their list, has been passed, and they have to acknowledge a contribution of 30*l.*; Mr. John Ainsworth, of Moss Bank near Bolton, being the first to set that example of enlarged munificence. The progress has been slow, but now the pace seems to be advancing.

Meanwhile, independently of this private subscription, the attention drawn to Mr. Wilderspin's just claims has had the useful effect of moving the proper disposition in the highest quarters. Lord John Russell, whose new administration is to be signalized by some decided activity in the task of educating the people, has advised the queen to bestow a pension of 100*l.* a year on the founder of Infant Schools. The royal gift was announced by Lord John in the following agreeable terms:

"Chesham Place, July 16, 1846.

"SIR—I have received her majesty's commands to place your name in the list of pensions to deserving persons charged upon the queen's civil list, for a yearly sum of one hundred pounds.

"It gives me great pleasure to convey the queen's gracious wish that you will accept this testimony to your services as the founder and promoter of Infant Schools.

"I remain your obedient servant,

"J. RUSSELL.

"— Wilderspin, Esq., Barton."

This timely tribute is likely to have a salutary influence on the private subscription. It is at once a royal and an official acknowledgment of Mr. Wilderspin's claims. In fact, they are of a kind to receive general acknowledgment when once attention is turned to the subject. Wilderspin's right to the public rewards for irregular services fully stands the test which we recently laid down. The good done by him is palpable and great: he has shown that tuition may be given in the very early years of childhood, and shown that it can best, can only be done, by kindness; he has set others upon the same task, until it has become a commonplace; and he has personally been instrumental, by early training, in saving thousands from vice and misery. The inducements to perform that service were scanty, the discouragements abundant: the project was at first thought to be impossible, and Wilderspin had to encounter the chilling doubts of the world at large, who thought him an idle dreamer—to say nothing of invidious attacks upon him for the unsectarian comprehensiveness with which he tendered his offers of assistance. His personal sacrifices have been great: his intelligence, his zeal, his constitutional activity, his good-humored address, might have been the means of securing his prosperity in many profitable vocations; but he devoted himself to the redemption of indigent infancy from squalid ignorance; and he is poor. And his work is done. His claims, therefore, stand all the tests in the highest degree—the value of the service, the small regular inducement to its performance, the personal sacrifices, and the accomplishment of the work to be rewarded. Few of the "testimonials" so much in vogue just now can so completely and unequivocally stand those tests; with this further consideration—that although the bounty of the crown will relieve Wilderspin's declining years from actual want, it would need something more to secure him that ease which he has so fully earned.—*Spectator*, August 1.

From Blackwood's Magazine.

THE MINE, THE FOREST, AND THE CORDILLERA*.

THE silver mines of Potosi, the virgin forests, and mighty cordilleras of South America, are words familiar and full of interest to European ears. Countless riches, prodigious vegetable luxuriance, stupendous grandeur, are the associations they suggest. With these should be coupled ideas of cruelty, desolation, and disease, of human suffering and degradation pushed to their utmost limit, of opportunities neglected, and advantages misused. Not a bar of silver, or a healing drug, or an Alpaca fleece, shipped from Peruvian ports to supply another hemisphere with luxuries and comforts, but is the price of an incalculable amount of misery and even of blood—the blood of a race once noble and powerful, now wretched and depraved by the agency of those whose duty, and in whose power it was to civilize and improve them. The corrupt policy of Spanish rulers, the baneful example of Spanish colonists and their descendants, have gone far towards the depopulation and utter ruin of the richest of South American countries. How imprudent and suicidal has been the course adopted, will presently be made apparent. Those who desire evidence in support of our assertion, need but follow Dr. Tschudi, as we now propose doing, into the mining, mountainous and forest districts of Peru.

Difficult and dangerous as a journey through the maritime provinces of Peru undeniably is, it is mere railroad travelling when compared with an expedition into the interior of the country. In the former case, the land is level, and the sun, the sand, and the highwaymen, are the only perils to be encountered or evaded. But a ramble in the mountains is a succession of hairbreadth escapes, a deliberate confronting of constantly recurring dangers, to which even the natives unwillingly expose themselves, and frequently fall victims. The avalanches, precipices, gaping ravines, slippery glaciers, and violent storms common to all Alpine regions, are here complicated by other risks peculiar to the South American mountains. Heavy rains, lasting for weeks together, falls of snow that in a few moments obliterate all trace of a path, treacherous swamps, strange and loathsome maladies, and even blindness, combine to deter the traveller from his dangerous undertaking. All these did Dr. Tschudi brave, and from them all, after the endurance of great hardship and suffering, he was fortunate enough to escape. At a very short distance from Lima, the traveller, proceeding eastward, gets a foretaste of the difficulties and inconveniences in reserve for him. Whilst riding through the vale of Surco, or through some other of the valleys leading from the coast to the mountains, he perceives a fountain by the roadside, and pauses to refresh his tired mule. Scarcely is his intention manifest, when he is startled by a cry from his guide, or from a passing Indian—“*Cuidado! Es agua de verruga!*” In these valleys reigns a terrible disease called the *verrug*, attributed by the natives to the water of certain springs, and for which all Dr. Tschudi's investigations were insufficient to discover another cause. Fever, pains in the bones, and loss of blood from cutaneous eruptions, are the leading symptoms of this malady, which is frequently of long duration, and sometimes

terminates fatally. It seizes the Indians and lighter castes in preference to the white men and negroes, and no specific has yet been discovered for its cure. Mules and horses are also subject to its attacks. In no country, it would appear from Dr. Tschudi's evidence, are there so many strange and unaccountable maladies as in Peru. Nearly every valley has its peculiar disease, extending over a district of a few square miles, and unknown beyond its limits. To most of them it has hitherto been impossible to assign a cause. Their origin must probably be sought in certain vegetable influences, or in those of the vast variety of minerals which the soil of Peru contains.

In the mountains, the shoeing of mules and horses is frequently a matter of much difficulty; and it is advisable for the traveller to acquire the art, and furnish himself with needful implements, before leaving the more civilized part of the country. Farriers are only to be found in the large Indian villages, and it is common to ride fifty or sixty leagues without meeting with one. In the village of San Geronimo de Surco, the innkeeper is the only blacksmith, and Dr. Tschudi, whose horse had cast a shoe, was compelled to pay half a gold ounce (upwards of thirty shillings) to have it replaced. This was one half less than the sum at first demanded by the exorbitant son of Vulcan, who doubtless remembered the old Spanish proverb, “for a nail is lost a shoe, for a shoe the horse, for the horse the horseman.”* The doctor took the hint, and some lessons in shoeing, which afterwards stood him in good stead. It is a common practice in Peru, on the sandy coast, and where the roads permit it, to ride a horse or mule unshod for the first four or five days of a journey. Then shoes are put on the fore feet, and a few days later on the hinder ones. This is thought to give new strength to the animals, and to enable them to hold out longer. On the mountain tracks, the wear and tear of iron must be prodigious, as may be judged from the following description of three leagues of road between Viso and San Mateo, by no means the worst bit met with by our traveller.

“The valley frequently becomes a mere narrow split in the mountains, inclosed between walls of rock a thousand feet high. These enormous precipices are either perpendicular, or their summits incline inwards, forming a vast arch; along their base, washed by the foaming waters of the river, or higher up, along their side, winds the narrow and dangerous path. In some places they recede a little from the perpendicular, and their abrupt slopes are sprinkled with stones and fragments of rock, which every now and then, loosened by rain, detach themselves and roll down into the valley. The path is heaped with these fragments, which give way under the tread of the heavily laden mules, and afford them scanty foothold. From time to time, enormous blocks thunder down the precipice, and bury themselves in the waters beneath. I associate a painful recollection with the road from Viso to San Mateo. It was there that a mass of stone struck one of my mules, and precipitated it into the river. My most important instruments and travelling necessities, a portion of my collections and papers, and—an irreparable loss—a diary carefully and conscientiously kept during a period of fourteen months, became the prey of the waters. Two days later the mule was washed

* Peru. *Reisekizzen aus den Jahren 1838—1842.* Von J. J. VON TSCHUDI. Volume the second.

* “Por un clavo se pierde una herradura, por una herradura un caballo, por un caballo un caballero.”

ashore, but its load was irrecoverably lost. Each year numerous beasts of burden, and many travellers, perish upon this dangerous road. Cavalry on the march are particularly apt to suffer, and often a slip of the horse's foot, or a hasty movement of the rider, suffices to consign both to the yawning chasm by their side. At the inn at Viso I met an officer, who had just come from the mountains, bringing his two sons with him. He had taken the youngest before him; the other, a boy of ten years of age, rode upon the mule's crupper. Half a league from Viso, a large stone came plunging down from the mountain, struck the eldest lad, and dashed him into the stream."

Although frequently ill treated by the Creoles, and especially by the officers, the Indians in most parts of Peru show ready hospitality and good will to the solitary traveller. Those in the neighborhood of San Mateo are an exception; they are distrustful, rough and disobliging. When a traveller enters the village, he is instantly waited upon by the *alcalde* and *regidores*, who demand his passport. Has he none, he risks ill-treatment, and being put upon a jackass and carried off to the nearest prefect. Luckily the ignorance of the village authorities renders them easy to deal with; it is rare that they can read. On one occasion, when Dr. Tschudi's passport was demanded, the only printed paper in his pocket was an old playbill, that of the last opera he had attended before his departure from Lima, and which he had taken with him as wadding for his gun. He handed it to the Indian *regidor*, who gravely unfolded it, stared hard at the words *Lucia di Lammermoor*, and returned it with the remark, that the passport was perfectly in order.

Anything more wretched in their accommodations than the *tambos* or village inns, can scarcely be imagined. So bad are they, that the traveller is sometimes driven to pass the night in the snow rather than accept of their shelter, and at the same time submit to the nuisances with which they abound. One of these villainous hostleries, in which Dr. Tschudi several times attempted to sleep, is described by him with a minuteness that will rather startle the squeamish amongst his readers. Vermin everywhere, on the floor and walls, in the clothes of the Indian hag officiating as hostess, even in the caldron in which a vile mixture of potato water and Spanish pepper is prepared for supper. For sole bed there is the damp earth, upon which hosts, children and travellers stretch themselves. Each person is accommodated with a sheepskin, and over the whole company is spread an enormous woollen blanket. But woe to the inexperienced traveller who avails himself of the coverings thus bountifully furnished, swarming as they are with inhabitants from whose assaults escape is impossible. Even if he creeps into a corner, and makes himself a bed with his saddle-cloths, he is not secure. Add to these comforts a stifling smoke, and other nauseous exhalations, and the gambols of innumerable guinea-pigs, common as mice in many parts of Peru, who caper the night through over the faces and bodies of the sleepers, and the picture of a South American mountain inn will be as complete as it is uninviting. But these annoyances, great though they be, are very trifles compared to the more serious evils awaiting the traveller in the higher regions of the Cordilleras. At about 12,600 feet above the level of the sea, the effects of the rarefaction of the atmosphere begin to be sensibly and painfully felt. The natives, unac-

quainted with the real cause of the malady thus occasioned, and which by them is called *puna*, by the Spanish Creoles *veta* or *mareo*, attribute it to the exhalations of metals, especially of antimony. Horses not bred in the mountains suffer greatly from the *veta*, and frequently fall down helpless. The *arrieros* adopt various cruel means for their revival, such as cutting off their ears and tail, and slitting up their nostrils, the latter being probably the only useful remedy, as it allows the animal to inhale a large volume of air. To preserve them from the *veta*, chopped garlic is put into their nostrils. With human beings, this state of the atmosphere causes the blood to gush from the eyes, nose, and lips, and occasion faintings, blood-spitting, vomitings, and other unpleasant and dangerous symptoms. The sensation somewhat resembles that of sea sickness, whence the Spanish name of *mareo*. The malady, in its most violent form, sometimes causes death from excessive loss of blood. Of this, Dr. Tschudi saw instances. Much depends on the general health and constitution of the persons attacked. The action of the *veta* is very capricious. Some persons do not experience it on a first visit to the mountains, but suffer on subsequent ones. Another singular circumstance is, that it is much more violent in some places than in others of a greater altitude. This affords ground for a supposition, that other causes, besides the diminished pressure of the atmosphere, concur to occasion it. These as yet remain unknown. The districts in which the *veta* is felt with the greatest intensity, are for the most part very metallic, and this has given rise to the Indian theory of its cause.

Another terrible scourge to the traveller in the Cordilleras is the *surumpe*, a violent inflammation of the eye, brought on by the sudden reflection of the sun from the snow. In those mountains the eyes are kept continually in an irritated state by the rarefied air and cutting winds, and are consequently unusually susceptible. Often the heavens become suddenly overcast, and in a few minutes the yellowish-green waste is one sheet of snow. Then out bursts the sun with overpowering splendor, a sharp burning pain is instantly felt in the eyes, and speedily increases to an unbearable extent. The eyes become red, the lids swell and bleed. So violent is the agony as to cause despair and delirium. Dr. Tschudi compares it to the sensation occasioned by rubbing Spanish pepper or gunpowder into the eyes. Chronic inflammation, even total blindness, is the frequent consequence of the *surumpe* in its most intense form. In the Cordilleras it is no unusual thing to find Indians sitting by the wayside, shrieking from pain, and unable to continue their journey. The Creoles, when they visit the mountains, protect themselves with green spectacles and veils.

During five months of the year, from November till March, storms are of almost daily occurrence in the Cordilleras. They commence with remarkable punctuality between two and three in the afternoon, and continue till five or half-past; later than this, or in the night, a storm was never known to occur. They are accompanied by falls of snow, which last till after midnight. The morning sun dispels the cold mist that hangs about the mountain peaks, and in a few hours the snow is melted. "On the raging ocean," says Dr. Tschudi, "and in the dark depths of the aboriginal forests, I have witnessed terrific storms, whose horrors were increased by surrounding gloom, and imminent danger, but

never did I feel anxiety and alarm as in Antaichahua, (a district of the Cordilleras celebrated for storms.) For hours together flash followed flash in uninterrupted succession, painting blood-red cataracts upon the naked precipices; the thunder crashed, the zigzag lightning ran along the ground, leaving long furrows in the scorched grass. The atmosphere quivered with the continuous roll of thunder, repeated a thousand-fold by the mountain echoes. The traveller, overtaken by these terrific tempests, leaves his trembling horse, and seeks shelter and refuge beneath some impending rock."

The hanging bridges and *huanos* are not to be forgotten in enumerating the perils of Peruvian travelling. The former are composed of four thick ropes of cow-hide, connected by a weft of cords of the same material, and overlaid with branches, straw, and agair roots. The ropes are fastened to posts on either side of the river; a couple of cords, two or three feet higher than the bridge, serve for balustrades; and over this unsteady causeway, which swings like a hammock, the traveller has to pass, leading his reluctant mule. The passage of rivers by *huanos* is much worse, and altogether a most unpleasant operation. It can be effected only where the banks are high and precipitous. A single strong rope extends from one shore to the other, with a wooden machine, in form of a yoke, slung upon it. To this yoke the traveller is tied, and is then drawn over by means of a second cord. In case of the main rope breaking, the passenger by the yoke is inevitably drowned. When rivers are traversed in this manner, the mules and horses are driven into the water, and compelled to swim across.

But a further detail of the dangers and difficulties of travel in Peru would leave us little space to enumerate its interesting results. Supposing the reader, therefore, to have safely accomplished his journey through the solitary ravines, and over the chilly summits of the Cordilleras, we transport him at once to the Cerro de Pasco, famed for the wealth of its silver mines. In a region of snow and ice, at an elevation of 13,673 feet above the sea, he suddenly comes in sight of a large and populous city, built in a hollow, and surrounded on all sides by lakes and swamps. On the margin of eternal snows, in the wildest district of Peru, and in defiance of the asperities of climate, Mammon has assembled a host of worshippers to dig and delve in the richest of his storehouses.

Some two hundred and fifteen years ago, according to the legend, on a small pampa that lies south-east from Lake Lauricocha, the mother of the mighty river Amazon, an Indian, Hauri Capcha by name, tended his master's sheep. Having wandered one day to an unusual distance from his hut, he sought shelter from the cold under a rock, and lighted a large fire. The following morning he saw to his astonishment that the stone beneath the ashes had melted and become pure silver. He joyfully informed his employer, a Spaniard of the name of Ugarte, of this singular circumstance. Ugarte hastened to the place, and found that his shepherd had hit upon a vein of silver ore of extraordinary richness, of which he at once took possession, and worked it with great success. This same mine is still worked, and is known as *la Descubridora*, the discoverer. Presently a number of persons came from the village of Pasco, two leagues distant, and sought and discovered new veins. The great richness of the ore and the increase of employment soon drew crowds to the place—some to work, others to supply the miners

with the necessaries of life; and thus, in a very brief time, there sprung up a town of eighteen thousand inhabitants.

The ground whereon Cerro de Pasco is built is a perfect network of silver veins, to get at which the earth has been opened in every direction. Many of the inhabitants work the mines in their own cellars; but this, of course, is on a small scale, and there are not more than five hundred openings meriting, by reason of their depth and importance, the name of shafts. All, however, whether deep or shallow, are worked in a very senseless, disorderly, and imprudent manner—the sole object of their owners being to obtain, at the least possible expense, and in the shortest possible time, the utmost amount of ore. Nobody ever thinks of arching or walling the interior of the excavations, and consequently the shafts and galleries frequently fall in, burying under their ruins the unfortunate Indian miners. Not a year passes without terrible catastrophes of this kind. In the mine of Matagente, (literally, Kill-people,) now entirely destroyed, three hundred laborers lost their lives by accident. For incurring these terrible risks, and for a species of labor of all others the most painful and wearisome, the Indians are wretchedly paid, and their scanty earnings are diminished by the iniquitous truck system which is in full operation in the mines as well as in the plantations of Peru. The miner who, at the week's end, has a dollar to receive, esteems himself fortunate, and forthwith proceeds to spend it in brandy. The mining Indians are the most depraved and degraded of their race. When a mine is in *boya*, as it is called, that is to say, at periods when it yields uncommonly rich metal, more laborers are required, and temporarily taken on. When this occurs in several mines at one time, the population of Cerro de Pasco sometimes doubles and trebles itself. During the *boyas*, the miners are paid by a small share in the daily produce of their labors. They sometimes succeed in improving their wages by stealing the ore, but this is very difficult, so narrowly are they searched when they leave the mine. One man told Dr. Tschudi how he had managed to appropriate the richest piece of ore he ever saw. He tied it on his back, and pretended to be so desperately ill, that the corporal allowed him to leave the mine. Wrapped in his poncho, he was carried past the inspectors by two confederates, and the treasure was put in safety. Formerly, when a mine yielded *polvorilla*, a black ore in the form of powder, but of great richness, the miners stripped themselves naked, wetted their whole body, and then rolled in this silver dust, which stuck to them. Released from the mine, they washed off the crust, and sold it for several dollars. This device, however, was detected, and, for several years past, the departing miners are compelled to strip for inspection.

Like the extraction of the ore, the purification of the silver from the dross is conducted in the rudest and most primitive manner. The consequence is an immense consumption of quicksilver. On each mark of silver, worth in Lima eight and a half dollars, or about thirty shillings, it is estimated that half a pound of quicksilver is expended. The quicksilver comes chiefly from Spain—very little from Idria—in iron jars containing seventy-five pounds weight. The price of one of these jars varies from sixty to one hundred dollars, but is sometimes as high as one hundred and forty dollars. Both the amalgamation and separation of the metals are so badly managed, as to occasion a terrible

amount of mercurial disease amongst the Indians employed in the process. From the refining-houses the silver is, or ought to be, sent to Callana, the government melting-house, there to be cast into bars of a hundred pounds' weight, each of which is stamped and charged with imposts to the amount of about forty-four dollars. But a vast deal of the metal is smuggled to the coast and shipped for Europe without ever visiting the Callana. Hence it is scarcely possible to estimate the quantity annually produced. The amount registered is from two to three hundred thousand marks—rarely over the latter sum.

Residence in the Cerro de Pasco is highly disagreeable. The climate is execrable; cold and stormy, with heavy rains and violent falls of snow. Nothing less than the *auri sacra fames* could have induced such a congregation of human beings, from all nations and corners of the globe, in so inhospitable a latitude. The new-comer with difficulty accustoms himself to the severity of the weather, and to the perpetual hammering going on under his feet, and at night under his very bed, for the mines are worked without cessation. Luckily earthquakes are rare in that region. A heavy shock would bury the whole town in the bosom of the earth.

Silver being the only produce of the soil, living is very dear in the Cerro. All the necessaries of life have to be brought from a great distance; and this, combined with the greediness of the vendors, and the abundance of money, causes enormous prices to be demanded and obtained. House-rent is exorbitantly high; the keep of a horse often costs, owing to the want of forage, from two to three dollars a day. Here, as at Lima, the coffee and eating-houses are kept by Italians, principally Genoese. The population of the town is the most motley imaginable; scarcely a country in the world but has its representatives. Of the upper classes the darling vice is gambling, carried to an almost unparalleled extent. From earliest morning cards and dice are in full activity: the mine proprietor leaves his counting-house and silver carts, the trader abandons his shop, to indulge for a couple of hours in his favorite amusement; and, when the evening comes, play is universal in all the best houses of the town. The mayordomos, or superintendents of the mines, sit down to the gaming-table at night-fall, and only leave it when at day-break the bell summons them to the shaft. Often do they gamble away their share in a boy's long before signs of one are apparent. Amongst the Indians, drunkenness is the chief failing. When primed by spirits, they become quarrelsome; and scarcely a Sunday or holiday passes without savage fights between the workmen of different mines. Severe wounds, and even deaths, are the consequences of these encounters, in which the authorities never dream of interfering. When, owing to the richness of a boy, the Indian finds himself possessed of an unusual number of dollars, he squanders them in the most ridiculous manner, like a drunken sailor with a year's pay in his pocket. Dr. Tschudi saw one fellow buy a Spanish cloak for ninety-two dollars. Draping it round him, he proceeded to the next town, got drunk, rolled himself in the gutter, and threw away the cloak because it was torn and dirty. A watchmaker told the doctor that once an Indian came to him to buy a gold watch. He handed him one, with the remark that the price was twelve gold ounces, (two hundred and four dollars,) and that it would probably be too dear for him. The Indian took the watch, paid for

it, and then dashing it upon the ground, walked away, saying that the thing was no use to him.

Besides the mines of Cerro de Pasco, Dr. Tschudi gives us details of many others situate in various parts of Peru. The Salcedo mine, in the province of Puno, is celebrated for the tragical end of its discoverer. Don José Salcedo, a poor Spaniard, was in love with an Indian girl, whose mother promised to show him a silver vein of uncommon richness if he would marry her daughter. He did so, and worked the vein with great success. After a time the fame of his wealth roused the envy of the Conde de Lemos, then viceroy of Peru. By his generosity and benevolence Salcedo had made himself very popular with the Indians, and this served the viceroy as a pretext to accuse him of high treason, on the ground of his stirring up the population against the Spanish government. Salcedo was imprisoned, and sentenced to death. Whilst in his dungeon he besought Count Lemos to send the papers relating to his trial to the supreme tribunal at Madrid, and to allow him to make an appeal to the king's mercy. If this request were granted, he promised to pay a daily tribute of a bar of silver, from the time of the ship's sailing from Callao to that of its return. In those days the voyage from Callao to Spain and back occupied from twelve to sixteen months. This may give an idea of the wealth of Salcedo and his mine. The viceroy refused the condition, hung up Salcedo, (in May, 1669,) and set out for the mines. But his injustice and cruelty were doomed to disappointment. Whilst Salcedo prepared for death, his mother-in-law and her friends and relations betook themselves to the mine, destroyed the works, filled it with water, and closed the entrance so skilfully that it was impossible to discover it. They then dispersed in various directions, and neither promises nor tortures could induce those who were afterwards captured, to reveal the position of the mine. To this day it remains undiscovered.

Another example of the exceeding richness of Peruvian mines is to be found in that of San José, in the department of Huancavelica. Its owner asked the viceroy Castro, whose friend he was, to stand godfather to his first child. The viceroy was prevented from going himself, but sent his wife as a proxy. To do her honor, the proprietor of San José caused a triple row of silver bars to be placed along the whole of the distance, and it was no short one, between his house and the church. Over this costly causeway the vice-queen Castro accompanied the child to its baptism. On her departure her magnificent Amphitryon made her a present of the silver road as a mark of gratitude for the honor she had done him. Since then, the mines and the province have borne the name of Castrovireyna. Most of the former are now no longer worked. In the richest of them, owing to the careless mode of mining, one hundred and twenty-two workmen were buried alive at one time. Since then, no Indian can be prevailed upon to enter it.

The Indians have not been slow to discover how little advantage they derive from the mining system, procuring them, as it does, small pay for severe labor. Hence, although acquainted for centuries past with innumerable rich veins of ore, the knowledge of which has been handed down from father to son, they obstinately persist in keeping them secret. All endeavors to shake this determination have hitherto been fruitless; even the rarely failing argument of brandy in these cases loses its power. The existence of the treasures

has been ascertained beyond a doubt; but there is not a shadow of hope that the stubborn reserved Indian will ever reveal their locality to the greedy Creole and detested Metis. Numerous and romantic are the tales told of this determined concealment, and of the prudence and watchfulness of the Indians. "In the great village of Huancayo," says Dr. Tschudi, "there lived, a few years ago, two brothers, José and Pedro Iriarte, who ranked among the most influential of Peruvian miners. They knew that in the neighboring hills veins of almost virgin silver existed, and, with a view to their discovery, they dispatched a young man to a village near which they suspected them to be situated. The emissary took up his dwelling in the hut of a shepherd, with whose daughter, after a few months' residence, he established an intrigue. At last the young girl promised to show him a rich mine. On a certain day, when she drove her sheep to the pasture, he was to follow her at a distance, and to dig the spot where she should let her cloak fall. This he did, and after very brief labor found a cavity in the earth disclosing ore of uncommon richness. Whilst breaking out the metal, he was joined by the girl's father, who declared himself delighted at the discovery, and offered to help him. After some hours' labor they paused to rest, and the old Indian handed his companion a gourd of chicha, (a fermented drink,) of which the latter thankfully drank. Soon, however, the young man felt himself ill, and knew that he was poisoned. Taking his wallet full of ore, he hastened to the village, mounted his horse, and rode to Huancayo, where he informed Iriarte of what had occurred, described the position of the mine, and died the same night. Immediate and careful researches were of no avail. The Indian and his family had disappeared, the mine had been filled up, and was never discovered."

A Franciscan monk, also resident in Huancayo, a confirmed gambler, and consequently often embarrassed for money, had gained, by his kindness, the affections of the Indians, who constantly brought him small presents of cheese and poultry. One day when he had lost heavily, he confided his difficulties to an Indian, his particular gossip. The latter promised to help him, and the next evening brought him a large sack full of the richest silver ore. The same was repeated several times; but the monk, not satisfied, did not cease to importune his friend to show him the place whence he took the treasure. The Indian at last agreed to do so. In the night-time he came, with two companions, to the dwelling of the Franciscan, blindfolded him, put him on his shoulders, and carried him, alternately with his comrades, a distance of some leagues into the mountains. Here the monk was set down, and found himself in a small shallow shaft, where his eyes were dazzled by the beauty of the silver. When he had gazed at it long enough, and loaded himself with the ore, he was carried back as he had been brought. On his way he unfasted his chaplet, and from time to time let a grain drop, trusting by this means to trace out the mine. He had been but a few hours in bed when he was disturbed by the entrance of his guide. "Father," said the Indian, quietly, "you have lost your rosary." And he presented him with a handful of beads.

This mania for concealment is not universal amongst the Peruvians, who, it must be remembered, originally sprang from various tribes, united by the Incas into one nation. Great differences of

character and manners are still to be found amongst them, some showing themselves as frank and friendly towards the white men as others are mistrustful and inimical. The principal mines that are or have been worked, were pointed out to the Spaniards by the natives. Generally, however, the latter look upon seekers of mines with suspicion, and they still relate with horror and disgust, how Huari Capcha, the discoverer of the mines of Cerro de Pasco, was thrown by Ugarte into a gloomy dungeon, where he pined away his life. Dr. Tschudi could not ascertain the authenticity of this tale, but he often heard it told by the Indians, who gave it as a reason for concealing any new mines they might discover.

At the pass of Antarrangra, 15,600 feet above the level of the sea, Dr. Tschudi found two small lakes, scarcely thirty paces asunder. One of these is the source of the river San Mateo, which flows westward, passes Lima under the name of the Rimac, and discharges itself into the Pacific Ocean; the other sends its waters through a number of small mountain lakes to the river Pachachaca, a diminutive tributary of the mighty Amazon. The worthy doctor confesses that he could not resist the temptation to disturb the order of nature, by transporting a jug-full of the water intended for the Atlantic, into the lake communicating with the Pacific. Of a more serious cast were his reflections on the mighty power that had raised these tremendous mountains, on whose summits sea-shells and other marine substances testify to the fact of the ocean having once rolled over their materials.

Between the Cordilleras and the Andes, 12,000 feet above the sea, lie the vast tracts of desolate table-land known as the Puna, a Peruvian word equivalent to the Spanish *despoblado*. These plains extend through the whole length of Peru from N. W. to S.E., a distance of 350 Spanish miles, continue through Bolivia, and run out eastward into the territory of the Argentine republic. Their sole inhabitants are a few shepherds, who live with their families in wretched huts, and tend large flocks of sheep, oxen, alpacas, and llamas, to which the yellow and meagre grasses of the Puna yield a scanty nourishment. The district is swept by the cold winds from the Cordilleras, the climate is most inhospitable, unintermitting snow and storm during four months of the year. A remarkable effect of the Puna wind is the rapid drying of dead bodies. A few days suffice to convert a dead mule into a perfect mummy, the very entrails free from corruption. Here and there the dry and piercingly cold wind, which causes extreme suffering to the traveller's eyes and skin, changes its temperature, or, it were better said, is crossed by a current of warm air, sometimes only two or three paces, at others several hundred feet, in breadth. These warm streams run in a parallel direction to each other, and Dr. Tschudi deposes to having passed through five or six in the space of two leagues. He noticed them particularly in the months of August and September, and, according to his observations, their usual direction was that of the Cordilleras, namely, from S.S.W. to N.N.E. He once travelled for several leagues in one of these currents, the width of which did not exceed seven-and-twenty paces. Its temperature was eleven degrees of Reaumur higher than the adjacent atmosphere. The existence of these warm streams is in some cases permanent, for the muleteers will frequently tell beforehand where they are to be met with. The causes of such singular phenomena, says Dr.

Tschudi, are well deserving the closest investigation of the meteorologist.

The numerous deep valleys, of greater or less extent, which intersect the Puna, are known as the Sierra, and their inhabitants as Serranos, although that term is also applied by the dwellers on the coast of Peru to all natives of the interior. Here the climate is temperate, not unlike that of the central countries of Europe; towns and villages are numerous, and the fruitful soil brings forth abundantly, watered by the sweat of the laborious Indians. The people are hospitable in the extreme, and the stranger is welcome in their dwellings so long as he chooses to abide there. They appear, however, to be as yet very far removed from civilization. Their favorite diversions, cock and bull fighting, are carried on in the most barbarous manner. Their chief vice is an extreme addiction to brandy, and even the better classes get up evening parties for the express purpose of indulging in the fiery liquor. The ladies as well as the men consume it in large quantities, and Dr. Tschudi estimates the average consumption at one of these jaranas, or drinking bouts, to amount to nearly a bottle per man or woman. At a ball given in 1839, in one of the principal towns of the Sierra, to the Chilean general Bulnes—now president of Chili—the brandy flowed so abundantly, that when morning came many of the dancers, both male and female, lay dead drunk upon the floor. The sole extenuation of such disgusting excesses is the want of education of those who commit them, and the force of habit, which prevents them from seeing anything disgraceful in intoxication. It is only in society that the Serrano gets drunk. In every day life, when jaranas are not going on, he is a sober man.

The dramatic representations of scenes in the life of Christ, introduced by the Spanish monks who accompanied Pizarro, with a view to the easier conversion of the Aborigines, have long been discontinued in the larger Peruvian cities. But in the Sierra they are still kept up, and all the efforts of enlightened priests to suppress them, have been frustrated by the tenacity and threats of the Indians. Dr. Tschudi gives an extraordinary description of the celebration of Good Friday. "From early dawn," he says, "the church is crammed with Indians, who pass the morning in fasting and prayer. At two in the afternoon a large image of the Saviour is brought out of the sacristy and laid down near the altar, which is veiled. No sooner does this occur than the whole congregation rush forward and strive to touch the wounds with scraps of cotton, and then ensues a screaming, crowding, and fighting, only to be equalled by the uproar at an ill conducted fair, until the priests at last succeed in restoring order. The figure of the Saviour is now attached to the cross with three very large silver nails, and a rich silver crown is placed upon its head; on either side are the crosses of the two thieves. The Indians gaze their fill and leave the church, but return thither at eight in the evening. The edifice is then brilliantly illuminated, and at the foot of the cross stand, wrapped in white robes, four priests, the *santos varones* or holy men, whose office it is to take down the body of the Saviour. A short distance off, upon a stage or scaffolding, stands the Virgin Mary, in deep mourning, and with a white cloth round her head. In a long discourse a priest explains the scene to the congregation, and at the close of his sermon, turning to the *santos varones*, he says—'Ye holy men, mount

the ladders of the cross, and bring down the body of the dead Saviour!' Two of the priests ascend with hammers, and the preacher continues—'Thou holy man on the right side of the Saviour, strike the first blow upon the nail in the hand, and take it out!' The hammer falls, and the sound of the blow is the signal for the cry of *Misericordia! Misericordia!* repeated by thousands of voices in tones of anguish so heart-rending, as to produce a strangely painful impression upon the hearer. The nail is handed to a priest at the foot of the cross, to be taken to the Virgin Mary, still standing upon her scaffold. To her the preacher now addressed himself with the words—'Thou, afflicted mother, approach and receive the nail that pierced the right hand of thy blessed son!' And as the priest draws near to the image of the Virgin, the latter, moved by a secret mechanism, advances to meet him, receives the nail in both hands, places it in a silver bowl, dries its eyes, and returns to its place. These movements are repeated when the two other nails and the crown are brought down. The whole scene has for accompaniment the unintermitting howling and sobbing of the Indians, which redoubles at each stroke of the hammer, and reaches its apogee when the body is delivered to the Virgin, who then again begins to weep violently. The image of Christ is laid in a coffin adorned with flowers, and is carried by torchlight through every street of the town. Whilst the procession makes its circuit, the Indians erect twelve arches of flowers in front of the church door, placing between each two of them a carpet of the like materials, the simplest and most beautiful that it is possible to see. Each carpet is manufactured by two Indians, neither of whom seems to trouble himself about the proceedings of his comrade; but yet, with incredible rapidity and a wonderful harmony of operation, the most tasteful designs grow under their hands in rich variety of colors. Arabesques, landscapes, and animals appear as if by magic. It was highly interesting to me to observe in Tarma, upon one of these carpets, an exact representation of the Austrian double eagle, as the Indians had seen it on the quick-silver jars from Idria. When the procession returns, the Virgin Mary is carried back into the church through the arches of flowers."

The traveller in the Sierras of Peru frequently encounters plantations of a shrub about six feet high, bearing bright green leaves, white flowers, and scarlet berries. This is the celebrated coca tree, the comforter and friend of the Peruvian Indian under all hardships and evil usage. Deprive the Turk of coffee and pipe, the Chinese of opium, the sailor and soldier of grog and tobacco, and no one of them will be so miserable as the Indian bereft of his coca. Without it he cannot exist; it is more essential to him than meat or drink, for it enables him to dispense with both. With his quid of dried coca leaves in his mouth, he forgets all calamities; his rags, his poverty, the cruelties of his taskmaster. One meal a day suffices him, but thrice at least he must suspend his labor to chew his coca. Even the greedy Creoles have been compelled to give in to this imperious necessity, and to allow their laborers a quarter or half an hour's respite three times in the day. In mines and plantations, wherever Indians work, this is the universal practice. Although considered a barbarous custom by the whites, some few of the latter are inveterately addicted to coca chewing, which they generally, however, practice clandestinely. The effect of this plant upon the human system is very

similar to that of certain narcotics, administered in small doses. Taken in excessive quantities it is highly injurious; used in moderation, Dr. Tschudi inclines to think it not only harmless, but positively salutary. The longevity of the Indians, and their power of enduring great fatigue, and performing the hardest work upon a very scant allowance of food, are certainly in favor of this belief. The doctor met with men of 120 and 130 years old, and he assures us that such are by no means exceedingly rare in Peru.* Some of these men had chewed coca leaves from their boyhood upwards.

Allowing their daily ration to be no more than one ounce, the consumption, in their lifetime, would amount to the prodigious quantity of twenty-seven hundred pounds' weight. Yet they were in perfect health. The coca is considered by the Indians to be an antidote to the *veta*, and Dr. Tschudi confirms this by his own experience. Previously to his hunting excursions in the upper regions of the Puna, he used to drink a strong decoction of coca leaves, and found it strengthening and a preservative from the effects of the rarefied atmosphere. So convinced is he of its salubrious properties, that he recommends its adoption in European navies, or at least a trial of its effects during a polar or some other distant expedition. One of the chief causes of Indian hatred to the Spaniards is to be traced in the attempted suppression by the latter of the use of coca, during the earlier period of their domination in Peru, their sole reason being their contempt for Indian customs, and wish to destroy the nationality of the people. Royal decrees were fulminated against coca chewing, and priests and governors united to abolish it. After a time, the owners of mines and plantations discovered its utility, in giving strength and courage to their Indian vassals; books were written in its defence, and anti-coca legislation speedily became obsolete. Since then, several learned and reverend writers, Jesuits and others, have suggested its introduction into Europe, as a substitute for tea and coffee, to which they hold it far superior. There can be little doubt that—like as tobacco is considered to preserve armies from mutiny and disaffection—the soothing properties of coca have saved Peru from many bloody outbreaks of the Indian population. But even this potent and much-loved drug has at times been insufficient to restrain the deadly hatred cherished by the Peruvians towards their white oppressors.

The *Leyes de las Indias*, or code for the government of the Spanish colonies, although in some instances severe and arbitrary, were mild and paternal compared with their administration by the viceroys and other officials. Amongst them were two enactments, the *Mita* and the *Repartimiento*, intended by their propounders to civilize and improve the Indians, but fearfully abused in practice. By the *Mita*, the Peruvians were compelled to work in the mines and plantations. Every Spaniard who possessed one of these, received from the *corregidor* a certain number of Indians, to each of

whom he paid daily wages, and for each of them an annual contribution of eight dollars to the state. This plan, if fairly and conscientiously carried out, might have been a means of reclaiming the Indians from barbarity and idleness. But the truck system, unlimited and excessive time of labor, and other abuses, caused it to produce the precisely opposite effect to that proposed by the framers of the law. One third only of the stipulated wage was given in money, the remainder in European manufactures, charged at exorbitant prices; and the Indians, unable to purchase the bare necessities of life, were compelled to incur debts with their employers—debts that they could never pay off, and which rendered them slaves for their whole lives. The field laborers were made to toil from three in the morning till an hour after sundown; even the Sunday was no day of rest for these unfortunate helots. Such increasing and painful exertions annually swept away thousands of Indians. Various writers estimate at nine millions the number of those killed by labor and accident in the mines, during the last three centuries. Dr. Tschudi does not think this an exaggeration, and calculates that three millions more have been sacrificed in the plantations, especially in the coca fields of the backwoods.

The *Repartimiento* was the distribution of European wares and luxuries by the provincial authorities. Under this law, intended for the convenience of the people, and to supply them with clothes and other necessities at fair prices, every *corregidor* became a sort of shopkeeper, caused all manner of merchandise to be sent to him from the capital, and compelled the Indian to buy. The prices affixed to the articles were absurdly exorbitant; a needle cost a real, a worthless knife or a pound of iron a dollar, an ell of printed calico two or three dollars. Lace, silk stockings, and false jewelry, were forced upon the richer class. After a short delay, the money was demanded; those who could not pay had their goods seized, and were sold as slaves to the mines or plantations. Not only useless objects—razors, for instance, for the beardless Indians—but things positively injurious and inconvenient, were thrust upon the unwilling purchasers. It will scarcely be believed that a *corregidor*, to whom a commercial friend had sent a consignment of spectacles, issued an edict, compelling all Indians, under penalty of a heavy fine, to wear glasses at certain public festivals.

Against the abominable system of which the above abuses formed but a part, it was to be expected that sooner or later the Indians would revolt. For two centuries they submitted to it with wonderful patience and long-suffering. At last, a man was found to hoist the bloody flag of insurrection and revenge.

Juan Santos, surnamed the Apostate, was an Indian from Huamanga, and claimed descent from Atahualpa, the last of the Incas, whom Pizarro hung. In the year 1741, having killed a Spaniard of noble birth in a quarrel, he fled to the woods, and there brooded over the oppression to which his countrymen were subjected. At that time, the zealous Spanish missionaries had made great progress in the conversion of the *Indios bravos*, a savage and cannibal tribe, amongst whom they fearlessly ventured, undeterred by the murder of many who had preceded them. Against these priests Santos instigated an outbreak. He first addressed himself to the tribe of the Campas, declared himself a descendant of the mighty Peruvian kings, and asserted that he possessed supernatural power,

*Stevenson, in his work on South America, refers to the extraordinary longevity of the Peruvian Indians. In the church register at Barranca, he found recorded the deaths of eleven persons in the course of seven years, whose joint ages made up 1207 years, giving an average of 110 years per man. Dr. Tschudi mentions an Indian in Jaaya, still living in 1839, and who was born, if the register and the priest's word might be believed, in the year 1697. Since the age of eleven years he had made a moderate daily use of coca. However old, few Indians lose their teeth or hair.

that he knew all their thoughts, and had the portrait of each of them in his heart. Then calling the Indians to him one by one, he lifted his upper garment, and allowed them to look in a mirror fastened upon his breast. The savages, astonished at the reflection of their faces, conceived a great veneration for Santos, and implicitly obeyed him. He at once led them to a general attack upon the priests, their property, and religion. By bold and sudden assaults, several Spanish fortified posts were taken, and the garrisons murdered. At the fort of Quimiri, the Indians put the muskets of the slain soldiers in a heap, set fire to them, and danced round the blazing pile. But the surprise of the place had been so well managed, that the Spaniards had had no time to fire even one volley, and their muskets were still loaded. Heated by the flames, they exploded, and spread destruction amongst the dancing savages. Churches and mission-houses were destroyed, villages burnt, plantations laid waste; the priests were tied to the images of saints, and thrown into the rivers. In a few weeks the missionary districts of middle Peru were utterly ravaged, and terror reigned in the land. The Spaniards feared a revolt with the Sierra Indians; strong measures were taken, forts built along the frontier, and the *bravos* driven back to their own territory. What became of Santos is not exactly known. Some affirm that he united several savage tribes in a confederacy, and ruled over them till his death. In the monastery of Ocopa, Dr. Tschudi found an old manuscript, in which was the following note:—"The monster and apostate Juan Santos Atahualpa, after his diabolical destruction of our missions, suffered terribly from the wrath of God. He met the fate of Herod, and was eaten alive by worms."

Although of short duration, the insurrection headed by Santos was weighty in its consequences. It showed the Indians their strength, and was followed by repeated revolts, especially in Southern Peru. For want of an able leader they all proved fruitless, until Tupac Amaru, cacique of Tungasuca, put himself at the head of a matured and well-organized revolution. A valid pretext for this was afforded by the corregidor of Tinta, Don Antonio Ariaga, who in one year, 1780, made repartimientos to the amount of three hundred and forty thousand dollars, and exacted the money for the useless wares with cruel severity. Tupac Amaru assembled the Indians, seized the corregidor, and hung him. This was the signal for a general uprising in the whole of southern Peru, and a bloody war ensued. In April, 1781, Tupac Amaru, his wife, and several of the rebel chiefs, were made prisoners by a detachment of Spanish cavalry. They were tried at Cuzco, found guilty, and condemned to death. The unfortunate cacique was compelled to witness the execution of his wife, two sons, his brother-in-law, Antonio Bastidas, and of other relations and friends. He then had his tongue cut out, and was torn by four horses. His body was burned, his head and limbs were stuck upon poles in different towns of the disturbed districts. In Huancaayo, Dr. Tschudi met with an old creole, who, when a lad of sixteen, had witnessed the barbarous execution of the cacique of Tangasuca. He described him as a tall handsome man, with a quick piercing eye, and serious resolute countenance. He beheld the death of his family with great emotion, but submitted without a murmur to his own horrible fate. He was not long unavenged. His brother, his remaining son Andres, and a dar-

ing Indian chief named Nicacatari, carried on the war with increased vigor and ferocity, and at the head of a numerous force threw themselves before the large fortified town of Sorrata, whither the Spaniards from the surrounding country, trusting to the strength of the place, had fled for safety. When Andres Tupac Amaru saw that with his Indians, armed only with knives, clubs, and slings, he had no chance against the powerful artillery of his foe, he caused the streams from the neighboring mountains to be conducted to the town, and surrounded it with water. The earthen fortifications were soon undermined, and when they gave way the place was taken by assault. With the exception of eighty-seven priests and monks, the whole of the besieged, twenty-two thousand in number, were cruelly slaughtered. From Sorrata the Indian army moved westwards, and was victorious in several actions with the Spanish troops. Gold, however, accomplished what the sword had failed to do. Seduced by bribes and promises, an Indian follower of Andres guided a party of Spanish soldiers to the council-house of the rebels. The chiefs were all taken and put to death. Deprived of its leaders, the Indian army broke up and dispersed. Innumerable executions followed, and the war was estimated to have cost from first to last nearly a hundred thousand lives. Its only beneficial result to the Indians was the abolition of repartimientos.

During the revolution that lost Peru to Spain, the Indians took part with the patriots, who deluded them with promises of a monarchy, and of placing a descendant of the Incas on the throne. Not clearly understanding the causes of the war, the Indians frequently turned their arms against their own allies, and killed all white men who fell into their power. Many provinces were entirely deserted by the Creoles and Metises, in consequence of the furious animosity of the colored race. In Jauja, the Indians swore they would not leave so much as a white dog or fowl alive, and they even scratched the white paint from the walls of the houses. When General Valdes and his cavalry crossed the river of Jauja and attacked the Indians, the latter scorned to save themselves by flight, but threw themselves upon the lances with cries of "*Mata me, Godo!*" * Kill me! Two thousand remained upon the field, the Spaniards not ceasing to kill till their arms were too tired to strike.

Dr. Tschudi inclines to believe that sooner or later the Indians will throw off the yoke of the effeminate and cowardly Creoles, and establish a government of their own. Whether such a government will be able or allowed to maintain itself, it is difficult to say; although, as the doctor observes, why should it not, at least, as well as a negro republic in an Archipelago peopled by the most civilized nations of Europe? Since the separation of Peru from Spain, the Indians have made great progress in many respects; they have been admitted into the army, have become familiar with fire-arms and military manœuvres, and have learned the manufacture of gunpowder, materials for which their mountains abundantly afford. Their hatred of the whites is bitter as ever, their feeling of nationality very strong—their attachment to the memory of their Incas, and to their old form of government, undiminished. In spite of long oppression, they still possess pride and self-reliance. Besides

* *Godo, goth*, the nickname given by Peruvian Indians to the Spaniards.

the government forced upon them by the Creoles, they preserve and obey their old laws. Let a leader like Tupac Amaru appear amongst them, and there is every probability of an Indian revolution, very different in its results to any that has yet occurred.

Most Robinson Crusoe-like in its interest is the long chapter wherein Dr. Tschudi details his forest adventures, and we regret that we must be very summary in our notice of it. With extraordinary courage and perseverance the doctor and a German friend made their way to the heart of the backwoods, built themselves a log-hut, and, despising the numerous dangers by which they were environed, abode there for months, collecting zoological specimens. Of the perils that beset them, Dr. Tschudi's unvarnished narrative of the daily sights and nocturnal sounds that assailed their startled senses in those wild regions, gives a lively idea. Indian cannibals, ferocious beasts, reptiles whose bite is instant death, venomous insects, and even vampires, compose the pleasant population of this district, into which these stout-hearted Europeans fearlessly ventured. Of the beasts of prey the ounce is the most dangerous; and so fierce and numerous has its breed become in certain districts of Peru, as to compel the Indians to abandon their villages. We are told of one hamlet, in the ravine of Mayunmarca, that has been desolate for a century past on this account. The ounces used annually to decimate its inhabitants. More perilous even than these animals, to the wanderer in the forest, are the innumerable serpents that lurk beneath the accumulation of dead leaves bestrewn the ground. The most deadly is a small viper about ten inches long, the only species of the viper family as yet discovered in South America. The virulence of its venom kills the strongest man in the space of two or three minutes. The Indians, when bitten by it, do not dream of seeking an antidote, but at once lie down to die. Bats are exceedingly plentiful, and very large, some measuring nearly two feet across the extended wings. The bloodsucker or vampire (*phyllostoma*) finds its way in search of food into stables and houses. The smooth-haired domestic animals are especially liable to its attacks. With wings half open it places itself upon their backs, and rubs with its snout till the small sharp teeth break the outer skin. Then it draws in its wings, stretches itself out, and sucks the blood, making the while a gentle movement with its body, not unlike the undulations of a busy leech. The fanning motion of the wings described by some writers was never observed by Dr. Tschudi. Although these vampires only imbibe a few ounces of blood, the subsequent hæmorrhage is very great, and full-grown mules sometimes die of the exhaustion caused by their repeated attacks. One of the doctor's beasts was only saved from such a fate by being rubbed every five or six days with turpentine and other strong-smelling drugs, which kept off the vampires. It has often been disputed whether these disgusting animals attack human beings. Our traveller deposes to their doing so, and cites an instance witnessed by himself. A bat (*Ph. erythromos*, Tsch.) fixed upon the nose of an Indian who lay drunk in the court of a plantation, and sucked his blood till it was unable to fly away. Violent inflammation and swelling of the Indian's head were the consequences of the trifling wound inflicted.

We must here make mention of the carbunculo, a fabulous animal, whose existence obtains credit

in most parts of Peru. Wherever he went, Dr. Tschudi heard stories of this creature, and met persons who asserted that they had seen it. It is reported to be of the size of a fox, with long black hair, and only to appear at night, when it glides slowly through the bushes or amongst the rocks. When pursued, a valve or trap-door opens in its forehead, and an extraordinarily brilliant object—believed by the natives to be a precious stone—becomes visible, dispelling the darkness and dazzling the pursuer. Then the forehead closes, and the creature disappears.¹ According to other accounts, it emerges from its lurking place with carbuncle displayed, and only conceals it when attacked. This strange superstition is not of Spanish origin, but of older date than Pizarro's invasion. Of course it has never been possible to catch or kill a specimen of this remarkable species, although the Spaniards have used every effort to get hold of such a creature; and in the viceroy's instructions to the missionaries, the carbunculo was set down in the very first rank of desiderata. Dr. Tschudi vainly endeavored to discover, with some degree of certainty, what animal had served as a pretext for the fable.

After a four years' residence in Peru, and when preparing for a journey that was to include an investigation of all the provinces, and to last for several years, Dr. Tschudi was seized in the Cordilleras with a nervous fever, which brought him to the brink of the grave. Upon his recovery, he found that long repose, both of mind and body, was essential to the complete restoration of his health. Such repose he could not be certain of granting himself if he remained in Peru, and he therefore resolved to seek it upon the ocean. He took ship, and reached Europe at the commencement of 1843, after an absence of five years. He greatly regrets not having visited every part of Peru, especially the historical city of Cuzco, and the forests of Urubamba. But his harvest of knowledge has been so rich and abundant, that he should not, we think, begrudge the remnant of the crop to the gleaners who may come after him.

IMMENSE NATURAL BEEHIVE.—In a cavern, on the right bank of the Colorado, about seven miles from Austin, Texas, there is an immense hive of wild bees. On a warm day a dark stream of bees may be seen constantly winding out from the cavern like a long dark wreath of smoke. The stream often appears one or two feet in diameter near the cliff, and gradually spreads out like a fan, growing thinner and thinner at a distance from the cavern until it disappears. The number of bees in that cavern must be incalculably great, probably greater than the number in a thousand or ten thousand ordinary hives. The oldest settlers say the hive was there when they first arrived in the country, and it is quite probable that it existed in the same state many years previous to the settlement of this country. It is estimated that there are many tons of honey and wax in this immense hive; and if its contents could be extracted readily, they would doubtless be found more valuable than the contents of any silver or gold mines that adventurers have been seeking for years in that section.

CHINESE PROFESSORSHIP IN KING'S COLLEGE.—The East India Company have just awarded the sum of 210*l.* for the purpose of the endowment of a Chinese Professorship in King's College, towards which, up to Thursday last, 2,169*l.* 11*s.* had been subscribed.

From Tait's Magazine.

AN EVENING'S ADVENTURE AT A COUNTRY INN.

EVEN in this age of rapid locomotion, there must be few of my readers who have not been, at least once in their lives, the habitant of a Scottish country inn on a Sabbath evening. It is necessary, however, that they should have been in the same situation on some other evening of the week, that they may properly appreciate that sober quiet, that softened stillness, that more than partial cessation from labor, and din, and discord, of things animate and inanimate, that pervades the precincts of a country inn on the evening in question. The lighting of a bed-room candle, or the ringing for a pair of slippers, at such a time, seems to be done under protest. The chambermaid, who the evening before looked so made up of "becks, and nods, and wreathed smiles," that you wondered whether she smiled through her sleep, or even if she ever shut her eyes at all, they glanced so brilliant, and cheerful, and happy, now looks demure and grave, while every dimple seems to say, "Nae daffin the night; ye ken it's Sunday."

Go down stairs, and you find the ostler seated at the kitchen fire, listless, inactive, with a face ten times more demure than the maid's, his finger and thumb inserted in a well-worn edition of the "Scots Worthies," or "The Confession of Faith." Passing the bar, you observe the landlady seated, similarly occupied; her snow-white cap and collar, and sober silk gown, proclaiming that maid and matron are at peace. Scolding is banished for a day. Mine host is stretched, pipe in hand, now eyeing his portly helpmate, anon watching the clouds that curl in regular succession from his almost motionless lips. The clock at the top of the staircase is the only object, within or without, that seems to court your observation; its constant, well-marked march sounding, amid the stillness, louder than you ever heard it before, till you attach an importance to it that amply makes up for your neglect of it in time past, because you have nothing else to listen to.

In such circumstances did I find myself the solitary incumbent of the travellers' room in the snug little inn at —, on an evening in November, 18—. In frame of mind I was listless, indolent, too lazy to be fretful, and too solitary to be altogether comfortable. I had swallowed three tumblers of toddy, each mellowed by its accompanying cigar, without producing any change beyond an increase of my indolence, and a tendency to nap. The yew-trees which grew in the church-yard, that stood on the opposite side of the way, had gradually become dark, and more dark, as I looked at them: the autumn wind gently swaying the lighter branches to and fro, against the dull sky beyond. One by one the head-stones disappeared, first the old, then the new. The old belfry, the whitewashed walls of which had made the room seem light even after sunset, had given in, and looked sombre as all which surrounded it. I tried to pick out the grave-stones, the records of which I had conned over that afternoon, instead of listening attentively to the sixteenthly, seventeenthly, and lastly, of a discourse excellent in all things but its length, which the parish minister had delivered; till I lost those frail memorials of the village dead in the gradually increasing darkness.

I had begun to nap in my chair, as it was too early to go to bed, when the sound of the mail rattling through the street impelled me once more to

the window. It stopped for an instant, and, to my infinite consolation, deposited a passenger at the door of "mine inn." "The night is not yet altogether lost," thought I; "I will have something to interest me now; if not to chat with, at least to look at, or drink with, or quarrel with, or—anything rather than this dormant, thumb-sucking use of time." The step of a light foot, followed by the tramp of a heavy ditto in the lobby, on the stair, crowned my hopes; and Martha immediately appeared, ushering in a bundle of wearing apparel, consisting chiefly of mufflers, boots, and greatcoat, surmounted by a hat: the only glimpse of humanity that could be obtained being a portion of a nose, much resembling the toe of a crab in formation; the color rich, rare, burnished red.

Hamlet's churchyard acquaintance, the grave-digger, might, for aught I know, possess a more extensive wardrobe in waistcoats; but I would have backed the new comer, for any odds, in greatcoats. One by one they fell from his shoulders, till I wondered how he had managed to carry them, and then how the mail had undertaken the transmission of such a mass. Greatcoat after greatcoat fell from his shoulders; muffler after muffler from his neck; till, stripped to a kind of covering that halted midway between a greatcoat and a surtout, and a woollen neckerchief not smaller than a blanket, the stranger, in his "habit as he lived," took his place on the opposite side of the fire-place; and drawing his hand across his eyes, and his legs to the fender, he rang the bell.

"Stiff and hot," said the stranger to Martha, who appeared and immediately withdrew.

I looked at the stranger, as he warmed his purple-pointed fingers at the blaze. There was something in his appearance which raised a feeling of dislike in my mind, although, if asked the reason, I probably could not give one. I scanned him from the boots to the wisp of hair, half gray, half black, which hung like a leaden waterspout over his forehead. My dislike grew as I gazed. I felt a kind of fidgety feeling: I was disappointed. Like Frankenstein, the being I had so ardently longed for was an annoyance which I now could have as ardently wished away. I thought of retiring to bed, when I recollected that I had not yet spoken to him: to leave without doing so would have been absolute rudeness. I said, "Mild weather for travelling, sir."

"It is," said the stranger, fixing his eyes on me as if he had observed my presence in the room for the first time. If my dislike was great when I looked at him, it grew greater now that he looked at me. Such eyes! they were neither black, blue, hazel, nor gray, but a kind of neutral tint, which I cannot give a name to; and yet they sparkled and glowed in the light like a cat's; bright, piercing, they seemed almost to stand out from under the pent-house of his brows, looking up and down a face which appeared as if the outer skin had been peeled off, and the under cuticle suddenly frozen, so red was it;—not the redness of health, but an unearthly, dark, crimson hue, like a stain of blood on a towel.

"Mail full to-night, sir?" said I, making an attempt to overcome a dislike which seemed to have now reached its climax.

"Nobody outside but myself," said he, as he wriggled his nose into his tumbler. I was in momentary expectation of seeing the mixture ignite from the fiery quality of his facial protuberance. It—the nose—avoided the collision, however, by a

dexterous jerk, which could only have been obtained by long practice. The liquid did not take fire, although it appeared considerably diminished, probably absorbed by the intense heat.

Another half hour elapsed, while I puffed my cigar with all the energy my lungs would permit. The stranger ordered glass after glass of "stiff and hot," while I mechanically followed his example. My friends tell me I get prosy when elevated; my readers may think I am so now. I had gazed so long in the face of the stranger that I wondered how it would look from the other side of the room. I tried the experiment without satisfying myself either one way or other. The church-yard caught my eye, and I again ventured an observation. "Bad taste to stick those grave-yards always in the centre of a town," said I.

"Very inconvenient," said he. "Those who did so were no friends to science."

The remark puzzled me. "In which way?" said I.

"Why, you see," said he, "a subject can't be got without running great risk. The Scotch are so nasty particular on that score."

"On the subject of science?" said I: "I thought they liked to dabble a little in all, from metaphysics to mesmerism."

"As to dabbling in the sciences, they like them well enough in the abstract: but they have not arrived at that *acme* of liberality which prompts them to give a subject now and then to the dissecting-room."

"I don't wonder at that," said I; "such a course outrages one of the finest feelings of our nature—respect for the dead."

"Stuff! stuff!" said he; "such feelings are a remnant of barbarism, or something worse. How much better if 'Imperial Cæsar, dead and turned to clay,' instead of stopping holes 'to keep the wind away,' had given his carcass to the schools. What a splendid action that would have been! Cæsar was a great man, sir!"

I assented to the opinion of ages by a nod of the head. "It can't be remedied now," said I.

"And though it could," said the stranger, "if the fortieth cousin of Cæsar were a Scotsman, that man would object to it. Shameful, sir!" and again the nose of the stranger gleamed like a fiery meteor in the tumbler.

"And yet there is no lack of subjects for the schools, in spite of Cæsar's forgetfulness," said I.

"Aye, but the risk that is run," said he. "No later than yesterday two gentlemen, or at least one of them, was nearly made a subject of himself in his endeavors to benefit posterity."

Something to interest me now, thought I, as I settled in my chair. "How was that, sir?" I inquired. He began—

"It was rumored in Edinburgh that a case of more than usual interest had been interred in the church-yard of —, some miles from this. Something handsome was offered for the purpose of securing it; but men who had never been known to stickle before, fought rather shy of this. From the state of feeling lately evinced in two or three affairs of the same kind, the attempt was a very hazardous one. Dr. — offered still more handsomely, as he was anxious to procure the subject in question to illustrate a course of lectures he was then delivering. With such warm offers the difficulties melted like wax, and T— and W—, two gentlemen well known for their friendly disposition to science when anything was to be got by it, made

the necessary arrangements, and even succeeded in disinterring the body, but, unable to convey it to town that night, left it in a heap of manure in a field by the road side, with the intention of removing it early next morning.

"Everything had succeeded as they could wish, and a gig was hired from mine host of the —, in the ancient burgh of L—, to convey the prize to town. In removing it, however, a herd boy, who had been snoozing away his time at the back of a dyke, was witness to the transaction, and immediately ran and informed his master, who, mounting his pony, set off in pursuit. W— and T—, seeing they were pursued, and rightly judging that the only chance was to outstrip the pursuer in speed, drove with fury. Still the farmer gained upon them. If they could only get through the burgh which lay in their way without discovery, all would be well. If he overtook them before they accomplished this, life was in jeopardy. The souters of L— were no hands to trifle with; as they had lately shown in the case of their gravedigger, another friend to anatomical pursuits in the first stage, viz., the procuring the subject. The danger was imminent; and T—, seeing the farmer making upon them every moment, had no disposition to try such an ordeal. He would not go on, but entreated W— to stop, relinquish the body, and cut for it. His friend, however, was in no such humor: having brought it thus far, it was like snatching the bite from his mouth to relinquish it. The other remonstrated, but without effect, and finding nothing else would do, left the gig and made off across the fields. Unfortunate stoppage. Still the farmer spurred, and was soon neck and neck with the gig and its remaining occupant, and thus they entered the burgh. The only chance now was that the farmer's cries would be drowned in the noise, or that the gig would precede the alarm, and thereby escape. Speed must do it. Seeing the idlers in the street, the farmer bawled out in a thick burr, 'Corpse, corpse!' In a moment all was commotion, every window was opened, every head was thrust out. Great black-bearded fellows, with the implements of their trade in their hands, rushed from every doorway. Old women, at other times unable to move, *stoited* out to swell the uproar with their cries. The inhabitants, one and all, were on the street in less time than I have taken to tell it. Still the gig careered onwards, the horse covered with foam. Still the farmer lashed his shelly, and this might have continued till the burgh was cleared, had not a carrier, who was packing his cart in the street, thrown a block which he held in his hand, with the view of stopping the gig; instead of going under the wheel as intended, it got between the spokes, and striking the shaft, wheel and block flew into the air in a thousand pieces, and down fell man, horse, and gig in the street.

"'Whar's the corpse?' shrieked out a plurality of voices.

"'I have none,' cried W—; 'you are mad, why do you stop me thus?'"

"'Corpse, corpse!' shouted the farmer, who was buried in the crowd, shelly and all.

"All this was spoken in a breath. In another instant, the contents of the gig were strewed in the air, and the sack containing the subject was dragged on the street. This was damning evidence. A universal groan was emitted, and for some minutes not a word was spoken. The stillness was broken only by the sound of the blows which fell thick and

three-fold on the devoted carcass of the resurrectionist—he was up in an instant. A hundred hands were at his throat; a hundred fists were beating like sledge-hammers at his ribs. His cloak, his coat, his vest, and even his shirt, were torn to shreds by the infuriated multitude. He always contrived to rise the moment he was knocked down, about thirty times to the minute: had he lain on the ground one instant he would have been trampled to death. While this unequal war was going on, others were employed in wreaking vengeance on the gig. They made chips of it in a few moments, and would have sacrificed the horse as well, but for the interference of the farmer. He could do anything with the mob for the time. Never was man so applauded.

“The noise of the riot having reached the town hall where the magistrates were assembled that morning, in furtherance of some burgh business, they hastened to interfere, impressed with a notion of the illegality of the proceedings and the likelihood of a long bill of damages against the burgh, which already had more debts than they were well able to liquidate. The provost, in virtue of his office, was foremost, and had his silver spectacles smashed to atoms in his endeavors. The town drummer was served with a similar reverence; till the remonstrances of the magistrates prevailing, our friend of the gig race was taken under their protection, and escorted to the Tolbooth: the mob followed to the door, and the moment it closed, swore and stamped like madmen, and vowed they would drag him out, in spite of nail and plank. The provost addressed them from the steps, and induced the more peaceable to go home; the more riotous waiting and uttering threats, and keeping the Tolbooth in a state of siege till supper-time, when they dropt off one by one.

“By this time the magistrates had begun to feel some alarm of the probable consequences of the riot, damages, &c. Some wiseacre among them having urged the necessity of getting quit of W——, and in all likelihood nothing more would be heard of the matter; it was thought the best course to pursue. Another incentive to this course lay in the fact, that a number of the townspeople had bound themselves together to force the Tolbooth door during the night, and have their will of him.

“With this view, then, did the magistrates visit the prison in a body; and for the better security of W—— from the fangs of the mob, he was transferred by a back way through the church-yard to a cellar belonging to the provost, that he might be conveyed away the succeeding evening by the mail, which, being Sunday, the magistrates rightly judged could be effected with more secrecy and silence as the streets would then be empty. In the cellar, then, did W—— lie all that day, and the evening again brought the worthy council, each with a greatcoat or some other article of clothing, as a donation or peace-offering, and by six o'clock the mail had received its destined passenger.”

To attempt an analysis of my feelings during

this narration, would be useless. If I had ever entertained a hatred of any class of men, it was of those grave-robbers, and my silence and satisfaction during the stranger's tale proceeded entirely from the conviction which had taken hold of my mind, that the stranger would end his story by assuring me that the mob had torn the fellow in pieces. No such fate had awaited him, however, notwithstanding my good wishes; and I was just about to vent an execration at my disappointment, when he said,—“Lucky escape, was n't it, and not so great a loss after all; I have made half-a-dozen greatcoats by the job, although little of the needful.”

“You! you!” I gasped or rather shrieked, while my tongue cleaved to the roof of my mouth. “I shall drag you before the nearest magistrate to answer this. I——”

In rising to lay hold on him, however, either the six tumblers I had swallowed, or the hearth rug was the cause, I slipped a foot, and fell heavily on the fender.

* * * * *

When I awoke next morning I was in bed, my tongue dry and parched, and an insufferable nausea pervading my whole frame. I managed to rise and staggered rather than walked to the ewer to get a draught of water, when passing the dressing-glass a stained bandage on my head caught my eye, and, although but half awake, the events of the previous evening rushed like a flood across my memory. It is not too late yet, thought I; he can't be gone; I'll secure him; and, bawling loudly for Martha, I found the door had been locked on the outside.

“Is he gone?” I continued to shout, is he away?”

“Wha is't ye mean?” cried Martha, through the key-hole.

“The man who came by the mail last night,” I cried. “Open the door—why am I locked in? who dared to lock me up in this manner?”

“It was the man, and my mistress has the key,” shouted Martha.

In due time the landlady joined Martha, making our duet a trio, and telling me “tae gang awa back to my bed; that I wasna weel able to rise yet; just tae tak another bit sleep, and I would be a' right.”

“Is the man away?” shouted I, scorning all advice. “Detain him—he's a resurrectionist: detain him till I get out,” and I vainly attempted to force the door.

“Awa! Lord bless ye, sir, he's awa by the sax o'clock mail, and left you his best respects and kind wishes, and said he forgied you for a' the ill names ye ca'ed him last night when he was putting ye till yer bed.”

“The villain,” muttered I.

“And better nor that,” chimed in Martha, “he gied me half-a-crown tae mysel', and said ye wou'd pay a' the toddy that was drank last night.”

“Doubly sold,” groaned I, and assenting to the entreaties which the landlady and Martha forwarded through the key-hole, I crawled back to bed.

MEXICAN ARGUMENT FOR ANNEXATION.

WE have given this head to the following article, because it appears to us to have been intended by the writer to awaken his readers to a sense of the security and prosperity which would arise to them from a junction with the United States.—[Liv. Age.]

Translated for the "Union" from the "Locomotor" of Vera Cruz, of July 26, 1846.

The Texas question, which has been converted into an Anglo-American question, owing, if not to our want of foresight, at least to our indolence and inexperience, may also be converted, and perhaps very soon, into a European question; and for this reason we are induced to set forth some considerations which may assist public opinion in correcting itself, and in coming to the conclusion most advantageous to the nation.

We believe that in Europe the Anglo-American question is viewed differently by the people and by the governments.

The people of Europe, no longer finding the territory of their countries sufficient to yield them what is essential to the comforts, or even necessities of life, and finding the demand for their manual labor more and more diminished by each successive improvement in machinery resulting from economy in expenses, are met every year by an excess of idle population, who, eager for employment, come to the New World in search of what they can no longer find in the old. The adventurers who compose this surplus population, find in the ports of their respective nations a multitude of merchant vessels ready to sail for the United States—thanks to the care with which that nation has protected its foreign commerce, by freeing it from the obstructions, rules, and exactions, which paralyze it in the Spanish American republics; and as these vessels are generally of large burden, as is requisite for the transportation of the cotton which the United States send to Europe, a passage is offered in them at very moderate prices, and they are preferred, because the emigrants are poor, and seek cheapness in all that they need. These adventurers are aware, moreover, that on arriving with their families in the United States, they are at liberty to live as they please, without meeting with restrictions of any kind, and that they may publicly practice their mode of religious worship, and even become citizens of the new nation, if they believe it advantageous to their interests, by simply desiring it. Their coming, then, increases the strength of the United States, and once established in that nation, they seek lands to cultivate, and will take the direction of Mexico if they hear that this country abounds in milk and honey, and if they believe that they can easily introduce themselves into it under the protection of the government of the United States, for that of Mexico has redoubled the restrictions and trammels which impede their entrance. This new population identify their lot and existence with the lot and existence of their new country, for their personal interest and that of their families thrive in it. This will happen more frequently now that Mexico is invaded by the United States, and is in open war with their government.

Hence it follows that Mexico will have to contend not only with the native Anglo-American population, but with the adopted citizens, or what is the same thing, with a part of the population of

Europe; and a proof of this has been furnished us in the sort of people who compose General Taylor's army, the greater part of them being Europeans!!

We believe that, generally speaking, the sympathies of the people of Europe are not in our favor but in favor of the United States, even although they are aware of the injustice of the latter in usurping our territory, for there are times when public opinion cares little about the means by which a thing is done, or a project executed, and looks only at the results which spring from it.

Mexico not only lacks the sympathies of Europe, but is almost hated; and this results from various causes and circumstances in which we ourselves have had no small share; and however grievous the confession may be to us, it is necessary to make it. Almost all the publications of the European press indicate the ill-will which exists towards us, and the works written by travellers who have visited us, with very few exceptions, have contributed to increase this tendency against us. And if it be certain that no people hate another without a sufficient cause or motive, it is necessary for us to inquire into the cause of this ill disposition, since it must exist. It cannot be found in a rivalry of power in war, commerce, or industry, because we have never been in a position sufficiently advantageous to provoke the jealousy of other nations. We must, then, seek elsewhere for the cause. In our opinion it is the restrictive system which we have practised, since our independence, against foreign commerce, against emigrants, and against the establishment of foreigners in our country.

When the people of Europe perceive that we impose trammels and restrictions on the entrance of foreigners; that we do not permit them to acquire landed property; that we do not wish to tolerate the exercise of their mode of worship; that we shut the door to their acquisition of the rights of citizenship, that we prohibit the introduction of their manufactures, &c., &c., it is impossible that they should take the slightest interest in our fate, for, after all, our national independence or the integrity of our territory, does not benefit them in any manner. And when they see that the United States adopt a policy entirely different, that they seek their interest in combination with the interests of other nations, it is natural that all their sympathies should be directed to that country, which has better comprehended the objects of fraternity among all the nations of the earth. Under these circumstances, they perhaps even desire that the United States should occupy Mexico, for they consider that in that event, our lands will be open not only to citizens of the United States, but also to those of all other nations; that all the riches of our soil will be explored, and humanity and civilization will thus gain more than by the possession of these resources by the Mexicans.

It is necessary, therefore, if we desire that the people of Europe should feel any sympathy for us, and take an interest in our fate, that we should endeavor wholly to reform ourselves, for the fault has been great; and we can accomplish it only by completely changing our policy, and adopting another, more frank and liberal than heretofore.

The governments of Europe will entertain sympathies in favor of Mexico, for it does not comport with their interests that the United States should be aggrandized. They know that the experiment which that nation has made of a democratic federa-

tive republic has great attractions for the people whom they govern, on account of its happy results; and that if it should extend through North America it will pass to South America, and, in course of time, even to the continent of Europe, and realize, perhaps, the idea of Chateaubriand, that a republic will be the future condition of the world; that then thrones would totter under the impulses of democracy, and dynasties would be extinguished by the abolition of the principle of inheritance of power. Kings perceive, moreover, that the forms of government and social organization of the United States are drawing away the population of Europe; that the emigration from Europe increases every day; that the debility caused by depopulation may reach a fearful point; and that, in fine, the Anglo-American nation will clothe and deck herself with the spoils of Europe, as has heretofore been the case.

It is natural, therefore, that the sympathies of kings should be in favor of any enemy of the United States, whether Mexico or any other Spanish American nation; for, in fact, it is no more than having sympathies in favor of their own interest, and of their own self-preservation and existence in time to come.

Mexico ought promptly to avail herself of this disposition, and reserve herself to cultivate the sympathies of the people afterwards; but it behoves her to proceed with circumspection, and not seek assistance on onerous conditions.

Nevertheless, we do not calculate in any case upon being protected by force of arms; for the commercial interests of Europe with the United States are of too much importance to be sacrificed by kings in a war, when they could hardly expect to be compensated by any concessions from Mexico on the reestablishment of peace; and consequently we ought not to expect anything more than the aid of diplomacy, which, however, is much; for although physical force does not make part of it, moral force does, and that, in these enlightened times, has become powerful.

We have seen, in the discussions in the French chambers, the difference between the opinions of the governments and people of Europe. Guizot, a man of the government, and representing the sentiments of the king, used emphatic and almost threatening expressions against the propagandism of the United States with respect to Mexico, and declared that the interests of France required the preservation of the American equilibrium. Thiers, an opposition man, representing popular opinions, addresses words of praise and sympathy to the Anglo-American nation: declares that the American equilibrium is impracticable, and that France has an interest in preserving the friendship of the United States, and in her always increasing prosperity. The opinions of these two statesmen should not be considered simply as the opinions of two individuals, but as the opinions of two great political functionaries, or even more, as the opinions of the king and the people.

From the Editor of the N. Y. Evening Post.

SAULT STE. MARIE.

August 15, 1846.

A CROWD had assembled on the wharf of the American village at the Sault Ste. Marie, popularly called the *Soo*, to witness our landing; men of all ages and complexions, in hats and caps of every form and fashion, with beards of every length and

color, among which I discovered two or three pairs of mustachios. It was a party of copper mine speculators, just flitting from Copper Harbor and Eagle river, mixed with a few Indian and half breed inhabitants of the place. Among them I saw a face or two quite familiar in Wall street.

I had a conversation with an intelligent geologist, who had just returned from an examination of the copper mines of Lake Superior. He had pitched his tent in the fields near the village, choosing to pass the night in this manner, as he had done for several weeks past, rather than in a crowded inn. In regard to the mines, he told me that the external tokens, the surface indications, as he called them, were more favorable than those of any copper mines in the world. They are still, however, mere surface indications; the veins had not been worked to that depth which was necessary to determine their value with any certainty. The mixture of silver with the copper he regarded as not giving any additional value to the mines, inasmuch as it is only occasional and rare. Sometimes, he told me, a mass of metal would be discovered of the size of a man's fist, or smaller, composed of copper and silver, both metals closely united, and yet both perfectly pure and unalloyed with each other. The masses of virgin copper found in beds of gravel are, however, the most remarkable feature of these mines. One of them which has been discovered this summer, but which has not been raised, is estimated to weigh twenty tons. I saw in the propeller Independence, by which this party from the copper mines was brought down to the Sault, one of these masses, weighing seventeen hundred and fifty pounds, with the appearance of having once been fluid with heat. It was so pure that it might have been cut in pieces by cold steel and stamped at once into coin.

Among these copper hunters came passenger from Lake Superior, a hunter of the picturesque, Mr. Charles Lanman, whose name I hope I mention without impropriety, since I am only anticipating the booksellers in a piece of literary intelligence. He has been wandering for a year past in the wilds of the west; during the present summer he has traversed the country in which rise the springs of the Mississippi and the streams that flow into Lake Superior, and intends to publish a sketch of his journey soon after his arrival at New York. If I may judge from what I learned in a brief conversation, he will give us a book well worth reading. He is an artist as well as an author, and sketched all the most remarkable places he saw in his travels, for the illustration of his volume. On the river St. Louis, which falls into the western extremity of Lake Superior, he visited a stupendous waterfall not described by any traveller or geographer. The volume of water is very great and the perpendicular descent a hundred and fifty feet. He describes it as second only to the cataract of Niagara.

Two or three years ago this settlement of the Sault Ste. Marie, was but a military post of the United States in the midst of a village of Indians and half-breeds. There were, perhaps, a dozen white residents in the place, including the family of the Baptist missionary and the agent of the American Fur Company, which had removed its station hither from Mackinaw and built its warehouse on this river. But since the world has begun to talk of the copper mines of Lake Superior, settlers flock into the place; carpenters are busy in knocking up houses with all haste, on the govern-

ment lands, and large warehouses have been built upon piles driven into the shallows of the St. Mary. Five years hence, the primitive character of the place will be altogether lost, and it will have become a bristling Yankee town, resembling the other new settlements of the west.

Here the navigation from lake to lake is interrupted by the falls or rapids of the river St. Mary, from which the place receives its name. The crystalline waters of Lake Superior on their way through the channel of this river to Lake Huron, here rush and foam and roar, for about three quarters of a mile, over rocks and large stones.

Close to the rapids, with birchen canoes moored in little inlets, is a village of the Indians consisting of log cabins and round wigwams, on a strong shrubby tract, reserved to them by the government. The morning after our arrival, we went through this village in search of a canoe and a couple of Indians to make the descent of the rapids, which is one of the first things that a visiter to the Sault must think of. In the first wigwam we entered were three men and two women as drunk as men and women could well be. The squaws were speechless and motionless, too far gone as it seemed to raise either hand or foot; the men though apparently unable to rise were noisy, and one of them, who called himself a half-breed, and spoke a few words of English, seemed disposed to quarrel. Before the next door was a woman busy in washing, who spoke a little English. "The old man out there," she said in answer to our questions, "can paddle canoe, but he is very drunk, he cannot do it to-day."

"Is there nobody else," we asked, "who will take us down the falls?"

"I don't know; the Indians all drunk to-day."

"Why is that? why are they all drunk to-day?"

"Oh, the whisky," answered the woman, giving us to understand, that when an Indian could get whisky, he got drunk as a matter of course.

By this time the man had come up, and after addressing us with the customary "*bon jour*," manifested a curiosity to know the nature of our errand. The woman explained it to him in English.

"Oh, Messieurs, je vous servirai," said he, for he spoke Canadian French, "I go, I go."

We told him that we doubted whether he was quite sober enough.

"Oh, Messieurs, je suis parfaitement capable—first rate, first rate."

We shook him off as soon as we could, but not till after he had time to propose that we should wait the next day, and to utter the maxim, "Whisky, good—too much whisky, no good."

In a log-cabin, which some half-breeds were engaged in building, we found two men who were easily persuaded to leave their work and pilot us over the rapids. They took one of the canoes which lay in a little inlet close at hand, and entering it, pushed it with their long poles up the stream in the edge of the rapids. Arriving at the head of the rapids, they took in our party, which consisted of five, and we began the descent. At each end of the canoe sat a half-breed with a paddle, to guide it, while the current drew us rapidly down among the agitated waters. It was surprising with what dexterity they kept us in the smoothest part of the water, seeming to know the way down as well as if it had been a beaten path in the fields.

At one time we would seem to be directly approaching a rock against which the waves were dashing, at another to be descending into a hollow of the waters in which our canoe would be inevitably filled, but a single stroke of the paddle given by the man at the prow put us safely by the seeming danger. So rapid was the descent that almost as soon as we descried the apparent peril, it was passed. In less than ten minutes, as it seemed to me, we had left the roar of the rapids behind us, and were gliding over the smooth water at their foot.

In the afternoon we engaged a half-breed and his brother to take us over to the Canadian shore. His wife, a slender young woman, with a lovely physiognomy, not easily to be distinguished from a French woman of her class, accompanied us in the canoe with her little boy. The birch bark canoe of the savage seems to me one of the most beautiful and perfect things of the kind constructed by human art. We were in one of the finest that float on St. Mary's river, and when I looked at its delicate ribs, mere shavings of white cedar, yet firm enough for the purpose—the thin broad laths of the same wood with which these are enclosed, and the broad sheets of birch bark, impervious to water, which sheathed the outside, all firmly sewed together with the tough slender roots of the fir tree, and when I considered its extreme lightness and the grace of its form, I could not but wonder at the ingenuity of those who had invented so beautiful a combination of ship-building and basket-work. "It cost me twenty dollars," said the half-breed, "and I would not take thirty for it."

We were ferried over the waves where they dance at the foot of the rapids. At this place large quantities of white-fish, one of the most delicate kinds known on our continent, are caught by the Indians, in their season, with scoop nets. The whites are about to interfere with this occupation of the Indians, and I saw the other day a seine of prodigious length constructing, with which it is intended to sweep nearly half of the river at once. "They will take a hundred barrels a day," said an inhabitant of the place.

On the British side the rapids divide themselves into half a dozen noisy brooks, which roar round little islands, and in the boiling pools of which the speckled trout is caught with the rod and line. We landed at the warehouses of the Hudson's Bay Company, where the goods intended for the Indian trade are deposited, and the furs brought from the northwest are collected. They are surrounded by a massive stockade, within which lives the agent of the company; the walks are gravelled and well kept, and the whole bears the marks of British solidity and precision. A quantity of furs had been brought in the day before, but they were locked up in the warehouse, and all was now quiet and silent. The agent was absent: a half-breed nurse stood at the door with his child, and a Scotch servant, apparently with nothing to do, was lounging in the court enclosed by the stockade; in short, there was much less bustle about this establishment of one of the most powerful trading companies in the world, than about one of our farm-houses.

Crossing the bay at the bottom of which these buildings stand, we landed at a Canadian village of half-breeds. Here were one or two wigwams and a score of log cabins, some of which we entered. In one of them we were received with great appearance of deference by a woman of decidedly Indian features, but light complexioned, barefoot,

with blue embroidered leggins falling over her ankles and sweeping the floor, the only peculiarity of Indian costume about her. The house was as clean as scouring could make it, and her two little children, with little French physiognomies, were fairer than many children of the European race. These people are descended from the French voyageurs and settlers on one side; they speak Canadian French more or less, but generally employ the Chippewa language in their intercourse with each other.

Near at hand was a burial ground, with graves of the Indians and half-breeds, which we entered. Some of the graves were covered with a low roof of cedar bark, others with a wooden box; over others was placed a little house like a dog-kennel, except that it had no door; others were covered with little log cabins. One of these was of such a size that a small Indian family would have found it amply large for their accommodation. It is a practice among the savages to protect the graves of the dead from the wolves by stakes driven into the ground and meeting at the top like the rafters of a roof, and perhaps when the Indian or half-breed, exchanged his wigwam for a log cabin, his respect for the dead led him to make the same improvement in the architecture of their narrow houses. At the head of most of these monuments stood wooden crosses, for the population here is principally Roman Catholic, some of them inscribed with the names of the dead, not always accurately spelled.

Not far from the church stands a building, regarded by the half-breeds as a wonder of architecture, the stone house *la maison de pierre*, as they call it, a large mansion built of stone by a former agent of the Northwest or Hudson's Bay Company, who lived here in a kind of grand manorial style, with his servants and horses and hounds, and gave hospitable dinners in those days when it was the fashion for the host to do his best to drink his guests under the table. The old splendor of the place has departed; its gardens are overgrown with grass, the barn has been blown down, the kitchen, in which so many grand dinners were cooked, consumed by fire, and the mansion, with its broken and patched windows, is now occupied by a Scotch farmer of the name of Wilson.

We climbed a ridge of hills back of the house to the church of the Episcopal mission, built a few years since as a place of worship for the Chippewas, who have since been removed by the government. It stands remote from any habitation, with three or four Indian graves near it, and we found it filled with hay. The river from its door is uncommonly beautiful; the broad St. Mary's lying below, with its bordering villages and woody valley, its white rapids, and its rocky islands, picturesque with the pointed summits of the fir-tree. To the northwest the sight followed the river to the horizon, where it issued from Lake Superior, and I was told that in clear weather one might discover, from the spot on which I stood, the promontory of Gros Cap, which guards the outlet of that mighty lake.

The country around was smoking in a dozen places with fires in the woods. When I returned I asked who kindled them. "It is old Tanner," said one, "the man who murdered Schoolcraft." There is great fear here of Tanner, who is said to be lurking yet in the neighborhood. I was going the other day to look at a view of the place from a lovely eminence, reached by a road passing through

a swamp full of larches and firs. "Are you not afraid of Tanner?" I was asked. Mrs. Schoolcraft, since the assassination of her husband, has come to live in the fort, which consists of barracks protected by a high stockade. It is said that Tanner has been seen skulking about within a day or two, and yesterday a place was discovered which is supposed to have served for his retreat. It was a hollow, thickly surrounded by shrubs, which some person had evidently made his habitation for a considerable time. There is a dispute whether this man is insane or not, but there is no dispute as to his malignity. He has threatened to take the life of Mr. Bingham, the venerable Baptist missionary at this place, and as long as it is not certain that he has left the neighborhood, a feeling of insecurity prevails. Nevertheless, as I know no reason why this man should take it into his head to shoot me, I go whither I list, without the fear of Tanner before my eyes.

From the same.

MACKINAW.

STEAMER ST. LOUIS, }
Lake Huron, August 20, 1846. }

YESTERDAY evening we left the beautiful island of Mackinaw, after a visit of two days delightfully passed. We had climbed its cliffs, rambled on its shores, threaded the walks among its thickets, driven out in the roads that wind through its woods—roads paved by nature with limestone pebbles, a sort of natural macadamization, and the time of our departure seemed to arrive several days too soon.

The fort which crowns the heights near the shore commands an extensive prospect, but a still wider one is to be seen from the old fort, Fort Holmes, as it is called, among whose ruined entrenchments the half-breed boys and girls now gather gooseberries. It stands on the very crest of the island, overlooking all the rest. The air, when we ascended it was loaded with the smoke of burning forests, but from this spot, in clear weather, I was told a magnificent view might be had of the Straits of Mackinaw, the wooded islands, and the shores and capes of the great mainland, places known to history for the past two centuries. For when you are at Mackinaw you are at no new settlement.

In looking for samples of Indian embroidery with porcupine quills, we found ourselves one day in the warehouse of the American Fur Company, at Mackinaw. Here, on the shelves, were piles of blankets, white and blue, red scarfs, and white boots; snowshoes were hanging on the walls, and wolf-traps, rifles and hatchets were slung to the ceiling—an assortment of goods destined for the Indians and half-breeds of the northwest. The person who attended at the counter spoke English with a foreign accent. I asked him how long he had been in the northwestern country.

"To say the truth," he answered, "I have been here sixty years and some days."

"You were born here then?"

"I am a native of Mackinaw, French by the mother's side; my father was an Englishman."

"Was the place as considerable sixty years ago as it now is?"

"More so. There was more trade here and quite as many inhabitants. All the houses, or nearly all, were then built; two or three only have been put up since."

I could easily imagine that Mackinaw must have been a place of consequence when here was the

centre of the fur trade, now removed further up the country. I was shown the large house in which the heads of the companies of *voyageurs* engaged in the trade were lodged, and the barracks, a long low building, in which the *voyageurs* themselves, seven hundred in number, made their quarters from the end of June till the beginning of October, when they went out again on their journeys. This interval of three months was a merry time with those light-hearted Frenchmen. When a boat made its appearance approaching Mackinaw, they fell to conjecturing to what company of *voyageurs* it belonged; as the dispute grew warm the conjectures became bets, till finally, unable to restrain their impatience the boldest of them dashed into the waters, swam out to the boat, and climbing on board, shook hands with their brethren, amidst the shouts of those who stood on the beach.

They talk, on the New England coast, of Chebacco boats, built after a peculiar pattern, and after Chebacco, an ancient settlement of sea-faring men, who have foolishly changed the old Indian name of their place to Ipswich. The Mackinaw navigators have also given their name to a boat of peculiar form, sharp at both ends, swelled at the sides and flat bottomed, an excellent sea-boat, it is said, as it must be to live in the wild storms that surprise the mariner on Lake Superior.

We took yesterday a drive to the western shore. The road twined through a wood of overarching beeches and maples, interspersed with the white cedar and fir. The driver stopped before a cliff sprouting with beeches and cedars, with a small cavity at the foot. This he told us was the Skull Cave. It is only remarkable on account of human bones having been found in it. Further on a white paling gleamed through the trees; it enclosed the solitary burial ground of the garrison, with half a dozen graves. "There are few buried here," said a gentleman of our party; "the soldiers who come to Mackinaw sick get well soon."

The road we travelled was cut through the woods by Captain Scott, who commanded the fort a few years since. He is the marksman whose aim was so sure that the western people say of him that a racoon on a tree once offered to come down and surrender without giving him the trouble to fire.

We passed a farm surrounded with beautiful groves. In one of its meadows was fought the battle between Colonel Croghan and the British officer Holmes, in the war of 1813. Three luxuriant beeches stand in the edge of the wood north of the meadow; one of them is the monument of Holmes; he lies buried at its root. Another quarter of a mile led us to a little bay on the solitary shore of the lake looking to the northwest. It is called the British Landing, because the British troops landed here in the late war to take possession of the island.

We wandered about awhile, and then sat down upon the embankment of pebbles which the waves of the lake, heaving for centuries, have heaped around the shore of the island—pebbles so clean that they would no more soil a lady's white muslin gown than if they had been of newly polished alabaster. The water at our feet was as transparent as the air around us. On the mainland opposite stood a church with its spire, and several roofs were visible, with a back ground of woods behind them.

"There," said one of our party, "is the old Mission Church. It was built by the Catholics in

1680, and has been a place of worship ever since. The name of the spot is Point St. Ignace, and there lives an Indian of the full cast, who was sent to Rome and educated to be a priest, but he preferred the life of a layman, and there he lives on that wild shore, with a library in his lodge, a learned savage, occupied with reading and study."

You may well suppose that I felt a strong desire to see Point St. Ignace, its venerable Mission Church, its Indian village, so long under the care of Catholic pastors, and its learned savage who talks Italian, but the time of my departure was already fixed. My companions were pointing out to me the mouth of Carp river, which comes down through the forest roaring over rocks, and in any of the pools of which you have only to throw a line, with any sort of bait, to be sure of a trout, when the driver of our vehicle called out, "Your boat is coming." We looked and saw the St. Louis steamer (not one of the largest, but one of the finest boats in the line between Buffalo and Chicago) making rapidly for the island, with a train of black smoke hanging in the air behind her. We hastened to return through the woods, and in an hour and a half were in our clean and comfortable quarter in this well ordered little steamer.

But I should mention that before leaving Mackinaw, we did not fail to visit the principal curiosities of the place—the Sugar Loaf Rock, a remarkable rock in the middle of the island, of a sharp conical form, rising above the trees with which it is surrounded, and lifting the stunted birches on its shoulders higher than they, like a tall fellow holding up a little boy to overlook a crowd of men—and the Arched Rock on the shore. The atmosphere was thick with smoke, and through the opening spanned by the arch of the rock I saw the long waves, rolled up by a fresh wind, come one after another out of the obscurity, and break with roaring on the beach.

The path along the brow of the precipice and among the evergreens, by which this rock is reached, is signally wild, but another which leads to it along the shore is no less picturesque—passing under impending cliffs and overshadowing cedars, and between huge blocks and pinnacles of rock.

I spoke in one of my former letters of the manifest fate of Mackinaw, which is to be a watering-place. I cannot see how it is to escape this destiny. People already begin to repair to it for health and refreshment from the southern borders of Lake Michigan. Its climate during the summer months is delightful; there is no air more pure and elastic, and the winds of the south and southwest, which are so hot on the prairies, arrive here tempered to a grateful coolness by the waters over which they have swept. The nights are always, in the hottest season, agreeably cool, and the health of the place is proverbial. The world has not many islands more beautiful than Mackinaw, as you may judge from the description I have already given of parts of it. The surface is singularly irregular, with summits of rock and pleasant hollows, open glades of pasture and shady nooks. To some, the savage visitors, who occasionally set up their lodges on its beach, as well as on that of the surrounding islands, and paddle their canoes in its waters, will be an additional attraction. I cannot but think with a kind of regret on the time which I suppose is near at hand, when its wild and lonely woods will be intersected with highways, and stuffed with cottages and boarding-houses.

THE RAILWAY TO OREGON.

We have before us the report of the committee on Public Lands made to the United States Senate on the subject of a railway from the Mississippi to the Pacific Ocean.

This project has assumed a new importance since the late treaty with Great Britain has assured to us the possession of Southern Oregon, and left us at liberty to form permanent agricultural and commercial settlements in the country without disturbance or question. That the future trade of this country, perhaps we might say the trade of Europe, with China, will find its passage through Oregon, we have no manner of doubt. A dense and active population, seated on the harbors of the Pacific, in a climate the most favorable to activity and industry, will make themselves the masters of that great commerce and scatter the products of Eastern Asia over our continent. There will then be no further occasion for doubling the Cape of Good Hope or tempting the storms of Cape Horn, nor even for the shorter passage across the isthmus of Panama. This commerce, however, must have the usual means of transportation by water or railway.

The tributary rivers of the Missouri and the Columbia, although approaching to each other on the opposite sides of the Rocky Mountains, yet offer a very imperfect means of transportation by boats, and ascend into elevated and cold regions far to the north, where they are frozen for a considerable part of the year. Nature has meanwhile provided, in the South Pass, as it is called, an opening through the chain of mountains which divides the immense valley of the Mississippi and its tributaries from the region drained by the rivers which flow into the Pacific. This passage ascends from the east and descends to the west so gradually and imperceptibly, that art itself could scarcely have levelled the mountain ranges in a more perfect manner to form the basis of a railway.

The project brought before Congress by Mr. Whitney, on which the committee make their report, only anticipates what must inevitably happen. The South Pass is the channel of a great future commerce, and the means of transportation, at some period or other, will be a railway. The new communities on the Pacific, with their Asiatic commerce, must and will possess this mode of communication with the Atlantic states, the seat of European commerce. The question before Congress is, whether it is not more expedient to offer, at the present time, facilities for building the railway; whether the channel for this future commerce could not now be most cheaply and easily provided, and with a certain and almost immediate increase of the national prosperity.

The report which was presented to the senate by Mr. Breese, of Illinois, is decidedly in favor of the project, and we understand that it was agreed upon unanimously by the committee. It discusses severally the questions whether Congress has the power to offer the facilities in question, whether the construction of the railway is practicable, whether the means which it is proposed to apply are adequate to the end, and what will be the effect of its construction. The question of constitutionality will not, we suppose, be attended with much difficulty. The practicability of the work the committee consider as settled by the observations of Colonel Fremont, and other practical men familiar with the route along which it is to pass. The two grounds on which the project will probably be most strenu-

ously opposed are, that the means relied upon are not adequate to the end, and that, after the work shall have been completed, there will not be sufficient transportation to keep such an immense length of railway in proper repair. As to the first of these points the committee say:

"Those means are to be derived from the sale of the public lands already acquired, and to be acquired by the extinguishment of the Indian title, to the breadth of thirty miles on each side of the road, extending from Lake Michigan to the shores of the Pacific."

"Through a considerable extent of the route the land is said to be unsuitable for settlement and cultivation, and could not, therefore, be expected to sell. But for about 700 miles from the eastern terminus, the lands are said to be of good quality, though for the most part destitute of timber, and would readily sell at \$1.25 per acre, if the road be made; which, estimating that there would be 26,800,000 acres, would produce the sum of \$33,500,000. Calculating that in the 1,483 miles, from the South Pass to the mouth of the Columbia, 1,000 miles of that distance would be found of sufficient value, in consequence of the construction of the road, to command the same price, (and it is believed that the value of agricultural productions, connected with the water-power to be found there for manufacturing purposes, fully justifies this estimate,) there would be 38,400,000 acres, which would amount to \$48,000,000; and together these sums would amount to \$81,500,000, without considering of any value the intermediate distance of 1,113 miles, forming an area of 42,739,200 acres of land; but which, taking it at the worst, must have at least some verdant and valuable spots, which would become desirable for small settlements, and as depots for the use of the road and for commodities and productions of intersecting veins or lateral channels of trade and commerce. The length of the proposed road being 2,630 miles, and the estimate for its construction, according to Colonel Abert, being \$20,000 per mile, the probable cost would be \$52,600,000, leaving an estimated surplus for repairs, and to keep the parts in operation until the whole is completed, of \$28,900,000. This would appear, on full reflection, to be a moderate and safe calculation; and, moreover, the committee have reason to believe that, from the exciting interest which would not fail to surround this undertaking, when once begun, the pressure for acquisition and investments in the fertile part of these lands, and in the vicinity of so extensive a work, would place their value at least at the minimum price of the public lands. The committee, therefore, incline to believe that the means proposed are abundantly sufficient for the end in view."

The question of the benefits of the railway and the extent to which it will be used, occupies a large portion of the report, and the committee seem to have labored this part of the subject with a good deal of care. We have space at present only for one of the remaining topics on which the report touches:

"Another powerful consideration in favor of the proposed road the committee will advert to. It is the probability of the occurrence, that as the Territory of Oregon, now so distant from us, fills up with an enterprising and industrious people from the several states, they will attract to them settlers from different parts of Europe, all wishing to share in the benefits of our free government, and claiming its protecting care, which cannot be enjoyed or be-

stowed in full measure by reason of the difficulty of access by land and by water. A well grounded apprehension seems then to exist, that, unless some means like the one proposed, of rapid communication with that region, be devised and completed, that country, soon to become a state of vast proportions and of immense political importance, by reason of its position, its own wants, unattended to by this government, will be compelled to establish a separate government—a separate nation—with its cities, ports, and harbors, inviting all the nations of the earth to a free trade with them. From their position, they will control and monopolize the valuable fisheries of the Pacific, control the coast trade of Mexico, South America and the Sandwich Islands, and other islands of the Pacific, of Japan, of China, and of India, and become our most dangerous rival in the commerce of the world. In the opinion of the committee, this road will bind these two great geographical sections indissolubly together, to their mutual advantage, and be the cement of a union which time will but render more durable, and make it the admiration of the world."

We are aware that the feasibility of this project has been called in question in a high quarter, and that some of its opposers who, however, have not taken pains to make themselves very well acquainted with its merits, are very fond of calling it a humbug. It is no humbug, but a magnificent scheme, founded in large views, looking to noble objects, and presenting an aspect of great plausibility, a scheme, in short, such as no man, who duly considers our geographical situation and the close intercourse with our western neighbors, the Asiatic nations, which we shall maintain at no distant day, when our steamers shall issue from the Straits of Fuca to trade with Japan and China, will feel himself justified in rejecting except after very careful examination.—*New York Evening Post*.

From the Knickerbocker.

A SHORT CHAPTER ON ADVERTISEMENTS.

As a tree is known by its fruit, so is a man by his advertisement. Let craniologists amuse themselves by manipulating the *outer* skull; give me a peep at his "three times inside" development, and I will distance them all, with Combe at their head, in arriving at his true character. He will betray himself in his advertisements, as in his cups.

Even when he thinks himself best concealed, having assumed a fictitious signature, he is but playing the woodcock part of hiding his head to no purpose. To illustrate: I am not the owner of any "two-story house in a pleasant neighborhood;" but if thus comfortably possessed, I should hardly be induced to pay much attention to the inquiry after just such a tenement by "a young gentleman with a small family," who desires you to address a line to "ROLLA." I have met with a notice of a stray dog who was represented as "answering" to that name, but doubt whether, under the circumstances, I should feel inclined to emulate that quadruped's sagacity. Indeed, from the extent of cleverness displayed, in the adoption of such a *nom de guerre*, I should entertain a suspicion as to the advertiser's being endowed with a sufficient strength of mind to know when quarter-day came.

But it is the body—the spirit, I may say—of the advertisement which should especially guide us. I can barely imagine that any one, unless in *extremis*, would voluntarily submit his head to the operating hands of a dentist who assures the public in

a "card" that "he will spare no pains in extricating the teeth of those who will favor him with a call." Favor him with a call! Yes, I think he stands fair, if his assurances hold good, to be favored with some extensively loud ones. And shall I, who am neither a Fry nor a Howard, go out of my way to patronize a tailor, because he gives us to understand that he is famous for his fits? And is a sensible person, with his eyes about him, to be deceived by the specious notice of a dry goods man's "selling off," when for the last six months his shop has afforded counter-evidence of his selling-on? There, he is at it now; hear him recommending that piece of shilling calico to the anxious-looking woman: "Fast colors, madam." Yes, good lady, you will say so yourself, when you come to see the rapidity with which they will disappear in the wash-tub. Observe that ticket wafered on the window-pane: "Colored woman's gloves." Don't be deceived into patronizing the establishment on abolition grounds, Mr. Birney, for you may read on the ticket below, "Green children's bonnets." He has only put the adjectives in the wrong place.

Perhaps the most "taking" advertisements are those in the controversial form, between individuals who may both have happened to hitch upon the same branch of business for a livelihood. Two dentists had a brush some time ago; I forget which got the better; perhaps it was what sportsmen call "drawn;" but the public seemed to think it strange that they whose business chiefly consisted in holding *other* people's jaws, could n't——; indeed, common sense and *Æsop's* fable might have dictated the policy of their both pulling one way. Then again, the "milk-question" at one time monopolized the advertising columns of the "Sun." The savage manner in which it was handled, made it but too apparent that there was no cow called "Human kindness" in the dairy of either solicitor for public sympathy; and yet, such is man, we were unconsciously drawn into it; for although it was no great vaccine matter to us whether the animals are fed upon carrots or hay, yet we are free to confess a prejudice in favor of taking the "pale result" of their ruminations in the natural way, without the addition of the Croton, which, to use the mildest language, does not shine in the galaxy.

But the great caoutchouc controversy now raging, bids fair, from the very nature of the subject, to "stretch to the crack of doom." Infringement of patent right is the *cousa belli*, and as this is a game at which two can play, "cribbage" seems to have naturally suggested itself, from the analogy, perhaps, between "two for his heels" and the article of over-shoes. Ambitious of a *rubber*, however, they have called in judge and jury. Did it ever occur to them that the lawyers are keeping the game?

We can arrive at no positive conclusion from the signs of individuals denoting their different trades, mysteries or callings. To be sure, a little pardonable vanity may be predicated of the poulterer who calls himself "Turkey Merchant;" but he is doubtless as well entitled to the appellation as the crockery-man is to that of "China Merchant." A worker in hard-wood and ivory has a sign at the corner of Sixth-avenue, whereon is neatly enough inscribed, "Turning up this Alley"—which reads more like the fragment of a broken sentence than an intimation respecting billiard-balls and chess-men; now, as "it is a long lane which has no turning," and this alley happens to be a short one, I doubt the necessity of any notification whatever. Perhaps this

very idea crossing the mind of the painter while at the job, accounts for its singular want of finish. But, as I before remarked, it is dangerous to speculate too closely upon this species of advertisement; for, as in a drouth, so in a metropolis, all signs fail.

The title of a book is an advertisement, and one which requires more consideration than it generally receives. An author has become so familiar with the common-place sound of his own name, that he is unconscious of the effect it may produce when conjoined with the subject on which he has been writing. Mark that short-necked man who came into Appleton's just now, for the purpose no doubt of making something of "a bill." Why has he colored up, and why does he move, in somewhat of a circular manner to be sure, toward the door? Is he offended? No; the first book he set his eyes upon was "Rush on the Brain." Observe that well-fed-looking old gentleman; what a screwing up of countenance, and sudden twitching up of right foot: "Treadwell on the Gout" meets his glance. "Is there nothing else, madam, you would like to look at?" "Nothing!" says the lady with the smelling-bottle, hysterically, as she leaves the shop. She had seen quite enough—the title of the first book which had greeted her, was "Bell on the Nerves," and the second was "Pitcher on the Head." Now, I myself am not more squeamish than most persons, but on a certain occasion, when a little more bilious than usual, I confess to a very bilge-watery sort of feeling coming over me, as "Watts on the Stomach" stared me full in the face. Let authors, who themselves of all others dread to be ill-spoken of behind their backs, have the same consideration for their books.

The Obituary and the Epitaph form another species of advertisement. The latter, like the signs before mentioned, are rarely to be depended on; their falsity has passed into a proverb; and "Hic jacet" is generally with correctness spelled in translation, "Hear lies." The shorter the epitaph the better. "My griefs cry louder than advertisement," says Shakspeare; and hence I was always favorably struck with the one on the tomb of an actor, once well enough known—"Exit Burbage."

With respect to the Obituary, I remember to have seen one in by-gone days, which, after setting forth the customary "Christian fortitude and resignation," contained an invitation for the friends and relatives of the deceased to follow him, on the next day, to "that bourn whence no traveller returns." The style of the above betrays the pen of no very close reasoner, as the terms of the invitation would be apt to produce what logicians call a "non sequitur." The "useful with the sweet" was well combined in the obituary of a French shop-keeper who died years ago in Paris. Therein we were made acquainted with the virtues of the defunct, and informed in a "nota bene" that "his inconsolable widow still continued his business at the old stand."

The grave got no victory, worth speaking of, over that woman.

In days of yore something might be gleaned from the names of cities relative to their several founders, locality, or other peculiarities; but that sort of advertisement does not obtain to any great extent with us of the New World. One would suppose that an insane schoolmaster had stood godfather for half the villages in the state of New York; witness Homer, Virgil, Ovid, Troy, Carthage, etc., etc., and Rome, too! I wonder whether the inhabitants have the face (the face includes the

nose, I believe,) to call themselves Romans! Now, this is unfortunate; for to the ear of a KNICKERBOCKER it sounds not unprettily—certainly not unpatriotically—to hear a good matron boast of her being "an old New Yorker;" whereas it would go against the grain of any lady in our sister city, Troy, to proclaim herself "an old Trojan."

To conclude. In former days the names of individuals were advertisements of the quality, shape, or occupation of their respective bearers. As the *Boncaurs* (now Bunkers) were so called no doubt from their generosity; probably the first of the name kept open house. *Little*, from the recipient of that cognomen being perhaps of a *short stock*; the *Clarks*, from their literary propensities, and so on. But the only name which occurs to me as substantially carrying out, even to the present day, the idea intended to be conveyed on its first application, is that given in the Scriptures to the devil—"Abaddon."

LO! THE POOR INDIAN.—The Albany Herald relates the following incident which occurred at the recent robbery of a German family in that city:

"They stood in a group on the pier, the women wringing their hands and crying most piteously; the old man and his sons and sons-in-law standing by with agony imprinted on their faces in stern lines. They were in a strange land, and their all was gone. The crowd stood gazing at the group, some curious, and some, shame be to them! merry. The law was by its agents seeking for the money and the robbers; but sympathy was what the poor Germans needed. No *white* man or woman conveyed it to them.

A beautiful squaw came by and looked at the mournful group with her piercing black eyes—her face except her eyes was as stone—but her heart understood and *felt* for the distress she saw. She stole noiselessly up to one of the women and plucked her robe; and then with a smile like an angel, that must have shot deep into the woman's heart, she offered her a shilling. It was refused with kindness and with fresh sobs; but we know the act was registered with a shout of triumph in heaven."—*Philadelphia American*, 28 Aug.

THE LATE ALEXANDER LAWSON.—We should have noticed, more particularly than has been done in this paper, the death of the late eminent and venerable artist, Alexander Lawson, who expired in this city, on Saturday last, in the seventy-fifth year of his age. Mr. Lawson, like his celebrated friend Wilson, was a native of Scotland, but like the "Paisley packman," he discovered here his abilities and won here his reputation. As an engraver of birds and animals, Charles Lucien Bonaparte declared that he had not an equal in the world. His chief excellence was, no doubt, in this department of his art, but everything from his burin was executed with great taste, skill and delicacy.

The plates to Wilson's Ornithology are a lasting monument of his ability, and of his devotion to science also, for he bestowed so much labor upon them, that we have understood that the price which was paid to him, did not amount to more than seventy-five cents per diem for his services. He died suddenly, having been engaged with the graver but two days before.—He was one of the most kind-hearted and honorable men in the world, and it may be said very truly that "none knew him but to love him."

From the True Sun.

COMMERCE VERSUS GLORY.

ONE of the most marked developments of the past few years, more particularly in the last twelve months, has been the fact that commerce and industrial interests, so far predominate in all countries, that international wars have become nearly impossible. The present skirmish with Mexico, so far from being at variance with this position, only proves its truth. Nearly all the great nations of the world are at this time at war with barbarous nations, while the most profound peace marks their rapidly growing intercourse with each other. Russia is combating in the Circassian mountains with a brave, fearless, but semi-barbarous race. France continues her bloody attempts to oppress the tribes of Algeria. England has not sheathed the bloody weapons that forced her way into Lahore. France and England together are attempting to crush the spirit of independence on the La Plata, and the United States are repelling the attack of the despotic chiefs of a weak, anti-commercial people. On the outskirts of civilization in all directions, from one cause or another, the arms of the larger powers are enlarging the circle of the general commerce.

This operation it appears is not interfered with as long as it does not take a shape to interrupt trade. Governments and politicians pursue their old trade of war unmolested by the commercial interests, as long as the free action of the latter is not restrained by the hostilities. Time was when the action of the English government was controlled by those who reaped all the fruits, the honors and emoluments of a state of war without incurring any of its hardships. The interests of commerce and the rights of the people were in those days of far less importance to government rulers than a fancied point of honor or the sovereignty of a patch of land. England went through long years of warfare and bloodshed at the expense of most of the debt which now crushes her people into the dust, because her minister could not find it in his heart to fulfil the terms of the treaty of Amiens into which he had solemnly entered, and which stipulated that English troops should evacuate the Island of Malta. He could not bring himself to surrender that rock which did not belong to him, and as a consequence, after twelve years of war, the people have for thirty years groaned under the annual payment of \$150,000,000 for the interest on the debt created to carry on that war, and the debt is still as large as ever. Notwithstanding that debt, commerce has continued to grow, and the industrial interests have annually gained upon the aristocratic power of the nobles. The result is, that they will no longer suffer war.

During that old period of arrogant pretensions, England laid claim to the Oregon, and refused to settle it on equitable principles. She adhered to her grasping policy in negotiation down to 1846, and then consented to take that which she always had refused, because her commercial interests overpowered the arrogance of her aristocracy. She consented to take, in June, 1846, the same quantity of land that her minister, Mr. Packenham, declared, in August, 1845, to be inconsistent with "fairness and equity." Thirty years ago, she could not, with safety to herself, have receded so palpably from her pretensions, in the face of Europe, almost avowedly from fear of a war. She can do so now, because the commercial interest of Europe has ad-

vanced in almost as great a ratio, and the people appreciate the importance of peace. They are aware that it is only in time of peace that the people become strong and the government weak:—that an occasional war is necessary to produce a new fusion of military feudalism in society, to enhance the dependents on government patronage, and to diminish that private wealth which forms the strength of and will ultimately enfranchise the people.

MISCELLANY.

THE next step in the emancipation of the people of Europe, will be on the death of Louis Philippe or Prince Metternich, one or both. The rare sagacity of these two chiefs has hitherto sufficed to retard the progress of popular rights, and their demise will be the signal for a mighty effort throughout Germany and France, to recover into the hands of the people those rights of which they have been so long deprived. The result is inevitable, and the train may be fired at any moment. The consequences none can foresee, and all governments are wisely preparing for the end. It must be a great struggle of the people of all countries for their rights, and the operation of railroads and increasing commerce are yearly uniting the people of Europe in mutual interests. A popular movement in one nation will be responded to by the people of all. The existence of despotism in one government cannot survive its extermination in another, and the liberties of Poland may be restored in the general emancipation of all from monarchical rule. To excite an international war and promote national antipathies will be the policy of royalists, but each year evinces an increase of international sympathies, and the union of the masses against oppressors.

In the chambers of Baden-Baden a motion was agreed to, inviting the government to bring under the notice of the German diet the vast extent to which emigration to America is being carried. Last year the number of emigrants was 62,000, or 800 more than in the preceding year, and it was increasing every month. The emigrants of last year formed not less than one five-hundredth part of the whole population of Germany. Such a draft from our people is felt, especially as Germany is not thickly populated like England. One half of the emigrants, it is not too much to say, are imposed upon by knavish emigration agents, and by fellows who persuade them to sell their little properties (when they have any) for less than their value.

THE correspondent of the European Times says: "One or two of the journals have expressed great mortification at seeing such vast numbers of Swiss and Germans wend their way to the United States, instead of to Algiers, where they think the chances of getting richer are better. But, unfortunately, they overlook one thing, and that is, that Algiers is governed by the iron hand of military tyranny, while in the United States, there is freedom. Some little pamphlets have lately been put forth in Paris, strongly recommending emigration to the United States, and telling most marvellous tales of the fortunes to be gained there by everybody. I have also seen a pamphlet in Germany to the same effect; but adding that the number of Germans in America is so great as to be already almost equal to the native-born Americans, and that not only do the Germans keep up their distinct nationality, speak their own language, and employ it in public

documents, but that, in the course of a few years, they will be sufficiently strong to effect a separation from the Anglo-Saxon States, and establish an independent German nation on the American continent. What likelihood there may be of such an event I am not able to say; but I can tell your readers, on the authority of a German gentleman who has the means of knowing, that it counts for a great deal—more, perhaps, than would readily be believed—in the estimation of the thousands of Germans who quit their beloved 'Vaterland' for the New World."

JEWISH EMIGRANTS TO AMERICA.—The Orient has the following from Ellwangen, May 11:—"A large and peculiar troop of emigrants to America passed here this day. The whole company consisted of Jews from the neighboring town of Oberdorf. The poverty which characterizes the appearance of German emigrants for America was happily not perceptible in this instance. On the contrary, affluence appeared to pervade their ranks. Elegant omnibusses conveyed the parties to the place of embarkation, and all were dressed, particularly the handsome Jewish girls, who formed no mean part of the company. The whole had a gay and cheerful appearance. The company carries with them a 'Sepher Tora,' (scroll of the law,) which they had solemnly dedicated in the synagogue of Oberdorf previous to their departure. The emigrants follow their relations and friends, who had preceded them several years, and encouraged them to seek the well beloved land of North America, where they are not, as in most German states, deprived of their natural rights and privileges as citizens, on account of adhering to the faith of their ancestors."

EMIGRATION INTO VIRGINIA.—The emigration from western New York and the New England states into the northern part of Virginia is very large. Fairfax county is coming fast into the possession of settlers like these. Other portions of the state are also likely to be rescued in a similar manner. "It is a singular spectacle," says the Richmond Republican, "which Virginia now presents; the departure of her own sons to other lands, and the immigration into her borders of citizens from other states. For years has she been drained of the flower of her youthful population, leaving their place to be supplied by men who seem to place a higher value upon the advantages which they have surrendered." In due time, no doubt, Virginia will awaken to the perception of the main causes of her premature decrepitude. The western portion of the state will show something by its example, by and by, of the true sources of a commonwealth's prosperity. Gov. McDowell's messages have some useful references on this subject, with facts and statistics which speak a very plain language of their own.

WEST-INDIA IMMIGRATION.—By the Zulette, at Norfolk, we have full files of West India papers, from which are gathered the following items relative to the much spoken of Coolie immigration to the British colonies.—*United States Gazette*.

Trinidad.—The Gazette announces the arrival of another batch of immigrants, from Madras and Calcutta, amounting, in the whole, to 353. The Madras people, the editor states, are a fine, athletic set, superior, as a whole, to any that had as yet arrived. The distribution of these immigrants seems to have been conducted in a very discreditable man-

ner. The Gazette admits that they were not satisfied, and that "distant kindred" were separated. The Spectator speaks of it in the following terms:

"Yesterday there was witnessed in the yard at government house a scene disgraceful to a free country—a scene bearing a striking resemblance to what is witnessed in a professed slave market. The Indian immigrants, by the Lord William Bentinck, from Madras, and the Cadet, from Calcutta, amounting to 453, were distributed gratis to the favorite applicants by the immigration agent general, in pure Baltimore or Cuban style. In apportioning to the planters the respective numbers applied for, no regard whatever was paid to the ties of family or friendship. Wives were separated from their husbands, and children from their parents. While being thus meted out as mules, if a husband rushed towards his wife, or *vice versa*, or a mother to the lot containing her sons, the poor affectionate creatures were rudely pushed back in the most brutal and unfeeling manner by that amalgamation of inhumanity and self-conceit, the immigration agent general. Shall such things be tolerated in Trinidad in 1846?"

Demerara.—The following paragraphs, from Emery's Journal, are worthy of perusal:

"Most people in this quarter anticipate, as a now inevitable event, the outbreak of a war with the United States. The feelings consequent on such an expectation are of a very gloomy kind. Not that a foreign invasion appears to be the most serious ill that could befall us. A permanent occupation of the province by a hostile force is improbable. But it has been the policy of our rulers to discountenance the cultivation of every product of the soil except sugar and its kindred staples. Peace and high prices at home enable us to buy food from America. The results of a fall in prices or a war must be obvious. Moreover, our rulers contemplate that, of a public revenue of \$820,000, \$290,000 shall be raised by a tax on imports. A war would cut off this branch at once.

"The scarcity of money continues to prevail to a degree not paralleled in the recollection of any body.

"So many coolies, half naked, scabby, famishing, helpless from ignorance, and overrun with vermin, infest the highways of the metropolis; the authorities have hounded on them the police, who drive them into the lock-up house, (surely an illegal act,) and the planters cry out for permission to conclude contracts of indenture, that is, with beguiled strangers, who cannot comprehend the signification thereof. That some coolies are doing well, is undeniable. But, as we have paid for the introduction of all, and are bound to re-export all, at the end of five years, at our own cost, every hour of coolie vagrancy aggravates the loss of our foolish speculation."

EARL DARNLEY felt the venom of Lord Ellenborough's wit in the house of lords, where he had been making a wearisome oration on the never-ending theme, the wrongs of Ireland. He had excited a contagious drowsiness in the house, which extended to himself, and was stopped in the midst of a parenthetical sentence by the necessity of making a hearty yawn. "There's some sense in that, however," growled the impatient judge, with a derisive gravity, whose influence not even the bench of bishops could resist.

A good specimen of pungent humor, not always observant of time or place, is given by Lord Eldon. Upon one of the royal marriages, there being much talking during the ceremony, in one corner of the drawing-room, Lord Ellenborough exclaimed, "Be silent in that corner of the room, or you shall be married yourselves."

THE EGYPTIAN PEA.—Several years ago, Sir Gardiner Wilkinson found a vase and an Egyptian sarcophagus, 2,844 years old, in a mummy pit, which he subsequently presented to the British Museum. On examination, the vase was found to contain a few grains of wheat, a few peas, and other decaying substances, supposed to have been originally similar substances. Three of the peas were presented by P. J. Pettigrew, Esq., to Mr. W. Grimstone, of the Herbarium, Highgate, who, on the 4th of June, 1844, planted them in a compost resembling the alluvial soil of the Nile. They were placed in a forcing frame, and in exactly one month he was most agreeably surprised by the sprouting of one of them. The product was nineteen pods, from which fifty-five peas were preserved. Some of these were planted on the 23d of April, 1845, and some on the 4th of June, in the open air, and in a similar compost, and all were soon in a most flourishing condition, producing quite a plentiful crop of seed. The Egyptian pea is very prolific, producing from seventy to one hundred pods. The tree grows similarly to a dwarf grape vine, about three feet in height, and has many stems, two or three mother stems generally springing from the parent stalk.—*Britannia*.

PARIS ACADEMY OF SCIENCES.—*July 13.*—A paper was read by M. Séguier on the construction of railroads. M. Séguier is an advocate for railroad travelling; and is of opinion that a very much greater rate of speed than that which is now attained could be adopted with perfect safety, if proper care and skill were taken in the construction of the roads and of the material, and due skill and attention manifested by the persons employed. He thinks, however, that any rate of speed however small, is dangerous, when all the conditions of safety are overlooked. He indignantly notices the indifference to human life in the construction of railroads on the border of precipices without parapets—in the mode of making tunnels and viaducts—in that of laying down the rails, &c. He suggests many improvements—and particularly one to which he attaches great importance. He recommends a middle rail with a centre wheel for the locomotive; by which means the weight would have an equal bearing, instead of throwing it all on the sides, and thus rendering a *déraillement* almost inevitable in the event of any sudden shock.—MM. Bouchardat and Sandras completed their series of communications on the digestion of food, by an article on the effect of alcoholic liquids. They state that these liquids do not undergo in the apparatus of digestion any other change than that of being weakened by the gastric juice and mucus, the saliva, and the other liquids which may be present. The absorption of alcoholic liquids is effected by the orifices of the veins. It is particularly in the stomach that this takes place, when these liquids are taken in excess or mixed with sugar. The absorption, however, may be continued throughout the intestines. The chyliferous vessels perform no part in this absorption. Spirituous liquors, when introduced into the circulation,

are not eliminated by any of the secretory organs, a small portion only is evaporated by the lungs. If the quantity taken be very great, the arterial blood preserves the color of venous blood, and alcohol may induce apoplexy. Alcohol, under the influence of oxygen, incessantly introduced into the system by the respiration, may be immediately converted into water and carbonic acid, but in many cases acetic acid has been obtained.—A paper was received from M. Lassaigne on the air of crowded rooms. The author proves that the carbonic acid is found in the entire mass of air in the room—and that the partial admission of fresh air will not suffice for the purposes of health.—*Athenæum*.

SUPPLY OF WATER TO ROME AND LONDON.—A correspondent of the *Mechanics' Magazine* has the following speculations on the relative supplies of this important agent of health and comfort to modern London and ancient Rome:—"The probable supply to the 1,000,000 inhabitants of which Rome could at one time boast, amounted to 50,000,000 cubic feet—being equal to about 50 cubic feet for each individual. This is probably 20 times the quantity which London now receives for each of its inhabitants—a fact which goes far to justify the application of the disgraceful term 'bathless' to this the largest, the most opulent, and the most powerful city in the world. How miserably insignificant do our water-works appear, and how trifling the supply they furnish to this mighty city of more than 2,000,000 when contrasted with the immense flood of pure water poured into old Rome by her gigantic aqueducts! And how discreditable the difference between the two capitals, when we reflect on the far superior resources which modern science has placed at her command, and on the well known fact, that, through the happy constitution of the strata on which London stands, she has at her command—requiring as it were, but the smiting of the rock, to make them gush forth—boundless supplies of the purest possible water!"—*Athenæum*.

PARTIAL DESTRUCTION OF THE HIPPODROME AT PARIS.—A terrible fire broke out at the Hippodrome about three o'clock on Monday morning, and reduced to ashes a portion of that building. The guardian perceiving that considerable smoke issued from the side of the stabling, immediately gave the alarm, and the most prompt assistance was immediately organized: but every effort was unavailing to save the building, and part of it was totally destroyed. The fire unfortunately broke out in the most valuable part of the edifice, where were situated the stables, the hay and corn lofts, as well as the dressing rooms. The halters of the horses were immediately cut, and the frightened stud were seen to gallop in every direction, some towards Paris, others towards the wood of Boulogne. The sight was a most extraordinary one, and those who witnessed above a hundred horses, with their manes erect and their nostrils dilated, flying in all directions, might have imagined they witnessed a real Barbary chase. The cries of the monkeys were truly frightful, and some difficulty occurred in saving them. Every one endeavored to catch them, and a large ape in particular was caught with considerable trouble, the animal preventing every one approaching him by throwing stones, chairs, everything in his reach at the persons who attempted to seize hold of him.—*Examiner*.

REVIVAL OF JOHANNA SOUTHCOTISM.—For some time past, the most active exertions have been made by the surviving followers of Johanna Southcote, and several rooms, termed chapels, been opened at various parts of town; and numerous preachers, chiefly females, hold forth every Sabbath on Kensington Common and other public places, intimating the near approach of the only true Shiloh.

DISAPPEARANCE OF A LAKE.—It is announced, from Inspruck, that the inhabitants of the valley of Oetzthel, in the Tyrol, have just been witnesses of an extraordinary event; not claiming, however, the character of a phenomenon—inasmuch as the cause is apparent, and of the most ordinary kind. The waters of the lake of Venner have suddenly disappeared; having flowed out, in a single night, through a large opening broken through the bottom of their basin.

THE NILE.—Mr. Nasmyth, the eminent engineer is constructing two of the powerful machines invented by him for driving piles, and which are to be employed in the great works at present in progress, by order of Mehemet Ali, for damming up the Nile, and rendering the irrigation of Lower Egypt in a great measure independent of the annual rising and overflowing of that river.

In the House of Commons, on the 9th of July, a somewhat curious petition was presented, of which the following notice is given:—

Mr. T. Duncombe presented a petition from Charles Augustus Frederick, Duke of Brunswick. The petitioner said he claimed the protection of that house because he had not been able to obtain justice in the courts of law; that on his father's death he became possessed of immense wealth; that at that period the Prince Regent, afterward George the Fourth, was appointed his guardian; that at the age of eighteen, when, according to the laws of the Duchy of Brunswick, he attained his majority, he claimed possession of his privileges and fortune, which claim was refused; that when he attained the age of twenty-one, the Duke of Cambridge, who was then viceroy of Hanover, was appointed his guardian; that a revolution afterward took place, and the then reigning Duke of Brunswick was deprived of his crown, and also of his private fortune; that in nearly all revolutions it had been customary to allow the deposed prince to retain his private possessions; that the crown of Brunswick is now held by the King of Hanover, who is self-styled "curator," contrary to all law and usage; that the petitioner has made various attempts to obtain redress, all of which had failed; and that it had been stated, in accounting for the revenues of the duchy, that £100,000 a year is remitted to this country for the support of the petitioner, who denies having received a single shilling. The petitioner not only prayed for inquiry on his own account, but because there were certain allegations made, affecting the character of some portions of the royal family of England. The hon. member moved that the petition should be printed with the votes, and gave notice that he would, to-morrow, call the attention of the house to the subject.

THE burial-ground of Santa Maria in Mexico is the most beautiful of the kind I have ever seen—and it is really not a misapplication of the term beautiful, to apply it to a grave-yard such as this. It is a space of ground of some eight or ten acres

enclosed with a stone wall, about fifteen feet high and ten thick. This wall serves the double purpose of enclosing the ground and as a place to deposit the dead. Little niches are made in it large enough to receive a coffin, like the pigeon-holes in a desk.

The whole area, is laid off in gravel walks and bordered with flowers and shrubbery, and beautiful marble tombs all over it. Lamps are always kept burning at night, and altogether I have never seen any other last resting-place which had so little gloom about it.

The lower classes are buried in other places and without coffins; they are carried to the grave on rude litters, but the children and women generally on beds made of roses and other flowers.

The wife of General Canalizo died whilst he was President *ad interim*, during the absence of Santa Anna. She was embalmed and had a pair of glass eyes inserted, and lay in state for several days, gorgeously dressed and glittering in jewels; every one was admitted to the great chamber of the palace where the body was exposed. It was a most revolting spectacle, and all the more so to those who knew the modest, gentle and unostentatious character of that very uncommon woman. She seemed to be unconscious of the great dignity of the situation to which her husband had been elevated, and spent her whole life in acts of charity and benevolence, and was singularly averse to all sorts of ostentation and parade.—*Recollections of Mexico.*

CAPTAIN PARRY was once asked, at a dinner party where the veteran joker was present, what he and his crew had lived upon when they were frozen on the Polar Sea. Parry said they lived upon the seals. "And very good living too," exclaimed Lord Erskine, "if you keep them long enough."

THE LAND RAIL, OR CORN CRAKE, A VENTRILQUIST.—We cannot write of the land rail, before dinner, without a certain exudation from the palate. This fat little bird must not be confounded with the water rail: besides that its bill is much shorter, it is much more timorous; indeed, so much so, as to be almost invisible but to the most persevering pointer and sportsman; and it is made so strong in the lower limbs, by the length of the leg, shank, and toes, that its rapidity of motion appears next to miraculous. What need of wings at all to a creature, considering its proportions, with such an enormous capacity of stretch. Talk of seven-league boots, indeed! You must drop the simile, and think of the railroad car. It is named corn crake, from its noise, or call, "Creke, creke, creke," which may be heard "now here, now there, now everywhere, and now nowhere;" and wherefore? Simply, that the bird is an uneducated ventriloquist, and deceives you into the belief that he is at any spot the farthest from the actual one. In many respects its habits are similar to those of the water rail; for, though the first seeks the thick grass meadows and moist and sheltered vales, yet are its preferences chiefly aquatic, taking to osier-beds, young grass, or grain in moist places, and low-lying districts, before any others. Here he will choose his position, uttering his "creke" from a clod of earth, and you shall be running on one side and the other, and ever so far away after his call, which possesses all the modulations of distance.—*Craven's Recreations in Shooting.*

[Bearing in mind that the Edinburgh Review may be supposed to express the opinions of the present ministry, our readers will appreciate the importance of this article. It foreshadows a great change which will promote the cause of peace, and will draw emigrants from all nations to British colonies.]

From the Edinburgh Review.

Sophismes Economiques. Par M. FREDERIC BASTIAT. 12mo. Paris: 1846.

M. BASTIAT has, in this well-written volume, collected and exposed the most popular Protectionist fallacies; those sophistical arguments which are most frequently employed in defence of protective duties on imports, and against the freedom of trade. The publication of such a book is of itself a proof that the doctrines of Free-Trade are beginning to make some progress in France; and that the countrymen of Turgot are not all deluded by that spurious patriotism which identifies the exclusion of foreign goods with the promotion of national interests. The simplicity and directness of the argument in favor of Free-Trade, ought, indeed, to secure it a ready acceptance in all countries where reason can make herself heard, and where sectional interests have not a complete ascendancy. But the present state of France is similar to that of England at the time when Adam Smith wrote his *Wealth of Nations*. The manufacturers and merchants were at that time the principal champions of the restrictive system in England; the agriculturists—as he observes—were not infected with the same selfish and narrow-minded spirit as the trading part of the community.* The system of protection is, by the French tariff, extended indeed to all native products, whether of agriculture or manufacture; but the persons interested in manufactures are in France the most active and zealous advocates of protection. The landed interest principally desire protection in their capacity of owners of wood for burning. In England, however, partly owing to the vast increase of our manufacturing industry, and partly to the influence of the last war with France, the opinions and interests on this subject have been completely reversed since the time of Dr. Smith. The manufacturers of England have ceased to confine their ambition to the supply of their native market; they work for the general market of the world. The monopoly of the English market is therefore no longer important to them; and instead of asking for the exclusion of

* "Country gentlemen and farmers are, to their great honor, of all people the least subject to the wretched spirit of monopoly. Country gentlemen and farmers, dispersed in different parts of the country, cannot so easily combine as merchants and manufacturers, who, being collected into towns, and accustomed to that exclusive corporation spirit which prevails in them, naturally endeavor to obtain, against all their countrymen, the same exclusive privilege which they generally possess against the inhabitants of their respective towns. They accordingly seem to have been the original inventors of those restraints upon the importation of foreign goods, which secure to them the monopoly of the home market."—*Wealth of Nations*, book iv. ch. 2. This passage was quoted by Sir Robert Peel, in his speech on the introduction of the corn-law measure, at the beginning of this session.

foreign manufactures, they desire that all restrictions on foreign trade, which limit the external demand for their goods should be abolished. On the other hand, the agricultural body has adopted the cast-off prejudices and alarms of the manufacturers and merchants;—that system of selfish error which, from its authors and promoters, obtained the name of the *Mercantile System*.

During the war, corn, although the importation was from 1800 to 1815 practically free, rose, on various accounts, to a very high price.* The range of high prices during this period produced a double effect. In the first place, the existence of scarcity and dearth during the war, combined with the violent anti-commercial policy of Napoleon, had created a genuine conviction of the importance of relying on home-grown corn, exclusively of foreign supplies.† The Corn-law report of 1813, in which the modern protective policy of this country originated, puts forward the danger of this commercial dependence, as the main argument for prohibition; and it particularly dwells on the probability of large supplies of grain being obtained from Ireland, for the supply of the manufacturing population of England, under an improved system of cultivation. In the next place, the agricultural interest, having been accustomed for several years to an extraordinary height of prices, were desirous of preventing a sudden and (apparently to them) ruinous depreciation. Accordingly the report of 1813 recommended that the importation of flour and meal should be totally prohibited; that the importation of wheat should be prohibited when the price was under 105s.; and that, when it reached this price, it should be admitted at a duty of 24s. 3d. a quarter.‡ These propositions, which now sound almost fabulous, were, at the time, considered fair and reasonable by statesmen still living; and it was then thought by persons favorable to freedom of commerce, that the government, which took up the subject in 1815, had made a great concession in fixing the point of prohibition at so low a price as 80s. instead of 90s. or 100s.—the amounts proposed by Sir Henry Parnell and the other advocates of restrictive policy.§ In consequence of the corn-law

* The average prices of the imperial quarter of wheat for the following years, stood thus:—

Year.	Average prices.
	s. d.
1810, - - - - -	106 5
1811, - - - - -	95 3
1812, - - - - -	126 6
1813, - - - - -	109 9

An allowance must, however, be made for the depreciation of the currency during this period.

† Mr. Tooke, in his *History of Prices*, vol. i., p. 309, has given some curious details as to the increase of the expenses of freight during the later years of the war. In 1809-12, the freight and insurance from the Baltic to London, was, on an average, for a quarter of wheat, 50s.; in 1837, it was 4s. 6d. For a load of timber, the same expenses were L.10 in 1809-12; and L.1 in 1837.

‡ This report is printed at length in Hansard's *Parl. Hist.*, vol. xxv. app. p. 55. An abstract of it may be found in the *Annual Register* for 1813: *State Papers*, p. 371.

§ Sir H. Parnell's opinions on this subject afterwards underwent an entire change, and he became an advocate of a free trade in corn. See his speech on Mr. Villier's motion, House of Commons, 15th March, 1838.

established in 1815, and modified by successive mitigations into the sliding-scale of 1842, the agricultural interest learnt to believe that their prosperity was identified with protection, and that rents would fall, or the land even go out of cultivation, if the duties on foreign corn were not maintained. During the same period, partly by the extension of the market for our own manufactures, and partly by the repeal of protective duties on foreign manufactures—commenced by Mr. Huskisson, continued by the administrations of Lord Grey and Lord Melbourne, and consummated by Sir Robert Peel—the manufacturing and, to a great extent, the trading classes of the country, had been deprived of their interest in favor of commercial restrictions. Their opinions and conduct, no longer misled by self-regarding considerations, naturally inclined to that policy which is favorable to the interests of the general public. Hence there were petitions in favor of free-trade, signed by the principal merchants and traders of London; hence the Anti-corn-law League—a body mainly composed of members of the manufacturing interest, and supplied with funds by their contributions—attacked the protection enjoyed by the agriculturist, instead of making common cause with them, for the maintenance of *all* protective duties; and even proclaimed its advocacy of universal free-trade. It is by this separation of interests that the cause of the consumer, of the mere member of the general public, not belonging to any organized body, or enrolled under the standard of any peculiar interest—has become triumphant. The joy of King Priam at the quarrels of the Grecian chieftains could not have exceeded the wondering delight with which Adam Smith would have heard of the English manufacturers and traders having become the champions of free-trade, and assailing the protective duties on agricultural produce. So long as all the powerful interests of a community—agricultural, manufacturing, and commercial—are bound together in a compact and firm alliance for the maintenance of a prohibitive system of import duties, the unconnected, undisciplined aggregate of consumers are, in the present state of opinion and intelligence, utterly helpless against such a coalition. But if, from any circumstances, the interests of those who have to sell begin to conflict, the cause of those who have to buy has some chance of success. Such has already been the case in England; and we will venture to predict, that, so soon as the protected interests of France, Germany, and the United States, begin to fall out amongst themselves—so soon as they cease to make a common prey of the consumer, and are found to do more harm to one another than to the public—then, and not till then, will the prohibitory tariffs of these countries be relaxed.

Since the open transition of Sir Robert Peel and Sir James Graham to the cause of universal free-trade, and the introduction of the comprehensive measure of commercial reform at the beginning of this session, it may be said that, with one exception, all the leading statesmen of the present day—all the public men who are likely, for some years to come, to guide the deliberations of Parliament—are favorable, not merely to the abstract principles of freedom of commerce, but to their practical application, and their adoption as rules of legislation. It is now generally admitted, that the protection of native British industry, whether manufacturing or agricultural, by means of duties on imports, intended not for revenue but for exclusion, is a false and vicious system, and is to be abandoned in practice.

Nevertheless, although it is conceded that *native* industry is not to enjoy a monopoly; and that the producers of Great Britain and Ireland are to be exposed to the salutary competition of the whole world; yet there still abides among us a delusion—partly sentimental and partly politic—that protection ought to be given to *colonial* industry. We ought not, it is granted, to protect native hardware, or silks, or corn; but we ought to protect the sugar or coffee of the West and East Indies; the wines of the Cape, and the timber of Canada; and to give these products the monopoly of the British market, to the exclusion of cheaper and better foreign articles, and to our own manifest and undeniable detriment. It appears to us that the time has now arrived, when this question deserves a separate consideration in this Journal; and we therefore propose, without going into details, or expressing opinions on the expediency of particular rates of duty, to lay before the reader our views upon the origin and policy of the system of protecting the produce of British colonies, by discriminating duties levied in the ports of the United Kingdom.

When the European nations had, in consequence of the extension of navigation, formed distant settlements in America and Asia, the main advantage to be derived by a mother country from the possession of colonies and dependencies, was supposed to consist in the *monopoly of their trade*. This monopoly, as Bryan Edwards has remarked,* had a very wide extent. It consisted in the monopoly of supply, the monopoly of export, and the monopoly of manufacture. The colony was permitted to trade only with the mother country, and was prohibited from commercial intercourse with the rest of the world. It was compelled to receive its supplies, both of raw and manufactured articles, from the same source. It was compelled to bring its produce to the same market, and to bring it in a raw state; in order that the natives of the paramount nation might enjoy the profits derivable from its manufacture. What the colony had to sell, it was to sell at a cheap rate to the mother country. What it had to buy, it was to buy at a dear rate from the mother country.

Upon this jealous and restrictive system, not only the foreign possessions of Spain and Holland, and the other continental countries, were administered, but even those of England, up to the American war. So completely had it been established in opinion as well as practice, that this was the natural relation between a dependent colony and its mother country, that the American colonies of England acquiesced in the system; and would doubtless have, for a time at least, retained their allegiance in spite of its existence, if the attempt to tax them directly for the benefit of the mother country had not been made.

The American war and its event gave to the world a memorable lesson on the necessity of moderation and forbearance in the exercise of the rights of a mother country over its colonies. The writings of Adam Smith and his followers, likewise, by degrees opened the eyes of the English government and people to the mischievous effect of the old colonial system; so that, since the end of the last century, the commercial restrictions

* *History of the West Indies*, vol. ii., p. 565. The subject of Colonial Trade, with the various restrictions and regulations by which it has been fettered, and the consequences of these restrictions, is well treated by Mr. Merivale, in his *Lectures on Colonization and the Colonies*, vol. i., chapters 7 and 8.

upon the English colonies have been relaxed, and a more liberal policy has been adopted.

Much of the old exclusive system is however retained by Holland, France, and Spain, in the few colonial possessions which these countries possess.* Thus, as the Spaniards formerly prohibited the cultivation of the vine and olive in their American colonies; so the French now prohibit the cultivation of the vine in Algeria;† a settlement whose agricultural prosperity would not seem to threaten any serious danger to the most timid and jealous of the vine-growers of France. England still maintains, for the benefit of the native sugar-refiners, the prohibition to refine sugar in her West India Islands; although this manufacture could be carried on profitably in those colonies. The distillation of spirits from sugar in the United Kingdom is likewise prohibited; and this prohibition is still enforced, although it can have little practical effect. However, since the abolition of the commercial privileges of the East India Company, and the permission of a direct trade in provisions between our West India Islands and the United States, by the reforms of Mr. F. Robinson and Mr. Huskisson, the English colonies are subject to no very material restrictions, as to industry and trade, imposed for the benefit of the mother country.‡

While this restrictive system was, to a considerable extent, still maintained for the English colonies, a plan of reciprocity was devised, which was to compensate the colony for the restrictions to which it was subjected. It was thought that the sacrifices made by the mother country and colony ought to be mutual; that, if the mother country enjoyed a preference in the market of the colony, the colony ought to enjoy a preference in the market of the mother country. A system of discriminating duties, by which an advantage was given to colonial produce imported into the mother country, was accordingly introduced. The theory of this contrivance is as follows:—the mother country knowingly subjects the colony to certain commercial or industrial disadvantages, for her own sake. In return, she

subjects herself to certain disadvantages of a like nature, for the sake of the colony. The two communities make an alliance for mutual injury, to be voluntarily inflicted on each other, and to be borne by each party without complaint. The contract is not, as in natural and unregulated commerce, *Do ut des*; but *Ledo ut ledas*. The balance of profit and loss, when reduced to its elements, stands thus: I make a gain by doing you an injury; and, in compensation, I permit you to make a similar gain by doing me a similar injury. It seems like an attempt to embody the *lex talionis* in mercantile transactions. And thus far the plan is successful. The injury which each party undertakes to inflict on the other, is actually inflicted and punctually suffered. But (as we shall see presently) the benefit which is to accrue to both parties, is often altogether absent, and is never fully enjoyed. So far as the scheme involves a loss, it is always successful; so far as it promises a profit, it is generally unsuccessful.

The most remarkable case in which this policy has been pursued by England, are Canada timber and corn, West India sugar, spirits, and coffee, and Cape of Good Hope wines.

During the late war, in consequence of the seizure of the Danish fleet, and the rupture with Denmark in 1807, it was feared that the supplies of Baltic timber might be interrupted. And although, up to the first years of this century, England was exclusively supplied with timber from the Baltic, and had not derived any supplies from North America, yet it must be admitted that there was some ground for this apprehension. The price of Memel timber, which in 1802 had been 78s. per load, rose in 1809, with only a slight increase of duty, to 320s. per load. Accordingly, Mr. Vansittart, the chancellor of the exchequer, and Mr. George Rose, the president of the board of trade, devised the singular plan of providing against this contingency, by an immense increase in the duties on European timber, and an almost total repeal of those on American timber. This discrimination of duties has been mitigated by various changes since the peace, particularly by the tariff of 1842; but even, after the alteration made by the tariff act of this session, the interval is still very wide, as will appear by a comparison of the three first items under the head of timber.

Timber or wood, not being deals, battens, boards, staves, handspikes, oars, lathwood, or other timber or wood, sawn, split, or otherwise dressed, per load of fifty cubic feet.	From foreign countries.	From British possessions after 6th April, 1848.
	£ s. d.	£ s. d.
— deals, battens, or other timber, for wood, sawn, or split, per load of fifty cubic feet.	1 0 0	— 2 0
— staves, per load of fifty cubic feet.	— 18 0	— 2 0

The result of this system has been, that an immense importation of the inferior timber of Canada has taken place; and that the good and cheap timber of the north of Europe has been in great measure excluded. Cases even occurred of ships being laden in the Baltic with timber, and making the voyage to Canada and back to England, in order to introduce their cargo as American timber. The timber trade between England and Canada, as compared with that between England and the Baltic, has for the last few years been nearly as ten to one. The rates which are introduced by the act of this session still leave an immense protection to Canada timber

* On the commercial system adopted by Spain and Holland towards their respective colonies, see M'Gregor's *Commercial Tariffs*, Part vi., p. 164; Part xiii., p. 121. It appears that Spain has now relaxed all the rigor of her ancient colonial monopoly.

† See *The French in Algiers*, p. 74. It is a singular circumstance, that the Romans had made a similar prohibition in Gaul, when it was a dependent province. "Nos vero, justissimi homines, (says Cicero,) qui Transalpinas gentes oleam et vitem serere non sinimus, quo pluris sint nostra oliveta nostræque vineæ; quod quum faciamus, prudenter facere dicimur, juste non dicimur."—*De Republica*, iii. 9.

‡ M. Thiers, in his *Histoire du Consulat et de l'Empire*, liv. xvi., ad init., (tom. iv.,) has imagined a strange theory in order to account for the relaxation of the colonial monopoly, without tracing it to a more enlightened state of opinion upon political and commercial subjects. "The European nations (he says) produce what they used to import; instead of being commercial they are manufacturing; instead of importing sugar, muslins, and cotton prints, they make these articles for themselves at home. *Au grand spectacle de l'ambition coloniale a succédé de la sorte le spectacle de l'ambition manufacturière.*" This view embodies another form of the favorite fallacy of commercial independence. It may be remarked, that in proving the worthlessness of colonies in the present state of the world, M. Thiers may seem to console his countrymen by an argument somewhat similar to that in the fable of the fox and the grapes. Of India, the value of which used to be greatly magnified by French politicians, he disposes as follows:—"L'Inde enfin, sous le sceptre de l'Angleterre, n'est plus qu'une conquête ruinée par les progrès de l'industrie Européenne, et employée à nourrir quelques officiers, quelques commis, quelques magistrats de la métropole."

while they nearly sacrifice the revenue upon an article of large importation, not subject to contraband.*

The Cape of Good Hope was acquired by England in 1795, and finally annexed to the crown in 1806. Unfortunately for us, the cultivation of the vine had been introduced into this colony by the Dutch, through the assistance, it is said, of French refugees, after the revocation of the edict of Nantes. It seems as if nature had nearly limited the making of wine to Europe. In spite of the latter fables concerning the Indian origin of Bacchus, he was essentially a European deity. Nor have the settlements of modern states, or their improvements in the arts of cultivation, much extended his domain. Except Asia Minor and Persia, Madeira and the Canary Isles, with some districts in Mexico,† the Cape is the only place out of Europe where wine is made. And it seems from the description of Dr. Henderson, in his *History of Ancient and Modern Wines*, to be thoroughly unsuited to this production. The vineyards which yield the Constantia wine have a natural fitness for the grape; but the soil of the colony is in general unfavorable to the growth of wine. Moreover, the culture is unskilful, and the processes of the vintage are ill conducted; so that, according to Dr. Henderson, a large proportion of the wine is "execrable." During the war, however, and the existence of the anti-commercial system of Napoleon, it was thought by our government that the supply of wine from the continent might be interrupted, and that it would be a prudent policy to rely on the produce of a British colony. Accordingly, a proclamation of the governor, in December, 1811, offered great encouragement to the growth of wine at the Cape of Good Hope;‡ and by an act of 1813, (53 G. III., c. 84,) Cape wines were admitted into the United Kingdom at a third of the duty on Spanish and Portuguese wines. With this protection, the produce rose in ten years from 859,195 to 2,249,910 imperial gallons, (or 7335 to 19,230 leggers.) The importation of Cape wines into the United Kingdom, in the year ended 5th January, 1845, was 423,336 gallons; while that of French wines was only 725,308. The duty on Cape wine is 2s. 9d. a gallon, on other wines 5s. 6d.

The British West India Islands have long enjoyed a preference in our market for their sugar. During the existence of slavery, the sugar produced in our islands was equal to the demand of the mother country, and the discrimination had not much effect. But since the emancipation of the slaves, the supply of sugar has fallen off, and the exclusion of foreign sugar has begun to operate. The quantity of sugar imported from the British West Indies into the United Kingdom, was 4,103,800 cwt. in 1831, and 2,508,910 cwt. in 1842. In 1836 the duty on colonial sugar was 36s. a cwt., on foreign sugar 63s. Since that time, the duty on colonial sugar has been reduced, and a discrim-

ination founded on a new principle has been introduced. Under the act of last year, the duties stand thus, until the 5th of July, 1846.

Brown sugar, produce of a Brit. pos- session,	s. d. 14 0 per cwt.
Do. foreign, not the produce of slave labor,	23 4
Do. foreign, the produce of slave la- bor,	63 0

Rum is likewise admitted at a discriminating duty of nine shillings per gallon, while the duty on foreign spirits has been 22s. 6d., which the tariff-act of this session reduces to 15s. The excise duty on spirits made in England is 7s. 10d. per gallon.

COFFEE imported from foreign countries is now subject to a duty of 6d. per lb.; if imported from British possessions, to a duty of 4d. Previously, this discrimination had been as great as 1s. 3d. and 6d., with a duty of 9d. for coffee imported from any British possession within the limits of the East India Company's charter, *not being the produce thereof*. Under this regulation a singular practice arose. As the Cape of Good Hope was within the limits of the East India Company's charter, large quantities of coffee were sent to it from Brazil, Cuba, and other foreign countries, in order to be "colonialized," (as it was called,) and then imported into England; in other words, in order, by this circuitous navigation, to obtain the benefit of the lower rate of duty. The quantities of coffee imported from the Cape, and admitted for home consumption in the two years, 1830 and 1842, stand thus:—

	lbs.
1830,	189
1842,	6,149,489

This costly system of smuggling, (similar to that mentioned above with respect to timber,) was suppressed in 1842, by rendering foreign coffee so imported liable to the high duty. The discrimination has, moreover, been since mitigated, and amounts now only to 2d. per lb.*

A very different feeling, with respect to the encouragement of colonial coffee, prevailed in the reign of Charles II. The Lord Keeper Guilford, being consulted by the government in 1679, as to the legality of coffee-houses, gave it as his opinion, that "as the coffee-houses are nurseries of idleness and pragmatism, and hinder the consumption of our native provisions, they may be treated as common nuisances." A proclamation was accordingly issued for shutting up all coffee-houses, and forbidding the sale of coffee in the metropolis; but it led to so much complaint, especially among persons connected with the foreign and colonial trade, that it was soon recalled.†

CORN was admitted from the British possessions in North America at a discriminating duty, by the 31 Geo. III. c. 30. passed in 1791. This act imposed a simple sliding-scale of duties, consisting of only three degrees; viz., a high duty of 24s. 3d. per quarter, and two low duties of 2s. 6d., and 6d. per quarter. By the arrangement of this scale, a small preference was given to North American corn, as will appear from the following table:—

* On the coffee duties, see Porter's *Progress of the Nation*, vol. ii., p. 113; vol. iii., p. 42.

† See Lord Campbell's *Lives of the Chancellors*, vol. iii., p. 455.

* Concerning the timber duties, see this Journal, vol. xliii., p. 341. McCulloch's *Commercial Dict.*, Art. "Timber." Porter's *Progress of the Nation*, vol. ii., p. 122. Merivale's *Lectures on Colonization*, vol. i., p. 202.

† In California and the Mexican province of Chihuahua adjoining Texas, wine is made to a considerable extent, though not sufficient for the consumption of the country. This wine is strong and full-bodied, but the culture is unskilful. Some wine is made in the State of Ohio, but of poor quality.

‡ See Montgomery Martin, *British Colonial Library*, vol. iii., p. 236.

Duty on wheat per quarter.		Imported from Ireland or a British colony in N. America.	Imported from any other foreign country.
24 3		under 48	under 50
2 6	When the price is	at or above 48	at or above 50
0 6		and under 52	and under 54
		at or above 52	at or above 54

The act of 44 Geo. III. c. 108, (1804,) made this scale more prohibitory, by raising the points at which importation began, and at which the low duty came into operation, but maintained about the same proportions between foreign and North American corn. Ireland, with respect to the duties on corn, remained subject to the same regulations as the North American colonies up to 1806; in which year an act was passed placing its corn-trade on the footing of a coasting trade. On the 15th of June, 1813, Sir H. Parnell moved certain resolutions on the corn-laws—stating at the same time, that the corn-law report of that year was intended to render the United Kingdom independent of the Continent for the supply of corn, and to lower prices. One of these resolutions (No. 8) was to the effect, that corn, the growth or produce of Quebec, or the other British colonies of North America might be imported into the United Kingdom without duty. This proposition was not adopted; but in the corn-law act of 1815, wheat from a British colony in North America was admitted when the price was 67s. per quarter, whereas foreign wheat was not admitted until the price reached 80s. (55 Geo. III. c. 26, s. 6.) By the act of 1822, the prices at which North American and foreign wheat could be imported were respectively reduced to 59s. and 70s. (3 Geo. IV. c. 60, s. 5.) In 1825, an act was passed (for a year, and until the end of the next session of parliament) by which wheat could be imported into the United Kingdom, from British possessions in North America, without restriction as to price, at a fixed duty of 5s. per quarter,* (6 Geo. IV. c. 64.) Up to this time the discriminating duty in favor of colonial wheat had been confined to the North American colonies. By the act of 1828, wheat imported from any British possession in North America; or *elsewhere out of Europe*, was admitted at a nominal duty of 6d. when the price was at or above 67s. a quarter; when below 67s. at a fixed duty of 5s. (9 Geo. IV. c. 60.) This duty was rendered still more favorable to the colonial producer by the act of 5 Vict. c. 11, (1812,) which converted the fixed duty of 5s. into a sliding-scale varying from 5s. to 1s., the nominal duty beginning when the price was 58s. With respect to Canadian wheat, this limited scale was repealed, and a fixed duty of 1s. substituted, by the 6 and 7 Vict. c. 29, (1843.) Prior to the passing of the latter act, the Canada legislature imposed a duty of 3s. a quarter upon foreign wheat imported into Canada. The quantity of wheat imported from Canada into the United Kingdom has never been large; in 1844 it amounted to 235,591 quarters. By the measure of this session, all corn imported from British colonies out of Europe is immediately admitted at a nominal duty.

We have likewise extracted from our customs tariff, as it stands after the amendments of the present session, the articles, not hitherto mentioned, which are subject to discriminating duties, for the

protection of imports from British colonies and possessions. We have, in order to exhibit the scale of protection afforded, divided these articles into eight classes; showing the different proportions of the duty on the *foreign*, to the duty on the *colonial* import.

CLASS I.—*Duty on the foreign article combined with free importation of the colonial article.*—Anchovies.

CLASS II.—*Duty on the foreign article twelve times and upwards.*—Rice, rough and in the husk; tallow.

CLASS III.—*Sextuple duty.*—Copper ores containing more than twenty per cent. of copper; ginger preserved; marmalade.

CLASS IV.—*Quintuple duty.*—Arrowroot; butter; cassava powder; eggs.

CLASS V.—*Quadruple duty.*—Copper ores containing not more than twenty per cent. of copper, (nearly;) lead, pig and sheet.

CLASS VI.—*Triple duty.*—Apples, raw; cassia; cheese, (nearly;) cocoa paste, or chocolate; copper ores containing not more than fifteen per cent. of copper; hams, (nearly;) liquorice juice, (nearly;) puddings and sausages; tamarinds; tongues, (nearly.)

CLASS VII.—*Double duty.*—Bandstring twist; bast ropes, twines, and strands; boxes; bricks or clinkers; cables; capers; chalk; cinnamon; cocoa; coir rope; comfits, (dry;) copper, unwrought; cordage; cotton manufactures; cucumbers, preserved; gauze of thread; ginger; hair; hides; honey; nickel, wrought; liquorice roots and paste; do. powders, (nearly;) mats and matting; onions; poultry, alive or dead; raisins; rice; seeds; starch; tiles; tin ores; twine; woollen manufactures.

CLASS VIII.—*Less than double.*—Nutmegs; soap, hard and soft.*

From these examples, it appears that, since the end of the last century, there has been a prevailing disposition to give to colonial produce a preference in the market of the mother country. During the war, this disposition was strengthened by a sincere though mistaken fear of commercial dependence, and a belief that the hostility of Napoleon would be able to close the Continent permanently against us. Its principal source, however, was a desire to afford encouragement to colonial industry; and by this bounty to attach the colonies more firmly to the parent state. The latter policy has seemed the more prudent, inasmuch as England, since the American war, has been disinclined to grant the same popular institutions to its colonies as were conceded to the early settlements in North America and the West Indies. Recent acquisitions, such as Trinidad, St. Lucie, the Cape of Good Hope, the Mauritas, Malta, and Ceylon; and recent colonies, as those in Australia, have not received houses of assembly. It seems, therefore, to have been thought, that for the want of free local institutions, some compensation might be afforded by the grant of commercial privileges, advantageous to the colony, and detrimental to the mother country.

Having given this outline of the system pursued by England with respect to its colonial trade, we will proceed to consider whether this country would be justified in making colonial protection an excep-

* As to the unfounded alarm created among the agriculturists by this bill, see the speech of Mr. F. Robinson, 8th March, 1827.—16 *Hansard*, p. 1055.

* Some of these discriminations were introduced by the tariff of 1842. See the debate on Lord Howick's motion, house of commons, 13th May, 1842.—(63 *Hansard*, 512-49.)

tion to the general principle of commercial freedom ; and in retaining, for the supposed benefit of colonial industry, a system of monopoly which it renounces in behalf of its own producers.

For this purpose, we must begin by ascertaining the view which is to be taken of the advantages derivable, in the present circumstances of the United Kingdom and the world, from the possession of dependent colonies.

The colonies and dependencies of England yield no tribute or revenue to the paramount state. No payments are made by any of our colonies into the British Exchequer. Instead of lightening our fiscal burdens, they are sources of expense. Their protection against actual or apprehended attacks is costly. A large part of our military and naval expenditure is incurred on their account. The late hostilities in Afghanistan, China, and Scinde, with the recent campaign on the Sutlej ; the insurrection in Canada, and the preparations for the defence of Oregon ; afford obvious instances of the onerous obligations which extensive empire imposes upon the ruling state. Moreover, the fortification of colonial possessions is a further source of expense. With the exception, too, of Gibraltar and Malta, and the newly-acquired post of Aden, they cannot be said to increase our military and naval strength ; inasmuch as they scatter our forces, and extend our lines of operation over half the world. And not only do they create the necessity for larger military and naval establishments in time of peace, but they involve us in wars to which otherwise we should not be exposed. Beyond the very questionable benefit of apparent power, (which may lead to jealousy as well as to fear,) we derive no advantage from the mere supremacy over remote provinces ; from our being able to say that the Queen of England has so many million subjects, and that her dominions include so many thousand square miles ; that the sun never sets on the British Empire ; that the English language is spoken in every clime, and that the flag of England floats in every latitude. That we do, however, in the present state of the world, derive much substantial advantage from our colonies, cannot be doubted : but that advantage, as it appears to us, consists, not in the barren attribute of sovereignty, but, principally, in the facilities which they afford for commercial intercourse.

At the time of the peace of Amiens, Bonaparte had conceived the wildest schemes of colonial aggrandizement for France ; he was to establish a chain of dependencies in America, Africa, and Asia, by which the influence of France would predominate over the whole world. Everything, in his mind, assumed the form of conquest and military encroachment ; and he could imagine no other foundation for the greatness of France than the ruin of England. That two independent countries could simultaneously flourish ; that they could even derive benefit from each other's prosperity ; were, to his mind, propositions so evidently false as not to require refutation. Even Napoleon, however, accustomed as he was to look at everything as a general, and not as a civil governor, was captivated with the commercial prospects of colonies ; and constantly associated with them the ideas of a mercantile marine and an extension of external trade.

In what, however, do the commercial advantages of colonial possessions consist ? They consist simply, as it seems to us, in the power which the mother country thereby enjoys of securing a fair and open market to her goods. They consist in her power of preventing the colony from excluding her from

its market, by restrictions and discriminating duties, and all the perverse follies which the union of national jealousy with false systems of political economy has engendered. If the colony were independent, it would, supposing it to understand its true interest, admit the goods of the mother country upon the same terms of equality as it does when dependent. It would do voluntarily what it now does under compulsion. But looking to the established errors on the subject of trade, to their general currency, and to the strength and speciousness of the prejudices with which they are associated, we may be certain that such would *not* be its conduct. It would, however small in extent, attempt to set up a separate industrial and commercial system. Certain bodies of producers and traders would raise a cry about native industry ; and the public, partly from simplicity, and partly from national antipathies, would yield to the interested delusion. Some of the Oriental countries, too, (as China and Japan,*) prohibit nearly all commercial intercourse with foreigners. If the obstacles opposed to our trade with these countries, are contrasted with the facilities which we enjoy for trading with Hindostan, we perceive the commercial advantages which our territorial sovereignty may confer. For these reasons we have, in the present state of the world, a substantial interest in the dependence of our colonies. We can secure an open market and a free trade, so long as we can procure a safe passage over the seas, and maintain the allegiance of the subject territories.

Notwithstanding the limited population of most of our colonies,† and their contracted means of purchase, the extent of our colonial trade is considerable, as compared with our trade with foreign countries. The following table will show the proportions for the three years 1839–41.

Years.	Declared value of British Manufactures exported	
	To all the World.	To British Colonies.
1839	£53,233,580	£16,279,108
1840	51,406,430	17,378,550
1841	51,634,623	15,153,632‡

In round numbers, about thirty per cent. of the exports of England are sent to the colonies. Considering the great wealth of the European countries, and the United States, and the proximity of the former, it is remarkable that the colonial should bear so large a proportion to the foreign trade ; and the extent of the exports to the colonies can only be explained by the freedom of intercourse with them, which we owe to our political ascendancy.

Generally, therefore, the advantages which we derive from the possession of colonies may be said to consist in this :—that, in consideration of the

* On the rigorous exclusion of foreign traders from Japan, see M'Culloch's *Dict. of Commerce*, Art. "Nangasacki ;" and an interesting volume on *The Manners and Customs of the Japanese*, published at London in 1841.

† Setting aside the territories of the East India Company, the only two dependencies of the British crown which contain a population exceeding 400,000, are Canada and Ceylon.

‡ See *Porter's Progress of the Nation*, vol. iii., p. 433.

responsibility and expense of superintending their government, and defending them against hostile attack, we require them to trade freely with us. They are separate political communities, each with its peculiar, though not sovereign, government—managing its own public revenue and expenditure, levying custom duties of its own, and maintaining a distinct system of taxation—but not permitted to use its power so as to impose restrictions and disabilities upon the trade of the mother country.

But the commercial advantages derivable from the possession of colonies have this, and no wider extent. No benefit can accrue to the mother country from attempting to incorporate distant and scattered colonies into her own fiscal system; and to draw a line of commercial privilege between her own colonies and foreign countries. A Zollverein for the colonies of England is an absurdity.

What is the principle of the German Zollverein? A number of adjoining states, having a general similarity of interests, climate, population, and language—some of them single towns, as Frankfurt—others being territories not larger than an English county—maintain separate customs establishments. Custom-house lines are drawn round each state, so that a traveller may pass through the territories of two or three states, and be subjected to a separate examination and payment of duties in a single day's journey. These states agree to abolish all the internal customs' lines, to levy their custom-duties only upon the external frontier of the confederacy, to pay them into a common treasury, and to divide the fund so formed according to a scale mutually agreed upon. This arrangement is practicable and convenient. Setting aside the *rates* of duty, (which we are not now considering,) it is beneficial both to the confederated states and to the rest of the world:—to the native consumer, to the merchant, and to the traveller. Each state retains its separate revenue system for *other* taxes. Its land tax, its excise duties, its stamp and postage duties, are collected by its own officers, and paid directly into its own coffers. But with respect to custom duties, it belongs to a larger system of states, which levies them for it, and from which it receives its proper share of the common fund.*

There is no necessary coincidence between custom-house lines and the frontiers of an independent state. They may be either more or less extensive. Before the measure of Turgot in 1774, the importation of corn from one province of France to another was prohibited. In like manner, the trade between Ireland and Great Britain was not put on the footing of a coasting-trade till the year 1825. There are still internal custom-duties in the British dominions in India. The German League, on the other hand, has extended the circle of its custom-house lines so as to include many independent states. The principle on which this league is founded, is highly beneficial in its operation; and is an advance in civilization, by tending to weaken national distinctions, to multiply the pacific relations of independent states, and to create a community of interests. But, however important and advantageous it may be, it requires, in order to obtain success and permanence, the union of several conditions, which are not of frequent occurrence.

1. The communities must be contiguous to one

another, so that the entire confederation may be surrounded by a single custom-house line. 2. The custom-duties must be collected for the common account, be paid into a single fund, and afterwards divided amongst the separate states. 3. There must be such a similarity of circumstances and interests, as to render the continuance of the arrangement probable; and to induce the members to acquiesce, without serious dissatisfaction, in the joint management and collection of the duties, and their subsequent division according to a fixed scale.

The principle of the German customs' league is applicable, for example, to the Italian states; it is applicable to Holland and Belgium, provided these countries could forget their mutual animosity, and combine for a purpose of common advantage. But to a system of communities such as England and her colonies, it is utterly inapplicable. The colonies of England are scattered over every part of the globe. If we made a colonial customs' union, our custom-house lines must reach to the antipodes. In order to be consistent, we must include Canada, Jamaica, the Cape, Australia, and Hindostan, with the British isles, in one custom-house system. The fundamental conditions for such an arrangement are wanting. These communities, distant from England and from each other, cannot be brought within one external line of duties, nor can the internal lines be abolished. Neither can their duties be levied on a common account; each must continue to maintain its separate and peculiar custom-house. Upon a moment's consideration, it is manifest that a colonial customs' union, so far as the empire of England is concerned, is an impossibility.

For a similar reason, we cannot accede to the opinion of Mr. M'Culloch, (with whose views on this subject we generally concur,) that the trade with the colonies should, as far as circumstances will permit, be conducted on the footing of a *coasting-trade*.* By a coasting-trade, we understand a maritime trade carried on between different parts of the country, which is subject to the same custom-house system. For example, the trade between Edinburgh and London, or between Marseilles and Havre, is a coasting-trade. Now we are unable to understand how the trade between London and Quebec, or Calcutta, or Sydney, can ever be brought into the form of a coasting-trade. With communities so distant and so dissimilar, no identity of economical interests, for fiscal purposes, can be established. Even such an approximation towards a joint fiscal system as was made by the Canada corn act of 1843, shows the inapplicability of the principle. By this act it was attempted to bring the English and the Canadian corn-grower within the pale of a common protection, excluding from it all foreign corn. But one of the main arguments for the protection of British corn was the existence of peculiar burdens on land; which rendered the native producer less able to compete against the foreign corn-grower. Now these burdens were not shared by the Canadian farmer; and therefore the admission of Canadian wheat at a nominal duty, while foreign wheat was subject to a heavy tax on importation, was utterly subversive

* "Being integral parts of the empire, the trade with the colonies should, as far as circumstances will permit, be conducted on the footing of a coasting-trade."—*Dict. of Commerce*, Art. "Colonies and Colony Trade," p. 320, ed. 1844.

* On the German Customs' Union, see this Journal, vol. lxxix., p. 108-9.

of this leading argument for the maintenance of the corn-law.*

But, even if a colonial customs' league is impossible for England, if the custom-duties of our vast and scattered empire cannot be centralized into one uniform system, is it not just and politic to give a preference to colonial imports into the United Kingdom? If the mother country must retain a customs' tariff distinct from the tariffs of its colonies, ought it not to establish a discrimination of duties between goods imported from colonies and from foreign countries, in favor of the former? In order to answer this question, we will revert to what has been already said with respect to the commercial advantage derived by a mother country from the possession of colonies;—viz., that it consists, not in assuming the *monopoly* of the colonial market, but in securing its *freedom*: not in excluding the rest of the world, but in protecting yourself against exclusion. If the commercial policy of England was managed on this principle, the colonies would not be entitled to ask for compensation in the shape of a monopoly of the home market. They would not be subjected by the mother country to any commercial-disadvantage which would call for indemnity. They not only have no substantial interest in a system of isolation, in duties for protecting their native industry; but they ought, if they understood their true interest, to be most grateful to the mother country for saving them from the introduction of this ruinous folly. So long as England avowedly maintained a colonial monopoly for *her own benefit*, so long as she regulated the trade of the colonists to their detriment and her supposed advantage, the case wore a different complexion. There was a sacrifice on the side of the colony, which might give a claim for a corresponding sacrifice on the side of the mother country. England, however, has now abandoned this restrictive system, and allows the colonists to trade freely without giving her goods the preference. Nevertheless, she retains the discriminating duties against herself, which were intended to serve as a counterpoise to the loss suffered by the colony. She makes a sacrifice as a compensation for an injury which she no longer inflicts. In an excess of devotion, she expiates by an enduring penance a sin which she has ceased to commit.

Let us consider the effect of the system of discrimination in favor of colonial produce, with respect to the interest of the mother country and its consumers, and of the colony and its producers.

When a discriminating duty on colonial produce is in operation, the effect is this. If importations take place regularly under *both* rates of duty—that is to say, if the article is imported as well from foreign countries as from the colonies—the price is

* The distinction between a dependency of the crown, and a district of the United Kingdom, with respect to commercial legislation and custom-duties, is well explained by Lord John Russell in his speech on the Canada corn-law, 22d May, 1843. It had been stated in debate, that the colonies are integral parts of the empire, and ought to be governed as an English county. Lord J. Russell observes, that Canada is indeed an integral part of the empire, but that, commercially speaking, it cannot be governed on the same principles as an English county. Canada, he remarks, does not share our fiscal burdens, or contribute to the common defence of the empire. Moreover, it imposes import duties upon our manufactures. This is not the case with an English county. Lincolnshire does not impose duties on goods imported from Yorkshire.—(69 *Hansard*, 742.)

raised to the same amount as if the duty upon *all* the imports stood at the maximum rate. For example, if coffee is imported at two duties; viz., foreign coffee at 6d. and colonial coffee at 4d. per lb., the price to the English consumer is the same as if there were an uniform duty of 6d. per lb. The revenue loses the difference between the sum received on the colonial imports, and the sum which would have been received if an equal quantity of coffee had been imported under the high duty. The English consumer gains nothing by the discrimination, inasmuch as the price paid in England is regulated by the price at which the coffee subject to the high duty can be sold. The effect of the discrimination is simply to cause a larger quantity of colonial coffee to be imported. But although the quantity of importations at the low duty may be greater than it would be if there was an uniform rate, the profits made by the growers and importers of the colonial article are not raised above the average rate—in as much as the trade is open, competition lowers them to the general level. With respect, therefore, to the *mother country*, a discriminating duty raises the price to the level of the high duty; and deprives the revenue of the difference between the sum paid upon the colonial importations, and the sum which would have been paid if an equal quantity had been imported from foreign countries. With respect to the *colony*, it merely directs a larger amount of capital into the protected trade; which capital yields, however, only the average rate of profit.

Now, looking to the colonial side of the question, it is to be observed, that in a newly settled country, containing large tracts of unoccupied or half-occupied land, there are in general abundant facilities for the profitable employment of capital. The field of enterprise is large, but capital and labor are scarce. In such a territory, capital, if fiscal laws do not create a fictitious motive for a different employment, will be attracted to those investments which are most profitable to the individual, and most advantageous to the colony. It is no advantage to a colony such as Canada, that its capital should be diverted from agriculture to wood-cutting. The effect of such an interference with the natural course of improvement, is well described by Mr. Lyell, in the following passage:—"I heard," he says, speaking of Nova Scotia—"frequent discussions on the present state of the *timber-duties*, both here and in Canada; and great was my surprise to find the majority of the small proprietors, or that class in whose prosperity and success the strength of a new colony consists, regretting that the mother country had legislated so much in their favor. They said that a few large capitalists and shipowners amassed considerable fortunes, (some of them, however, losing them again by over-speculation,) and that the political influence of a few such merchants was naturally greater than that of a host of small farmers, who could never so effectively plead their cause to the government. But, on the other hand, the laborers engaged during the severe winter at high pay, to fell and transport the timber to the coast, became invariably a drunken and improvident set. Another serious mischief accrued to the colony from this traffic;—as often as the new settlers reached the tracts from which the wood had been removed, they found, instead of a cleared region, ready for cultivation, a dense copsewood or vigorous undergrowth of young trees, far more expensive to deal with than the original

forest; and, what was worse, all the best kinds of timber, fit for farm-buildings and other uses, had been taken away, having been carefully selected for exportation to Great Britain. So that, while the English are submitting to pay an enhanced price for timber inferior in quality to that of Norway, the majority of the colonists, for whom the sacrifice is made, feel no gratitude for the boon; on the contrary, they complain of a monopoly that enriches a few timber-merchants, at the expense of the more regular and steady progress of agriculture."*

The protection which the parental solicitude of England has afforded to the timber trade of its colony, has therefore proved a barren gift, yielding a return of dissatisfaction rather than of gratitude.

On the other hand, the mother country is necessarily a loser. A discriminating duty can never be advantageous to the country which establishes the discrimination. We can conceive no state of things, in which discriminating duties on colonial produce imported into England, can be advantageous to England. At the utmost, they may not be disadvantageous. For example, during the existence of slavery in our colonies, the means of producing sugar, at a moderate price, in our West India islands, may have been so great, and the competition so effectual, that the protection was inoperative; so that the price of sugar in the United Kingdom would perhaps not have been lower, if the competition of the foreign sugar had been let into our market upon equal terms. But cases of this sort are rare. In general, the discrimination either enhances the price, or (what is equivalent) causes the consumption of articles of an inferior quality. Of the first case, the present state of the sugar-duties affords an example. For the sake of our West Indian colonies, and the interests involved in them, we now pay a considerably higher price for sugar, than we should pay if the trade was open indiscriminately, at a moderate duty, with the whole world. Both the consumer and the revenue are losers by the present scale of duties. The result of this system of self-sacrifice, is, (as M. Say has remarked,)[†] that no countries in Europe buy their sugar at so high a price as those which have sugar colonies! Those countries (as Italy) which have none, obtain their sugar at the lowest cost. Of the forced consumption of articles of inferior quality, the timber of Canada and the wines of the Cape afford instances. We have imported, and still import, large quantities of inferior deal from Canada, simply because Canada is our colony. Permanent national detriment has resulted from this discrimination of duties. The enormous number of buildings and public works which have been constructed in London, and the manufacturing and populous districts of the country, since the peace, have been deteriorated in value by the use of an inferior quality of timber, peculiarly liable to dry-rot. So, in consequence of the lower rate of duty, England annually imports more than 400,000 gallons of the extremely bad wine which is made at the Cape, and which is used chiefly as a menstruum for the wine manufacturer. Little of it appears to be sold avowedly as Cape wine; it is chiefly passed off in an adulterated form, as Spanish or Portuguese.

It may however be said, that although a country would lose by imposing a discrimination on imports from different foreign countries, (for example,

England, by admitting the wines of Portugal at a lower duty than those of Spain and France;)—yet it is the interest of a nation possessing colonies, to give a preference to their imports, not on *their* account, but in order to secure its own commercial independence. It may be compelled to make war against an independent state, with which it had previously maintained commercial relations; but (unless it should rebel) it can never be at war with its own colony. Such (as we have already seen) was the view with which the discriminating duties on Canada timber were established, (avowedly intended to be only temporary;) and such, too, was the origin of the privilege given to Cape wine. Probably, too, the proposition of Sir Henry Parnell in 1813, to admit North American corn without duty, had a similar foundation; for the dread of commercial dependence was then at its height. That the theory of commercial independence, which has an attractive and patriotic look, should have gained credit during the violent disturbance of commerce produced by the wars of Napoleon—that people should have looked out for some apparently immovable spot in the midst of the earthquake caused by his reckless ambition—was not unnatural; but it was a singular delusion which led our government to suppose that this security was to be found in discriminating duties. If the timber-trade with the Baltic was interrupted by the closing of the Sound, Canada timber would spontaneously, without the aid of duties, be brought into our market. So, if all intercourse with the Continent was to be permanently broken off, (a supposition extravagantly improbable,) a natural demand for the Cape wines would be created in England.

The theory of commercial independence seems to us fitted only for an Utopian state of things; for a golden age of the world, when every country shall, of its own accord, produce all things. So strong are the motives to commercial interchange, and so steady the common interest in its maintenance, that no large nation has, so far as we are aware, been unable, even in time of war, to carry on foreign trade. Athens, indeed, near the time of the Peloponnesian war, was able, out of enmity to the petty neighboring state of Megara—about as large as an English parish, or a French commune,—to cut off its supplies, and to threaten it with starvation.* But it would be utterly impossible, even for a first rate naval power, to blockade all the ports of a large nation, and intercept all its land communications. A thousand interests would be at work to defeat the prohibition. The failure of Napoleon's Continental System—which was undermined from within and without, by licenses, by smuggling, by corruption, by connivance, by fraud—is a sufficient proof that the most despotic power, and the most unscrupulous use of it, are not able to close the avenues of foreign commerce. However, even if it were possible for a powerful country, in time of war, to interrupt the foreign trade of its enemy, it does not follow that commercial independence, based on a trade with distant colonies, would be of any value. Let us, for example, suppose the most unfavorable state of things with respect to the foreign trade of England; viz. a war with France and the United States at the same time. If, during these hostilities, England

* Lyell's *Travels in North America*, vol. ii., p. 224-6.

[†] *Cours d'Economie Politique*, tom. iii., p. 440.

* See *Aristoph. Acharn.*, 535. The Megarians complained, in the Congress at Sparta, that they had been excluded, not only from the market of Athens, but also from the harbors in the subject islands and territories. *Thucyd.* i., 67.

could maintain her maritime ascendancy, she could secure the continuance of her foreign trade, either direct or indirect. The belligerent states would not be able to interrupt her commercial intercourse with other powers; nor, indeed, either directly or indirectly, with their own subjects. On the other hand, if England could not maintain her maritime preëminence, and keep the seas open to her vessels, she would be unable to carry on her trade with her remote possessions, such as Canada, the West Indies, the Cape, Australia, and Hindostan. A large country, such as France, or an extensive confederacy of contiguous states, as Germany, may, to a certain extent, render itself independent of foreign trade, by the variety of its native products, and the power of preserving its internal communications during war. But what is the worth of that commercial independence which assumes the power of maintaining, in time of war, an unbroken intercourse with the most distant regions of the globe? Of what avail is it, that we are exempt from the bondage of European timber and wine, if we are to fetch the one from Canada, and the other from the Cape? The *panacea* for the evils of commercial slavery turns out, on examination, to be no remedy at all, but rather an aggravation of the calamity.

But while we are attempting, by a system of discriminating duties, to provide against the interruption of commerce consequent upon war, do we not forget, that by this very system we are sowing the seeds of hostilities, and multiplying the chances of the occurrence of the evil which we seek to counteract? By establishing differential duties in favor of our colonies, we exclude from our ports the produce of foreign countries, or admit it on less favorable terms. Regulations of this sort, tending to the discouragement of the industry and trade of foreign countries, are naturally considered by them as unjust and unfriendly. Such distinctions, therefore, engender feelings towards us of no amicable nature, and must rank among the causes which lead to war. At all events, a system of exclusion and discrimination, directed against foreign countries, cannot fail to prevent the formation of that community of interest and feeling, which naturally springs from unfettered commercial intercourse, conducted upon equal terms.

It will, however, be said, that even if it should be apparent that colonial protection is detrimental to the mother country, yet it ought to be maintained for the sake of the colony. The colony, it will be argued, is an integral part of the empire; it is a possession of the British crown; its inhabitants are our fellow-subjects; and it is our duty, not less than our policy, to show favor to its interests, and to strengthen its allegiance, by according preferences to its trade.* The parental relation of the mother country to the colony, furnishes, according to this view, a ground why the more powerful state should make sacrifices of a commercial nature, for promoting the interests of the dependent community. This reasoning, however, obviously proceeds in a vicious circle, and returns upon itself. It is first proved, that the possession of colonies is advantageous to a country on account of the encouragement and extension which they give to its trade. The expenses of civil government, and of military and naval protection, and the increased

chances of war, are admitted to be evils; but it is said that a compensation for them is found in the commercial facilities which the colony affords to the parent state. When, however, it is objected, that the mother country is a loser in regard to its trade, and that it sacrifices its commercial interests to the colony; then it is answered, that in order to preserve the allegiance of a valuable colony, and to cultivate the affections of our colonial subjects, we must submit to disadvantages by which their trade and industry are benefited. This species of logic reminds us of the reasoning which is sometimes used to justify the common practice of "throwing good money after bad." A person is advised to engage in some speculation on the ground that it will yield him a large profit. He makes the attempt—invests his money in buildings and machinery, and, instead of gaining, finds a large deficit. His impulse is to sell all his stock at the best price he can obtain, to escape from the enterprise as speedily as possible, and thus to avoid all additional loss. But his advisers represent to him the value of his fixed capital, and the large sacrifices which he has made in order to engage in the undertaking, and they therefore urge him to raise more money in order to make a further attempt. He builds in order to gain; but when the enterprise has been attended with loss, he proceeds to spend more money upon an unpromising concern, because he has built expensive works. So we obtain colonies for the sake of their trade; and then make sacrifices in colonial trade in order to retain our colonies.

If the preceding views are correct, it follows that a system of colonial protection, by means of discriminating duties and concealed bounties, is unsound and impolitic; and that the notion of a colonial custom's union is thoroughly impracticable.

Supposing protection to be afforded with respect to an article of colonial produce, not grown in the mother country, (for example, sugar or coffee;) then, as we have shown, the mother country is almost necessarily a loser. No real reciprocity exists, even if the system of excluding foreign produce is adopted on both sides; for one market is larger than the other. The advantages which the monopoly of the market of the mother country offers to the colony, are far greater than those which the monopoly of the colonial market offers to the mother country. At present, however, even this semblance of reciprocity does not exist, so far as this country is concerned; for England no longer limits her colonies to her own produce. She has abandoned her restrictions on the colonies, though she upholds the privileges to colonial goods by which she suffers. If there is no reciprocity, neither is there any community of interests. Wherever the article is exclusively of colonial growth, the colony and the mother country have avowedly separate interests. The colony sells and the mother country buys. It is the interest of the mother country to buy in the cheapest market, but she is excluded from the cheapest market by her own discriminating duties, and confined to the produce of her own colony.

If the article is produced both in the mother country and the colony, and protecting duties common to the produce of both countries are imposed, (as in the case of Canada corn,) then the protection rests on a different ground. An attempt is made to bring the producers of both countries within the same circle of protection, and to consider them, for this purpose, as members of one community. It

* "Is it wise for you to set up (?) this line of distinction between yourselves and your fellow-countrymen in Canada?" Lord Stanley, Speech on Canada Corn-law, 19th May, 1843, (69 *Hansard*, p. 598.)

is, to a certain extent, an endeavor to create a colonial Zollverein. If, however, anybody will consider the principles of the German Zollverein, and apply them consistently to our colonial empire, he will speedily discover the dissimilarity of the cases, and the impossibility of success; he will, we think, soon convince himself that it is necessary to regard the colonies as separate, though not independent communities, for custom-house purposes; and to abandon the idea of bringing them within a system of import duties common to themselves and the mother country. For fiscal purposes, the colonies ought to be as foreign countries, with which a perfectly free trade prevails. Each colony has its own tariff, and raises its own revenue of customs, which it applies to the exigencies of its own service. The mother country can watch over these various tariffs; it can prevent the exclusion of its own commodities by prohibitions and discriminating duties, and can secure an uninterrupted free-trade with its colonies. On the other hand, it ought to permit its colonies to trade freely with all the world, and to open its own ports at fair revenue duties to all colonial products; but without giving them an undue preference, detrimental to its own interests, by discriminating duties.

If the attempt to establish a colonial customs' union were made consistently, it would lead to far more extensive consequences than those which our present legislation has sanctioned; and would inflict upon the people of England far more serious privations and losses than the system of colonial protection has hitherto produced. The principle of colonial protection has been applied capriciously and irregularly. There are several important articles which we might obtain from our colonies, but which are not subject to discriminating duties. For example, there is a protection for colonial sugar and coffee, but not for colonial tobacco or cotton. There is, moreover, the utmost variety in the amount of protection afforded; the duties vary from an approach to equality up to ten or twelve times the amount. At times no object seems too small for the microscopic vision of the colonial protector. Thus, there is a protection of 2d. per lb. upon colonial anchovies. Upon oranges there is no discrimination; but colonial marmalade enjoys a protection of 5d. per lb. The importer of colonial tapioca and sago is left by our tariff to bear the full brunt of the foreign competition in these articles; but we have not been regardless of colonial interests in the item of arrow-root, which is protected by a discrimination of 4s. per lb. Our differential duties have in some cases been fixed with a minuteness of adaptation to circumstances, which would, no doubt, command our admiration, if we understood the grounds of the distinction; but which does not at once explain itself to the casual observer. For example, there is no protection for colonial dried apples; but colonial raw apples are favored by a discrimination of 4d. per bushel. The duty on colonial tin-ore is half the duty on foreign tin-ore; but for tin manufactures there is no discrimination. Cattle and meat are, under the tariff of this session, to be imported without duty; but colonial poultry, alive or dead, still retains over foreign poultry the advantage of a double differential duty. The same measure likewise extends this benefit to colonial "cucumbers preserved in salt." We regret, however, to be unable to discover that fresh cucumbers, or even melons, the produce of our colonies, have any preference in our

tariff; certainly "fruit, raw, and not otherwise enumerated," is subject to the same duty of five per cent. *ad valorem*, whether imported from a foreign country or a British possession.

Fortunately, it has never been attempted to apply the principle of colonial protection systematically to our tariff; or to confine the consumption of these islands to the produce of our colonies for all articles which can be grown in them. Almost all the discriminations have been established with a view to the interests of some particular colony. Even in last session, when Mr. Hutt moved in the house of commons a resolution for extending the Canadian scale of corn-duties to the Australian colonies, the motion was resisted by ministers, upon the ground that the concession had been made with reference to the special circumstances of Canada.* It may be added, too, that the rule of the customs' law with respect to manufactures, destroys to a great extent the principle of excluding foreign produce under a discriminating duty. Thus, American wheat imported into Canada cannot be imported into England as Canadian wheat. But American wheat imported into Canada, and there ground into flour, can be imported into England as Canadian flour, and thus obtain the advantage of the low duty. The truth is, that if the corn-law of 1842 had been maintained, a principle had already been introduced, which, if consistently pursued, ought to have permitted all the corn of Danzig and Odessa to have been ground into flour in Heligoland and Gibraltar, and imported into England at a nominal duty.

It is fortunate for this country that the system of colonial protection has not been driven to its utmost possible limits; and that the consumer in the mother country has not been consistently sacrificed to the colonial producer. But, although the principle has not been applied universally, it has been established in many extensive branches of import, and under the existing protection vested interests have been created which would suffer by a change of law. For example, the wine establishments of the Cape, and the sawmills of Canada, would, to a great extent, be abandoned if the inequality of duties on which their artificial life depends was removed. And however little advantage it may have been to Canada, for example, that its capital should be diverted from the cultivation and improvement of the soil, to cutting timber, and the lumber-trade; yet as the investment has been made, and the buildings and machinery erected, the owners of that property would undoubtedly now endure a loss, if the protection was suddenly withdrawn. Accordingly, the legislative assembly of Canada, in their recent address to the crown, speak of "the happiness and prosperity of the people of this colony, advancing in steady and successful progression under that moderate system of protection of her staple productions, grain and lumber, which her majesty and the imperial parliament have hitherto graciously secured them;" and they intimate a loyal fear, that "should the inhabitants of Canada, from the withdrawal of all protection to their staple products, find that they cannot successfully compete with their neighbors of the United States in the only market open to them, they will naturally and of necessity begin to doubt whether remaining

* On the inconsistency of not extending the same principle to other colonies, see Lord Howick's speech in the debate on Mr. Hutt's motion 8th May, 1845. — *Hansard* vol. 80, p. 333.

a portion of the British empire will be of that paramount advantage which they have hitherto found it to be."*

In cases where a purely artificial branch of production has been created by fiscal legislation, the cessation of which is demanded by the general welfare, it would be harsh and unjust to make a sudden change, without any regard for the interests which have been called into being by the act of the government. A striking instance of an artificial industry of this kind, created by protecting duties, (not indeed in favor of colonies, but against them,) is afforded by the beet-root sugar of France. After the existence of this manufacture for some years, under the shelter of protective duties, it was found that the loss to the revenue, and the high price to the public, were no longer tolerable, and it was decided to put an end to the system. It was first proposed to give a compensation of forty million francs to the growers of beet-root, and to prohibit the home manufacture; but it was ultimately thought preferable to adopt a gradual change, and to raise the duty on home-made sugar by annual increments, until it reaches the duty on colonial sugar. This transition began in August, 1844, and the change will be complete in August, 1848. A similar choice of means presents itself for the extinction of the more important of our colonial protections. We might either give compensation to the vested interests, (which, with respect to the Canada sawmills, and the Cape wine establishments, would undoubtedly be an advantageous bargain for the public;) or we might make the abolition gradual, and thus afford time for the withdrawal of capital invested in the protected industries, and for the adaptation of the colonial interests to the altered state of the law.

The following is, in a few words, a summary of the principles upon which the relation of England to her colonies—especially with reference to her colonial trade—ought, in our opinion, to be regulated. It should be constantly borne in mind, that each colony is a separate and distinct community, occupying a territory distant from England, though politically dependant upon the imperial government. Owing to this separateness and remoteness, its local and subordinate government ought to be conducted as much in accordance with the opinions and wishes of the inhabitants as is compatible with the condition of political dependence, and the maintenance of the supremacy of the British crown. For the expenses of its military and naval defence, England must not expect any direct compensation. Nor ought she to subject the trade of the colony to any restrictions for her own exclusive advantage.

* Address of 12th May, 1846. In his answer to this address, Mr. Gladstone says—"Her majesty's government conceive that the protective principle cannot with justice be described as the universal basis, either of the general connexion between the United Kingdom and its colonies, or even of their commercial connexion."—*Despatch to Lord Cathcart*, 3d June, 1846. (House of Lords, sessional paper, No. 169.) By the protective principle, is here meant the principle of protecting colonial industry at the expense of the mother country. Not only is Mr. Gladstone's proposition undeniably true; but (if he had been looking merely to historical truth) he might have added, that the generally received maxim with respect to colonial trade was formerly the very reverse—viz., that the industry of the mother country was to be protected at the expense of the colony.

She ought to assume no preference in the markets of the colony, and should rest contented with the establishment of a perfectly free trade on both sides. She ought to permit her colony to trade freely with all the world, and open her own ports to its products. But, on the other hand, she ought not to sacrifice her own interests, by levying at home discriminating duties for the supposed benefit of the colony;—a system of fiscal privilege which excludes cheaper and better foreign goods from her own markets, and gives just offence to foreign nations.

DISEASE OCCASIONED BY LUCIFERS.

DR. BALFOUR, in the Northern Journal of Medicine, describes the occurrence of necrosis in the jaw-bones, caused by continued exposure to the fumes of phosphorus, in persons employed in lucifer manufactories. The dipping the pieces of wood in the phosphoric mixture, and the drying the matches afterwards, it appears, are carried on in an ill-ventilated room, where the girls are who are employed in the factories, and who pass from twelve to thirteen hours daily in these rooms, exposed to excessive heat, and the fumes given off by the phosphorus which is used. In each manufactory from three to four pounds of phosphorus are daily employed in the production of from one to two millions of matches, the mere drying of which must give no inconsiderable quantity of phosphoric fumes, to which also must be added the quantity of metaphosphoric acid produced by the burning of sundry parcels, which, in spite of care, is no infrequent occurrence. It would seem that continued exposure to the phosphoric fumes for a length of years is requisite to produce the disease, as no cases were observed at Vienna until the manufactories had been at work upwards of eleven years. Scrofulous subjects suffer most, and in them the disease is most fatal. Almost all the girls employed have the gums more or less affected, and at their junction with the teeth, a red ulcerated line, like that produced by mercurial salivation, is apparent. When the individual is robust, and the necrosis confined to a small portion of the bone, exfoliation takes place, and a gradual cure follows; but where there exists any tendency to scrofula, phthisis becomes developed, and the patient sinks under the combination.

To counteract, as far as possible, this distressing malady, the Austrian government has, with praiseworthy alacrity, ordained the observance of the following precautions:—1st, That the matches must not be permitted to be dried in the workroom, and, if possible, this must take place in one situated above it; 2d, that every second hour the girls be obliged to wash their mouths well with acidulated water; and 3d, that they be sent out twice a-day to take their meals, and get some fresh air. These precautions are ordained on the recommendation of a medical commission; precautions which, with the addition of frequent washing, and exposure of the cloths to air and sunshine, might be beneficially adopted in many of our large factories, where metallic and other fumes are continually being less or more inhaled by the work-people.—*Chambers' Journal*.

WHITE AND BROWN BREAD.—UNFERMENTED BREAD.

SEVERAL years ago, we threw out the surmise that the separation of the white from the brown parts of wheat grain was likely to be baneful to health. We proceeded upon theoretical grounds, believing that Providence must have contemplated our using the entire grain, and not a portion only, selected by means of a nicely-arranged machinery. It struck us forcibly, that to go on, for a long course of years, thus using a kind of food different from what nature designed, could not fail to be attended with bad consequences. We have since learned that our views have some recognized support in science. The following paragraph from a recent pamphlet* will at once serve to keep the subject alive in the minds of our readers, and explain the actual grounds on which the separation of flour is detrimental:—"The general belief," says the writer, "is, that bread made with the finest flour is the best, and that whiteness is the proof of its quality; but both these opinions are popular errors. The whiteness may be, and generally is, communicated by alum, to the injury of the consumer; and it is known by men of science that the bread of unrefined flour will sustain life, while that made with the refined will not. Keep a man on brown bread and water, and he will live and enjoy good health; give him white bread and water only, and he will gradually sicken and die. The meal of which the first is made contains all the ingredients necessary to the composition of nourishment of the various structure composing our bodies. Some of these ingredients are removed by the miller in his efforts to please the public; so that fine flour, instead of being better than the meal, is the least nourishing; and, to make the case worse, it is also the most difficult of digestion. The loss is, therefore, in all respects a waste; and it seems desirable that the admirers of white bread (but especially the poor) should be made acquainted with these truths, and brought to inquire whether they do not purchase at too dear a rate the privilege of indulging in the use of it. The unwise preference given so universally to white bread, led to the pernicious practice of mixing alum with the flour, and this again to all sorts of adulterations and impositions; for it enabled bakers, who were so disposed, by adding more and more alum, to make bread made from the flour of an inferior grain look like the best or most costly, or to dispose of it accordingly; at once defrauding the purchaser, and tampering with his health. Among the matters removed by the miller are the larger saline substances, which are indispensable to the growth of the bones and teeth, and are required, although in a less degree, for daily repair. Brown bread should, therefore, be given to nurses, and to the young or the growing, and should be preferred by all, of whatever age, whose bones show a tendency to bend, or who have weak teeth. It is believed that brown bread will generally be found the best by all persons having sluggish bowels, and stomachs equal to the digestion of the bran. But with some it will disagree; for it is too exciting to irritable bowels, and is dissolved with difficulty in some stomachs. When this happens, the bran should be removed, either wholly or in part; and by such means the bread may be

adapted, with the greatest ease, to all habits and all constitutions."

Mr. Smith, in his late remarkable work on *Fruits and Farinacea* as the food of man, gives some illustrations of this doctrine. "Bulk," he says, "is nearly as necessary to the articles of diet as the nutrient principle. They should be so managed that one will be in proportion to the other. Too highly nutritive diet is probably as fatal to the prolongation of life and health, as that which contains an insufficient quantity of nourishment. It is a matter of common remark among old whalers, that, during their long voyages, the coarser their bread, the better their health. "I have followed the seas for thirty-five years," said an intelligent sea captain to Mr. Graham, "and have been in almost every part of the globe; and have always found that the coarsest pilot-bread, which contained a considerable portion of bran, is decidedly the healthiest for my men." "I am convinced from my own experience," says another captain, "that bread made of the unbolted wheat meal is far more wholesome than that made from the best superfine flour—the latter always tending to produce constipation." Captain Dexter of the ship *Isis*, belonging to Providence, arrived from China in December, 1804. He had been about 190 days on the passage. The sea-bread, which constituted the principal article of food for his men, was made of the best superfine flour. He had not been long at sea before his men began to complain of languor, loss of appetite, and debility. These difficulties continued to increase during the whole voyage; and several of the hands died on the passage of debility and inanition. The ship was obliged to come to an anchor about thirty miles below Providence; and such was the debility of the men on board, that they were not able to get the ship under weigh again, and the owners were under the necessity of sending men down from Providence to work her up. When she arrived, the owners asked Captain Dexter what was the cause of the sickness of his men. He replied, "The bread was too good."

The primary object of the pamphlet already quoted, is to explain a mode of making bread without the use of yeast, the *raising* process being accomplished by carbonate of soda and muriatic acid. The formula recommended for bread made of *wheat meal* (that is, the flour of entire grain) is—wheat meal 3 pounds avoirdupois, bicarbonate of soda, in powder, 4½ drachms troy, hydrochloric acid 5 fluid drachms and 25 minims or drops, water 30 fluid ounces, and salt ½ of an ounce troy. "Bread made in this manner," says the writer, "contains nothing but flour, common salt, and water. It has an agreeable natural taste, keeps much longer than common bread, is more digestible, and much less disposed to turn acid. Common bread, like everything that has been fermented, ferments easily again, to the great discomfort of many stomachs; and not only so, but as "a little leaven leavens the whole lump," it communicates a similar action to all the food in contact with it. Unfermented bread being free from this defect, is beneficial to those who suffer from headache, acidity, flatulence, eructations, a sense of sinking at the pit of the stomach, or pain after meals, and to all who are subject to gout or gravel. It is also useful in many affections of the skin. These remarks apply to both varieties of the bread, but especially to the brown, which is further invaluable to all who are liable to constipation from torpidity of the colon, or large

* Instructions for Making Unfermented Bread, by a Physician. London: Taylor and Walton. 1846.

intestines—the common infirmity of the sedentary, and of those who have been accustomed to oatmeal diet in their youth."

Of unfermented bread we know nothing besides what is stated in its favor in this pamphlet, excepting that an intelligent friend assures us of his having experienced much benefit to his health from the use of it for the last twelvemonth. It is certainly, however, very desirable, for another reason, that unfermented should be, as far as possible, substituted for fermented bread. At present, owing to the process of fermenting this aliment, the life of the operative baker is one of the most slavish known in our country. It is distressing to think of the misery and hardship incurred by a portion of our fellow-creatures in producing the bread laid upon our tables every day. We used to associate sugar with the blood and tears of the negroes: we might, with equal justice, connect hot rolls and snowy loaves with the sleepless, harassed lives of a portion of our own population. Could we agree to use unfermented bread, the slavish life of the baker would be at an end, for bread could then be made in two hours, where eight are now necessary.

It is hardly necessary to point out that unfermented bread, being produced at less expense of labor, would in that measure be cheaper to the public. A reduction of price would arise from another cause. By the use of the chemicals, there would be a saving of ten per cent. in the flour. "In the common process," says the pamphlet, "much of the saccharine part of the flour is lost by being converted into carbonic acid and spirit; and this waste is incurred solely for the purpose of getting carbonic acid to raise the dough. By the new method, the waste is avoided, and the gas obtained in a manner equally beautiful and efficacious—another striking instance of the successful application of chemical philosophy to the arts of life."

From Chambers' Journal.

SPECTRE WITNESSES.

MUCH as the disembodied spirits of the dead have associated themselves with men's actions, it is a rarity to find the intercourse between the world of life and that of spirits forming an item in official and practical business, and holding a place in the record of its transactions. The conflict of intellects in the practical business of life is a great exorciser of evil spirits; and while the strong-minded, the educated, and the learned, in the solitude of cloisters, in old graveyards, in caverns, or on "blasted heaths," have every now and then professed to be visited by apparitions, twelve of the most superstitious men in the world, empannelled as a jury, would hardly be found to attest a ghost story by a verdict returned in open court. Defoe, it is true, presents to us the history of a murderer who, in giving false evidence against an innocent man, is confronted by the ghost of the victim, with which he carries on a dialogue in open court, ultimately fatal to his conspiracy. But the ingenious writer leaves it undetermined whether the spectre was supposed to be present, or the diseased imagination of the perjured murderer, working upon his organs of sight, had called up the impression, and made the suggestions of his evil conscience, like those of Macbeth, appear to be embodied before his eyes. And here, by the way, let us just note how preposterously the stage, in representing this awful instance of the force of conscience, outwits itself in

the belief that it is gratifying the taste of the multitude. The true impressiveness of the guilty man's terror consists in his seeing what the on-lookers see not. "The table is full," but to him only—not to the wondering guests, or to his own iron-nerved wife. Yet at this moment, in the usual performance of the piece, some big stout man, dressed in tartans, with his throat painted to represent its being cut, stalks in and seats himself right in front of the audience, who should see the ghost of Banquo only reflected in the horror that distorts the countenance of Macbeth.

To return to our immediate subject. Sir Walter Scott having discovered, in the criminal records of Scotland, a trial for murder, in which some information received from the ghost of the murdered man was a part of the evidence, thought the record of sufficient interest to be printed for the Bannatyne Club, with the title, "*Trial of Duncan Terig alias Clerk, and Alexander Bayne Macdonald, for the murder of Arthur Davies, Sergeant in General Guise's regiment of foot, June, 1754.*" The sergeant was commander of a small party, employed in the obnoxious duty of enforcing the act against the Highlanders carrying arms and wearing their native costume. He was stationed at Braemar, where the quantity of game on the surrounding hills tempted him to make solitary sporting excursions. The spot where he met his death was on the hill of Christie, one of the range of mountains which extend from the Dee in Aberdeenshire towards the Spital of Glenshee, in the Braes of Angus. It is at this day a savage and solitary district, where human habitations or cultivated lands are hardly to be met with, and a body might lie in the deep heather till the flesh fell from the bones ere the usual course of chance might bring a visitor to the spot. We may have some idea of the sergeant's character from the testimony of his widow. He seems to have been a fearless, frank, good-natured man, fond of field-sports, and well to do in the world. The wealth he carried about his person would not now be often found with one of his standing; but from Fielding's novels, and other sources, it is pretty clear that a sergeant in the army occupied a much higher social position in that age than in the present.

The most important portion of the widow's testimony was thus given:—"Her husband was a keen sportsman, and used to go out a shooting or fishing generally every day. When he went along with the party on patrol, he sent the men home, and followed his sport. On other occasions, he went out a shooting by himself alone. He was a sober man, a good manager, and had saved money to the value of about fifteen guineas and a half, which he had in gold, and kept in a green silk purse, which he enclosed within a leathern purse, along with any silver he had. Besides this gold, he generally wore a silver watch in his pocket, and two gold rings upon one of his fingers, one of which was of pale yellow gold, and had a little lump of gold raised upon it, in the form of a seal. The other was a plain gold ring, which the deponent had got from David Holland, her first husband, with the letter D. H. on the inside, and had this posy on it—"When this you see, remember me." Sergeant Davies commonly wore a pair of large silver buckles in his shoes, marked also with the letters D. H. in the inside, which likewise had belonged to her said former husband; as also he wore silver knee-buckles, and had two dozen silver buttons upon a double-breasted vest, made of striped

interesting. He frequently had about him a folding penknife, that had a brown tortoise shell handle, and a plate upon the end of it, on which was cut a naked boy, or some such device, with which he often sealed his letters. One day, when he was dressing some hooks, while the deponent was by, she observed he was cutting his hat with his penknife, and she went towards him and asked what he meant by cutting his hat! To which he answered that he was cutting his name upon it. To which the deponent replied, she could not see what he could mean by putting his name upon a thing of no value, and pulled it out of his hand in a jocular way; but he followed her, and took the hat from her, and she observed that the A. was then cut out in the hat; and after he got it, she saw him cut out the letter D., which he did in a hurry, and which the deponent believed was occasioned by the toying that was between them concerning this matter; for when she observed it, she said to him, you have made a pretty sort of work of it by having misplaced the letters. To which he answered that it was her fault, having caused him to do it in a hurry. The hat now upon the table, and which is lying in the clerk's hands, and referred to in the indictment, to the best of her judgment and belief is the hat above-mentioned. She never has seen neither the said sergeant, the green silk purse or leathern purse before-mentioned, nor the buckles for his shoes or knees, watch, or penknife, since he marched from his quarters with the party at the time at which he is supposed to have been murdered. On Thursday, being the day immediately preceding Michaelmas, being the 28th of September, 1749, her husband went out very early in the morning from Dubrach, and four men of the party under his command soon after followed him, in order to meet the patrol from Glenshee; and in the afternoon, before four o'clock, the four men returned to Dubrach, and acquainted the deponent that they had seen and heard him fire a shot, as they believed, at Tarmatans, but that he did not join company with them. At the place appointed they met with a corporal and a party from Glenshee, and then retired home. Her husband never returned. She has never met with anybody who saw him after the party returned from the foresaid place, excepting the corporal who that day commanded the party from Glenshee, who told her that, after the forementioned party from Dubrach had gone away from the foresaid appointed place, Sergeant Davies came up to him all alone, upon which the corporal told him he thought it was very unreasonable in him to venture upon the hill by himself, as for his part he was not without fear, even when he had his party of four men along with him; to which Sergeant Davies answered, that when he had his arms and ammunition about him, he did not fear anybody he could meet. Her husband made no secret of his having the gold before-mentioned; and upon the many different occasions he had to pay and receive money, he used to take out his purse and show the gold; and even when he was playing with children, he would frequently take out his purse and rattle it for their diversion, from which it was generally known in the neighborhood that the sergeant was worth money, and carried it about him. From the second day after the sergeant and party went from Dubrach as aforesaid, when the deponent found he did not return, she did believe, and does believe at this day, that he was murdered; for that he and

she had lived together in as great amity and love as any couple could do that ever were married, and he never was in use to stay away a night from her; and it was not possible he could be under any temptation to desert, as he was much esteemed and beloved by all his officers, and had good reason to believe he would have been promoted to the rank of sergeant-major upon the first vacancy." The body had lain for nearly a year before it was discovered. Of the state in which it was found, and the alleged appearance of the sergeant's ghost to the witness, Alexander Macpherson *alias* Macgillias, the following is an account in that person's own words, as his evidence was taken down in court:—

"In the summer of 1750, he found, lying in a moss-bank in the hill of Christie, a human body; at least the bones of a human body, of which the flesh was mostly consumed, and he believed it to be the body of Sergeant Davies, because it was reported in the country that he had been murdered in that hill the year before. When he first found this body there was a bit of blue cloth upon it, pretty entire, which he took to be what is called English cloth; he also found the hair of the deceased, which was of a dark mouse color, and tied about with a black ribbon; he also observed some pieces of a striped stuff; and found also lying there a pair of brogues, which had been made with latches for buckles, which had been cut away by a knife. By the help of his staff, he brought out the body, and laid it upon plain ground; in doing whereof, some of the bones were separated one from another. For some days he was in a doubt what to do; but meeting with John Growar in the moss, he told John what he had found, and John bade him tell nothing of it, otherwise he would complain of the deponent to John Shaw of Daldownie; upon which the deponent resolved to prevent Growar's complaint, and go and tell Daldownie of it himself; and which having accordingly done, Daldownie desired him to conceal the matter, and go and bury the body privately, as it would not be carried to a kirk un kent, and that the same might hurt the country, being under suspicion of being a rebel country. Some few days thereafter he acquainted Donald Farquharson of his having seen the body of a dead man in the hill, which he took to be the body of Sergeant Davies. Farquharson at first doubted the truth of his information, till the deponent told him that, a few nights before, when he was in bed, a vision appeared to him as of a man clad in blue, who told the deponent, 'I am Sergeant Davies;' but before he told him so, the deponent had taken the said vision, at first appearance, to be a real living man, a brother of Donald Farquharson's. The deponent rose from his bed, and followed him to the door, and then it was, as has been told, that he said he was Sergeant Davies, who had been murdered in the hill of Christie near a year before, and desired the deponent to go to the place he had pointed at, where he would find his bones, and that he might go to Donald Farquharson and take his assistance to the burying of of him. Upon giving Donald Farquharson this information, Donald went along with him, and found the bones as he had informed Donald, and then buried them with the help of a spade, which he (the deponent) had along with him: and for putting what is above deposed on out of doubt, deposes that the above vision was the occasion of his going by himself to see the dead body, and which he did before

he either spoke to John Dowar, Laldownie, or any other body. While he was in bed another night, after he had first seen the body by himself, but had not buried it, the vision again appeared, naked, and minded him to bury the body; and after that he spoke to the other folks above-mentioned, and at last complied, and buried the bones above-mentioned. Upon the vision's first appearance to the deponent in his bed, and after going out of the door, and being told by it he was Sergeant Davies, the deponent asked him who it was that had murdered him, to which it made this answer, that if the deponent had not asked, he might have told him, but as he had asked him, he said he either could not, or would not; but which of the two expressions the deponent cannot say. But at the second time the vision made its appearance to him, the deponent renewed the same question; and then the vision answered that it was the two men now in the panel [at the bar] that had murdered him. And being further interrogated in what manner the vision disappeared from him first, it fast, depones that, after the short interviews above-mentioned, the vision at both times disappeared and vanished out of his sight in the twinkling of an eye; and that, in describing the panels by the vision before-mentioned as his murderers, his words were, 'Duncan Clerk and Alexander Macdonald;' depones that the conversation betwixt the deponent and the vision was in the Irish language."

The idea of an English sergeant, even in the exalted form of a spirit, being able to speak Gaelic, startled the judge and jury, although, as Sir Walter Scott remarks, there is no greater stretch of imagination in supposing a ghost to speak a language which the living person did not understand, than in supposing it to speak at all. The other evidence against the prisoners was very strong; but this consideration as to Macpherson's deposition seems to have thrown a discredit over the whole case, and a verdict of acquittal was the consequence. A German would now suggest that phenomena of this kind are not wholly objective or external to the beholder, but partly subjective, and taking a character from himself, so that the English sergeant might really appear to the seer to speak "as good Gaelic as ever heard in Lochaber." But such considerations were not likely to occur to a Scotch criminal court in the middle of the eighteenth century.

A book, privately printed under the title of "Notices relative to the Bannatyne Club," as appropriate to Sir Walter Scott's volume, gives an account of a case in Queen Anne's county, Maryland, where the appearance of a spectre was attested in an action as to a will.

"William Briggs said that Thomas Harris died in September, 1790. In the March following he was riding near the place where Thomas Harris was buried, on a horse formerly belonging to Thomas Harris. After crossing a small brook, his horse began to walk on very fast; it was between the hours of eight and nine o'clock in the morning; he was alone; it was a clear day; he entered a lane adjoining to the field where Thomas Harris was buried; his horse suddenly wheeled in a panel

of the fence, looked over the fence into the field where Thomas Harris was buried, towards the graveyard, and neighed very loud. Witness then saw Thomas Harris coming towards him in the same apparel as he had last seen him in his lifetime; he had on a sky-blue coat. Just before he came to the fence, he varied to the right, and vanished. His horse took the road."

We give some other instances of delusions or impostures having some resemblance to our Highland ghost story, in Sir Walter Scott's words:—

"In the French *Causes Célèbres et Intéressantes*, is one in which a countryman prosecutes a tradesman, named Anguier, for about twenty thousand francs, said to have been lent to the tradesman. It was pretended that the loan was to account of the proceeds of a treasure which Mirabel the peasant had discovered by means of a ghost or spirit, and had transferred to the said Anguier, that he might convert it into cash for him. The defendant urged the impossibility of the original discovery of the treasure by the spirit to the prosecutor; but the defence was repelled by the influence of the principal judge; and on a charge so ridiculous, Anguier narrowly escaped the torture. At length, though with hesitation, the prosecutor was persuaded, upon the ground that if his own story was true, the treasure, by the ancient laws of France, belonged to the crown. So that the ghost-seer, though he had nearly occasioned the defendant to be put to the torture, profited in the end nothing by his motion.

"This is something like a decision of the great Frederick of Prussia. One of his soldiers, a Catholic, pretended peculiar sanctity, and an especial devotion to a particular image of the Virgin Mary, which, richly decorated with ornaments by the zeal of her worshippers, was placed in a chapel in one of the churches of the city where her votary was quartered. The soldier acquired such familiarity with the object of his devotion, and was so much confided in by the priests, that he watched for, and found, an opportunity of possessing himself of a valuable diamond necklace belonging to the Madonna. Although the defendant was taken in the manner, he had the impudence, knowing the case was to be heard by the king, to say that the Madonna herself had voluntarily presented him with her necklace, observing that, as her good and faithful votary, he had better apply it to his necessities than that it should remain useless in her custody.

"The king, happy of the opportunity of tormenting the priests, demanded of them whether there was a possibility that the soldier's defence might be true. Their faith obliged them to grant that the story was possible, while they exhausted themselves on the improbabilities that attended it. 'Nevertheless,' said the king, 'since it is possible, we must, in absence of proof, receive it as true in the first instance. All I can do to check an imprudent generosity of the saints in future, is to publish an edict, or public order, that all soldiers in my service who shall accept any gift from the Virgin, or any saint whatever, shall, *eo ipso*, incur the penalty of death.'

From Punch.

THE LIFE AND ADVENTURES OF MISS ROBINSON CRUSOE.

CHAPTER VI.

SINCE that beautiful looking-glass was gone forever—for never having learned to dive, it was impossible that I could hope to recover it—I still had hope. I remembered the number of lady passengers we had brought out, and felt comforted. There must be, I thought, twenty more looking-glasses in the wreck; though not such a love as the mirror I had lost.

Having pushed my raft as far near the land as possible, I fastened it with a string to a large stone, believing that, as the tide went down, the raft would be left upon the shore. I had not calculated falsely. So it happened. My next work, however, was to look about me. Where was I? In what corner of the earth? It could not be Peru, for I saw not a morsel of gold upon the beach; it was not one of the Spice Islands, for not a single nutmeg was to be seen upon any of the trees. Was it the Canaries?—flights of birds flew past me; but they flew so high, it was impossible for me to discern if there were any canaries among them. And here—I must confess it—I felt some anger towards the respected principals of my Blackheath boarding-school. I have said that I was nominally taught the use of the globes; my learning was down in the bill, and paid for every quarter. I had been taught to talk about California and Behring's Straits, and the Euxine, and Patagonia, as if they were all so many old acquaintance; and yet I knew not if at that moment I might not be upon some of them. And then I sighed, and felt that it is n't for a young lady to know anything of the world, because she sits with the globe in her hand two hours a day. And I felt too that if I ever should have a daughter—and how my eyes did sadly wander about that uninhabited tract—I should not conclude that she knew anything of geography, because I had paid for it.

However, I was resolved to look about me, and explore the country. Whereupon, I waded into the water, and removed one of the light trunks, and one of the bonnet-boxes. Of course, I could not go out without first dressing myself. My mortification was very great, though very foolish—for what could I have expected?—to find the box locked. Fortunately, it was a hasp lock; I therefore sat down upon the beach, and with a large stone hammered away until I had broken it. With some natural anxiety, I lifted the lid. The first thing that burst upon my view was a very pretty muslin—worked with a green sprig—a nice morning thing. I remembered the lady to whom the box belonged, and felt that the gown could not fit me—it must be at least half-a-quarter too wide in the waist. But I felt half-comforted, and much distressed with the thought that nobody would see me. I therefore began my toilette; and, considering my many difficulties, felt—for though I had no glass, we feel when we look well—I felt myself interesting. I contrived to pin in the gown, hiding it where most wanted with a primrose-colored China crape shawl. Dressing my hair in bands—for, though from childhood it always curled naturally, it could not be expected to curl so soon after so much salt water—I put on a beautiful chip bonnet, (I am certain the unfortunate soul had brought it out with her ready truncheon for a hasty

marriage.) I was not troubled with the shoes; for, by some strange fatality, even in England I never could get a shoe small enough for me; and the lady whose shoes I was doomed to wear had a foot like—but no; never while I live will I speak ill of the dead. I said my hair would not curl. Let me correct myself. One lock always could, particularly well. / And this lock—do what I might—always *would* show itself just under my bonnet. And so it happened now.

Among the many little elegances—which I will not stop to name, for they will find names in the bosom of every lady—discovered in the box, I found some court plaiter. This was a blessing. I felt that even among tigers—if there were tigers—I should not be deprived of my daily beauty-spot. I also found a very handsome shot-silk parasol, fresh from the shop, wrapt in its virgin paper. Now, I never thought too much of my beauty—no woman can ~~be~~ ^{be} proud of the loveliness of my complexion, people called me, from a child, Little Dresden China. Therefore, my emotions on discovering the parasol, the sun being at the time—perhaps two hundred in the shade, may, in the words of a great public writer, “be more easily conceived than described.”

Being as well dressed as my dreadful circumstances would permit, I felt that I might venture out. As, however, the country might be inhabited—(my heart beat thicker at the thought)—I felt it necessary to be prepared for the worst. For what I knew, it might be an island not far from Constantinople, and—the pure blood of a free-born English maiden burned in my veins—I would prefer death to the captivity of the Harem, or (according to the last editions) Hareem. At the thought, I remembered that I had been suckled at the same breast with the British lion, and knew the proper moment when—to die!

My sister readers—and these pages are written for them alone—cannot therefore but applaud my resolution when I inform them that I took with me (placing them like sleeping vipers in my bosom) my pair of scissors, and in my right hand (my left carried my parasol) one of the captain's pistols. If the country was not inhabited by Hottentots or Hindoos—I always had a horror of a black skin, whereas there is something romantic in the true olive—there might be lions and tigers, leopards and crocodiles.

I therefore began my morning walk, never once turning round, though now and then—how deceitful is fancy!—I thought I heard footsteps following me. They might be men: but even then the lessons of my dear mother were not forgotten—I never looked behind me: I tripped a little quicker, unconsciously lowering my parasol. I began to ascend a hill, I should say quite as high as Highgate. Arrived at the top, I turned round and round, and wherever I turned saw nothing but the sea heaving about me. Then I felt that I had, after all, learned something of geography. I knew I was upon an island.

Was it inhabited? There was a beautiful double opera-glass in the box I had opened. Why had I not brought it with me? If inhabited, I might have beheld the smoke of chimneys; the dancing, perhaps—what indecorous, what different dancing to the aerial movements of her majesty's theatre—of the benighted savages. No: it was plain I was alone. Alone! My eye rested upon my sprigged muslin—my feelings flew back to my white chip—and I wept.

I descended the hill; and at the bottom, that was skirted with some thick bushes, I heard a noise. In a moment, and with a courage that at any other time I should have thought it impossible for me to possess, I turned my head aside, and presenting my pistol, fired. Something, with a heavy bump, fell a few yards from me. Before I ventured to look, I asked myself—"Is it a tiger!—is it an eagle?" I turned round, and saw it was neither one nor the other. It was a bird of an enormous size, with large fleshy knobs about his head and neck. Had I seen such a bird before? I had been to Mr. Wombwell's; he had nothing like it. And then I recollected that I had seen something like the bird in London, at Christmas. In a word, after much deep thought and patient examination, I discovered the bird to be a turkey—a wild turkey. At least, I thought, here is a dinner. But how to get it home? "Home!" so sweet is the word, it follows us everywhere. My "how" was where my boxes were. "How to get it home!"

"If anybody," I thought, forgetting my desolation, "was to see me carrying a turkey, could I ever look the world in the face again?" Instinctively I looked round and round that nobody might behold me, and at length lifted up the turkey by the neck. I do not profess to be a correct judge of weights and measures—I never could learn 'em at school, but I am very much mistaken if the turkey did not weigh at least seventy pounds. It was most oppressive to carry; but I thought how nice it would be when cooked.

Cooked! Who was to cook it? I, who never even made a custard—because I thought it low—how was I to cook such a tremendous animal as a turkey! However, I walked on—wearily enough—until I came back to my boxes. The tide had left my raft upon dry land; I would therefore, I thought, prepare my dinner. I knew that the turkey must be picked. But how! There was a dressing-case in one of the boxes. I had secured that. I therefore searched for it; and taking from it a pair of tweezers, sat me down upon the beach, and began to pick my turkey.

CHAPTER VII.

WHILST picking the turkey—which, in my heart, I wished a golden pheasant, not so much for its flesh as for its feathers for a tippet—my thoughts continued fixed upon my home. I then felt the bitter fruits of my obstinacy. I had neglected all the truly useful arts of life for its vain accomplishments. I could work a peacock in worsted; but, I felt it, I could not draw a turkey. Again and again had my dear mother tried to impress upon my giddy brain *Mrs. Glasse's* golden rules "to choose poultry, game, &c.;" and as often I had turned a careless ear from the dear soul, saying, that all such learning would, of course, be known to my housekeeper; that I would never marry a man who would expect me to know the age of poultry; and other impertinence of the like kind. I ought to have known that "a turkeycock, if young, has a smooth black leg, with a short spur." But when I should have laid this wisdom to my heart, it was beating for spurs not to be found upon turkeys. Then for telling the age of geese—I despised such homely knowledge. Enough for me, if I could tell the age of certain beautiful officers, with white feathers not to be thought of with poultry. How I bewailed the time I had given to the parks, bestowing no thought upon the kitchen!

Having, with the aid of my tweezers, picked my turkey, I had a confused suspicion that the bird should be drawn, and stuffed, and served with gravy. I turned it over and over, looked at it again and again; and felt humbled by my ignorance. Then I thought of cooking it as it was, just helping myself to little bits of the breast. Again I thought, fortune will not send a turkey every day; therefore no part of it should be wasted. In my perplexity, I at length resolved to hang it to a tree until the next day, that I might reconsider the difficulty. I did so; but I could not silence the self-reproach that said: "Here you are, Miss Robinson, a finished young lady. You can play the Battle of Prague—can read very easy French—can work chain-stitch—can paint tulips on velvet—can dance any country-dance as though you came into the world with the figure in your head; but you cannot cook a turkey." Oh, my dear sisters, may you never feel the pang of that reproach!

Assuaging my hunger with some biscuit and the captain's potted anchovies, I set to work to barricade myself against savages or wild beasts. With infinite labor I piled trunk upon trunk and bandbox upon bandbox in a complete circle. Never being accustomed to sleep in the dark, you may imagine how I missed my rushlight. A woman always feels protection in a candle; and the lion itself, as I had heard, was to be awed by a lighted long-six. However, worn out by fatigue, I soon sank to sleep; and awoke about the time—so far as I could judge from the sun—that hot rolls are served in the morning. I made a hearty breakfast of shell-fish and biscuit—but somehow, I felt a strange vacuity, an "aching void," as Doctor Dodd somewhere says, that I could not account for. I wanted something; an essential something. It was the *Morning Post*. It was always such blessed food—such support and gladness for the day—to read the "Court Circular;" to be sustained by a knowledge of the royal ridings and walkings; and though I knew I should never be invited to such junketings, still it imparted a mysterious pleasure to know that "The Marchioness of Mayfair had a party, at which all the *élite*," &c. It was, somehow to see the jewels reflected in the type—somehow to catch the odor of high society even from the printers' ink. And this, the balm of life, was denied me. I was so haunted by the thought that, with playful bitterness, I sometimes wrote with a stick "*Morning Post*" upon the sand; and then wanly smiled and moralized, as the rising tide would wash that morning print away! After a season I devoted the time formerly given to the *Post* to my parrot; and found in the eloquent intelligence of the bird much more than a recompense for my loss. But let me not anticipate.

I made continual trips to the wreck, and every time returned with new treasures of food and goods and raiment. What a wardrobe I had—if anybody could but have seen it! Sometimes, when aboard the ship, I felt a concern for my stores on land, lest they should be ravaged by men or beasts, but on my return from the ship I found all as I had left it. Once only I saw two little creatures run from among the boxes. They were, I thought, either ermine or rabbits. If real ermine—the notion would rise—what a muff and tippet I might promise myself!

Whilst loading my raft, an accident occurred that mightily discomposed me. The wedding-

ring that, for safety, I continued to wear, became severed in the middle. It was plain there was a flaw in the virgin gold. Solitude had made me superstitious; and I looked upon the broken circle as an omen that I was doomed to perpetual celibacy. The thought of never-ending singleness fell upon my heart with a crushing weight. And, to make my misery perfect, the cat that I have spoken of in a former chapter, again came rubbing herself against me, looking upwards with horribly speaking eyes, as though confirming my fear of destitution.

I took the fractured ring from my finger. Hope whispered—"Take heart, Miss Robinson; like a first love broken, it may be soldered." With this, I secured the precious bit of domestic metal, and renewed my work, a little comforted.

Like a bee gathering sweets, I went from cabin to cabin. Rummaging a locker I found three razors; I was about to leave them, when my previous train of thought recurred. "The fate that requires a wedding-ring," said the thought, "also gives a value to razors." I therefore resolved to take the instruments: and the same resolution induced me to bring away a prodigious stock of tobacco. "I shall never smoke myself," I seemed to remark; "but *he* may."

In another locker I found some knives and—I could have wept with gratitude—some silver forks. It having been made one of the first principles of my education to consider a silver fork essential to any assertion soever of human dignity, I felt myself lifted by the discovery. I had learned that what was known as the Iron Age, was no other than the time of Iron Forks: or why did I take real silver to Blackheath with me! The age of iron was the age of vulgar toil, when everybody labored: now the first-known silver spoon—as I was instructed by the Misses Whalebones—came into the world in the mouth of the first gentleman.

In another locker I found a bag of sovereigns. They made me sigh. "Of what use, O sovereigns!" I said, "are you to me? You cannot buy me a seat at the opera. You cannot take me to Brighton. You cannot waft me to Rundell and Bridge's, to make choice there." Flinging down the gold, I said, "O drug, stay there, and"—and then the thought of the shops in Bond street, and with the thought the stock of the four seasons rose in my mind, and I moralized no more, but took the bag. As I did this, the sky became overcast, and I found that if I would secure my goods I must shorten my stay. I ran into a cabin which I recollected had been occupied by a very nice old gentleman, a clergyman, going out to join his regiment, then fighting very hard indeed, in India. But, like a dove, he was going out with the olive in his mouth, to comfort the wounded and preach patience to the flogged. Taking a hasty glance, I saw nothing but a book upon the bed-clothes of his cot—the book he had doubtless been reading when the ship struck; without opening it, I secured my prize, and ran upon deck. The sky was getting blacker and blacker, and I resolved to swim for it. The weight of the gold was a little embarrassing, but, for the first time, I found that almost any amount of gold might be borne in difficulties. After a time I seemed to swim the lighter for it.

The wind continued to rise, but at length I got ashore, and making a hasty supper of biscuit and salt-beef with the smallest imaginable drop of *eau-de-cologne* on a lump of sugar, I went comfortably

to bed; for I had in the course of my trips secured a hammock, which I suspended right across my barricade, by tying each end of it to the handles of opposite trunks. I must confess that for a long time it was very difficult for me to get into the hammock, as I no sooner got in on one side than I fell out from the other. However, as I knew there could be no witness of my awkwardness, I persevered, and in a few nights not a midshipman in the whole of the royal navy could jump more adroitly into his sleeping-birth than I did.

CHAPTER VIII.

WHILST making my breakfast, I began to think—it was the constant custom of my dear father—of my dinner. My thoughts immediately flew to the turkey; and again I felt confounded by my ignorance. How was I to dress it! Whilst in this state of perturbation, and inwardly reproaching myself for the time I had lost at tambour-work that might have been so usefully, so nobly employed in at least the theory of the kitchen, my eye fell upon the book I had brought from the wreck; the book lying in the cot of the regimental chaplain going out to India. Listlessly enough, I took the volume in my hand—opened it, and, equally to my astonishment and joy, read upon the title-page—*The Complete Art of Cookery!* My gratitude was unbounded, and I blessed the good man whose midnight studies had indirectly proved of such advantage to me.

With beating heart, I turned over the pages, until I came to "Turkey." Again and again I read the directions; but though they were written with all the clearness of a novel, they only gave me, what I once heard called, a magnificent theory. I felt that drawing required a practical hand; for how was I to know gall from liver! "A stuffing of sausage-meat" sounded very well—but how to make it! And then—though, possibly, the plant might grow in the island—where to get a shred shalot! The excellent chaplain's book, instead of instructing and comforting me, plunged me in the profoundest melancholy. As I turned over the pages—I, a desolate spinster on a desolate island—I seemed scoffed and mocked at by the dishes that I read of—dishes, all of them associated with the very best society, and many of them awakened thoughts of Michaelmas goose, of Christmas beef, of spring lamb, and all the many amenities that impart the sweetest charm to civilized existence. With a strong effort of will, I laid down the book: I would keep it, I thought, for calmer hours. When more accustomed to my hideous solitude, it might soothe and support me, throwing the fascinations of romance about a cold and hungry reality.

Walking upon the beach, I looked, as usual, in the direction of the wreck, and found it—gone. The gale of the night had doubtless been very violent—though I slept too soundly to hear it—and the remains of the miserable vessel had sunk forever in the deep. I was, at first, very much affected; but when I remembered that with the exception of one box, containing a bonnet of the most odious color for my complexion, I had brought all my dear sister-passengers' trunks and boxes safe ashore, I felt soothed with the consciousness that, at least I had done my duty.

And I was upon an island—alone; with neither man, nor—excepting the aforesaid rabbits (or *er mine*)—beast. After a flood of tears, I resolved like a true woman, to make the best of my misery. I walked further into the island, and discovered

beautiful bit of grass-plot, backed by a high rock. To this place, with a strength and patience I am almost ashamed to confess, I removed every trunk and every box, placing them in a semicircle, with the rocks—I believe it's called—the gable end. When this was done, I cut down innumerable stakes of willow: this I was enabled to do with the surgeon's saw, a remarkably neat and elegant little instrument. The stakes I drove into the earth, within about six inches round the trunks, by means of a cannon ball—providentially, as it afterwards turned out, brought from the wreck. This being done—and it cost me incredible labor to accomplish it—I dug up hundreds of creepers, and parasitical plants, and cactuses, that I found in different parts of the island, and replanted them near the willow stakes. Vegetation was very rapid indeed, in that island. In less than a week the plants and willows began to shoot, and—to anticipate my story a little—in two months every trunk and every box was hidden by a green and flowering wall. The cactuses took very kindly, and formed a hedge, strong enough, I verily believe, to repel a wild beast or a wild Indian. I ought to have said that I had taken the precaution to roof my bower, as I called it, with some tarpaulin, that stained and made my hands smell horribly. However, I had no remedy.

Whilst I worked at my bower, I lived upon the biscuit and potted meats and preserves found in the steward's cabin. In time, however, I began to grow tired of these, and longed for something fresh. As for the turkey, I had left that hanging to the tree, being incapable of drawing and dressing it. Many wild-fowl flew about me, but, disheartened by the turkey, I took no heed of them. At length it struck me that though not much of a cook I might be able to boil some shrimps. The first difficulty, however, was to catch them. During my visits to English watering-places I had observed females of the lower orders, with hand-nets I think they call them, fishing for shrimps. I therefore resolved to make a net. Here, at least, some part of the education acquired at the Misses Whalebone's was of service to me, for I knew how to knit. Amongst the stores I had brought from my ship, were several balls of twine. Chopping and chiselling a needle, I set to work, and in less than three days produced an excellent net. This I stretched on a stout elastic frame of wood, and the tide serving, walked—just like one of the vulgar women I had seen at Brighton and Margate—bare-legged, into the sea. The shrimps came in little shoals, and in less than a couple of hours I am sure, I returned to the shore with not less than three quarts of the best brown shrimps, Gravesend measure. These I boiled; obtaining a light after this fashion:

When a very little girl, I had always assisted my brother when making fireworks for Guy Fawkes. It was he who taught me how to make—I think they are called, little devils. A pinch or two of gunpowder is taken in the palm of the hand, and wetted: it is then kneaded into the form of a little cone; a few grains of dry powder are laid upon the top, when fire is applied to it, and the whole thing goes off in a red eruption, like a toy Vesuvius. Having prepared the powder, I struck sparks upon it; using my steel busk (how the sparks did fly about it, to be sure!) and a flint. By these means I burnt a piece of linen—a beautiful bit of new Irish, and so got my original stock of tinder. After this, I had only to use my busk and the flint to obtain a light—for I found a heap

of matches in the purser's locker—when I wanted it. Gathering dry sticks and leaves into a heap, I made a rousing fire. I had brought away the ship's compass; and so used the metal basin that contained it as a saucepan. In this I boiled my first shrimps. I had no salt, which was a great privation. Necessity, however, the mother of invention—(and, certainly, for a little outcast, he has proved a very fine child in the world; though when prosperous, I'm afraid he very seldom thinks of his mamma)—necessity suggested to me, that if I would pound the gunpowder very fine, it might at a pinch serve for salt. I tried the experiment; and though I must allow that salt is better without charcoal, nevertheless, salt with charcoal is infinitely better than no salt at all.

For some time I took very much to shrimps; but the human mind is given to variety—a fact that in my solitude I have frequently pondered on—and I began to long for some other kind of food: in fact, for some fresh fish. In my wanderings about the island, I had discovered a beautiful piece of water—clear as crystal, and sweet as milk—in which were multitudes of the most beautiful roach, and gudgeon, and pike, and I know not what. I felt very much disposed to obtain some; but my wishes met with a check from these thoughts. “In the first place,” I said, “I have no tackle; in the next, I am no fisherwoman.” Now to have made my argument complete against angling, there should have been no fish. But it was not so. I therefore determined to invent me some tackle.

My petticoat—my *crinoline*—I had no doubt there were fifty others in the boxes—flashed upon me. It was a little worn, and the others were, no doubt, new; besides, I had more than one of my own stock. Knowing that fishing-lines were made of hair, I immediately began to draw my *crinoline*. As I drew out horse-hair by horse-hair I moralized—I could not help it—upon the wondrous accidents of life. “When,” thought I, “for the Crown-and-Anchor Ball, I first put on this *crinoline*, swimming into the room in a cloud of white satin—did I then think it (the petticoat) was ever intended to catch little gudgeons?” And with these thoughts, I patiently, mournfully, drew out hair by hair, and found that they would bear any weight of fish that might jump at the hook.

The hook! Where was the hook? In another instant a thought suggested the ring—the broken wedding-ring. There was a something in the notion that brought to my face a melancholy smile. There was a bitterness, a pleasant bitterness, in the idea, that I relished mightily. I therefore resolved to turn the ring into a rude hook, which, by means of a pair of pliers from the surgeon's case, I accomplished. And it looked so remarkably like a hook, nobody could have imagined it had ever been a wedding-ring.

A tall, tapering rod grew on every tree. I therefore set out to the brook fully equipped. Arrived at the place, I baited the ring—the hook I should say—with nothing more than a little chewed biscuit, mixed, to keep it together, with pomatum. I threw in, and as fast as I threw in, I had a bite. It was curious to see the innocent creatures fly to the ring; that is, the hook that was to destroy them. I was some time astonished at their simplicity. At length I thought, “Poor things! their eagerness to bite at the wedding-ring proves the island to have been always uninhabited. They bite in this way, because they have never before beheld the face of a woman!”

THE TWO SIDES OF THE QUESTION.

We print these communications without comment:—

No. I.—A PLANTER TO PUNCH.

“Cheltenham.”

“Sir,

“I don’t expect much sympathy from you. I’ll tell you why. When my medical attendant, at Cheltenham last year, recommended what he called ‘peristaltic motion of the lower viscera’ for my liver complaint, (for I’ve not lived in Berbice eighteen years for nothing, and yet there was n’t a planter in the colony more moderate in his sangrosum and sangaree,) he suggested taking in your publication, which, he said, would make me laugh, and produce the motion with the odd name above mentioned. Well, sir, I ordered your publication, and laughed a good deal at it I must say, but every now and then I came across some high-flying bit of stuff, which I dare say the fellow who writes it calls humanity and philanthropy, but which, between you and me, is humbug and nothing else.

“I dare say if you’d lived in 1833, at the time of the iniquitous emancipation of the black fellows, you’d have been one of the loudest in the ‘man and brother’ clap-trap. You don’t know the Snow-halls as well as I do. I’ve seen them under the cart-whip; and the more’s the pity since the cart-whip was hung up for good and all. I felt it was all up with the colonies when that happened. I could not sell my estate, but I leased it to my attorney, and with the paltry share I got of your so-called compensation, (a downright robbery by the way, if ever there was one,) left Berbice, and settled at Cheltenham, alongside of some old Guiana cronies in the same predicament with myself. Sir, we are a small and far from cheerful part of wronged and ruined men. They’re going to take away the little protection that was left us. Of course I don’t intend to chime in with the abolition nonsense of that old rascal Clarkson, about encouraging the slave trade and such like stuff. I only wish we were where Cuba is, and had been wise enough to keep our blacks under the collar when we had ‘em there. But that’s all over, the more’s the pity. I’ll tell you the real point where the shoe pinches. The black fellows won’t work. They’re a set of the idlest vagabonds! They’ve no respect for the rights of property and the interests of their employers. There’s a gang of scoundrels about Mount Pleasant—my estate—rascals that were my slaves, most of them since they were pickaninnies fighting for bananas under my dinner-table, up to that fatal 1st of August.

“I’ve clothed those fellows, sir, I’ve fed them, I’ve let them cultivate provision grounds on my waste, and fatten themselves like pigs with the cane-juice at boiling times; I’ve flogged them (that is, my overseer has) week after week, and done what I could to teach them industrious habits, by field-work twelve hours a day, six days out of the seven—for I know what’s due to the church. What’s my reward! Why, now that the fellows are free, as they call it, they have n’t the gratitude to work more than two days in the week. That brings them in their eight shillings, and they can live the whole seven days through like fighting-cocks for six. So, their two days’ work done, there they sit, as lazy as so many gentlemen and as happy as so many kings, under their verandahs,

with their wives by their sides and their pot-bellied little Sambos and Julius Cæsars tumbling about their feet, and won’t do a stroke of work—not if the governor was to go on his knees to ‘em. Now, I put it to you—is this a tolerable state of things! How would you like to see the laborers in England kicking their heels in comfort, and putting their thumbs to their noses while tenant and landlord were begging and praying them to go to work, when once they’d made enough to keep them for the week! What comes of it all! The negroes are enjoying themselves, and the planters are ruined; four-sixths of the plantations are out of cultivation, and many of the rascally black fellows are saving money and clubbing it to buy us out one after another—fellows that you’ve seen writhing and squeaking under your dining room windows and your own cart-whips! They’ll have all the property of the colony before ten years are gone.

“I always said what it would come to. How the government can reconcile it to their consciences I don’t know!

“I am, sir,

“Your indignant reader,

“NATHANIEL THRESHER.”*

No. II.—A FREE NEGRO TO PUNCH.

“Mount Pleasant, Berbice.”

“MASSA PUNCH,

“Sir, We read you ebbery week, dat you come here reglar, saar, wid very great satisfakshun, and much amooement, self and wife, Dinah.

“Saar, we receive papers from home, (dat England, saar, always call him ‘home,’ now ‘mansipashun diffused in dese happy quarters of the ‘arth,) and find dat de Perdeckshun is to be took off de furrin and slave-grown shugar. Some white gentlman make uncommon row, and say dat ‘dis ruin dis deliteful col’ny of British Guiana, where I write to you, saar, at present. But do white gentlman berry much de worse for aggrawashun, let me ‘sure you, saar, black gentlman perfectly trankle, as to ‘liberations of British Parliament.

“Sir, I don’t aut to blush to say dat, once, owing to circumstances oher which I could not control, I myself was in de ‘gradin persicion of common slave-field nigger! Den I work berry unpleasantly hard, ‘specially bilin-times: once, sir, perticler, berry near fell into biler by reason ob being overtook wid sleep after four days’ work and extra rum. Dat time, saar, is unpleasant reminisense; but now as free black gentlman let me ‘sure you, saar, for self and friends find change of life uncommon pleasant. We are not berry ekal in demand and supply hereabouts, (you see, saar, I hab studied polical ‘comony,) especially for labor. Uncommon plenty white persons ob property in cane-land, not so many black gentlmen to work. Wages being unobjexshnable at a dollar a day, and two days a week quite ‘nuff for illigansees of life for self and Dinah. White properioter come to black gentlman to ask him work ebbery day in de week. ‘Diculous! what for work, in de name ob common sense, when you can get de luxshries of life widout putting oneself out of de way to do nothing ob de kind! No, I say to white properioter, ‘No, saar, ‘acuse me; when hab misfortune to be slave-nigger, you fix de work-hours.

* “Late Importer of 10,000 hogsheds of sugar from Berbice—now imports 0.”

Now dat I free, 'tanks to de British legislature, I settle 'em for self and family—no tank you.' Also, saar, I mass money. Seberal black persons of my 'quaintance done de same, and we s'pose soon to set up a plantashun of our own. Old Massa Thresher, prhapse, hab no 'jeckshun to sell Mount Pleasant, near where I now reside. Den, saar, we shall rebel in de proud feelins of dark properioters, where we once worked common field niggers wid de driver berry sharp behind. Berry proud feelin, saar, and I 'sure you, I feel affected to look at Dinah, and de lubly obsepring she have maternally reared, and tink what dey wood have been ten year long ago, and what dey are now under de new redgment! I 'sure you, saar, dat dis is ex-lent place for black gentleman now. He don't wish at all for any change whateomdever,

"Especially yours,
"POMPEY JONES."

THE ANTI-SLAVERY HANNIBAL.

SCENE—A Dining-room, with a very well-spread table. Present, HANNIBAL and Friend.

WHAT! let in slave-grown Muscovados!

Help Brazil of her sugar to rid!

What! give way to free-trade bravados!

No! Wilberforce, Clarkson, forbid!

I'd not touch such a sweet'ner accursed,

Tho' it cost but this penny a pound—

(And Hannibal flourished his copper,
Dug in Cuba, by slaves, from the ground.)

To wormwood 't would turn in my cobbler,

To gall it would change in my tea;

For a conjurer, potent as Dobler,

Is the spirit of hu-man-i-tie!

Ere my babes should suck lolly-pops slave-grown,

I'd hang them all up, sir, in that—

(And Hannibal fingered, heroic,
His slave-grown, sea-island cravat.)

No, no; at my table you 're safe, sir,

From all fruit of the negro's despair—

But, bless me! amidst all this talking,

You eat nothing at all, I declare!

Pray, do try that curry—for boiling

The rice I've a plan of my own:—

(And Hannibal gulped down a spoonful,
'T was the best Carolina—slave-grown.)

What! you really have finished your dinner!

I can answer for that Curaçoa;

From a friend, a great Rotterdam merchant—

Slave-grown?—Oh, how can you talk so?

You shock me! I must have some coffee,

For the nerves 't is a famous resource—

(And Hannibal swallowed his Mocha,
'T was slave-raised, Brazilian, of course.)

And now, as my wife's down at Brighton,

And yours hors de combat, old boy,

We'll make it a Bechelior's dinner—

'T is a treat we don't often enjoy.

[Brings out box of cigars.]

There! Puros! Direct from Havana!

You may wink, but I tell you they are—

(And Hannibal straight disappeared
'Neath the cloud of a slave-grown cigar.)

THE PEN AND THE SWORD.—The British lion never wanted to make a meal, not even of a Yankee cabin-boy; and we hope that the American eagle is now content to feed upon native Indian corn, instead of dining upon Britishers, gloriously dead upon the battle-field. Mr. Calhoun, however, very wisely attributes all this to the tongues of statesmen and the quills of public writers. "Had there been," says the American, "the least false step on the other side—had the speeches in parliament, or the articles in the public journals been of an exasperating character, we could not then have arranged matters on this side as we have done." And then he lauds the moderation of Peel and Aberdeen. And all this cheering for the present, is hopeful for the future. A statesman's windpipe, wisely employed, may in good time shut up in rusty dumbness those—

—"mortal engines, whose rude throats
Th' immortal Jove's dread clamors counterfeit,"

and half a dozen quills of half a dozen journalists prove too much for a whole park of artillery. Mortars are devastating instruments—and yet they may be beaten by inkstands.

PROTECTION DINNERS.

WHEN children have a tumble or roll down stairs, folks give them fruit or sweet-stuff to stop their crying. The protectionists having sustained a thumping tumble, are comforted with dinners. Master Bentinck has been treated at Lynn, and Master Marquis Granby has also been consoled at Walsam. His father, the Duke of Rutland, shone very brilliantly on the occasion. Pity it is that so many coronets have spoilt so many wits! The duke opposed the free-trade principle; and his opposition was strengthened by the following tremendous illustration. (Several farmers were carried out in fits of laughter, and were not fully recovered until well pumped upon.) The duke said:—

"He had heard of a gentleman, who having two chances, tossed up with his friend, agreeing, if the sovereign came head, he was to win, but if tail he was to lose. It was not long before the gentleman had the tail, and he feared we should soon be very much in the same situation [Hear, hear, and applause]."

Now, if his grace will—for one minute—lend us the illustration, we will venture to observe, that once when fate tossed for a duke for the house of Manners, certainly "a head" did not get it.

Mr. Disraeli, who "attends" all protection dinners at the shortest notice, made at Walsam a dreadful onslaught on Manchester; the same Manchester that only two little years ago invited him to preside on a festal occasion, when he said "all things that are pretty and sweet" to the unsuspecting and admiring cotton-pods. And at Walsam very magnificently did he pooh pooh poor Manchester, asking where it was when Englishmen won Magna Charta? This is unkind. We have a great admiration for the author of "Coningsby;" and, therefore, in our own meek way, we should reprimand either Cobden, Bright, Wilson, or any other Manchester man who, seeking to depreciate the parent of "Coningsby," should ask—"Where, when the Israelites passed the Red Sea, was Benjamin Disraeli?"

A CARD.

Mr. Benjamin Disraeli begs leave to inform the Nobility, Gentry, and Ultra-Conservative public in general, that he attends Protectionist Parties, and has a large collection of speeches of every description always ready, together with a set of sarcasms, which he undertakes shall be carefully delivered either in town or country.

B. D'I. feels justified in assuming to himself the title of the

ONLY POLITICAL IMPROVISATORY ;

for having during several years given his attention to the *impromptu* line, he has on hand a very large assortment of retorts and replies, suited to every occasion. Though he keeps a large quantity ready made, they are warmed up so rapidly, after a process peculiar to the advertiser, that he feels justified in announcing them as absolute novelties.

B. D'I. has no objection to enter into a contract to supply protectionist oratory by the single dinner, or he will go out to evening meetings at a great reduction on an arrangement being made for the entire session. Ministers worried by the day, night, week, month, or year, and protectionist peers waited upon at their own houses.

The following testimonials are humbly submitted to the public:—

No. 1.

"I can recommend the advertiser as a willing and attentive person. I have generally found him desirous of making himself useful. I think if he got a place he would do his utmost to keep it.

RICHMOND."

No. 2.

"The bearer, Benjamin Disraeli, is a very amusing person, and I can give him a character for being a capital waiter at protectionist dinners. His great anxiety is to get into some regular situation, and I have no doubt he might be made very serviceable, if the duties were not onerous.

G. BENTINCK."

No. 3.

"Though I do not much like this person, I think there can be no objection to his attendance at a protectionist dinner-party; for I know at all events, from my own experience, that he can tell a good story.

R. PEEL."

No. 4.

"A very nice young man for a very small party.

PUNCH."

A QUEER CONSECRATION.

THE 13th Light Infantry have received a present of some new colors from that distinguished veteran, Prince Albert. The ceremony of presentation took place on Southsea Common. In the report of it, as contained in the *Times*, we read that—

"The prince dismounted and entered the hollow square, accompanied by General Packenham, Sir Charles Ogle and staff, and stood uncovered while the Rev. J. R. Gleig, Chaplain-General to the forces, consecrated the colors."

Consecrated the colors! Is the Rev. Mr. Gleig a priest of Mars! Colors are strange things to be consecrated by a clergyman. Why

not consecrate muskets as well! Why not pronounce a benediction over gunpowder, over cartridges, shots, shells, howitzers, and congreve rockets! Why not give a canonical sanction to cannon! Is it felt that this would be going too far—would be too palpable an association of Christianity with carnage—terms, that in spite of alliteration, will not harmonize! Now, it strikes us, that there is a species of consecration which would be much more suitable to the emblems of slaughter than the clerical.

Have any of our readers witnessed the performance of *Der Freischutz*? If so, perhaps they will anticipate our suggestion. In the incantation scene, having invoked *Zamiel*, and in the name of the demon mixed his lead and sundries of sorcery in the bullet ladle—"And now," says *Caspar*, "for the blessing of the balls." The benison recited on this occasion by our friend *Caspar* would, to our thinking, be the best adapted to the flag of battle. Give a certain personage his due. We are not told, that the service performed by the chaplain to the forces was followed by a sermon. Perhaps it was. If so, could his homily have been the Sermon on the Mount!

CATHERINE SEYTON.

BY H. M. SIDNEY.

In his hall at Abbotsford—

Travellers so the legend bring—
When the shades of midnight fall,
Sits the mighty wizard king!
Dark and weird the shadows lie
On the gothic tracery there;
Suddenly a noiseless train
Enters on the haunted air!

Vague they come, with spectral forms
Answering to the wizard spell,
Marmion in coat of steel,
Constance from her stifled cell,
Balfour hot with prelate's blood,
Judah's meek forgiving maid,
Richard in his mail of black,
Dark McIvor's threatening shade!

Ravenswood, as on the morn
When he rode to meet his foe,
And the pitying sands engulfed
All his pride and all his woe!
Amy! poor deluded wife,
When she flew to meet her lord,
Claverhouse, with the blood of saints
Reeking on his brutal sword!

Mary, melancholy queen,
Not with haughty step and eye,
But as on the sorrowing morn
When they led her forth to die!
Catherine too, her friend, is there,
She of Seyton's lordly line,
Rarest creature of them all,
Half of earth, and half divine!

Not in kirtle nor in snood,
Comes the laughing Scottish maid,
But in velvet cap and cloak,
Like a jaunty page arrayed!
Thus in lonely Abbotsford!
Travellers so the legend bring—
When the shades of midnight fall,
Sits the mighty wizard king!

From the Dublin University Magazine.

PARIS IN 1846.

PARIS as it is after fifteen years rule of the throne of the Barracades, and Paris as it was under the divine-right crown of the Restoration—Paris as it presented itself to the staring wonder of the crowd that rushed from Corn-hill to the Palais Royal as soon as the echo of the cannon had died away on the plains of Waterloo, and as it now addresses itself to the twenty thousand strangers that swarm between the Rue de la Paix and the Arc de Triomphe, is a subject interesting to contemplate. Under the consulate and the empire, as of old under the ancient regime, the fine arts, in all their departments, engrossed the attention of the government, and captivated the public. The substantial comforts, the convenience and health of the people, were subjects of comparatively minor importance. Magnificent buildings, splendid monuments, and gorgeous palaces everywhere attracted the eye; and in their immediate vicinage, poverty, filth, and misery. The marble walls of temples and palaces were defiled by the river of filth and offal which flowed through the sewerless streets. The passenger who aspired not to a coach, unprovided with a footway, scrambled along the inclined pavement which sloped from either wall to the central gutter, which discharged the functions of a sewer, and was from time to time bespattered with the mud and filth flung around by the wheels of the carriages in which the more wealthy were transported. Lanterns suspended like a performer on the corde volante, at distant intervals, like angels' visits, few and far between, in the centre of the street, and at a height sufficient to allow carriages to pass under them, served as a sort of light-houses for the navigation of the vehicles of the rich through the streams of puddle, but by their distance, height, and position, afforded no benefit to the humble pedestrian. To say that they illuminated the streets would be an abuse of language; they just served to make darkness visible.

Fifteen years of constitutional liberty, and the substitution of a representative government—presided over by a prince who has been schooled in misfortune, had experienced the sweet uses of adversity, and had known what it was to eat the bread of his own industry—for the throne of the restoration, vainly struggling against the spirit of the age and the popular will, have changed all this. The wand of an enchanter has been waved over the city, and a magical transformation has been effected. The ornamental has ceased to monopolize the attention of government, and the useful has claimed its due care. The frightful ravages of the cholera, in 1832, left a warning which has not been unheeded. In an incredibly short space of time, a perfect system of drainage by sewers throughout this vast city has been completed. Footways have everywhere been constructed. The system of carriage pavement with square blocks of granite, forming a convex road, with side drains leading to the sewers, has taken the place of the concave street with open centre gutters. The offensive effluvia which excluded the English visitor from certain quarters of Paris no longer exists, and the demon of malaria has been expelled. Gas illumination, extending now through every quarter, including the interior of buildings as well as the streets, has superseded the suspended lantern; and it is hard to say which most attracts the admiration of foreigners, the gaiety of the streets, boulevards,

and public walks by day, or their brilliancy when lighted up by night.

But the achievement which will be remembered in connection with the reign of Louis Philippe, with the most grateful feelings by the philanthropist, is undoubtedly the example he has afforded even to the advanced civilization of Great Britain in his efforts for the repression of gambling and prostitution. He has accomplished what the English authorities have not even thought of attempting. There are now no public gambling tables in Paris, and even private play is subject to so many restraints, that it has been stripped of half its evils. The purest female may now walk the public thoroughfares of the city by day or by night without the risk of having her sight outraged or her ears polluted by the indecencies which are still suffered to prevail in the most frequented streets of the metropolis of Britain. The theatres and other places of public resort are equally purified. Even the Palais Royal—that temple of vice—has been thoroughly reformed; and it is due to the present king to add, that this reformation has been effected by a large sacrifice of his private revenue; a considerable portion of the rental of the Palais Royal having risen from the extensive and long-established gambling rooms by which it was occupied, and by the employment of the loftier stories for still more impure, and not less profitable purposes.*

Among the improvements in the arts of life, imported from England, the most striking, at the present moment, is the railway system, which is progressing in France more rapidly than is imagined at our side of the channel. The manner of accomplishing these public works here is essentially different from the English system, and has certainly some advantages over the latter in a national point of view. To comprehend it, and the circumstances out of which it has arisen, it must be remembered, that the construction and maintenance of the public roads has always constituted a department of the government in France, under the title of *L'Administration des ponts et chaussées*, or the Department of Roads and Bridges. Connected with this department there is a public school of engineering, the pupils of which ultimately form a corps of engineers, in the immediate pay, and under the control of the state. By this corps, or under their superintendence, all the great public communications of the country are made and maintained. When the invention of railways, therefore, had been advanced so far in England, as to supersede, to a greater or less extent, common roads, and the improvement had forced itself upon the French public, the construction of such lines of intercourse by private companies presented a novelty in the civil administration of the country; and after the concession of one or two of the first enterprises of this kind to joint stock companies, (a large portion of the shareholders of which were English,) the government reverted to the established usage, subject, however, to a slight modification. The great lines of railway are now projected, surveyed, and executed by or under the immediate superintendence of the *Administration des ponts et chaussées*, and at the cost of the state. When they are completed, or nearly so, they are offered to public competition, on a lease for a specified time, varying from forty years to a century. The company, or individual, who, under sealed proposals, sent in within a specified time, and to be opened on an appointed

* It is well known that the Palais Royal is the private property of Louis Philippe.

day, offers the terms most advantageous to the state, obtains the lease. The lessee company usually replaces the capital expended by the government in the construction of the road, and provides from its own funds all the movable capital necessary for the operation of the line. At the termination of the lease, the property in the line reverts to the state.

This method of proceeding is attended with several obvious advantages. The general projection of the lines of communication through the country is not left to chance or to the fancy of individuals or companies, or the suggestion of local coteries, but is governed by the high and general interests of the state. By retaining a general control and surveillance, which form part of the conditions of the lease, the interests of the public are better protected, and abuses of administration are more effectually prevented than could be effected if the railways were the property of independent bodies and associations as in England. After the expiration of the leases, these enterprises becoming national property, may either be made a direct source of revenue to the state, relieving the public in a proportionate extent from less tolerable burthens, or be worked for the public benefit at rates only sufficient to maintain them.

The lines of railway now in actual operation are the following :—

	DISTANCE.		TIME.	
	Miles.	h. m.		
Paris to Versailles, (right bank,)	13½	0	30	
Do. Do. (left bank)	12½	0	30	
Paris to St. Germain, . . .	12	0	30	
Paris to Rouen,	86	4	0	
Paris to Orleans,	79	4	0	
Paris to Valenciennes (& thence to Brussels,)	133	—	—	
Strasbourg to Basle,	88	5	0	
Mulhouse to Thann,	12½	1	0	
Bordeaux to La Teste,	32	—	—	
Montpellier to Cette,	17½	0	50	
Lyons to St. Etienne,	33½	4	0	
St. Etienne to Roanne,	42	4	0	
Nismes to Alaix,	31	2	0	
Alaix to Grand Combe,	11	0	30	
Nismes to Beaucaire,	16	1	0	

Besides these, there are several important lines of railway in a forward state of construction, among which may be mentioned the continuation of the Paris and Rouen railway, by two branches to Havre and to Dieppe; a branch of the northern railway from Amiens to Boulogne and Calais; the railway from Paris to Lyons, &c. &c.

The effects which in a few years may be expected to be produced on the inter-communication of different parts of Europe, but especially between France and England, when these enterprises come into operation, must be very striking. It is presumable that between two capitals so important as Paris and London, no known practical means of expeditious communication will be neglected. At present, the express trains between London and Exeter travel (stoppages included) at fifty miles an hour. The stoppages being much less frequent, it may then be expected that express trains between Paris and Boulogne will travel at the same rate at least; in which case the trip between Paris and Boulogne will be made in less than three hours. Steamers of improved efficiency may easily make the passage between Boulogne and Folkstone in an hour and a-half, and the trip between Folkstone and

London (eighty-eight miles) may be made in two hours. Thus the entire distance between Paris and London, making allowance for fair stoppages, may be effected in seven hours by express trains, and by common trains may certainly be brought within twelve hours!! On an emergency, a despatch may be sent to Paris, and an answer obtained in fifteen hours! But this emergency itself may be superseded by the electric telegraph which will reduce the hours to minutes!!

The railway from Paris to Lyons, and thence to Marseilles, is also in rapid progress. This distance will be about five hundred miles, and at the same rate of travelling for express trains, may be completed in ten hours. Thus an express train may reach Marseilles from London in seventeen hours! The same rate on the Sardinian and Tuscan lines, when constructed, would reach the frontier of the papal states in a few additional hours; but here we must stop. The states of the Church forbid the construction of railways within their precincts, as dangerous to Christianity!* There we must surrender the locomotive, and betake ourselves to the road. The papal authorities of the nineteenth century are as hostile to the speed of the railway as those of the sixteenth were to the orbital motion of the earth, and are as strongly opposed to Stephenson as those of the latter were to Galileo.

Fashion is everything in Paris. Its sway is omnipotent and universal. It

“ ——— rules the camp, the court, the grove,
And men below and gods above.”

Even religion here is not exempt from its sceptre, and the church revives under its fostering influence. After the revolution of July, the few ecclesiastics who under the restored Bourbons had gained a sort of footing in society, fell into such disrepute that no one appeared for several years in the public streets in the clerical costume. The shovel and three-cornered chapeaux were laid aside, and the loose-robe was abandoned for the ordinary coat and round-hat of the layman. In the churches, on the Sabbath, the congregation consisted almost exclusively of females, with a slight sprinkling of old men, generally of the humbler classes. Within a few years, however, it has—for what reason would be hard to say—become fashionable among the Parisians to observe the external forms of religion; and when the Parisians adopt any fashion, they don't do so by halves. The streets now have become a perfect rookery. Black robes of every cut and fashion, shovel hats, three-cornered hats, and every other characteristic of clerical costume abound. The churches, on Sundays, are as overflowing as the theatres, and as brilliant in the rank and fashion of the assemblies which fill them. Go to the Madeleine, and look at the luxurious velvet-covered *prie d'icis*, and you will discover the rank of the *habitués*, by the names of their owners engraved on the pretty brass plates attached to them. Madame La Duchesse de M—, Madame La Vicomtesse de N—, Madame La Princesse de P—, &c. &c., attest the rank of the votaries at this fashionable temple.

Shops have been opened in the vicinities of all the principal churches, *pour la vente des objets religieux*. In the windows are displayed rosaries, of exquisitely carved beads; crucifixes in gold, silver, and ivory, beautifully sculptured; Agni-Deis, Virgins and infant Saviours; ecce homos, missals, gor-

* Since the above was in type, Pope Gregory XVI. has died, and it is announced that his successor, adopting a more enlightened policy, has decided on the construction of railways.

geously bound in the richest velvet, with sculptured crucifixes on the covers; priests' robes of the richest cloth of gold; little shrines for the private closet of the faithful; and an infinitely various assortment of like objects, by which religion is rendered ornamental and externally attractive.

The children are reminded of the observances of their religion in their playthings and their sweetmeats. The toy-shops exhibit in their windows baby-chapels, with baby altars, shrines, and crucifixes. The boy who used to take his pocket money to purchase little soldiers, now buys little monks, and the girl shows you her doll dressed as a sister of charity. Sugar plums are formed into the figures of the Virgin and the Saviour, and priests in their robes are eaten in sweet chocolate, as images in sugar are swallowed from the crust of a twelfth night cake.

With all this external parade of the forms of religion, there is at the same time scarcely a serious pretension to any real or deep feeling on the subject. Even among women the matter begins and ends in ceremonials. In the actual practical conduct of life all this religion (if it can be so denominated) exercises little or no influence. Whether this arises from the fact that the national clergy do not constitute a prominent section of good society in the country, as is the case in England, we must leave others to determine.

The statistics of the population of Paris, published from year to year, disclose some curious facts which may aid in the discussion of such questions.

It appears from the statistical returns of last year that the births which took place in Paris, in the year 1844, were as follows:

Legitimate children,	21,526
Illegitimate children,	10,430
Total number of births,	31,956

These figures lead to the astounding conclusion that *thirty-two and a-half per cent. of the children born in the metropolis of France, are illegitimate!*

It may be inquired in what condition of life this enormous extent of concubinage prevails! Some light may be thrown on this question by examining the proportion of the entire number of illegitimates which are born in the hospitals, to which here the poorer classes almost invariably resort.

It appears, then, that of the total number of illegitimates, there were—

Born in private houses,	5,744
Born in the hospitals,	4,686
	10,430

From which it follows, that above fifty-five per cent. of this large proportion of natural children belong to classes sufficiently independent to provide for their comforts in private domiciles.

From births let us turn to deaths, and we shall obtain a result scarcely less surprising. The total number of deaths which took place in Paris, in the year 1844, was as follows:—

In private houses,	16,356
In the hospital,	10,054
In military hospitals,	465
In prisons,	185
Brought to the Morgue,	298
Executed,	2
	27,360

Thus it seems that of the total number of persons who die in Paris, very nearly forty per cent. die in the hospitals.

The improvement of the general comforts of the poorer classes in France, which has taken place since the Revolution, combined with the extensive use of vaccination, is exhibited in its effects on the average duration of life. By the statistical returns, it appears that for the last twenty-seven years the ratio of the whole population, to the number of births, is 33.4 to 1, which gives the mean duration of life, during that period, to be 33 years. By the tables of Duvilland, it appears that before the Revolution the average duration of life was only 27½ years, which gives an increase of 19 per cent. on the length of life since the Revolution.

The proportion of the sexes among the children born, offers some curious and inexplicable circumstances. On taking the returns of births from 1817 to 1843, it is found that the total number of boys born in that interval was 13,477,489, while the number of girls was 12,680,776; so that, of the whole number there are 6½ per cent. more boys than girls.

But let us examine separately the two classes of legitimate and illegitimate children.

It is found, that among legitimate children 106½ boys are born for every 100 girls; while among illegitimate children 104½ boys are born for 100 girls. In the latter class, therefore, there are only four per cent. more boys born than girls; while in the former there are nearly seven per cent. more of boys.

This ratio is not casual, for it has been found to obtain, not only for different periods of time and for different parts of France, but is equally found in other countries where exact statistical records are kept.

It seems, then, that a greater proportion of boys are born among legitimate than among illegitimate children. What strange inferences this uncontestedly established phenomenon leads to! Are we to infer that the solemnization of marriage produces a specific physiological effect, varying in a determinate manner the sex of the offspring! We must leave this curious question to the faculty to explain. Meanwhile we must assure them that they are absolutely excluded from taking refuge in the *doubtfulness of the fact itself*. The evidence is quite incontestable.

If the intellectual condition of the population of the French metropolis can be inferred from the amount of intellectual food provided for them, and apparently enjoyed and voluntarily consumed, it must be admitted to have attained rather an high standard. The first, most obvious, and most abundant source of mental information, is the daily press. Journalism is carried to an extraordinary extent in Paris. Not only is the number of newspapers considerable, but the average circulation is much greater than that of the London journals. They are issued at a much lower price, and much more extensively read. The annual subscription to the principal daily papers is only forty francs, equal to thirty-two shillings, British. These papers are published daily, including Sundays, and consequently their price is little more than one penny. But small as this cost is, the Parisian rarely incurs so much; nor would a single journal satisfy his thirst for information. He requires to see the journals of all parties, and to hear all sides of the question. This object is attained easily, economically, and agreeably, by the *Cabinets de Lecture* or read-

ing rooms, above three hundred of which are established in Paris. The admission to these is three halfpence. Here all the journals of Paris, great and small, all the periodicals of the day, the popular romances and pamphlets, and other works of current interest, are provided. In many of the better class of these establishments, the English and other foreign papers are found. Every Parisian above the rank of the mere working class resorts to these rooms, and makes himself *au courant* on the subjects of the day. Besides these sources of daily information, he has his *café*, to which all Frenchmen resort morning or evening, and where all the principal journals are provided.

The aim and object of a Parisian journal, are somewhat different from those of an English newspaper. It is less the vehicle of advertisements, or of mere gossip, such as accidents and offences, than the latter. It is more discursive, and affects more the character of a review, embracing literature and the arts, as well as politics and miscellaneous intelligence. In a certain sense it may be said to have a higher intellectual tone, and, although no single French journal can be truly said to be as perfect a vehicle of general intelligence as one of the leading morning papers of London, yet this deficiency is more than compensated by the facility with which the various journals are accessible.

The *feuilleton* is a department of French journalism which has no corresponding branch in the English press. Here the writings of many of the most eminent men of letters of the day, more especially the authors of fiction, first are offered to the world. Here are also found literary and dramatic criticism, reviews of the arts, and a general record of the progress of mind.

The number of journals which thus form channels of popular information in Paris alone, is about forty; half that number being daily papers for politics and general intelligence.

The intellectual taste of the Parisians is manifested, in a striking manner, by the desire they show for attendance on public lectures in every department of literature and science. Such discourses are accessible gratuitously in various parts of Paris, and delivered by professors eminent in the various departments of knowledge. Among these ought to be especially mentioned the lectures on astronomy delivered throughout the season by Arago, at the royal observatory, and those on mechanical philosophy, given on Sundays, by the Baron Charles Dupin, at the *Conservatoire des arts et métiers*. Each of these professors is attended by audiences of six or seven hundred persons of both sexes and all ages, from the youth of sixteen upwards.

Of all the class of public professors coming under the title of *adult instructors*, Arago is, perhaps, the most remarkable, and we might even extend the comparison beyond the limits of France. The well-known felicity of Faraday gives him a high rank in this species of teaching. But he yields to Arago in the eloquence of language, and what may be called the literary qualifications of the instructor. If Arago had not been a member of the Academy of Sciences, he might have preferred a fair claim to admission to the Academy of Letters, (*L'Académie Française*.)

As a member of the chamber of deputies, Arago has assumed his seat on the extreme left, the place of republican opinions pushed to their extreme limit. He is a violent politician, and will go every length with his party. He rarely, however, mounts

the tribune; never except on questions on which his peculiar acquirements are capable of throwing light. Whenever he does, the chamber is hushed in the most profound and respectful silence. There are no interruptions, either of approbation or dissent, such as even the most eminent parliamentary speakers are accustomed to. The members listen with inclined heads and inquiring countenances. The strangers' galleries are filled with respectful and anxious spectators and hearers. The stature of the savant is above the middle size, his hair is curled and flowing, and his fine southern bust commands the attention. His forehead and temples indicate force of will and habits of meditation. The moment he opens the subject of his speech, he becomes the centre to which every look is directed, and on which all attention is fixed. If the question is complicated, it becomes simple as he utters it. If it be technical, it is resolved into the most familiar. If it be obscure, it becomes luminous. The ignorant are astonished that what seemed unintelligible has become suddenly self-evident, and the dull are charmed with the consciousness of their awakened powers of perception. The gesture, the *pantomime* of the orator is captivating. Flashes of light seem to issue from his eyes, his mouth, and even from his fingers! He varies and relieves his discourse by the most lively digressions and well-pointed anecdotes immediately arising out of the subject, which adorn without overcharging it. When he relates facts, his language has all the graces of simplicity; but when he unfolds the mysteries of science, and develops some of the wonders of nature, his speech rises, his style becomes elevated and figurative, and his eloquence corresponds with the sublimity of his theme.

The versatility of Arago, and his vast fund of peculiar information, always ready in his memory, and available for felicitous application, remind us of the qualities of his friend Lord Brougham. Like the latter Arago is a linguist, a politician, a man of letters. He is perpetual secretary of the institute, in which office he has produced remarkable *eloges* of some of his most eminent contemporaries, among whom may be mentioned Volta, Fourier and Watt.

One of the principal avowed instruments for the intellectual advancement for the people in France, is, the drama. Whether the counteracting evils which attend theatrical entertainments, preponderate over the means of mental improvement which they offer, is a question on which some difference of opinion will, no doubt, prevail. However this be decided, the state in France regards the drama as a national object, as the means of sustaining an important branch of French literature, and, in a word, as a department of *les beaux arts*, as well entitled to protection and encouragement as painting or sculpture.

There are within the barriers of Paris about twenty-four theatres, permanently open; most of them nightly, including Sunday. Several of these are directly supported by the state, receiving an annual subvention, of greater or less amount, and being consequently subject, in some degree, to government control. In defence of the moral effect of these places of public amusement, it must be said that none of them present the offensive and revolting scenes which are witnessed in the saloons and upper tiers of boxes of the English theatres. In fact, that class of persons who thus outrage decency, in the place of public amusement in England, dare not show themselves in any theatre in Paris. In that respect, at least, there is a wholesome

stringency of police regulations. In the audience part of a Paris theatre there is, in fact, nothing to offend the eye or the ear of the most fastidious moralist.

The principal theatre of Paris, and that to which the state attaches most importance, is the *Académie Royale de Musique*, commonly called the grand opera. It is here that the art of dancing is cultivated; in connexion, however, with the higher class of opera. Notwithstanding that the prices of admission are considerable, and the theatre accommodates two thousand persons, and is generally filled, yet such is the splendor with which musical entertainments are produced, that the entire receipts do not amount to anything near the expenses of the establishment. The annual subscription allowed by the state to this school of music is above thirty-five thousand pounds sterling.

A second theatre, called the *Opéra Comique*, is also devoted exclusively to the advancement of music, and receives an annual grant of £10,000.

The great school of French dramatic literature is the Theatre Français, where the works of Racine, Corneille, Voltaire, Molière, and the other great dramatic writers, are kept continually before the public, supported by the best living artists, among whom Mademoiselle Rachel at present holds the first place. This theatre is supported by an annual grant of £8,000, notwithstanding which it is now tottering on the brink of dissolution, and must come to a suspension if the state do not intervene.

Exclusive of these, all the other theatres are private enterprises, conducted independently of the government, and generally attended with profitable results in a financial sense. The character of the dramas represented at them is very various, and in some instances exceptionable on the score of moral tendency, not more so, however, than those of the minor theatres in London.

Among the means of intellectual advancement enjoyed by the Parisians, we ought not to omit the mention of the public libraries, of which above twenty are open to the public daily. It is impossible to refrain from contrasting these admirable institutions with similar public establishments in London, not only as to the facilities which they offer to the public, but as to the extent to which the public avail themselves of the benefits which they present. If the number of daily readers at such institutions be any indication of the intellectual advancement of the people, then assuredly our French neighbors have greatly the advantage of us. To perceive this, it is only necessary to look into the *salle de lecture* of the Bibliothèque Royale any morning, and call to your recollection the reading-room of the library at the British Museum. Is the difference to be ascribed to the different state of mental advancement of the people, or to the restrictions imposed on the admission to the use of the latter library? If this last be to any extent the cause, the sooner these restrictions are removed the better. In Paris the public libraries are open without any restrictions whatever. You have no permission to ask, no introduction or recommendation to seek, no qualification to attain—not even a name to acknowledge. Whatever be your condition, rank, country, language, or garb, you are free to enter these institutions; write on a paper which is provided for you the titles of the works you wish to consult or to study, and without further inquiry or delay they are handed to you by porters, who are in waiting for the purpose; you have convenient seats and tables in rooms well ventilated in summer and warmed in winter, with ink for extracts, and

you are only required to find your own paper. The number of readers who avail themselves of this privilege is enormous.

While means so ample are thus presented for the improvement of the understanding, opportunities for the cultivation of taste, and the refinement of the imagination, are not less profusely supplied, and still more eagerly and extensively enjoyed by all classes, including even the most humble of the operatives. To be convinced of this, we have only to make a promenade of the magnificent collection of Versailles, or of the museum of the Louvre, on any Sunday or holiday, when the working classes are free. Those who in London would be found at the gin-shop, or at the smoking bazaar, are here found familiarizing their eye with the productions of Raffaele, Titian, Paul Veronese, the Poussins, or Claude, or wandering among the antiquities of Italy, Greece, and Egypt. It is not an overcharged estimate to state, that on every festival day, with favorable weather, not less than fifty thousand of the lower orders of Paris enjoy themselves in this manner.

STOCKHOLM, June 5.—About one thousand persons will sail this month from Gefle and Stockholm. —These emigrants may be regarded as a fair specimen of the better class of Swedish peasants, and some are men of considerable property. They are generally hard-working, honest lovers of order, and will, no doubt, prove a valuable addition to our population. They are dissenters from the established church of Sweden, and are in fact driven out by the strong hand of religious tyranny. I understand it is their intention to form a colony, as soon as possible, in some of the western States.—*Union*.

RICHARD COBDEN.—Elihu Burritt, now travelling in England, thus speaks of the last meeting of the League:

"Cobden arose—not to speak for the space of several minutes, but to stand up in affecting silence before the assembly, who would have drowned the voice of a trumpet before the swelling peals of applause with which they greeted the Napoleon of moral revolution. Several times he essayed to speak, but before he could frame his lips to the utterance of a word, the multitude would burst forth anew with another volume of cheers. I saw his clear, spirit-speaking eyes fill with tears, on thus being interrupted the third time in his efforts to make himself heard. There stood the meekest looking man I ever saw fronting a public assembly, and in the meekest attitude. As he stood with his slight form inclining forward, with one of his thin pale hands hanging by the forefinger from a button hole in the left breast of his coat, and with the other resting on a corner of the speaker's desk as if for support, he looked the very impersonation of timid modesty. His whole attitude and appearance reminded me of some humble member of the Methodist church, in America, arising in one of their class meetings to 'tell his experience,' in a contrite spirit. And that was England's foremost man! Among all the heroes her annals have numbered, that soft-voiced revolutionist stood the highest in the people's gratitude! For England had become a people, and he the people's man, and this was the hour of his coronation. The first words he uttered fell upon the listening multitude in tones of querulous modulation. They were uttered with child-like simplicity, and were tremulous with the emotion he confessed."

From Chambers' Journal.

LIKINGS OF THE UNLIKE.

AMONGST the perversities of fortune bewailed by Thomson, is her "joining the gentle to the rude." It must be a misfortune for the gentle to enter upon such an alliance, if the qualities of the opposite party are so extremely rough as to be a constant offence to good taste and good feeling. But I am prepared to contend that, within a certain limit, associations of this kind are advantageous, and that, when our inclinations are free, we instinctively seek them as more agreeable than any of an opposite kind. The remark extends to other qualities than those of gentleness and rudeness; in fact to personal associations of every kind. It appears to be a law of our nature, that we should find a solace and satisfaction in connexion with qualities which we ourselves do not possess; and that whatever we are ourselves largely endowed with, that do we shrink from in others.

View the operation of this principle even in our earliest days. Those pairings for which children are remarkable, both within the domestic circle and in the more miscellaneous assemblages at school, do not, as a rule, take place between individuals alike gentle, alike dull, alike energetic, alike brilliant. No: the clever boy finds a mysterious pleasure in the society of some unfortunate dunce, in whom the multitude can see no attractions of any kind. The active irrepressible spirit of the class—he who is always fighting, or playing tricks, and with whom the master has ten times more trouble than with any other boy under his care—this precious youth never assorts with any similar Boanerges or Ajax; he is found to be devoted to some tame, quiet boy, remarkable for his total inability to fight, and who, on the other hand, indifferent to companions of his own stamp, clings to the wild fellow as to something which vastly helps and comforts him. Even where a boy may display somewhat dangerous qualities, it not unfrequently happens that one the very reverse—a jacketed Sir Charles Grandison—finds a strange fascination in his society, and likes him, with all his faults, better than he does any contemporary of merely passable character.

Some fair readers of this paper have probably received their education at a boarding-school. I put it to all such to recall the prettiest, brightest, most accomplished of their companions—she who was the star of the school, the pride of the mistress, the glory of the dancing-master, and the extolled of every other teacher whose province was the outward and ornamental. Now, there is such a thing as jealousy; but I do not think it will wholly account for what is found in the history of this school-paragon, that she hardly ever forms an attachment amongst the other young ladies of a showy character, but almost invariably selects for her friend and confidante one who, with perhaps a fair endowment of good sense, is notably quiet and unpretending, possessed of solid, and not of showy qualities; in short, the perfect antithesis of herself. It is curious, in such a case, to see the one lively, clever, restless, perhaps irritable, while the other is so much the reverse. Often it hardly appears a friendship at all—the one chafing, as it were, against the dullness of the other; this other, again, to all appearance suffering much from the impatience of her companion. And yet they never separate; so that we cannot doubt that it is a real friendship, the very fitness of which rests in that

opposition of qualities which might be supposed to be its bane.

The indifference or repugnance so often shown by one pretty woman towards another, is usually accounted for on the ground of rivalry. But we so often see similar results where rivalry is not presumable, that I believe it may be owing to some deeper spring of feeling in our nature, of which the sentiment of rivalry is only one of the outward appearances. It will be found that two pretty women will be more apt to like each other, if they are of different styles of beauty: the one fair, perhaps; the other dark. This shows that it is not competition for admiration which wholly animates them. So, also, they will form a friendship if they be different in manners, temper, and deportment. In some rare instances, there may be a mutual regard where there is both a community of beauty, and of temper, and deportment; but always, in such cases, some striking discrepancy will be detected in another quarter. *Only one will be lively and talkative*, the other being gentle and grave, demure or languishing, as the case may be. The friendship will then be founded not on the general parity, but the one disparity. The rule will still hold good.

Let us suppose two such friends exposed to the election of the other sex. Fully sure may we be that the man who loses his heart to the one, will see no charm in the other. Your grave or reserved, silent or sensible, stupid or timid wooer, invariably takes to the bright animated beauty, who will talk for herself and for him; the gay, good-humored, rattling suitor, prefers her who will reward his sallies with a passive smile, and love the sound of his voice rather than her own. Happy for us that it is so! If the grave, silent man were to prefer a woman of like characteristics, what a stupid pair, what a sombre household would be theirs! If he of the social, volatile temperament could only find charms in one gay and witty as himself, which of them would be disposed for the sober forethought, the quiet daily duties, indispensable to the domestic comfort of married life?

In this latter relation, it is only difficult to determine, whether in mental or personal characteristics husbands and wives are most often found to differ. What man of deep learning and science, for instance, ever takes to himself a learned and scientific wife? Or rather, what sort of woman does he choose? Why, one who probably never opens a book, but who will see that his friends are well received, that his servants do their work, that the baker's bill is not overcharged, nor the leg of mutton over-roasted. So much for the cant of mental congeniality.

In personal attributes, what striking, what often ludicrous contrasts continually meet our view! For example, how seldom do little women find favor in the eyes of little men! On the contrary, take one of these latter, the most meagre, insignificant, unhappy-looking as to all outward bearing, and then turn to the portly, jolly, smiling dame to whom he has united himself! Look at another, to whom nature has tried to make amends for want of height by such a liberal share of breath and rotundity, as gives him much the *tout ensemble* of a squat decanter or a beer barrel. If you hear such a man talk of his wife, be prepared to see one of those tall, slender, gossamer figures which some people designate graceful and elegant, and others liken to lathe and thread-paper.

That little women are almost always the admired

and chosen of tall men, is, I believe, generally admitted. The taller the husband, it would almost appear that the more kindly does he look down upon feminine diminutiveness. There is also a characteristic gentleness in great robust men. How often, therefore, do we meet a man of towering stature linked to a female hardly reaching his elbow, and are told, moreover, that he is the most attentive and obedient of husbands! This does not, however, apply to your majestic race of men indiscriminately. All of them have, beyond doubt, a prepossession in favor of little wives; but it is not all who choose to be governed by them.

How seldom do we see a very handsome man married to a very beautiful woman! Never, we might say, except in the pages of a novel, where the hero and heroine must have of course their rightful portion of personal charms. On the contrary, we often behold these latter united to downright ugliness. But then there is wealth, or worth, or talent in the opposing scale, which is always observed to be the influential one; for mere beauty—by which we mean a faultless regularity of figure and features—is almost invariably accompanied with that complete insipidity which requires to be acted upon by a nature stronger than, and superior to, its own. We far oftener see it allied to this characteristic than to affectation and conceit; these belonging to a different, and inferior class of pretenders.

Our principle may be said to be developed in every friendship, partnership, and coalition voluntarily formed between those who have to act together on the stage of life. There may be equality as regards outward station and abilities, but never can there be resemblance in disposition or intellectual characteristics. In every era of man's existence the principle is inherent. We see it in the mere schoolboy or college youth, and we perceive it in the different classes and callings of life, civil or military, where mankind are thrown into collision, and the individual pretensions of each are tested.

In our sentimental faculties generally, it will be found that any one which becomes prominent in the character, shrinks from the active exercise of the same faculty in others. For instance, a person possessing much of the venerative principle, does not like to be made an object of worship. He is comfortable while allowed to look up to his great men; but make a great man of himself, and he becomes uneasy. Flattery, and a great show of deference, are to such a man unusually distasteful. It is for the very same reason that one possessing a large endowment of the opposite quality—self-esteem—shrinks from another like himself. In like manner the acquisitive man has always a great dislike—quite irrespectively of pecuniary detriment to himself—to become a subject for the exercise of acquisitiveness in others. It is an old and familiar remark, that those who are much given to jesting at the expense of their fellow-creatures, exhibit a peculiar dislike to be made the subject of jokes by others. This, I am persuaded, is from no ultra-sensitiveness of nature connected with the jest-loving character, but a curious reflex action of the leading faculty, causing it to be as painful in the passive, as it is agreeable in the active voice. Hence it is that your noted wits never shine in the company of men like themselves, and a dinner-party where an effort has been made to bring a plurality of them together, usually proves a failure. If it ever be found that two witty men do

agree well, and promote the general hilarity, examine them narrowly, and you will discover some great difference between them—one perhaps a biting satirist, the other a good-natured humorist—so that the apparent exception only confirms the rule. Assuredly, two wits, both alike of either the first or the second kind, never yet were seen to spend an hour amicably together. And if two humorists of the other kind were brought together, it is ten to one that they would afterwards speak of each other as the perfection of dulness.

Reverting to matrimonial alliances, some interesting consequences arise from the principle of contraries on which partners are usually chosen. Where an alliance of this kind has been happy—to which it is equivalent to say, where it has been founded upon affection—it will be found that each party has a certain degree of preference for such of the children as resemble the other. A father of tame character, who has chosen an energetic wife, will best love the children who, like her, are energetic. If he has a beloved partner of complexion and general aspect very diverse from his own, he will be apt to make favorites of the children who resemble her in these respects, while comparatively indifferent to such of the young people as are copies of himself. It is doubtless from a similar principle that fathers are observed generally to prefer their daughters to their sons. The man-nature delights in the feminine gentleness, because its own opposite.

Perhaps it might not be thought very fanciful to suggest a final cause for all this seeking of opposites, in the need that has been contemplated for producing a diffusion of all the various qualities of families, of races, and of human nature generally, throughout the constitution of society. Sir Walter Scott, who had a great deal of a natural kind of philosophy, arising from the observation of his sagacious mind, makes some remarks to nearly the same purpose, with which I shall conclude my lucubrations. "As unions," he says, "are often formed betwixt couples differing in complexion and stature, they take place still more frequently betwixt persons totally differing in feelings, tastes, in pursuits, and in understanding; and it would not be saying perhaps too much to aver, that two-thirds of the marriages around us have been contracted betwixt persons who, judging *a priori*, we should have thought had scarce any charms for each other. A moral and primary cause might be easily assigned for these anomalies in the wise dispensations of Providence—that the general balance of wit, wisdom, and amiable qualities of all kinds should be kept up through society at large. For what a world were it, if the wise were to intermarry only with the wise, the learned with the learned, the amiable with the amiable, nay, even the handsome with the handsome! And is it not evident that the degraded castes of the foolish, the ignorant, the brutal, and the deformed (comprehending, by the way, far the greater portion of mankind,) must, when condemned to exclusive intercourse with each other, become gradually as much brutalized in person and disposition as so many orang-outangs! When, therefore, we see the 'gentle joined to the rude,' we may lament the fate of the suffering individual, but we must not the less admire the mysterious disposition of that wise Providence which thus balances the moral good and evil of life; which secures for a family, unhappy in the dispositions of one parent, a share of better and sweeter blood transmitted from the

other; and preserves to the offspring the affectionate care and protection of at least one of those from whom it is naturally due. Without the frequent occurrence of such alliances—missorted as they seem at first sight—the world could not be that for which Eternal Wisdom has designed it—a place of mixed good and evil—a place of trial at once and of suffering, where even the worst ills are chequered with something that renders them tolerable to humble and patient minds, and where the best blessings carry with them the necessary alloy of embittering depreciation.”*

From Chambers' Journal.

THE PROBABLE.

It has now become a trite remark, that truth often brings before us “things stranger than fiction.” The reason is, that when a man writes fiction, he has to keep near a particular level of general probability, based on an average of occurrences and situations such as we arrive at in the course of our experience in actual life. The reader holds him as under an engagement to give things at about this average; if he goes much above it, he is condemned as resorting to a silly expedient, in order to work out an effect, or escape from a difficulty. Thus, for example, when he brings home a rich uncle from India exactly in time to save a virtuous family from ruin, he is thought to be merely resorting to a trick of his trade; and yet we know that rich uncles do come home occasionally from India, and may well find things at sixes and sevens among their friends. One or two such events in the course of his three volumes may be allowed the moralist; but if he indulges much more frequently in out-of-the-way occurrences that serve his general design, he is thought a decidedly clumsy artist. Yet nothing can be more certain than that, in actual life, series of events do occur, all of which are greatly beyond that medium line which constitutes our ideal of the probable. As an example, a man will at once be overtaken by insolvency, by illness, by the losses of children, by a burning of his house, and all this in an abrupt or sudden manner, after many years of quiet, comfortable existence, unmarked by any such incidents. Or a considerable number of relations will die in the course of four or five years, and open a succession to wealth and title to an individual who originally had no expectation of it. There are, indeed, some conjunctures in actual life of so singular a nature, as to mock the highest flights of the human imagination.

I speak of those events as singular against the occurrence of which there is a great number of chances. For example, we are told in Brand's *History of Newcastle*, that a gentleman of that city, in the middle of the seventeenth century, dropped a ring from his hand over the bridge into the river Tyne. Years passed on; he had lost all hopes of recovering the ring, when one day his wife bought a fish in the market, and in the stomach of that fish was the identical jewel which had been lost! From the pains taken to commemorate this event, it would appear to be true; it was merely an occurrence possible, but extremely unlikely, to have occurred. A similar incident was lately recorded, with all the appearance of seriousness, in a popular miscellany. “Many years ago a lady sent her servant—a young man about twenty years of age, and a native of that

part of the country where his mistress resided—to the neighboring town with a ring, which required some alteration, to be delivered into the hands of a jeweller. The young man went the shortest way across the fields; and coming to a little wooden bridge that crossed a small stream, he leant against the rail, and took the ring out of its case to look at it. While doing so, it slipped out of his hand, and fell into the water. In vain he searched for it, even till it grew dark. He thought it fell into the hollow of a stump of a tree under water, but he could not find it. The time taken in the search was so long, that he feared to return and tell his story, thinking it incredible, and that he should even be suspected of having gone into evil company, and gamed it away, or sold it. In this fear he determined never to return—left wages and clothes; and fairly ran away. This seemingly great misfortune was the making of him. His intermediate history I know not; but this, that after many years' absence, either in the East or West Indies, he returned with a very considerable fortune. He now wished to clear himself with his old mistress; ascertained that she was living; purchased a diamond ring of a considerable value, which he determined to present in person, and clear his character, by telling his tale, which the credit of his present position might testify. He took the coach to the town of —, and from thence set out to walk the distance of a few miles. He found, I should tell you, on alighting, a gentleman who resided in the neighborhood, who was bound for the adjacent village. They walked together, and in conversation, this former servant, now a gentleman, with graceful manners and agreeable address, communicated the circumstance that made him leave the country abruptly many years before. As he was telling this, they came to the very wooden bridge. ‘There,’ said he; ‘it was just here that I dropped the ring; and there is the very bit of old tree into a hole of which it fell—just there.’ At the same time he put down the point of his umbrella into the hole of the knot in the tree, and drawing it up, to the astonishment of both, found the very ring on the ferrule of the umbrella.”* Here also was an occurrence against which, one would have previously said, the chances were as one to infinity. It was one of those things which we see to be most unlikely, yet must acknowledge to be possible, and, when well-authenticated, to be true.

There is a class of double occurrences, or coincidences, which serve to illustrate the same principle. How often will we hear a name or a fact mentioned, which we had previously never once heard of, and yet that name or fact will once come under our notice, from a totally different quarter, ere two days, or even one, have passed! For example, not a week before the penning of these remarks, a gentleman alluded, in conversation with me, to a Russian plant which is supposed to be of a partly animal nature, and to be in a kind of animal form, with which it chanced that I was unacquainted. Two hours after, consulting the Penny Cyclopædia on the subject of the barometer, my eye lighted on the next ensuing article—“*BAROMETZ*, a singular vegetable production, of which, under the name of the Scythian lamb, many fabulous stories are told. * * * It is, in reality, nothing but the prostrate hairy stem of a fern called *Aspidium Borometz*, which from its procumbent position and shaggy appearance, looks something like a crouching animal, &c.” Or two

* “The Pirate,” chapter xiii.

* Blackwood's Magazine.

persons, associated in our minds, but widely apart in life, will, by letter or visit, cast up in the same day. For example, I have received in one evening, letters introducing strangers from two cousins living in different countries, and from neither of whom I had previously received any communication for several years, except a single letter of introduction from one of the parties about three months previously. One day, proceeding to a place of business where I have duties to attend to, I passed a gentleman whom I recollected having met at a country-house ten years previously, but had not seen since. We formed two out of three guests entertained by a family consisting of three persons, all of them considerably advanced in life. I was aware that two of our entertainers were since dead. With a mind full of the recollections which this gentleman's face excited, I entered the office, and there sat, waiting for me, to consult about a small matter of business, a lady, the survivor of the family of our host, and whom also I had not seen since the dinner-party. On interrogation, I found that she had come there that day, without the least knowledge of the proceedings or whereabouts of the gentleman whom I had just seen in the street. Like myself, she had never once seen him since the day when we had all met ten years ago.

The following is a still more striking instance. In the early part of October, 1844, I was taking an excursion with a friend in Northumberland. Stopping for an hour at Morpeth, to refresh our horse, we asked for a newspaper to while away the time; but were told that the papers of that day had not yet arrived. I therefore resorted for amusement to a miniature copy of Crabbe's *Borough*, which I had put into my pocket for this purpose, selecting it from many books purely on account of its conveniently small size. The section of the poem on which my attention became engaged, was that in which occurs a striking description of the alarm occasioned to a picnic party when, in the midst of their enjoyments on a low sandy islet, usually covered at high water, they were informed that their boat had, by negligence been allowed to float away, leaving them a prey to the rising tide, unless they should be rescued by a passing vessel, which was not likely. The most forcible part of the description of the forlorn party, is that in which the behavior of various persons is put into contrast :

"Had one been there, with spirit strong and high,
Who could observe, as he prepared to die,
He might have seen of hearts the varying kind,
And traced the movement of each different mind :
He might have seen that not the gentle maid
Was more than stern and haughty man afraid ;
Such, calmly grieving, will their fears suppress,
And silent prayers to mercy's throne address ;
While fiercer minds, impatient, angry, loud,
Force their vain grief on the reluctant crowd."—&c.

Immediately after I had read this passage, the waiter put the *Sun* of the preceding evening into my hands. It contained an extract from an Edinburgh paper, giving an account of an accident which had happened a few days before to the Windsor Castle steamer, on her passage from Dundee to Leith with a large pleasure party, which had been witnessing the departure of the queen from the former port, after her short residence at Blair-Athole. The vessel had been allowed to strike on the Carr rock, when instantly music and dancing were exchanged for alarm and terror, as the almost immediate sink-

ing of the vessel was anticipated. Strange to say, the description of the behavior of the passengers was an exact reflection of that in Crabbe's poem, as if the writer had been reading that composition a short while before, and had copied it ; or else the poem was so true to nature, that an actual occurrence unavoidably resembled it. The identity was perfect, even to the particular of gentle women maintaining a quiet and resigned demeanor, while strong men were frantic with vain terror. This will clearly appear from the following passage in the report, which I had the curiosity to search out in the file of the paper in which it originally appeared :—"In a few moments, and the crowd of human beings collected on board, who had just before been radiant with gayety and good humor, changed into a wretched, terrified, and helpless mass, among whom every moral quality of the mind might be discerned brought out into frightful relief, from the sternest of stubborn endurance, to the lowest point of pusillanimity and despair. There was no distinction of age or sex ; *men howled and ran about frantic like women ; and women were there, young and beautiful, who exhibited to the full the calmness of moral heroism.*"—*Edinburgh Courier*, October 3, 1844.*

The day after, I went to attend service in St. Nicholas' church, Newcastle, full of the recollection of the covenanters entering the town after their victory over Charles I. at Newburnford, in 1640, when Alexander Henderson preached a sermon on the text, "And the Lord said unto my lord, sit thou on my right hand, until I make thine enemies thy footstool." Imagination could not resist bodying forth the scene of two hundred years ago—a stern puritan army, flushed with their first victory, listening grimly to an application of this sublime promise, amidst the long-withdrawing aisles of this noble old pile. So possessed in mind, it was absolutely startling to come suddenly, in the readings of the day, upon this very text—"The Lord said unto my lord," &c. This looked like being persecuted with coincidences.

One might say that, if real life gives such striking phenomena as these, while fiction is forbidden to use them, records from actual life ought to be far more interesting, even to the readers for mere excitement, than any of the effusions of fancy. And it really does seem far from unlikely that, if the former were chronicled with fidelity, they would be apt to run romance entirely out of the market.

The wonder, after all, remains, that events, against which there are so many chances, should occur so often as they seem to do. Let us consider what probability actually is. An able philosopher of our century thus speaks of it :—"It is to the imperfection of the human mind," he says, "and not to any irregularity in the nature of things, that our ideas of chance and probability are to be referred. Events which to one man seem accidental and precarious, to another, who is better informed, or who has more power of generalization, appear to be regular and certain. * * * The laws of the material world have the same infallible operation on the minute and the great bodies of the universe ; and the motions of the former are as determinate as those of the latter." He adds, that every particle of water or air has described from the beginning a *trajectory* or path determined by mechanical principles, and which is therefore *knowable*, "and would be an object of science to a mind informed of all the

* On inquiry, it appears that the writer of the report had not previously read the passage in the *Borough*.

original conditions, and possessing an analysis that would follow them through their various combinations. The same," he continues, "is true of every atom of the material world: so that nothing but information sufficiently extensive, and a calculus sufficiently powerful, are wanting to reduce all things to a certainty. * * * Probability and chance are thus ideas relative to human ignorance. The latter means a series of events not regulated by any law that we can perceive. Not perceiving the existence of a law, we reason as if there were none, or no principle by which one state of things determines that which is to follow."*

Unable to discover or follow the laws by which events of this nature are determined, we can nevertheless reduce them to calculation in a particular way. All are familiar with the throwing of dice. There being six sides, any of which may be uppermost, the chance of throwing the die with a particular side, say the ace, uppermost, is one-sixth. With two dice, the chance of throwing two aces is 1-36th: as each face of the one die may be combined with any face of the other. Thus we learn that, "when any event may fall out a certain number of ways, all of which, to our apprehension, are equally possible, the probability that the event will happen, with certain conditions accompanying it, may be expressed by a fraction, of which the numerator is the number of instances favorable to those conditions, and the denominator the number of the possible instances." Now observe, in a couple of dice there are but thirty-six combinations; but what would be the denominator of a fraction which should express the little likelihood of my being engaged in reading Crabbe's account of the distressed pic-nic party, at the moment when a newspaper was approaching me, containing an account of a similar occurrence, expressed almost in the same terms! One can see in a moment the possibility of such an event; but he cannot help thinking, at the same time, that thousands of lives were likely to have passed without its occurring in one of them. It seems difficult to reconcile the frequency of such coincidences, which is matter of familiar observation to all, with the idea of our philosopher, that all secular events might be reduced under fixed laws, if we only could trace the series in their mutual dependency.

Some considerations will, nevertheless, occur to bring such events into at least an approximation with our ideas respecting fixed laws. In the first place, there are what may be called extenuating circumstances. These we usually discover when we look narrowly into particulars. For example, the scriptural text already quoted, being a portion of the 110th Psalm, had a chance of occurring in the usual readings of the Psalter equal to about one in sixty-two (the Psalms being divided into so many portions for reading during the month.) Then it is repeated no fewer than five times in the New Testament. In the portions of Scripture appointed for the daily lessons throughout the year, chapters containing this passage occur no fewer than thirteen times. This obviously added very considerably to the chance that, on attending worship in the St. Nicholas' church for the first time I should hear Henderson's text repeated. Thus the total likelihood was not so little as one would, on a cursory glance, imagine. It is, in the second place,

to be observed that the total number of acts, movements, and occurrences of every kind in life must be much greater, even in the case of the most quiet-living people, than at first sight appears. If this truly be the case, instances of coincidence must bear a much smaller proportion to the entire mass than we are apt to suppose; that is the same thing as to say, that the frequency of their occurrence is more apparent than real. Again, amidst the multitude of the things which pass unobserved and unremembered, there may of course be many occurrences of facts and other particulars, which we believe to be new to us when they occur collisively: thus the apparent first of the two instances may be the tenth, or twentieth, or hundredth, instead of the first. All of these considerations undoubtedly tend to bring the supposed supernaturality *towards*, if not wholly *into*, naturality. If so much can be accounted for from what we know, let us add some further unknown quantity for what we do not know, and then perhaps little, if any, difficulty will remain.

THE WATER-LILY.

BURTHENED with a cureless sorrow,
Came I to the river deep;
Weary, hopeless of the morrow,
Seeking but a place to weep;
Sparkling onwards, full of gladness,
Each sun-crested wavelet flew,
Mocking my deep-hearted sadness,
Till I sickened at the view.
Then I left the sunshine golden
For the gloomy willow-shade,
Desolate and unbeholden,
There my fainting limbs I laid.
And I saw a water-lily
Resting in its trembling bed,
On the drifting waters chill,
With its petals white outspread.
Pillowed there, it lay securely,
Moving with the moving wave,
Up to heaven gazing purely,
From the river's gloomy grave.
As I looked, a burst of glory
Fell upon the snowy flower,
And the lessoned allegory
Learned I in that blessed hour:—
Thus does Faith, divine, indwelling,
Bear the soul o'er life's cold stream,
Though the gloomy billows swelling,
Evermore still darker seem.
Yet the treasure never sinketh,
Though the waves around it roll,
And the moisture that it drinketh,
Nurtures, purifies the soul.
Thus aye looking up to heaven
Should the white and calm soul be,
Gladden in the sunshine given,
Nor from the clouds shrink fearfully.
So I turned, my weak heart strengthened,
Patiently to bear my woe;
Praying, as the sorrow lengthened,
My endurance too might grow.
And my earnest heart beseeching
Charmed away the sense of pain;
So the lily's silent teaching
Was not given to me in vain.

THE NEW "HOLY" ALLIANCE.

WHAT is the price which the ministry has consented to pay for O'Connell's support? He is too shrewd a judge of the value of his votes and influence to let them go cheap. The cry of Conciliation-hall now is, that there never was so good a government for Ireland as the present, that it must be supported, that cheers for repeal are to give way to cheers for Russell. This altered tone must have been bought at a high price.

The priests are with Mr. O'Connell to a man. They are in the secret of the promises he has received, and of his hopes of their fulfilment. Are we to suppose the priesthood so very independent as to join in a shout to swell whig popularity without sure expectation of commensurate advantage to themselves?

There are two objects dear alike to Romish ambition and to whig desire. They are, the destruction of the Protestant establishment in Ireland, and the endowment of the Romish church. The premier makes no secret of his own wishes, but seeks to disarm vigilance by avowing he has no thought of carrying them into effect. He is waiting for the next election.

Some members of the liberal party, very few it must be confessed, honestly opposed to the endowment of popery, have taken alarm at the near prospect of that measure being brought forward with the whole weight of government support. Mr. Robertson, a writer, we believe, in the "Westminster Review," has just issued a pamphlet, expressing his conviction that the endowment of the Church of Rome is already a settled question in the cabinet. His language is clear and logical:—

"Lord John Russell avows himself, like a man of honor, favorable to the reduction of the Protestant, and the endowment of the Catholic, Church of Ireland. This is the view entertained by nearly everybody who voted for the Maynooth endowments. Never was there a ministry so favorable to Roman Catholics. Mr. Macaulay will discover the slip in logic he made use of to secure his election. Cogeny will come to him, and he will show, without an error in mood or figure, how maintenance is a necessary sequence of preparation for the priestly office. All his colleagues think so. Every sound head must regard the position Mr. Macaulay, Mr. Gibson Craig, and Mr. Fox Maule take as *uniquely* preposterous. On another occasion we may show how completely and conscientiously the whole Russell administration are committed to the endowment of popery. Votes, speeches, reviews, pamphlets, may all be quoted to prove how completely they are pledged, how cordially they are wedded to this great whig delusion.

"The exact purport of the answer of the premier to this question—'Will you pay the priests?'—was, 'I will when I can.' He will have his eye on a new parliament. Earl Grey and Sir George Grey, the colonial and the home secretaries, are both devoted to this measure. Sir William Somerville, the *protégé* of O'Connell, is the home under-secretary. Mr. Wyse, who enjoys the friendship and confidence of the highest dignitaries of the Catholic church, is on the Board of Control. Lord Palmerston has given priests glebes privately, and recommended the same course to the government publicly. If ever there was an administration which had its purpose blazoned upon the forehead of it, this administration has been constructed with a view to the endowment of popery. For one person in the upper liberal circles against paying any sect,

there are twenty in favor of paying all. Everybody thinks it good policy to pay the priests and make good subjects of them. Catholic ascendancy is the cherished purpose of Conciliation-hall. It will be done when O'Connell wishes it; for he is the strongest, and premiers are not false to their own convictions when their interest coincides with them.

"O, but the Catholics will not take the pay!" It is amazing what some heads are fitted to believe, and some tongues to say. Did not the welkin of the whole world ring with a shout of Catholic joy when the state undertook to provide for the education of the priesthood in Ireland? Will they who rejoiced over the maintenance of the students reject the maintenance of the priests of Maynooth? Catholic ascendancy in Ireland is the Catholic notion of justice. In the teeth of all his loud professions of voluntarism, now silent, Mr. O'Connell, in a memorable speech in the beginning of last year, made his last declaration on this subject; which was, that as Presbyterianism was the established religion of Scotland, and Episcopacy of England, Catholicism ought to be the established religion of Ireland. Only imagine the Vatican spurning state pay! As much of state pay and as little of state control as possible is the object of the Irish priesthood. Gold as much as they can get, with as little of it as possible in the shape of chains, is the object of the priests."

This able extract states the question with perfect fairness. The Protestant church will be reduced, and the Romish church endowed, the instant Lord John Russell can securely count on his parliamentary majority.

We quite agree with Mr. Robertson that a state provision for the maintenance of priests is a necessary sequence to state provision for the education of priests. One follows the other naturally. Every argument used for the endowment of Maynooth can be urged with tenfold force for the endowment of Romish benefices.

The danger is apparent: If the country will make no provision against it, we must expect to encounter it unprepared, and hopeless of resistance. The policy, once put in action, can only end with the entire destruction of the Protestant church in Ireland, and in the absolute dominion of the church of Rome. Mr. O'Connell may, after all, be sincere; these changes would greatly smooth the way for repeal.—*Britannia*, 8 Aug.

From the *Britannia*, Aug. 15.

THE CANADIAN "LEAGUE."

THE speech of Lord Ashburton on Monday relieved the monotony of the debate by a reference to the real measure before the house, and the consequences likely to flow from it. His address is marked by the practical genius for which this eminent commercialist is distinguished. No man is better entitled to speak with authority on questions affecting our colonies, because no man is more deeply interested in their prosperity, or has had more extensive experience in their trade. He is neither a theorist nor a blind worker in the great transactions of commerce. His position, like that of the commander of an army, enables him to command a view of the whole field of action, and to combine the principles of science with the necessities of the time. If he goes farther than most of those who took part in the debate, it is because he sees farther, and looks more steadily to remote consequences, not because he is more visionary in his opinions.

Very wisely, as we think, Lord Ashburton says nothing of slavery in connexion with this question. The real point at issue, in his judgment, is, whether our whole system of colonial protection is to be retained or abolished. He is satisfied that the principle of free trade, once acknowledged and acted on by the legislature, must be carried out to its full extent. We yield entire assent to this frank and decided avowal of his convictions:—

"This measure involved a complete change in the whole colonial system of this country; *it involved, in fact, the question of our having colonies at all.* All the world must admit that the principle of protection was sometimes carried to an absurd and ridiculous extent; but that some degree of protection was required by the dependencies of a country whose great wealth had been created by colonies and commerce, no man possessed of political knowledge or experience would be disposed to controvert. *The principle on which this measure was founded necessarily involved the loss of these colonies.*"

These remarks are true to the letter. Political systems are not like material edifices, visible to sight. There is nothing tangible in them. They cannot be touched, or handled, or examined, or measured; and hence to the careless or ignorant they may seem to have no existence. But, in reality, they are composed of many parts, and are held solidly together only by the support those parts afford to each other. You cannot deprive our colonial system of one of its main pillars without grievously damaging the whole structure. When the supports are weakened, it must be taken down as rapidly as possible lest it should by its own weight descend in ruins.

We have already an illustration of this in the state of affairs in Canada. One party is indignant at the withdrawal of protection to Canadian exports, and vehemently protests against the injustice of charging on the colony the expenses of those works undertaken on the faith of a market being reserved for its surplus produce in Great Britain. A second party, believing free trade to be inevitable, considers only how the Canadians can take advantage of it, to remove those restrictive laws by which the parent country has made her colonies a source of wealth and extended commerce to herself. It is said, very reasonably, that, if the principle of buying in the cheapest and selling in the dearest market is to be acted on by the imperial legislature, it must also be acted on by colonial legislatures; and that, if Canadian exports are to meet with no more favor from England than the exports of foreign countries, the people of Canada are entitled to purchase the commodities they require wherever they can obtain them to the greatest advantage. They go a little farther, and directly assert that it is not for the interest of Canada to have any restrictions placed on her carrying trade; they say freights should be regulated by the same principle as other operations of commerce, and that the traders of Canada have a right to obtain them at the cheapest rates that are offered. In short, they insist that the British navigation laws, as far as they regard Canada, shall be wholly and entirely repealed. We confess we do not see how this demand can be resisted.

A free-trade association has been formed at Montreal to agitate for those changes indicated above, which, it is asserted, are rendered absolutely necessary by the legislative enactments in England during the present session, and which are demanded

equally by reason and by justice. This Canadian League has its organ in a weekly journal, the *Canadian Economist*, in which its views are urged with great freedom and vigor. In an able report from the association a list is given of those articles on which high discriminating duties are imposed for the benefit of the English manufacturer. We extract a few of the items:—

Articles.	Foreign.	British.	Discrimination.
Coffee,	5s. per cwt. & 1d. p. lb.	1d. p. lb.	5s. pr. cwt.
Glass and Glassware,	20 pr. cent.	5 pr. cent.	15 pr. cent.
Harness,	12 " "	5 " "	7 " "
Hardware,	12 " "	5 " "	7 " "
Hats, Leather, Wool-	12 " "	5 " "	7 " "
len, Cotton,	12 " "	5 " "	7 " "
Iron, except Pig, . . .	12 " "	5 " "	7 " "
Jewellery,	12 " "	5 " "	7 " "
Leather Manufactures,	12 " "	5 " "	7 " "
Machinery,	17 " "	10 " "	7 " "
Musical Instruments,	12 " "	5 " "	7 " "
Manufactures, Cotton,	12 " "	5 " "	7 " "
Linen, Woolen, . . .	12 " "	5 " "	7 " "
Paper Manufactures,	12 " "	5 " "	7 " "

These discriminating duties the League requires shall be given up. It seems there will be no opposition to their demand from the home government. Power will be allowed our colonial legislatures to deal with discriminating duties as they think best. Our manufacturers who have hitherto held almost exclusive possession of the colonial markets will then, probably, find powerful rivals in them. The goods of the United States can be carried to the West Indies and Canada more rapidly and at less expense than from the ports of Great Britain; and it is, therefore, only reasonable to conclude that a large portion of the trade and commerce hitherto enjoyed exclusively by ourselves will be diverted to other sources.

But it is on the repeal of the navigation laws that the Canadians lay the most stress. In the free-trade manifesto, the "baneful influence" of those laws is dwelt on at length, and the people are urged to join in a vigorous effort for their total abolition. Some passages in the report show how keenly the restriction is felt, and what hearty efforts will be made for its removal:—

"The council trusts that a representation of the injury to this province, arising from the restrictive character of the British navigation laws, is all that is requisite to induce the British ministry to cause their modification, so far as respects this colony. *Their baneful influence* has, more especially during the present year, been felt both in our export and import trade. Such has been and is the scarcity of British vessels, adapted to the conveyance of wheat and flour, in the ports of Quebec and Montreal, that freight has advanced fully fifty per centum beyond the remunerating or average rate. Now, had those laws permitted, *foreign vessels could have been procured in the ports of the United States, at moderate rates*, (as is manifest from the low freights between New York and Britain,) to convey the produce to its destined market. Is it not obvious that *we are thus placed in a much less advantageous position than foreigners, in being taxed to support British shipping*, and that tax offers great encouragement to the western producer to send his goods via the United States, rather than by the route of the St. Lawrence! *Thus this colony is laboring at the same time under the twofold inconvenience of removal of protection, and prohibition of free trade.*

"The like evil is severely felt in the import trade of the province, and is exemplified in the article of muscovado sugar, of which our supplies are now principally derived from the Spanish islands. The navigation laws, on which we now animadvert, prevent our importing foreign commodities in any but British ships, or ships of the country where the goods are produced. Now, Spain has little shipping, and none suitable for the trade with America, and there are no British vessels to be met with in the Spanish islands. The importer of a cargo of sugar to this province is thus compelled to charter a British vessel from some distant port, to proceed in ballast, to convey the cargo, for which he pays a freight of, say 4s. per cwt., or fully twenty-five per cent. on the prime cost of the article, *whilst there are fleets of American vessels on the spot, which would convey it at one half that rate.* Can he, then—drawing his supplies of sugar in this circuitous and expensive method—compete in the western market with the merchant of the United States? Obviously he cannot; nor need it be matter of surprise that the trade, which, under a free system, would flow through the St. Lawrence, is thus diverted to other channels."

We do not see how a Russell government is to oppose itself to these representations. If we allow the colonies no favor, we have no right to place them at a disadvantage. They are entitled to a real, not a nominal, equality. If our navigation laws prevent them from sending or receiving commodities so cheaply as they might otherwise do, those laws must be given up. We cannot be unjust to our colonies if we would, because *we cannot deprive them of the power of resistance.*

It is assumed, indeed, that the people of our colonies care little for financial considerations, and that they are willing to forego all benefits, nay, even to incur serious disadvantages, for the honor of being connected with the British empire. This theory is flattering to our pride. We may wish it to be true, but it will hardly stand the test of examination. The current of experience is against it.

It was a point of finance, a mere question of the pocket, that produced the American revolt and the war that followed it. The tax was trifling we know; and we quite agree with those who say the Americans fought for a principle more than against the duty on tea. But that principle was still a financial principle; it was, that the pecuniary interests of the people should not be attacked against their will; it was, in short, that they would not submit to be taxed for the benefit of the parent country.

The Canadians, according to present appearances, are ready to hoist the same banner; taxation may take the shape of a navigation law as well as of a direct impost; and the Canadians openly declare their repugnance to be *taxed* for the support of British shipping. Our colonies were perfectly willing to live under a protective system, while it sheltered and benefited them. But it is not to be expected that they will patiently suffer all its evils while deprived of its benefits. One change must be followed by others. In a commercial sense our colonies, since we choose to abolish all differential duties in their favor, must be made *independent*. The inquiry will not then long be allowed to rest—Of what use is a political dependence that is barren of useful results, and is known only by the exercise of a distant, an arbitrary, and a capricious authority?

A MOTHER'S RESIGNATION.

"There are griefs that lie in the heart like treasures.
Till Time has changed them to solemn pleasures."

No, not forgotten! Though the wound has closed,
And seldom with thy name I trust my tongue,
My son 'so early lost, and mourned so long;
'The mother's breast where once thy head reposed
Still keeps thy image, sacred through long years,
An altar, hallowed once with many tears.

How oft my heart beats at some idle saying,
Some casual mention of that foreign land
Wherein thy grave was dug with hasty hand,
And thy sole requiem was thy mother's praying;
Till o'er the ocean swift-winged memory flies,
To that lone forest where my first-born lies!

Sometimes, when in my other babes I trace
A momentary likeness unto thee—
Thy smile that ever shines in memory,
Thy thoughtful eyes, thy love-illumined face—
I clasp the wondering child unto my breast,
And fancy that my arms round thee are prest.

I think of thee, but 't is with grief no longer;
I number thee among my children still;
Though parted in the flesh, by God's high will,
I feel my soul's deep love for thee grow stronger:
Like one of old, I glory to have given,
Out of my flock, an angel unto heaven.

Chambers' Journal.

As an instance of the adaptation between the force of gravity and forces which exist in the vegetable world, we may take the positions of flowers. Some flowers grow with the hollow of their cups upwards; others "hang the pensive head," and turn the opening downwards. The positions in these cases depend upon the length and flexibility of the stalk which support the flower, or, in the case of the *euphorbia*, the germen. It is clear that a very slight alteration in the force of gravity, or in the stiffness of the stalk, would entirely alter the position of the flower-cups, and thus make the continuation of the species impossible. We have, therefore, here a little mechanical contrivance, which would have been frustrated if the proper intensity of gravity had not been assumed in the reckoning. An earth, greater or smaller, denser or rarer, than the one on which we live, would require a change in the structure and strength of the footstalks of all the little flowers that hang their heads under our hedges. There is something curious in thus considering the whole mass of the earth, from pole to pole, and from circumference to centre, as employed in keeping a snowdrop in the position most suited to the promotion of its vegetable health.—*Whewell.*

A STEREOTYPED MIND.—At a public meeting at Scarborough, the Rev. B. Evans made this striking remark:—"I value not at all the mind that is stereotyped. Give me the sort of mental type that can be changed when required, that will admit of additions and improvements, such as increasing light and intelligence demand."

NANTUCKET SAILORS.

BY THE REV. MR. ABBOT.

A MAN was speaking a few days ago of the emotions with which he was overwhelmed, when he bade adieu to his family on his last voyage. The ship in which he was to sail was at Edgartown on Martha's Vineyard. The packet was at the wharf which was to convey him from Nantucket to the ship. He went down in the morning and saw all his private sea stores stowed away in the sloop and then returned to his home to take leave of his wife and children. His wife was sitting at the fireside struggling in vain to restrain her tears.

She had an infant a few months old in her arms, and with her foot was rocking the cradle in which lay another little daughter about three years of age, with her cheeks flushed with a burning fever. No pen can describe the anguish of such a parting. It is almost like the bitterness of death. The departing father imprints a kiss upon the cheek of his child. Four years will pass away ere he will again take that child in his arms. Leaving his wife sobbing in anguish, he closes the door of his house behind him. Four years must elapse ere he can cross that threshold again. One sea captain upon this island has passed but seven years out of forty-one upon the land.

A lady said to me a few evenings ago, "I have been married eleven years, and counting all the days my husband has been at home since our marriage, it amounts to but three hundred and sixty days." He is now absent, having been gone fifteen months, and two years more must undoubtedly elapse before his wife can see his face again, and when he shall return it will be merely a visit to his family for a few months, when he will again bid them adieu for another four years' absence.

I asked the lady, the other day, how many letters she wrote to her husband during his last voyage. "One hundred," was the answer. "And how many did he receive?" "Six." The invariable rule is to write by every ship that leaves this port or New Bedford, or any other port that may be heard of for the Pacific Ocean. And yet the chances are very small that any two ships will meet on this boundless expanse. It sometimes happens that a ship returns, when those on board have not heard one word from their families during the whole period of their absence.

Imagine then the feelings of a husband and father, who returns to the harbor of Nantucket, after the separation of forty-eight months, during which time he has heard no tidings whatever from his home. He sees the boat pushing off from the wharves which is to bring him the tidings of weal or woe. He stands pale and trembling pacing the decks with emotions which he in vain endeavors to conceal. A friend in the boat greets him with a smile, and says, "Captain, your family are all well." Or perhaps he says, "Captain, I have heavy news for you, your wife died two years and a half ago."

"A young man left this island last summer, leaving in his quiet home a young and beautiful wife, and an infant child. The wife and child are now both in the grave. But the husband knows not, and probably will not know it for some months to come. He perhaps falls asleep every night thinking of the loved ones left at his fire-side, little imagining that they are both cold in death.

On a bright summer afternoon, the telegraph announces that a Cape Horn ship has appeared in the horizon, and immediately the stars and stripes of

our national banner are unfurled from our flag-staff, sending a wave of emotion through the town. Many families are hoping that it is the ship in which their friends are to return, and all are hoping for tidings from the absent. Soon the name of the ship is announced; and then there is an eager contention with the boys to be the first bearer of the joyful tidings to the wife of the captain. For which service a silver dollar is the established and invariable fee.

And who can describe the feelings which must then agitate the bosom of the wife! Perhaps she has heard of no tidings from the ship for more than a year. Trembling with excitement, she dresses herself to meet her husband. "Is he alive," she says to herself, "or am I a widow, and the poor children orphans?" She walks about the room, unable to compose herself sufficiently to sit down. Eagerly she is looking out of the window, and down the street; she sees a man with hurried step turn the corner, and a little boy hold of his hand.

Yes, it is he. And her little son has gone down to the boat and found his father. Or, perhaps, instead of this, she sees two of her neighbors returning slowly and sadly, and directing their steps to her door. The blood flows back upon her heart. They rap at the door. It is the knell of her husband's death. And she falls senseless to the floor, as they tell her that her husband has long since been entombed in the fathomless ocean.

This is not fiction. These are not extreme cases which the imagination creates. They are facts of continued occurrence—facts which awaken emotions to which no pen can do justice.

A few weeks ago a ship returned to this island, bringing the news of another ship, that was nearly filled with oil, that all on board were well, and that she might be expected in a neighboring port in such a month. The wife of the captain resided in Nantucket, and early in the month, with a heart throbbing with affection and hope, she went to greet her husband on his return.

At length the ship appeared, dropped her anchor in the harbor, and the friends of the lady went to the ship to escort the husband to the wife from whom he had been so long separated. Soon they sadly returned with the tidings that her husband had been seized with the coast fever, upon the island of Madagascar, and when about a week out, on his return home, he died and was committed to his ocean burial. A few days after I called upon the weeping widow and little daughter in their destined home of bereavement and anguish.

SONNET.

BY THE HON. MRS. NORTON.

O for the time—the happy sinless time—

When first we murmured forth our infant prayer,
Listened with reverence to the church-bells'
chime—

Gazed on the sky, and deemed that God dwelt
there!

No more we hear those holy deep toned bells;

But as their echo trembles on the air,
So in our sorrowing minds remembrance dwells—

Breathing of those fine days ere passion's sigh,
Remorse and sorrow, (sad the tale she tells,)

Polluted the petition sent on high;—

When we knelt sinless, and our God alone

Was in the prayer that rose to his Almighty throne.

DISCOVERY OF COPPER MINES IN AUSTRALIA.

AFTER the great depression which the Australian colonies have suffered of late, it is gratifying to find that a new impulse has been given to the energies of the colonists around Adelaide by the discovery of rich mines of copper. The discovery of the copper ore was entirely accidental. A son of Captain Bagot, in his chance rambles, had picked up a greenish stone, and carried it home, where it excited some attention. A short while afterwards, Mr. Dutton, having gone to the same locality in search of some stray cattle, was attracted by a greenish-looking substance imbedded in the shaly rock, which there rose to the surface. He carried home a specimen, and, showing it to his friend Bagot, it was ascertained to be an ore of copper of the same nature as the specimen found by his son. The next object of these enterprising gentlemen was to get possession of the land embracing this hidden treasure. This they did by a regular purchase from government of eighty acres, at the price of one pound sterling per acre. It appears that there is no reserve made by government in the sale of lands, but that all minerals, and everything else, become the sole property of the purchaser. As the copper ore in this locality comes to the surface of the soil, the working of such a mine is a comparatively easy task; and some Cornish miners being on the spot, operations were commenced immediately, and in due time a quantity of the ore was sent to England. It was found that the ores consisted of a carbonate and sulphuret of copper; and so rich were they, that, on an average, they furnished 29½ per cent. of pure metal; and the sale of the ore at Liverpool brought an average of £24, 8s. 1d. per ton—a price greatly above that of any British ores, or even of those of South America, with one exception. The average price of British and European ores is from £5 to £6 per ton; and the South American brings from £10 to £15, the richest being £29. The enterprising proprietors of the Kapunda mine, ascertaining that some adjoining lands contained copper also, became purchasers of additional ground; but the value of the mines having now to some extent transpired, the price per acre was raised tenfold. Another locality containing very rich ore was soon after discovered in the Mount Lofty range of hills, about ten miles from Adelaide. This, called the Montaculi copper mine, has been purchased by a company, and is now also in full operation. From the number of buffaloes in the country, the facility of carrying the ore to the shipping port is very great. Improved modes of roasting the ores, and thus lessening greatly their bulk, are also being adopted. The whole colony is in activity, and the trade, if pursued with moderate caution and prudence, is likely to be of essential importance to the community. Not only is the British market open for the commodity, but there is also a wide field in India, China, and other parts of the world.

A volume just published by Mr. F. Dutton on South Australia and its mines,* affords an interesting detail of this recent discovery, as well as the most recent notice of the trade and prospects of South Australia. The colonies appear to be gradually recovering from the late effects of over-impetration and excessive speculation. Cattle and

sheep are in such abundance, that the principal consumpt consists in melting down the carcasses in order to obtain their tallow. The newly-discovered mines, however, promise to employ somewhat more profitably the muscular powers of the buffaloes, as well as to furnish steady and profitable labor to a considerable number of miners, engineers, and other artisans required for mining operations.

IDIOCY.

DR. CAMPBELL, in a communication published in the Northern Journal of Medicine, states, on the authority of Dr. Kombs, that an unusual number of idiots and deformed persons are to be found at Jena, in the Grand Duchy of Weimar. This fact is, by the medical men of the place, coupled with the circumstance of there being brewed at Lichtenhain, a neighboring village, a very strong beer, of pleasant taste, which is a great favorite with the inhabitants of Jena. This beer is very intoxicating, and the state of intoxication produced by it is far more violent than that brought about by any other beverage in common use. These highly-intoxicating qualities of the Lichtenhain beer are ascribed to belladonna, which, it is said, the brewers mix with the beer. Now, no day passes without some of the inhabitants of Jena returning home in the evening highly intoxicated; and the idiotic and deformed children are regarded as the offspring of fathers addicted to this pernicious beverage.—This is a curious surmise, and one which after-experience is most likely to confirm; for there is no reason why mental deformity should not be transmissible as well as physical malformation—which, unluckily, is but too well-authenticated. And should it be confirmed, what a fearful responsibility do such men incur, who, through vicious propensities, not only destroy their own constitutions, but transmit to their innocent offspring an enfeebled frame, and the worst of all maladies—a hopeless imbecility of mind! Our chief distinguishing characteristic in creation is MIND, the noblest of all the Creator's gifts; and no offence can be more enormous than the debasement of that gift by voluntary indulgence in gross and unseemly practices. Most people, indeed we might say all, make a great profession of regard for their offspring; but we question that sincerity in every case where there exists not a strict attention to such habits of life as will, to the best of human knowledge, secure for that progeny a sound and healthful constitution. The basis of a sound constitution, bodily and intellectually, is infinitely more valuable than any other bequeathment a parent can make. Without the one, life cannot be an enjoyment; without the other, progress is utterly unattainable.

LAWFUL DUELLING.

A LETTER from Munster, Westphalia, of the 30th ult., published in the Journal des Debats, contains the following:—

"The day before yesterday we were witnesses of an afflicting spectacle, and which to a certain degree transported us to the middle ages. This spectacle was that of a duel under the sanction of justice.—The following is an account of this strange affair:—

"Two young officers, the Baron de Deukhaus, a lieutenant in the 11th Regiment of Hussars, and M. de Bonnhart, also a lieutenant in the 13th Infan-

* South Australia and its Mines. With an Historical Sketch of the Colony, under its several administrations, to the period of Captain Grey's departure. By Francis Dutton. London: Boone. 1846.

try, had, whilst playing at billiards in a coffee house at Munster, a violent dispute, in which M. de Deukhaus made use of several offensive expressions towards his adversary.

"These words having been uttered in a public place, and before a great number of witnesses, M. de Bonnhart felt himself under the necessity of demanding public satisfaction, and to this effect cited M. de Deukhaus to appear before the tribunal of honor sitting at Munster. It is known that for the last two years tribunals of this description are instituted in all the divisions of the Prussian army.

"This tribunal, conformably to the law, used all its efforts to induce the offending party to retract the offensive expressions, and not being able to succeed, came to a decision that, considering the words in question attacked the honor of M. de Bonnhart, the latter could no longer continue in the army without having obtained public satisfaction; and considering that M. de Deukhaus obstinately refused to grant him such satisfaction, the tribunal authorized a duel between the two parties, according to the military rules.

"The duel took place on Monday, June 29, at three o'clock in the afternoon, in a plain situate to the north of the city of Munster. A platform was erected in the middle of the plain, on which was seated the tribunal, the judges of the combat.

"Before the tribune, a large space, surrounded by ropes supported by staves, was reserved for the combatants. Some detachments of infantry and cavalry were placed round the enclosed ground and tribune of the judges. At an early hour an immense crowd filled the vast plain, in order to witness the strange contest which was about to take place.

"At three o'clock precisely the judges, wearing their uniforms, took their places in the tribune. They again attempted to effect a reconciliation, and this attempt also failing, authorized the combat to take place.

"It was agreed upon by the two adversaries, with the sanction of the tribunal, that the combat should take place with cavalry swords, and be continued until one of the adversaries became *hors de combat*, and that both should fight with their heads uncovered and in their shirt sleeves.

"A certain number of sabres were then brought forward, and the two adversaries, after having bound their eyes, took by chance their weapons. Then taking off the handkerchiefs from their eyes, as well as their coats and hats, they put themselves in an attitude of defence, and at a signal given by the president of the tribunal, the combat began.

"MM. de Deukhaus and de Bonnhart fought with the greatest obstinacy. The latter successively received two slight wounds in the arm, but soon afterwards wounded his adversary so severely in the thigh, as to render it impossible for the latter to continue the combat.

"When the surgeons had dressed the wounds of the officers, the president of the tribunal again attempted to reconcile them; this time he was immediately obeyed, and the two adversaries embraced each other. The public, which had throughout the combat observed the profoundest silence, hailed the reconciliation with loud and continued applause.—Two coaches took away the late opponents, and M. de Bonnhart assisted in carrying M. de Deukhaus to his. The tribunal then separated, and the crowd quietly dispersed.

"It is the first time that a tribunal of honor in Prussia has ever authorized a duel. All the disputes which had been hitherto brought before the tribunal, had invariably terminated by a reconciliation."

THE REFORMATION IN GERMANY.

THE new Reformation has ended (as seemed but too probable at first) in one of the thousand forms of infidelity that are the curse of German speculation and inquiry. Unable to discern the difference between truth and error, the synod of the congregations have abjured the divinity of the Lord, together with the corruptions of Rome. Thus a serious injury has been done by these rash and presumptuous men to the cause of scriptural truth; and the movement commenced by Ronge, from which so much was anticipated, will only tend to bring German Protestantism into contempt, and to strengthen the hands of Rome. The following letter is taken from the *Morning Herald*. Other accounts received entirely confirm its accuracy;—

"Berlin, July 27.—We have news of the result of the synod of the congregations professing the apostolical faith, which has been held at Schneidemühl; and it is most afflicting. So unblushing was the denial of the saving truths of the gospel, manifested at this meeting, that Dr. Jettmar and his lay coadjutor withdrew in disgust before its sittings terminated. They represented the apostolical flock in this city, and, in spite of all the persuasions and exhortations which Christian love and faithfulness could urge, were unable to prevent the meeting from repudiating the confession of the Holy Trinity, the divinity of Jesus Christ, and the personality of the Holy Ghost. Not only did the members protest against the adoption of the three oecumenical creeds, but treated even the apostles' creed with slight. The Godhead of the Saviour having become the subject of discussion, the Rev. Mr. Port, of Posen, who acted as president, asked whether any one present really believed that Jesus Christ was very God? And upon one of the Berlin deputies replying that he believed it, and was as fully convinced of it as of his own existence, the president treated the assertion with scorn and contempt. Again, when the Berlin deputies earnestly besought the assembly not to reject the apostles' creed, and to abstain from abbreviating it, the same individual observed that it contains 'arrant nonsense.' One of the deputies called upon Czerski to use his influence to discountenance so unscriptural and unbecoming a remark, and to support the opposition raised by them in behalf of the apostolical symbol. He answered that he saw nothing objectionable in the remark; and for himself was averse to all confessions, (symbolicism,) and should vote for the doing away with all creeds, and the adoption of the Bible as the only standard. Dr. Thirnen was also present, and proposed a confession for the congregations of the Grand Duchy of Posen, which is of so equivocal a character as to suit almost every shade of belief, and the meeting adopted it."

This must put an end to the movement, which henceforth can only result in some declaration of infidelity. It will next be carried that the Bible was not written by inspiration; then that it is without authority; and lastly, that all revelation is a fable, and Christianity is an imposition. May this country long be preserved from the fatal errors of German speculation!—*Britannia*.

CORRESPONDENCE.

Parts of Mr. Walsh's letter to the National Intelligencer, dated Paris, 16th August.

THE Paris National of the 8th holds this language: "How do you understand your constitution? Is it, or not, based on the principle of the sovereignty of the people? Is the king anything else than the product of our election? May he not be cashiered lawfully to-morrow, if to-morrow he should violate the conditions imposed on him. Is not the will that created him, and which can proclaim his *déchéance* or forfeiture, always above him? We do not refer to subversive revolutions; we keep within the strict right and scope of the charter. We pursue the regular and insuperable consequences of popular sovereignty."

Mr. Cobden has been for several days the lion of Paris. Cæsted, the celebrated Danish natural philosopher, is also here, and was present at the last meeting of the Academy of Sciences, of which he is a corresponding member.

The Amnesty of the new pope, in the Italian, is a beautiful composition; his allocution to the Cardinals a masterpiece of Latinity. Our Paris *National* is not satisfied with the amnesty because it contains the word *pardon*, and a promise of future loyalty to the Holy See is exacted.

Young Oscar Lafayette, the son of George, was elected to the chamber of deputies by virtue of his glorious name. Six members of the Lafayette connections have now seats in the chamber.

In the months of June and July the theatres of Paris received less money than during the months of the cholera. The swimming and bathing establishments gained more than in any one year for the twenty-five years past.

Mr. Coupey, an erudite judge of Cherbourg, published some years ago a tract showing that the institution of the jury—nearly the same as that of the present day—subsisted in Normandy for a century or more in the middle ages. He has issued another tract on *Judicial Proof in Normandy* at the same era, fortifying the first.

M. Guérin Meneville's "Studies of the habits and organization of the numerous insects or creatures mischievous to useful vegetables," deserve to be known in the United States. When the olive shall be cultivated in our country, his treatise on the insects of that tree will be consulted with advantage.

A colossal head in Pentelic marble, in the Royal Library of Paris, is ascertained to be from the chisel of Phidias, and to have been brought from the ruins of the Parthenon in 1676, after the fatal explosion of that year.

In consequence of the drought, the inhabitants of the city of Aix have been put on an allowance of three quarts of water per day for all domestic purposes.

The Abbé Miche, apostolical missionary, was *smuggled* into Cochinchina in a boat with a false bottom, in which he lay *perdu*.

The London Morning Chronicle of the 8th instant has a remarkable editorial article on the Californias, the state and prospects of Mexico and the war, and ending with an appeal to all the governments of Europe to arrest the strides of American ambition. It is not, indeed, the organ of the British cabinet, but rather of the discomfited and forlorn Hudson Bay Company.

The learned Israelite Cahen's translation of the Bible will consist of thirteen volumes. He has just issued the seventeenth *livraison*, containing the

Psalms, with an introduction. The whole work will soon be finished. It exhibits the labors of the German philologists and Jewish theologians. His dissent from the Christian commentators is always temperately expressed.

Benoiston de Chateauneuf lately read to the Academy of Moral and Political Sciences a memoir on the length of human life in many of the principal States of Europe, and on the greater or less longevity of their inhabitants; it is a work of extensive research and immense calculation. He concludes that all climates are favorable to longevity; that in Europe *woman* is everywhere longer lived than man, and that the human career may be estimated at ninety years as the extreme; of one thousand individuals fourteen remain to that period, from the age of thirty, and six from birth.

There is a remarkable tribute to the spirit and tendency of the times in the following conclusion of the address of Marshal Bugeaud, *Duke of Isly*, to his constituents. "I profess to love and to merit popularity. I have always labored for the people: I am of the people, the son of my own works; I cannot entertain aristocratic ideas."

In a recent lawsuit, Alexandre Dumas was convicted of *double vente*; that is, of having sold twice over the same literary materials: his *Clarissa Harlowe*, a French compression and recast of Richardson's endless work, has found astonishing success in England as well as France. *Clarissa Harlowe*, a drama in three acts, founded on the principal events of the novel, and skilfully executed, has been welcomed in like manner at the theatre of the Gymnase. Mademoiselle Rose-Chéri (a new Mademoiselle Mars) is the applauded *Clarissa*.

Mehemet Ali lately said to the British Ambassador at Constantinople that he was quite sensible of the importance of a good and safe communication across the Isthmus of Suez, but would give the opening of it to no company: he would execute it himself. Monopoly of profits is his object.

The premature unexpected death of the famous Baboo Dwarkanauth Tagore, at London, affords topic for many French paragraphs. The Parisians saw him last winter everywhere seemingly in robust health, and especially devoted to the ladies, whose smiles and pressures of his tawny hand he requited with Cashmere shawls and glittering trinkets. Where they were present all serious conversation with him was out of the question. Tagore was not a prince, as he was commonly dubbed, but a princely merchant, fond of the appearances of a *magnifico*. He was born in the caste of the Brahmins, of parents in moderate circumstances. He amassed his large fortune by hard work and lucky speculations in opium and indigo. He paid a visit to Rome, and, in his interview with the pope, intended to discourse on deism as taught by Ramoun Roy, but Gregory diverted him from the subject by gracious queries concerning his deeds of munificence. He was zealously devoted to the East India Company.

The will of Louis Bonaparte, ex-king of Holland, who died lately at Florence, is an interesting document. It implies that he was enormously rich. Louis Napoleon, the ex-prisoner of Ham, inherits enough to equip another expedition for the imperial crown of France.

Shamil, the hero of the Caucasus, again annoys the Russians by incursions, which yield him much booty. A letter from Tiflis states that he is at the head of twenty thousand Circassian mountaineers, who slay their many Cossack prisoners, when these

are found inconvenient. A French writer describes Shakspeare as a barbarian incrustated with genius. Shamil and Abd-el-Kader seem to merit the same description.

The recent and curious article of the London Times on the marriage of the Queen of Spain fell like a bomb in the French cabinet and the political circles of Paris. In no instance, by any foreign journal whatever, has Louis Philippe been so directly and personally arraigned or so harshly treated. Before the accession of the whigs in England the Times held a very different strain about the Spanish match, and paid profound homage to the wisdom and virtues of the king of France. The *Journal des Débats* was roused to an immediate semi-official reply, in which, though the British cabinet be generally exculpated, Lord Clarendon, a member of it, and formerly British ambassador at Madrid, is accused of having written or prompted the indecorous and spiteful article.

There was more diffusive animation and interest in the recent general election of Deputies than on any former occasion. The conservatives have a majority of about one hundred; but the ministry cannot count on that number for their purposes during the next session. The Dupin and Dufaure groups will be disposed, as heretofore, to baffle Mr. Guizot. The new members are not certain adherents; they may throw themselves, according to emergencies, into the different sections of the chamber. Not one half of the so-called conservatives elected, new or old, pledged themselves to support Mr. Guizot's policy, or professed his doctrines or attempted to defend his past measures.

The monument of Christopher Columbus, which the Sardinian government has caused to be executed in marble, for the city of Genoa, is completed, and will be immediately erected on the Quay de Darse-na. The inauguration will take place in September next, during the time that the meeting of naturalists is being held in that city. The king and the royal family will be present on the occasion.

The late experiments made at Berlin of casting iron cannon by the galvanic-elastic process were so successful that it has been determined to apply it to all the guns in the Prussian fortresses. A sum of 100,000 thalers (375,000fr.) has already been appropriated towards the execution of the plan.

CONFIDENTIAL COMMUNICATIONS.—In an action for slander, which came up for trial at the assizes at Norwich (England) this week, before Mr. Baron Alderson, it appeared that the words complained of were uttered by the defendant in private familiar conversation with a friend; and the learned judge stopped the case, saying that such a conversation ought to be treated as a privileged communication; for, if persons were to be subject to actions for words so spoken, all intercourse between friends would be at an end.—*Atlas*.

From the same, dated July 20.

Mr. Guizot's acts, aims, and theories, in the Texas affair, form a prominent topic in the circulars of the French opposition. The *Journal des Débats* styles him the greatest statesman and orator of the present times. Surely, the statesmanship may be questioned in his whole foreign policy. It is affirmed that France has spent within the ten years past, a million and half of francs for her legation in Mexico, and with what fruit! The follies of Tahiti, Marquesas, Montevideo, could scarcely be exceeded. Nothing but disappointment and loss will come of the struggle to estab-

lish French supremacy in the Lebanon. Final discomfiture of all efforts in Greece and Spain is quite probable. It is presumed that, while the Duke of Bordeaux lives, Louis Philippe will inflexibly refuse assent to a match between the son of Don Carlos (late titular King of Spain) and Queen Isabel. The example of such a triumph for *legitimacy* might prove dangerous to the Orleans dynasty.

Professors are about to be established in the south of France—in the Mediterranean provinces—for the diffusion of the (vulgar or spoken) Arabic tongue.

A recent case before the tribunal of commerce brought out the circumstance that Monsieur de Larmatine, the poet, sold to a bookseller for the sum of four hundred and fifty thousand francs the copyright or property during his life, and twenty years after his death, of his *History of the Gironde*, and his *Confidential Memoirs*. The purchaser became unable to fulfil his contract, which might have proved a bargain. The posthumous memoirs of Marshal Duke of Belluno (Victor) are announced. Some extracts thrown into the journals beget the expectation of an interesting book.

We have a French translation of Mr. Cooper's *History of the Navy of the United States*, in two octavos, by Paul Jessé. In the press, a *History of the Accursed Races of France*, meaning, I presume, Jews, Gipsies, and so forth. The common phrase in Europe, the *dangerous classes*, meaning the lower, hardly admits of application in the American Union; at least, not in the non-slaveholding States.

The *Essay on the Life and Labors of the late Baron de Gérando*, by his niece, will interest many philanthropists and students of philosophy on your side of the Atlantic. There is no French memory of my personal acquaintance which I venerate so much as that of the Baron, man and author.

The announced *History of the Clergy of France*, from the introduction of Christianity among the Gauls to the present time, by an erudite lawyer, Bousquet, has a general welcome. A naturalist has given us a tract, with an atlas of eight plates, entitled "The Omnipotent Godhead proved by the admirable organization of the Silkworm."

Dr. Bowring's exposition in the house of commons, on the 15th instant, of the tobacco question in Great Britain, went to the United States by the steamer of the 19th; but I cannot refrain from indicating it to you and your readers. The high duties and the consequent contraband are exhibited in most instructive magnitude and deformity. The amount smuggled is at least equal to that on which the duty is paid; that duty being between 800 and 900 per cent. on the value of the raw commodity. This year the convictions in the courts for the smuggling have been five hundred and thirty-eight and before magistrates not less than eight hundred and seventy-two, in England alone. The doctor added:

"The ratio in Ireland and in Scotland was even greater; for while in England they were 102 per cent., in Ireland they were 252 per cent., and in Scotland 451 per cent.; but of 333 persons convicted last year of smuggling tobacco in quantities exceeding 100 pounds, only fifteen persons had paid any fines, and the aggregate amount of those fines was only £905. The enormous charges that fell upon the public in consequence deserved consideration: 1,478 prisoners had to be maintained in jail,

at a cost of more than £5,000, without reference to the cost of prosecutions and other incidental expenses. It was grievous to see also that the greater portion of the parties convicted of smuggling tobacco were British sailors."

Nearly twenty-two million pounds were fraudulently introduced every year; in London alone there are not fewer than a hundred and thirty thousand shops in which tobacco is sold. The motive for contraband operates to occasion adulteration in a like degree. Dr. Bowring expatiated on the immorality, crime, and misery, as a consideration more important, even for the government, than any tobacco income. He adverted also to the heavy cost of the coast-guard, amounting to £600,000 or £700,000 per annum, much of which might be saved if the duty were lowered and the inducement to smuggle thereby diminished. It seems probable that the duty will be considerably lowered, on clear calculations of fiscal gain.

SUGAR—SLAVE-TRADE.—The lords have lost no time on the sugar-duties bill, though they have not neglected to discuss it. Indeed, it met with an unusual discussion—one on the first reading, meant to be a substitute for the usual debate on the second reading. The object of that arrangement seems to have been to accommodate certain peers bound for the moors. It came out that the Bishop of Oxford had not been consulted in the arrangement; but there was a marked desire not to prevent a Wilberforce from speaking his mind on such an occasion; and so there was a second discussion, on the second reading. The opponents of the bill came out strongly on the anti-slavery ground. Lord Brougham made an effective speech; Lord Stanley showed to advantage on the same point; but both, as well as Lord Chief Justice Denman, made unexpected admissions that the West Indians had been hardly treated. Bishop Wilberforce's speech constituted the bulk of the second discussion: it was forcible and close, putting the anti-slavery arguments at once in the soberest and clearest light. The bishop will be a powerful debater in the upper house. The present measure, however, has drifted beyond the bound of his hereditary estate in the question; and the strength of the anti-slavery position is made by the chief weakness of the scheme. The way to turn that position would be, for ministers themselves to abandon the anti-slavery ground altogether. At present they are trying to reconcile incompatibilities: they had better get out of the dilemma by withdrawing their cruisers, and absolutely relinquishing the coercive system of prevention.—*Spectator*.

FLOGGING.—The Duke of Wellington has made a speech, short and unpretending as his orations always are, which is an event: he avows the hope that he may live to see flogging in the army abolished. He relinquishes the notion that the practice is absolutely necessary, its abolition merely impossible; and adopts the opinion that the abolition is inevitable. This indicates a vast progress since the duke maintained the very opposite opinions before the commission on military punishments in 1836. It will have immense effect on what may be called public opinion in the army; a most important consideration, since it would be very much more difficult to abolish the practice

without convincing the majority of well-informed and intelligent officers. The great task in the accomplishment of the reform now is, to devise needful substitutes for that bad coercion—means to a better composition of the army, and an improved system of rewards and correctives. Time should not be lost from the consideration of that auxiliary to simple abolition.—*Spectator*.

POLAND.—Some slight progress has been made towards a clearer view of the Polish question. The present ministers are evidently in advance of their predecessors on that ground. Lord Beaumont has proved a total infraction of the treaty of Vienna, which declared that Cracow should be an independent city, and should "on no pretext whatever" be entered by foreign troops. The Duke of Wellington admits the infraction, but maintains the sufficiency of the pretext. Lord Lansdowne plainly entertains doubts whether the conduct of Austria and Russia has not been as base as rumor asserts in fomenting rebellion as a pretext for intervention. Acknowledging the doctrine of non-intervention, it cannot be denied that we have "the right" to interpose for the maintenance of the treaty. Perhaps in the present case all practical good would be attained by a declaration of opinion on the part of the English government: ministers evidently have an opinion to declare; and it would be most beneficial if uttered without heat or rancor, without reserve or qualification, with calmness but with unmistakeable distinctness.

REPEAL.—There seems to be a lull in the repeal agitation: Young Ireland is vanquished, and is magnanimously sulky; Old Ireland reposes on its victory, in a good humor with all the world. Mr. O'Connell reciprocates compliments with the *Times*, and finds excellent sense in the suggestion of that journal that he should aid the whig ministers to carry measures for the practical benefit of his country. Surely it is a millennium; the Daniel lying down with the *Times*. Furthermore, "my dear Ray," has been formally deputed by the Repeal Association to communicate some information, "of course in his private capacity," to the government at Dublin Castle; and his communication has met with a degree of attention which Mr. Ray "in his private capacity" could scarcely expect. These coquettings between the official and the repeal governments suggest one measure which would vastly help to smooth away difficulties. When the whigs were before in power, under Earl Grey's premiership, they committed a great blunder in not providing for Mr. O'Connell. Perhaps it is not yet too late to realize some of the advantages of such a step. It should be done when his circumstances are not at the lowest—and the rent is at this moment reviving again. Moreover, his conscience should be eased, and his good name with the Irish shielded from reproach, by some official earnest of the wish to do Ireland substantial service in the way of material improvements. "Testimonials" and such acknowledgments of past services are in vogue just now; O'Connell's real services eminently belong to the past. If it is thought that he has outlived the occasion when the full benefit might have been felt by himself, let it be put in such a shape as to benefit his children. That might be done without implicating anybody in objectionable reversionary gifts.—*Spectator*.

THE POPE.—It is difficult to keep pace with the progress of the new policy in Rome. Pius the Ninth is said to have declared that he takes for his guide the New Testament; and thus far his policy seems to be animated by the highest spirit of that volume. He has not only released all political prisoners and pardoned refugees, but he has furnished the latter with public money to return home, and has received the more able and earnest of the pardoned revolutionists into favor—examining their claims and suggestions, applauding some, and even putting his approval in the substantial form of a medal. With all this, there is a moderation, an absence of ostentatious display in the thorough overturning of all past policy, that helps to remove doubts as to the reality of the pontiff's liberal intentions. The extreme popularity that he has attained, on the instant, appears to have provoked no serious counteraction among the conservative party in Rome, which might have been presumed to be at once bigoted and powerful. There is a strong sense not only of the pontiff's honesty and benevolence but also of his ability and courage. It seems that if any party entertains a secret wish to resist him, none *dares* do so. Unflinching courage is an essential quality in all great statesmanship.—*Spectator*.

MEHEMET ALI AT CONSTANTINOPLE.—The Pasha of Egypt arrived at Constantinople on the 19th of July, and has been received with the highest distinction. A letter from Constantinople says:—

"Mehemet Ali Pasha arrived here at noon on the 19th July, in the Sultan's steam-yacht *Esseri Djedid*, sent to Alexandria expressly to bring him up. Without deviating from the etiquette of the Porte as regards the distinction kept up between the sovereign and his most favored subjects, the highest possible honors have marked the reception of the Viceroy of Egypt. He was scarcely arrived in the Konack assigned for his residence when he was called to the imperial palace. The sultan received him standing in the middle of his grand hall of audience, and, taking him by the hand, conducted him to an arm-chair placed purposely for him near the seat of his highness, after which they had a conference, which lasted for about an hour. On his return home the viceroy was visited by all the high Ottoman ministers, except the grand vizier, who, in virtue of his official rank, must first receive at the Sublime Porte Mehemet Ali's own visit."

RIZA PASHA, the celebrated liberal politician of the Porte, has again been restored to office, and nominated minister of commerce. As his appointment was simultaneous with the arrival of Mehemet Ali at Constantinople, it is conjectured the two events may in some way be connected with each other.

LITERARY INTELLIGENCE.—Washington Irving, who will soon return home, will immediately put to press his History of Mohammed, the materials of which he has collected during his residence in Spain, from the Moorish manuscripts and legends. Prescott has ready his Conquest of Peru, which will be followed by a life of Philip the Second.—Mr. Bancroft has completed the fourth volume of his History of the United States, which will soon appear. Jared Sparks is engaged in writing a History of the American Revolution. The Hon. John P. Kennedy is engaged upon a Life of Wirt.

EUREKA.—A new monthly magazine, under the title of "Eureka; or the Journal of the National Association of Inventors," has been commenced by W. H. Star, New York, Messrs. Kingsley and Pierson, acting editors. The first number gives promise of great usefulness and interest to all connected with the mechanic arts, or who take any interest in them. Price \$1 a year.

VARIETY.

The drawings, sketches and other effects of the late Mr. Haydon, were exposed to public sale this week. Little anxiety was exhibited to acquire memorials of the deceased artist. The prices obtained for a few articles of historic interest may be mentioned. An octagon color-stone and two mullers, belonging to James Barry, R.A., afterwards in the possession of Hoppner, and bought by Mr. Haydon for 35*l.* sold for 1*l.* 13*s.* The coat worn by Earl Grey at the reform banquet, and presented to the deceased at his request, was "put up;" but only 7*s.* being offered for it, the auctioneer withdrew it. A small drawing of Haydon Asleep, by Wilkie, sold for 17*s.* A portrait of Mr. Hume, M. P., which the auctioneer said was a good likeness, but which the honorable member had repudiated, sold for 1*l.* Portrait of the Duke of Richmond, in chalk, 10*s.* During the sale, a note from some person was handed in, forbidding the auctioneer to sell the picture of "Alfred and the first British Jury;" but no attention was paid to the warning; the painting was put up, and knocked down at 200*l.* It is supposed that the auctioneer was commissioned to buy the picture at that sum for Sir Robert Peel.

The *Augsburg Gazette* confirms the statement of the *Rhenish Observer*, that a great company has been formed which will undertake to convey travellers in all directions, and to spare them the trouble of paying the expenses of the journey en route, by giving them coupons on their departure, which will be received in payment throughout the journey by the hotels with which the company has made arrangements. This company is to have its seat in London. It has already made all its arrangements on the route from Ostend to Alexandria; and hopes to despatch, a short time hence, a caravan of three hundred travellers, who will proceed from Ostend to Cologne by the railroads, and will ascend the Rhine for Trieste, and thence sail for Alexandria.

JAVA AMUSEMENTS.—The hog and goat fight was vastly amusing. A wild hog and beautiful goat were turned into a small arena, a stool being allowed the goat to leap on occasionally. At first he was very cautious, and, watching an opportunity, jumped down and butted the hog whenever he turned his back. His escapes and frights were comical in the extreme; but in a very short time he had the better, and at length beat the hog from place to place, till he fell quite exhausted and vanquished.

Next followed a battle-royal—three wild hogs, six dogs, and the victorious goat. The hogs were torn to pieces, most of the dogs in the same state; but the goat was as fresh and frolicsome as ever. Never was combatant more impartial: hog or dog were the same to him, and all most studiously avoided him.

The tiger and buffalo fights afforded little sport. The latter gains almost invariably an easy conquest.—*Addison's Indian Letters*.

We understand that an expedition which promises the most important results both to science and commerce is at this moment fitting out for the purpose of navigating some of the most important unexplored rivers in South America. It is to be under the command of Lord Ranclagh. Several noblemen and gentlemen have already volunteered to accompany his lordship; and the enterprising and scientific band, it is said, will sail as soon as the necessary arrangements shall be completed.—*Times*.

By a parliamentary return of the cost of postage-stamps and envelopes from the beginning of 1841 to the 5th of April last, it appears that the cost per million of the envelopes, upon the average of the period, was 359*l.* 6*s.* 11*d.*; and 371*l.* 4*s.* 2*d.* per million was repaid by the consumer. The profit per million upon the whole number issued was 11*l.* 17*s.* 3*d.*; the profit per million at the present time is 21*l.* 16*s.* 1*d.* The postage-labels cost per million 79*l.* 0*s.* 7*d.*, no part of which is repaid by the consumers: it is, in fact, a charge on the collection of the tax.

NEW BOOKS AND RE-PRINTS.

Liddell & Scott's Greek-English Lexicon. New York. Harper & Brothers.

"We are at length able to put forth this Lexicon," say the English editors, at the beginning of their preface. We can imagine the pleasant sigh of satisfaction with which this pithy sentence was written; and doubtless some such gentle inspiration escaped from Professor Drisler as he laid down the last revise of the American edition. Well indeed may all the parties concerned in this noble work be satisfied, not merely because their labor is done, but because it is so well done; and the whole generation of Greek students in this country, professors, teachers, pupils and all, owe them thanks and praise for their learning, industry and perseverance.

In our school-boy days the highest resource in lexicography was Schrevelius' lexicon, and well do we remember many a doleful hour spent over its dull pages in hunting out crabbed explanations given in bad Latin, almost as unintelligible as the Greek itself. The first relief to puzzled school-boys, as far as we recollect, was afforded by Pickering's lexicon, and a wretched compilation called Grove's. Then followed Donnegan, whose advent was hailed as the dawning of a new era, and who, in spite of multitudinous inaccuracies and defects, has kept the field until this time. But Donnegan's day is over; the lexicon of Liddell and Scott is destined not only to sweep all competitors aside, but also to hold dominion in all places where Greek is studied, for long years to come. Already has it been adopted in the English schools to the almost entire exclusion of all others; and now it is offered, greatly improved by Prof. Drisler's learned labors, for the use and comfort of American students.

Messrs. Liddell & Scott took up Passow's great work where he left it, and completed it in the very spirit of his system by independent reading of their own; so great indeed are their additions, that the work is rather an entirely new one than a modification of Passow. Prof. Drisler has not only carefully revised the work, but has added largely to its value, especially by the insertion of all the proper names in their alphabetical order. It is impossible for

us, within the compass of a newspaper article, to notice all the merits of the English or American editors of the lexicon; suffice it to say that the fruit of their labors is before us in a specimen of Greek lexicography so far superior to any that has yet appeared in the language that comparison would be ridiculous. Moreover the getting up of the book is splendid; type, paper and binding are all of the finest. Our only marvel is that 1700 pages of a Greek lexicon, thus done up, can be offered for five dollars—a price which nothing could justify but the prospect—a sure one for the publishers—of an extraordinary and long continued demand for the work.—*Com. Advertiser*.

The Eclogues and Georgics of Virgil, with English Notes. By CHARLES ANTHON, LL. D. New York. Harper & Brothers.

This is another of Dr. Anthon's valuable contributions to the cause of classical learning. He has given these beautiful poems of Virgil in a form, and with aids, that cannot fail to make their perusal not only advantageous in the acquirement of Latin, but delightful in the highest degree to every person of taste. The explanatory notes are very copious, and remove every difficulty from the path of the student. The metrical index is especially adapted to lead to a thorough appreciation of these creations of genius. The celebrity of Dr. Anthon, together with the unequalled excellence of the work, will no doubt introduce it into all the classical schools of the country.—*Com. Advertiser*.

The Pictorial History of England; being a History of the People as well as a History of the Kingdom, down to the Reign of George III. To be completed in about forty numbers. Harper & Brothers.

THE first numbers of this beautiful work which has been favorably known among us in the English edition, have been issued by the Messrs. Harper in a style which will commend it to general circulation. It is profusely illustrated with engravings on wood of monumental records; coins; civil and military costumes; domestic buildings, furniture and ornaments; cathedrals and other great works of architecture; sports and other illustrations of manners; mechanical inventions; portraits of eminent persons; and remarkable historical scenes. The work is intended for popular perusal, and aims to exhibit the "History of Common Life," as the essential element of "the History of Civilization," a history much more difficult to trace than to describe the march of the conqueror, or speculate upon the intrigues of the statesman. Its pages are not encumbered with unnecessary reference, but it neglects no important source of information which the nature of its design may make it proper to consult.

Having been for some years familiar with the work, we can speak confidently of its merits.—*Protestant Churchman*.

A Text Book of Chemistry, for the use of schools and colleges. By JOHN WILLIAM DRAPER, M. D. With nearly 300 illustrations. Harper & Brothers.

Questions on I. Corinthians. By ALBERT BARNES. For Bible Classes and Sunday Schools. Harper & Brothers.

The American Cruiser. A Tale of the Last War. Waite, Peirce & Co. Boston.
